### Book 4

## Integrated circuits

Part IC02b

**Television, video and associated systems:  
bipolar, MOS  
types TDA1525 to  $\mu$ A733C**

1989

**PHILIPS**

Book 4 Part IC02b 1989

Television, video and  
associated systems:  
bipolar, MOS

**VIDEO AND ASSOCIATED SYSTEMS  
BIPOLAR, MOS**

**Part A**

	<i>page</i>
<b>Selection guide</b>	
Functional index . . . . .	5
Numerical index . . . . .	17
Maintenance type list . . . . .	31

**General**

Product status definition for type numbers with prefixes NE, SA, SE and $\mu A$ . . . . .	35
Ordering information for type numbers with prefixes NE, SA, SE and $\mu A$ . . . . .	36
Type designation for type numbers with prefixes MAB, MAF, PCA, PCB, PCD, PCF, SAA, SAB, SAD, SAF, TDA and TEA . . . . .	39
Rating systems . . . . .	41
Handling MOS devices . . . . .	43

**Device data**

MAB8031AH-2 to TDA1524A

**Part b**

	<i>page</i>
<b>Selection guide</b>	
Functional index . . . . .	1127
Numerical index . . . . .	1138
Maintenance type list . . . . .	1153

**Device data**

TDA1525 to  $\mu A733C$

**Package information**

Package outlines . . . . .	2209
Soldering . . . . .	2255

**SELECTION GUIDE**

**Functional index**

**Numerical index**

**Maintenance type list**

FUNCTIONAL INDEX

type no.	description	page
<b>AMPLIFIERS</b>		
NE592	video amplifier	93
NE5204	wide-band high frequency amplifier	71
NE5205	wide-band high frequency amplifier	81
NE5539	ultra high frequency operational amplifier	103
NE5592	video amplifier	65
SA592	video amplifier	93
SA5204	wide-band high frequency amplifier	71
SA5205	wide-band high frequency amplifier	81
SE592	video amplifier	93
SE5539	ultra high frequency operational amplifier	103
$\mu$ A733	differential video amplifier	2201
$\mu$ A733C	differential video amplifier	2201
<b>CAMERA ICs</b>		
SAA1043	universal sync generator	431
SAA1044	subcarrier coupler circuit	447
SAD1019	multi-norm pulse pattern generator	971
<b>CLOCK/CALENDAR</b>		
PCF8573	clock calendar; I <sup>2</sup> C-bus	215
PCF8583	clock calendar with 256 x 8-bit static RAM; I <sup>2</sup> C-bus	377
<b>COLOUR DECODERS</b>		
SAA9055	digital SECAM colour decoder; I <sup>2</sup> C-bus	817
TDA3501	video control combination	1421
TDA3505	video control combination with automatic cut-off control; -(B-Y) and -(R-Y) input	1429
TDA3506	video control combination with automatic cut-off control; +(B-Y) and +(R-Y) input	1429
TDA3507	video control combination with automatic cut-off control; -(B-Y) and -(R-Y) input	1439
TDA3510	PAL decoder	1451
TDA3561A	PAL decoder	1455
TDA3565	PAL decoder	1467
TDA3566	PAL/NTSC decoder	1477
TDA3567	NTSC decoder	1495
TDA3569	NTSC decoder with fast RGB blanking	1507
TDA3590A	SECAM processor circuit (improved TDA3590)	1519
TDA3592A	SECAM/PAL transcoder	1535
TDA4510	PAL decoder	1771
TDA4532	SECAM decoder	1777
TDA4555	multistandard decoder for -(R-Y) and -(B-Y) signals	1783

# FUNCTIONAL INDEX

type no.	description	page
TDA4556	multistandard decoder for + (R-Y) and + (B-Y) signals	1783
TDA4557	multistandard colour decoder	1791
TDA4560	colour transient improvement circuit	1799
TDA4565	colour transient improvement circuit; output signal delayed 180 $\mu$ s less than that of TDA4560	1805
TDA4566	colour transient improvement circuit; switchable delay time	1813
TDA4570	NTSC decoder	1821
TDA4580	video control combination with automatic cut-off control	1827
TDA8390	single-chip PAL decoder and RGB matrix	1935
TDA8442	I <sup>2</sup> C-bus interface for colour decoders	2055
TDA8443A	I <sup>2</sup> C-bus-controlled YUV/RGB interface circuit	2063
TDA8451	P <sup>2</sup> CCD delay line and matrix for colour decoders	2087
TDA8452	P <sup>2</sup> CCD filter combination for colour decoders	2097
TDA8461	PAL/NTSC decoder; I <sup>2</sup> C-bus	2111
TDA8490	SECAM decoder	2135
TDA9080	video control combination circuit	2151

## DATA CONVERSION

### ADCs, DACs

NE5150	RGB video DAC	57
NE5151	RGB video DAC	57
NE5152	RGB video DAC	57
PCF8591	8-bit ADC/DAC; I <sup>2</sup> C-bus	395
PNA7509	7-bit ADC; 22 MHz; 3-state output	413
PNA7518	8-bit multiplying DAC; 30 MHz	425
SAA9079	ADC for digital TV	889
SAD1009	universal DAC (UDAC)	959
TDA1534	14-bit ADC	1171
TDA1541A	dual 16-bit DAC	1179
TDA1543	dual 16-bit economy DAC (I <sup>2</sup> S-bus format)	1187
TDA8444	octuple 6-bit DAC; I <sup>2</sup> C-bus	2079

## DIGITAL PROCESSING

SAA9050	digital multistandard TV decoder; I <sup>2</sup> C-bus	785
SAA9055	digital SECAM colour decoder; I <sup>2</sup> C-bus	817
SAA9057	clock generator circuit	839
SAA9058	sample rate converter	845
SAA9060	video digital-to-analogue converter (VDAC)	851
SAA9068	picture-in-picture controller (PIPCO); I <sup>2</sup> C-bus	865
SAA9069	digital vertical filter (DVF)	881
SAA9079	ADC for digital TV	889

## DISPLAY DRIVERS

PCF1303T	18-element bar graph LCD driver (with analogue input)	123
PCF2100	LCD duplex driver; 40 segments	129
PCF2110	LCD duplex driver; 60 segments and 2 LEDs	129
PCF2111	LCD duplex driver; 64 segments	129
PCF2112	LCD driver; 32 segments	129

type no.	description	page
PCF2201	LCD flat panel row/column driver	145
PCF8566	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 96 elements; I <sup>2</sup> C-bus	175
PCF8576	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I <sup>2</sup> C-bus	245
PCF8577	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C-bus	279
PCF8577A	LCD direct driver (32 segments) or duplex driver (64 segments); I <sup>2</sup> C-bus; different slave address	279
PCF8578	LCD row/column driver for dot matrix graphic displays; 40 outputs, of which 24 are programmable; I <sup>2</sup> C-bus	295
PCF8579	LCD column driver for dot matrix graphic displays; 40 column outputs; I <sup>2</sup> C-bus	333
SAA1060	LED display/interface circuit	455
SAA1064	4-digit LED driver; I <sup>2</sup> C-bus	461

#### EAST/WEST CORRECTION

TDA1082	east-west correction driver circuit	1061
---------	-------------------------------------	------

#### MEMORIES

PCF8570	256 x 8-bit static RAM; I <sup>2</sup> C-bus	205
PCF8570C	256 x 8-bit static RAM; I <sup>2</sup> C-bus; different slave address	205
PCF8571	128 x 8-bit static RAM; I <sup>2</sup> C-bus	205
PCF8582A	256 x 8-bit EEPROM; I <sup>2</sup> C-bus; -40 to +85 °C	367
PCF8583	clock calendar with 256 x 8-bit static RAM; I <sup>2</sup> C-bus	377

#### MICROCONTROLLERS (8-bit)

##### 8051/80C51 family, NMOS

MAB8031AH-2	microcontroller; 128 x 8 RAM; 3.5 to 12 and 3.5 to 15 MHz; 0 to +70 °C	47
MAB8032AH	microcontroller; 256 x 8 RAM; 3.5 to 12 MHz; 0 to +70 °C	49
MAB8051AH-2	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 3.5 to 12 MHz; 0 to +70 °C	47
MAB8052AH	microcontroller; 256 x 8 RAM; 8 K x 8 ROM; 3.5 to 12 MHz; 0 to +70 °C	49
MAF80A31AH-2	microcontroller; 128 x 8 RAM; 3.5 to 12 MHz; -40 to +110 °C	47
MAF80A51AH-2	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 3.5 to 12 MHz; -40 to +110 °C	47
MAF8031AH-2	microcontroller; 128 x 8 RAM; 3.5 to 12 MHz; -40 to +85 °C	47
MAF8051AH-2	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 3.5 to 12 MHz; -40 to +85 °C	47

# FUNCTIONAL INDEX

type no.	description	page
<b>8051/80C51 family, CMOS</b>		
PCA80C31BH-3	microcontroller; 128 x 8 RAM; 1.2 to 12 MHz; -40 to + 125 °C	111
PCA80C51BH-3	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 1.2 to 12 MHz; -40 to + 125 °C	111
PCA80C552	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I <sup>2</sup> C-bus; 1.2 to 12 MHz; -40 to + 125 °C	115
PCA80C652	microcontroller; 256 x 8 RAM; serial I/O; UART; I <sup>2</sup> C-bus; 1.2 to 12 MHz; -40 to + 125 °C	117
PCA83C552	microcontroller; 256 x 8 RAM; 8 K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I <sup>2</sup> C-bus; 1.2 to 12 MHz; -40 to + 125 °C	115
PCA83C652	microcontroller; 256 x 8 RAM; 8 K x 8 ROM; serial I/O; UART; I <sup>2</sup> C-bus; 1.2 to 12 MHz; -40 to + 125 °C	117
PCB80C31BH-2	microcontroller; 128 x 8 RAM; 0.5 to 12 MHz; 0 to + 70 °C	111
PCB80C31BH-3	microcontroller; 128 x 8 RAM; 1.2 to 16 MHz; 0 to + 70 °C	111
PCB80C51BH-2	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 0.5 to 12 MHz; 0 to + 70 °C	111
PCB80C51BH-3	microcontroller; 128 x 8 RAM; 4 K x 8 ROM; 1.2 to 16 MHz; 0 to + 70 °C	111
PCB80C552	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; two pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I <sup>2</sup> C-bus; 1.2 to 12 MHz; 0 to + 70 °C	115
PCB80C652	microcontroller; 256 x 8 RAM; serial I/O; UART; I <sup>2</sup> C-bus; 1.2 to 12 MHz; 0 to + 70 °C	117
PCB80C851	microcontroller; 128 x 8 RAM; 256 x 8 EEPROM; 1.2 to 12 MHz; 0 to + 70 °C	121
PCB83C552	microcontroller; 256 x 8 RAM; 8 K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; two pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I <sup>2</sup> C-bus; 1.2 to 12 MHz; 0 to + 70 °C	115
PCB83C652	microcontroller; 256 x 8 RAM; 8 K x 8 ROM; serial I/O; UART; I <sup>2</sup> C-bus; 1.2 to 12 MHz; 0 to + 70 °C	117
PCB83C654	microcontroller; 256 x 8 RAM; 16 K x 8 ROM; serial I/O; UART; I <sup>2</sup> C-bus; 1.2 to 12 MHz; 0 to + 70 °C	119
PCB83C851	microcontroller; 128 x 8 RAM; 256 x 8 EEPROM; 1.2 to 12 MHz; 0 to + 70 °C	121

MAF8048H	microcontroller; 64 x 8 RAM; 1 K x 8 ROM; 1.0 to 11 MHz; -40 to +85 °C	51
MAF8049H	microcontroller; 128 x 8 RAM; 2 K x 8 ROM; 1.0 to 11 MHz; -40 to +85 °C	51
MAF8050H	microcontroller; 256 x 8 RAM; 4 K x 8 ROM; 1.0 to 11 MHz; -40 to +85 °C	51
<b>8048 family, CMOS</b>		
PCB80C39	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; 0 to +70 °C	113
PCB80C49	microcontroller; 128 x 8 RAM; 2 K x 8 ROM; 1.0 to 15 MHz; 0 to +70 °C	113
PCF80C39	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; -40 to +85 °C	113
PCF80C49	microcontroller; 128 x 8 RAM; 2 K x 8 ROM; 1.0 to 15 MHz; -40 to +85 °C	113

# FUNCTIONAL INDEX

type no.	description	page
<b>POWER SUPPLY ICs</b>		
<b>SMPS controllers</b>		
TDA8380	SMPS controller	1917
TEA1039	SMPS controller	2163
<b>PPS controllers</b>		
TDA2582	control circuit for PPS	1313
<b>RECORDER ICs</b>		
SAA4700	video recorder VPS dataline processor	561
SAA5235	dataline slicer for video cassette recorders	585
SAA5236	dataline slicer	591
SAD1009	universal DAC (UDAC)	959
SAF1135	dataline decoder	999
TDA3724	SECAM identification circuit for video recorders	1569
TDA3725	SECAM (L) chrominance signal processor for video recorders	1571
TDA3730	frequency demodulator and drop-out compensator for video recorders	1575
TDA3740	video processor/frequency modulator for video recorders	1581
TDA3755	PAL/NTSC sync processor for video recorders (VHS system)	1589
TDA3760	PAL chrominance signal processor for video recorders (VHS system)	1599
TDA3765	NTSC chrominance signal processor for video recorders (VHS system)	1607
TDA3791	band selector and window detector	1615
TDA4720	SECAM identification circuit for video recorders	1843
TDA6800	video modulator circuit	1883
TDA8405	TV and video recorder stereo/dual sound processor; I <sup>2</sup> C-bus	1951
TDA8415	TV and video recorder stereo/dual sound processor with integrated filters and I <sup>2</sup> C-bus control	1961
TEA2000	PAL/NTSC colour encoder	2175
<b>REMOTE I/O EXPANDERS</b>		
PCF8574	remote 8-bit I/O expander; I <sup>2</sup> C-bus	233
PCF8574A	remote 8-bit I/O expander; I <sup>2</sup> C-bus; different slave address	233
<b>REMOTE CONTROLLERS</b>		
SAA3004	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	491
SAA3006	high performance transmitter (RC-5) for infrared remote control; up to 2048 commands	501
SAA3008	high performance transmitter (38 kHz) for infrared remote control; low voltage	515
SAA3009	infrared remote control decoder; decodes 64 commands (RECS80/RC-5); up to 32 subaddresses; high current output for direct LED drive	529
SAA3027	infrared remote control transmitter (RC-5)	539

type no.	description	page
SAA3028	high performance transcoder (RC-5) for infrared remote control; I <sup>2</sup> C-bus	553
SAA3049	infrared remote control decoder; low current version of SAA3009	529
SAF1032	receiver/decoder for infrared remote control	985
SAF1039	transmitter for infrared remote control	985
TDA3047	high performance receiver for infrared remote control; positive output voltage	1409
TDA3048	high performance receiver for infrared remote control; negative output voltage	1415

### SMALL SIGNAL COMBINATION

#### Black-white TV

TDA4500	small signal combination for B/W TV	1697
TDA4503	small signal combination for B/W TV (improved TDA4500)	1741

#### Colour TV

TDA4501	small signal combination with sound circuit for colour TV	1709
TDA4502A	small signal combination with video switch for colour TV	1723
TDA4505	small signal combination with sound circuit for colour TV	1755

### SOUND ICs

TBA120U	sound IF amplifier/demodulator for TV	1011
TDA1013B	4 W audio power amplifier with DC volume control	1023
TDA1015	1 to 4 W audio power amplifier with preamplifier	1031
TDA1015T	0.5 W audio power amplifier with preamplifier	1041
TDA1029	signal-sources switch (4 x two channels)	1047
TDA1512	12 to 20 W hi-fi audio power amplifier	1067
TDA1514	40 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	1073
TDA1514A	40 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	1079
TDA1520B	20 W hi-fi audio power amplifier; complete SOAR protection	1085
TDA1521	2 x 12 W hi-fi stereo audio power amplifier	1091
TDA1521A	2 x 6 W hi-fi stereo audio power amplifier	1101
TDA1521Q	2 x 12 W hi-fi stereo audio power amplifier	1091
TDA1524A	stereo tone/volume control circuit	1111
TDA1525	stereo tone/volume control circuit	1157
TDA2543	AM sound IF circuit for French standard	1233
TDA2545A	quasi-split-sound circuit	1239
TDA2546A	quasi-split-sound circuit with 5.5 MHz demodulation	1245
TDA2555	dual FM demodulator for TV sound; 8-stage limiter	1257
TDA2556	quasi-split-sound circuit with dual FM sound demodulators	1263
TDA2557	dual FM demodulator for TV sound; 5-stage limiter	1257
TDA2611A	5 W audio power amplifier	1353
TDA2613	6 W hi-fi audio power amplifier	1363
TDA2795	TV stereo/dual sound identification decoder	1403
TDA3800G	stereo/dual TV sound processor (dynamic selection)	1621
TDA3800GS	stereo/dual TV sound processor (static selection)	1621

# FUNCTIONAL INDEX

type no.	description	page
TDA3803A	stereo/dual TV sound decoder	1629
TDA3806	multiplex PLL stereo decoder	1637
TDA3808	second audio programme (SAP) signal processor	1643
TDA3810	spatial, stereo and pseudo-stereo sound circuit	1649
TDA3825	single FM TV sound demodulator system with external AF input and mute	1653
TDA3826	single FM TV sound demodulator system with mute and 6 dB AF amplifier	1663
TDA3845	quasi-split-sound circuit and AM demodulator	1673
TDA8405	TV and video recorder stereo/dual sound processor; I <sup>2</sup> C-bus	1951
TDA8415	TV and video recorder stereo/dual sound processor with integrated filters and I <sup>2</sup> C-bus control	1961
TDA8420	hi-fi stereo audio processor; I <sup>2</sup> C-bus	1979
TDA8421	hi-fi stereo audio processor; I <sup>2</sup> C-bus	2001
TDA8425	hi-fi stereo audio processor; I <sup>2</sup> C-bus	2023
<b>SYNC PROCESSORS</b>		
<b>Horizontal</b>		
TBA920S	horizontal combination	1017
TDA2593	horizontal combination	1327
TDA2594	horizontal combination with transmitter identification	1335
TDA2595	horizontal combination with transmitter identification and protection circuits	1343
<b>Vertical</b>		
TDA2653A	vertical deflection circuit; PIL-S4; 30AX systems and monitors	1371
TDA2655B	vertical deflection circuit; colour and monochrome (90°)	1387
TDA2658	vertical deflection circuit (90°)	1395
TDA3653B	vertical deflection and guard circuit (90°)	1549
TDA3653C	vertical deflection and guard circuit (90°)	1549
TDA3654	vertical deflection and guard circuit (110°)	1559
TDA3654Q	vertical deflection and guard circuit (110°)	1559
<b>Horizontal/vertical</b>		
TDA2577A	horizontal/vertical synchronization circuit	1269
TDA2578A	horizontal/vertical synchronization circuit	1283
TDA2579A	horizontal/vertical synchronization circuit	1297
TDA8370	synchronization processor for TV; I <sup>2</sup> C-bus	1899
<b>TEXT SYSTEMS</b>		
SAA5231	teletext video processor (successor of SAA5030)	573
SAA5235	dataline slicer for video cassette recorders	585
SAA5243E	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (West European language version)	597
SAA5243H	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (East European language version)	597
SAA5243K	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (Arabic and English version)	597

type no.	description	page
SAA5243L	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (Arabic and Hebrew version)	597
SAA5245	525-line system enhanced computer-controlled teletext circuit (USECCT); I <sup>2</sup> C-bus (West European language version)	627
SAA5250	interface for data acquisition and control	649
SAA5351	EUROM 50 Hz, CRT controller	681
SAA5355	FTFROM, CRT controller (525-line)	709
SAA5361	EUROM 60 Hz, CRT controller	737
SAA9041	digital video teletext (DVTB) processor for Philips digital TV system (525 and 625-line systems); I <sup>2</sup> C-bus (West European language version)	765
SAA9068	picture-in-picture controller (PIPCO); I <sup>2</sup> C-bus	865
SAA9069	digital vertical filter (DVF)	881
<b>TUNER/TUNING CIRCUITS</b>		
SAA1300	tuner switching circuit; I <sup>2</sup> C-bus	487
SAB3035	computer interface for tuning and control (CITAC); 8 DACs; I <sup>2</sup> C-bus	899
SAB3036	computer interface for tuning and control (CITAC); without DACs; I <sup>2</sup> C-bus	915
SAB3037	computer interface for tuning and control (CITAC); 4 DACs; I <sup>2</sup> C-bus	931
SAB6456	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	947
SAB8726	2.6 GHz divide-by-2 prescaler	953
TDA5030A	mixer/oscillator for VHF tuner	1849
TDA5030AT	mixer/oscillator for VHF tuner	1855
TDA5330T	VHF, UHF & hyperband mixer/oscillator for TV and VCR 3-band tuners	1861
TDA5332T	double mixer/oscillator for TV and VCR tuners	1875
TSA5510	1.3 GHz PLL frequency synthesizer	2183
TSA5510T	1.3 GHz PLL frequency synthesizer	2193
<b>VIDEO/AUDIO SWITCHES</b>		
TDA8440	video/audio switch for CTV receivers; I <sup>2</sup> C-bus	2045
TDA8443A	I <sup>2</sup> C-bus-controlled YUV/RGB interface circuit	2063
TDA9045	video processor and input selector	2145
<b>VIDEO GAMES</b>		
SAA1099	stereo sound generator for sound effects and music synthesis ( $\mu$ C-controlled)	471
TDA6800	video modulator circuit	1883
<b>VISION IF ICs</b>		
TDA2549	IF amplifier and demodulator for multistandard TV receivers	1251
TDA8340	TV IF amplifier and demodulator	1887
TDA8340Q	TV IF amplifier and demodulator	1887
TDA8341	TV IF amplifier and demodulator	1887
TDA8341Q	TV IF amplifier and demodulator	1887

NUMERICAL  
INDEX

type	description	page
MAB8031AH-2P	microcontroller; 128 x 8 RAM; 3.5 to 12 and 3.5 to 15 MHz; 0 to +70 °C	47
MAB8031AH-2WP	microcontroller; 128 x 8 RAM; 3.5 to 12 and 3.5 to 15 MHz; 0 to +70 °C	47

SAA1064P	4-digit LED driver; I <sup>2</sup> C-bus	461
SAA1064T	4-digit LED driver; I <sup>2</sup> C-bus	461
SAA1099	stereo sound generator for sound effects and music synthesis (μC-controlled)	471
SAA1300	tuner switching circuit; I <sup>2</sup> C-bus	487
SAA3004P	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	491
SAA3004T	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	491
SAA3006P	high performance transmitter (RC-5) for infrared remote control; up to 2048 commands	501
SAA3008	high performance transmitter (38 kHz) for infrared remote control; low voltage	515
SAA3009P	infrared remote control decoder; decodes 64 commands (RECS80/RC-5); up to 32 subaddresses; high current output for direct LED drive	529

# NUMERICAL INDEX

type	description	page
SAA3009T	infrared remote control decoder; decodes 64 commands (RECS80/RC-5); up to 32 subaddresses; high current output for direct LED drive	529
SAA3027P	infrared remote control transmitter (RC-5)	539
SAA3028	high performance transcoder (RC-5) for infrared remote control; I <sup>2</sup> C-bus	553
SAA3049P	infrared remote control decoder, low current version of SAA3009	529
SAA3049T	infrared remote control decoder, low current version of SAA3009	529
SAA4700P	video recorder VPS dataline processor	561
SAA5231	teletext video processor (successor of SAA5030)	573
SAA5235	dataline slicer for video cassette recorders	585
SAA5236	dataline slicer	591
SAA5243E	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (West European language version)	597
SAA5243H	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (East European language version)	597
SAA5243K	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (Arabic and English version)	597
SAA5243L	enhanced computer-controlled teletext circuit (ECCT); 625-line system; I <sup>2</sup> C-bus (Arabic and Hebrew version)	597
SAA5245	525-line system enhanced computer-controlled teletext circuit (USECCT); I <sup>2</sup> C-bus (West European language version)	627
SAA5250P	interface for data acquisition and control	649
SAA5250T	interface for data acquisition and control	649
SAA5351	EUROM 50 Hz; CRT controller	681
SAA5355	FTFROM, CRT controller (525-line)	709
SAA5361	EUROM 60 Hz, CRT controller	737
SAA9041P	digital video teletext (DVTB) processor for Philips digital TV system (525 and 625-line systems); I <sup>2</sup> C-bus (West European language version)	765
SAA9050	digital multistandard TV decoder; I <sup>2</sup> C-bus	785
SAA9055	digital SECAM colour decoder; I <sup>2</sup> C-bus	817
SAA9057	clock generator circuit	839
SAA9058	sample rate converter	845
SAA9060	video digital-to-analogue converter (VDAC)	851
SAA9068WP	picture-in-picture controller (PIPCO); I <sup>2</sup> C-bus	865
SAA9069T	digital vertical filter (DVF)	881
SAA9079P	ADC for digital TV	889
SAA9079T	ADC for digital TV	889
SAB3035	computer interface for tuning and control (CITAC); 8 DACs; I <sup>2</sup> C-bus	899
SAB3036	computer interface for tuning and control (CITAC); without DACs; I <sup>2</sup> C-bus	915
SAB3037	computer interface for tuning and control (CITAC); 4 DACs; I <sup>2</sup> C-bus	931
SAB6456	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	947
SAB6456T	sensitive 1 GHz divide-by-64/divide-by-256 switchable prescaler	947

type	description	page

SE592F8	video amplifier	93
SE592H	video amplifier	93
SE592N14	video amplifier	93
TBA120U	sound IF amplifier/demodulator for TV	1011
TBA920S	horizontal combination	1017
TDA1013B	4 W audio power amplifier with DC volume control	1023
TDA1015	1 to 4 W audio power amplifier with preamplifier	1031
TDA1015T	0.5 W audio power amplifier with preamplifier	1041
TDA1029	signal-sources switch (4 x two channels)	1047
TDA1082	east-west correction driver circuit	1061
TDA1512	12 to 20 W hi-fi audio power amplifier	1067
TDA1512Q	12 to 20 W hi-fi audio power amplifier	1067
TDA1514	40 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	1073
TDA1514A	40 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	1079
TDA1520B	20 W hi-fi audio power amplifier; complete SOAR protection	1085
TDA1521	2 x 12 W hi-fi stereo audio power amplifier	1091
TDA1521A	2 x 6 W hi-fi stereo audio power amplifier	1091
TDA1521Q	2 x 12 W hi-fi stereo audio power amplifier	1091
TDA1524A	stereo tone/volume control circuit	1111
TDA1525	stereo tone/volume control circuit	1157
TDA1534	14-bit ADC	1169
TDA1541A	dual 16-bit DAC	1179
TDA1543	dual 16-bit economy DAC (I <sup>2</sup> S-bus format)	1187
TDA2501	PAL/NTSC encoder	1195
TDA2506	SECAM encoder	1201
TDA2506T	SECAM encoder	1213
TDA2507	FM modulator controller for video recorders	1225
TDA2507T	FM modulator controller for video recorders	1225
TDA2543	AM sound IF circuit for French standard	1233
TDA2545A	quasi-split-sound circuit	1239
TDA2546A	quasi-split-sound circuit with 5.5 MHz demodulation	1245
TDA2549	IF amplifier and demodulator for multistandard TV receivers	1251
TDA2555	dual FM demodulator for TV sound; 8-stage limiter	1257
TDA2556	quasi-split-sound circuit with dual FM sound demodulators	1263
TDA2557	dual FM demodulator for TV sound; 5-stage limiter	1257
TDA2577A	horizontal/vertical synchronization circuit	1269
TDA2578A	horizontal/vertical synchronization circuit	1283
TDA2579A	horizontal/vertical synchronization circuit	1297
TDA2582	control circuit for PPS	1313
TDA2582Q	control circuit for PPS	1313

## MAINTENANCE TYPE LIST

The types listed below are not included in this handbook. Detailed information will be supplied on request.

SAA1056P	PLL frequency synthesizer
SAA1082	remote transmitter
SAA3027	infrared remote control transmitter
SAA5030	teletext video processor
SAB1164	1 GHz divide-by-64 prescaler
SAB1165	1 GHz divide-by-64 prescaler
SAB1256	1 GHz divide-by-256 prescaler (successor SAB6456)
SAF3019	clock/timer with serial I/O; microcontrolled
TDA2502	tacho motor speed controller
TDA2503	track sensing amplifier for VCR
TDA3540,Q	IF amplifier and demodulator; npn tuners
TDA3541,Q	IF amplifier and demodulator; pnp tuners
TDA3571B	sync combination with transmitter identification
TDA3576B	sync combination with transmitter identification
TDA3590	SECAM processor circuit (successor TDA3590A)
TDA3591	SECAM processor circuit (successor TDA3591A)
TDA3650	vertical deflection circuit
TDA3701	PAL sync processor for VCR
TDA3710	chrominance signal/mixer for VCR
TDA3720	SECAM processor for VCR (successor TDA3725)
TEA1002	PAL colour encoder and video summer (successor TEA2000)

TDA1525

## STEREO TONE/VOLUME CONTROL CIRCUIT

### GENERAL DESCRIPTION

The TDA1525 is an active stereo tone/volume control for car radios, television receivers and mains-fed audio equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by DC voltages or by single linear potentiometers.

### Features

- Few external components necessary
- Low noise due to internal gain
- Bass emphasis can be increased by a double-pole low-pass filter
- Wide power supply voltage range

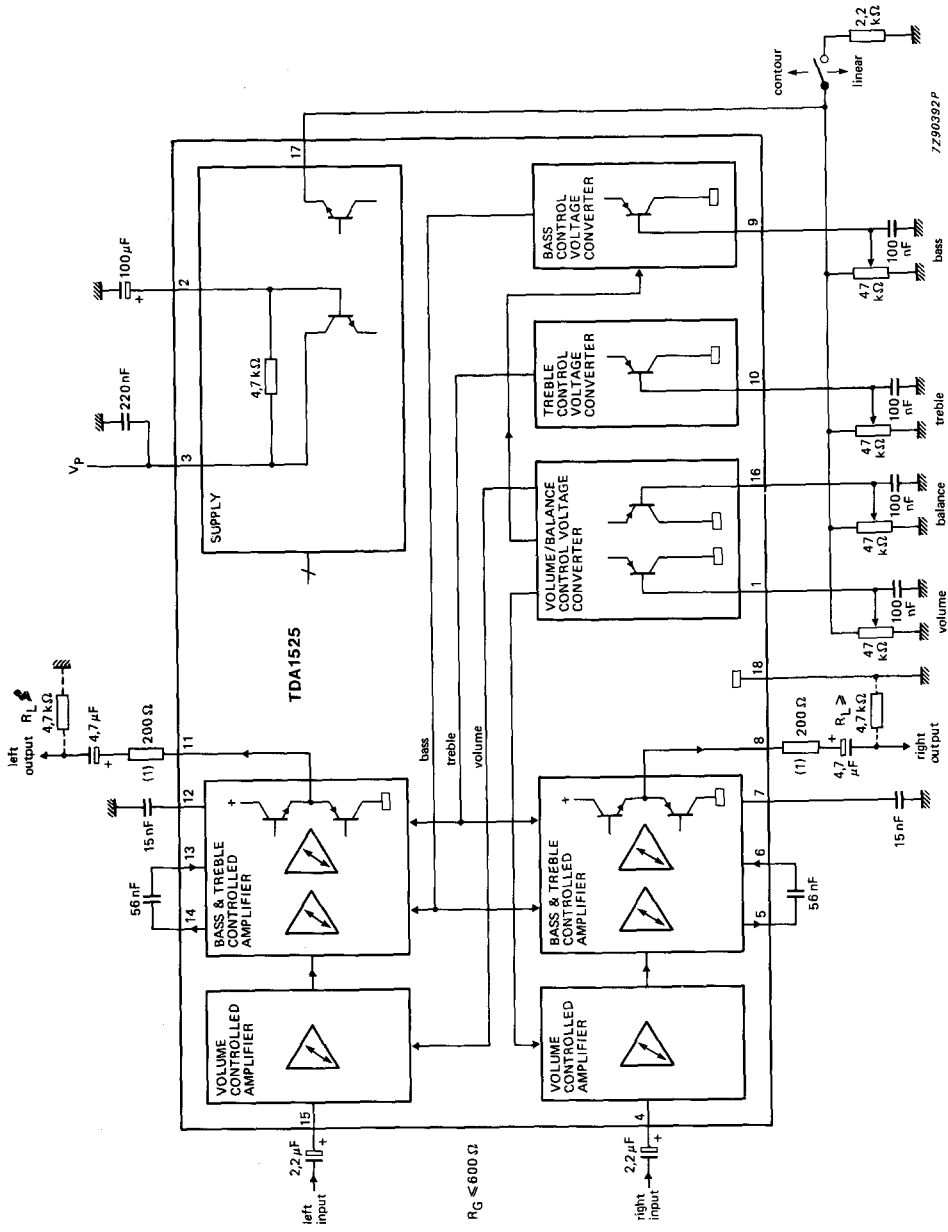

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 3)		$V_P = V_{3-18}$	7.5	12	16.5	V
Supply current		$I_3$	—	35	—	mA
Maximum input signal with DC feedback (RMS value)		$V_{i(rms)}$	—	2.5	—	V
Maximum output signal with DC feedback (RMS value)		$V_{o(rms)}$	—	3.0	—	V
Volume control range		$\Delta G_V$	-80	—	+ 21.5	dB
Bass control range	at 40 Hz	$\Delta G_V$	—	-19 to +17	—	dB
Treble control range	at 16 kHz	$\Delta G_V$	—	$\pm 15$	—	dB
Total harmonic distortion		THD	—	0.3	—	%
Output noise voltage (RMS value)	unweighted; f = 20 Hz to 20 kHz; $V_P = 12$ V					
for maximum voltage gain		$V_{no(rms)}$	—	310	—	$\mu$ V
for voltage gain = -40 dB		$V_{no(rms)}$	—	100	—	$\mu$ V
Channel separation	$G_V = -20$ to +21.5 dB	$\alpha_{cs}$	—	60	—	dB
Tracking between channels	$G_V = -20$ to +26 dB	$\Delta G_V$	—	—	2.5	dB
Ripple rejection	f = 100 Hz	RR	—	50	—	dB
Operating ambient temperature range		$T_{amb}$	-40	—	+ 85	$^{\circ}$ C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

(1) Series resistor is recommended in the event of the capacitive loads exceeding 200 pF.  
 Fig. 1 Block diagram and application circuit with single-pole filter.

Fig.2 Double-pole low-pass filter for improved bass-boost.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage (pin 3)		$V_p = V_{3-18}$	—	18	V
Total power dissipation		$P_{tot}$	—	1200	mW
Storage temperature range		$T_{stg}$	-55	+ 150	°C
Operating ambient temperature range		$T_{amb}$	-40	+ 85	°C

DEVELOPMENT DATA

**DC CHARACTERISTICS**

$V_P = V_{3-18} = 12\text{ V}$ ;  $T_{amb} = 25\text{ }^\circ\text{C}$ ; all voltages are with reference to pin 18; measured in Fig. 1;  
 $R_G \leq 600\ \Omega$ ;  $R_L > 4.7\ \text{k}\Omega$ ;  $C_L \leq 200\ \mu\text{F}$ ; unless otherwise specified

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage		$V_P = V_3$	7.5	12	16.5	V
Supply current	$V_P = 8.5\text{ V}$	$I_3$	19	27	35	mA
	$V_P = 9.7\text{ V}$	$I_3$	—	—	40	mA
	$V_P = 12.0\text{ V}$	$I_3$	25	35	45	mA
	$V_P = 15.0\text{ V}$	$I_3$	30	43	56	mA
DC input levels (pins 4 and 15)	$V_P = 8.5\text{ V}$	$V_{4, 15}$	3.8	4.25	4.7	V
	$V_P = 12.0\text{ V}$	$V_{4, 15}$	5.3	5.9	6.6	V
	$V_P = 15.0\text{ V}$	$V_{4, 15}$	6.5	7.3	8.2	V
DC output levels (pins 8 and 11)	all control voltage conditions					
	$V_P = 8.5\text{ V}$	$V_{8, 11}$	3.3	4.25	5.2	V
	$V_P = 12.0\text{ V}$	$V_{8, 11}$	4.6	6.0	7.4	V
	$V_P = 15.0\text{ V}$	$V_{8, 11}$	5.7	7.5	9.3	V
Potentiometer supply voltage output (pin 17)	$V_P = 8.5\text{ V}$	$V_{17}$	3.25	3.6	3.85	V
Contour on/off switch (control by $I_{17}$ )	switch open switch closed	$-I_{17}$	—	—	0.5	mA
		$-I_{17}$	1.5	—	10.0	mA
Application without potentiometer supply from pin 17 (contour cannot be switched off); voltage range forced to pin 17	$V_P \geq 10.8\text{ V}$	$V_{17}$	4.5	—	$\frac{V_P}{2} - V_{BE}$	V
DC voltage range for volume, bass, treble and balance controls (pins 1, 9, 10 and 16 respectively)	$V_{17} = 5.0\text{ V}$ using supply from pin 17	$V_{1, 9, 10, 16}$	1.0	—	4.25	V
		$V_{1, 9, 10, 16}$	0.25	—	3.8	V
Input current to pins 1, 9, 10 and 16		$-I_{1, 9, 10, 16}$	—	—	5.0	$\mu\text{A}$

## AC CHARACTERISTICS

$V_P = V_{3-18} = 8.5 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; all voltages are with reference to pin 18; measured in Fig. 1; contour switch closed (linear position); volume, balance, bass, and treble controls in mid-position;  $R_G \leq 600 \text{ } \Omega$ ;  $R_L \geq 4.7 \text{ k}\Omega$ ;  $C_L \leq 200 \text{ pF}$ ;  $f = 1 \text{ kHz}$ ; unless otherwise specified

DEVELOPMENT DATA

## Notes to the characteristics

- Equation for input resistance (see also Fig. 3)

$$R_i = \frac{160\text{ k}\Omega}{1 + G_v}; G_{v\text{ max}} = 12.$$

- Frequencies below 200 Hz and above 5 kHz have reduced voltage swing, the reduction at 40 Hz and at 16 kHz is 30%.
- In the event of bass boosting the output signal handling is reduced. The reduction is 1 dB for maximum bass boost.
- Linear frequency response.
- For peak values add 4.5 dB to RMS values.

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1534

## 14-BIT ANALOGUE TO DIGITAL CONVERTER (ADC)

An integrated 14-bit analogue to digital converter (ADC) which uses the successive approximation conversion technique and includes the comparator, reference source and clock on the same chip. The high linearity makes it very suitable for signal processing while the accurate, temperature-compensated reference source makes it applicable for instrumentation purposes. The ADC accepts unipolar or bipolar input signals. Digital output data is in serial form. All digital outputs are fully TTL compatible.

### QUICK REFERENCE DATA

Positive supply voltage (pin 5)	$V_p$	typ.	5 V

## FUNCTIONAL DESCRIPTION

The circuit consists of the following parts:

### 14-bit D/A converter

Using "dynamic element matching", which results in high accuracy, linearity and longterm stability, without the need of trimming. The main parts of the DAC are the binary weighted current sources and the bit switches. The DAC also delivers an offset binary current for bipolar operation of the ADC.

### Fast settling comparator/subtractor

Consisting of a high speed, clamped operational amplifier with special frequency compensation system.

### Successive approximation register (SAR)

This register is an array of fourteen addressable latches, with the outputs connected to the bit switches of the D/A converter.

### Logic-level converters

Converting the internally used current-mode-logic (CML) levels to TTL levels, for easy interface of the ADC with standard logic families.

### Clock oscillator and control logic

Delivering the pulses and timing for the SAR and takes care of the communication with the peripheral circuits.

### Reference source

Based on the bandgap voltage of silicon, with extra temperature compensation circuit.

For the timing of the output signals see Fig. 3. At the leading edge of the start conversion (SC) pulse the ADC starts converting the input voltage. During the conversion cycle the following signals appear at the output pins:

### Status (pin 2)

This signal can be used to force the Sample-Hold-Circuit, in front of the ADC, in hold mode.

### Data strobe (pin 4)

This signal is used to clock the data-out signal into the peripheral devices.

### Data out (pin 3)

The 14 bits serial, binary, output code of the A/D converter starting with the most significant bit (MSB). The data must be considered valid at the trailing edge of the data-strobe signal.

TDA1541A

## DUAL 16-BIT DAC

### GENERAL DESCRIPTION

The TDA1541A is a monolithic integrated dual 16-bit digital-to-analogue converter (DAC) designed for use in hi-fi digital audio equipment such as Compact Disc players, digital tape or cassette recorders.

### Features

- Selectable two-channel input format: offset binary or two's complement
- Internal timing and control circuit
- TTL compatible digital inputs
- High maximum input bit-rate and fast settling time
- No requirement for external deglitcher circuitry

### PACKAGE OUTLINE

28-lead DIL; plastic with internal heat spreader (SOT-117).

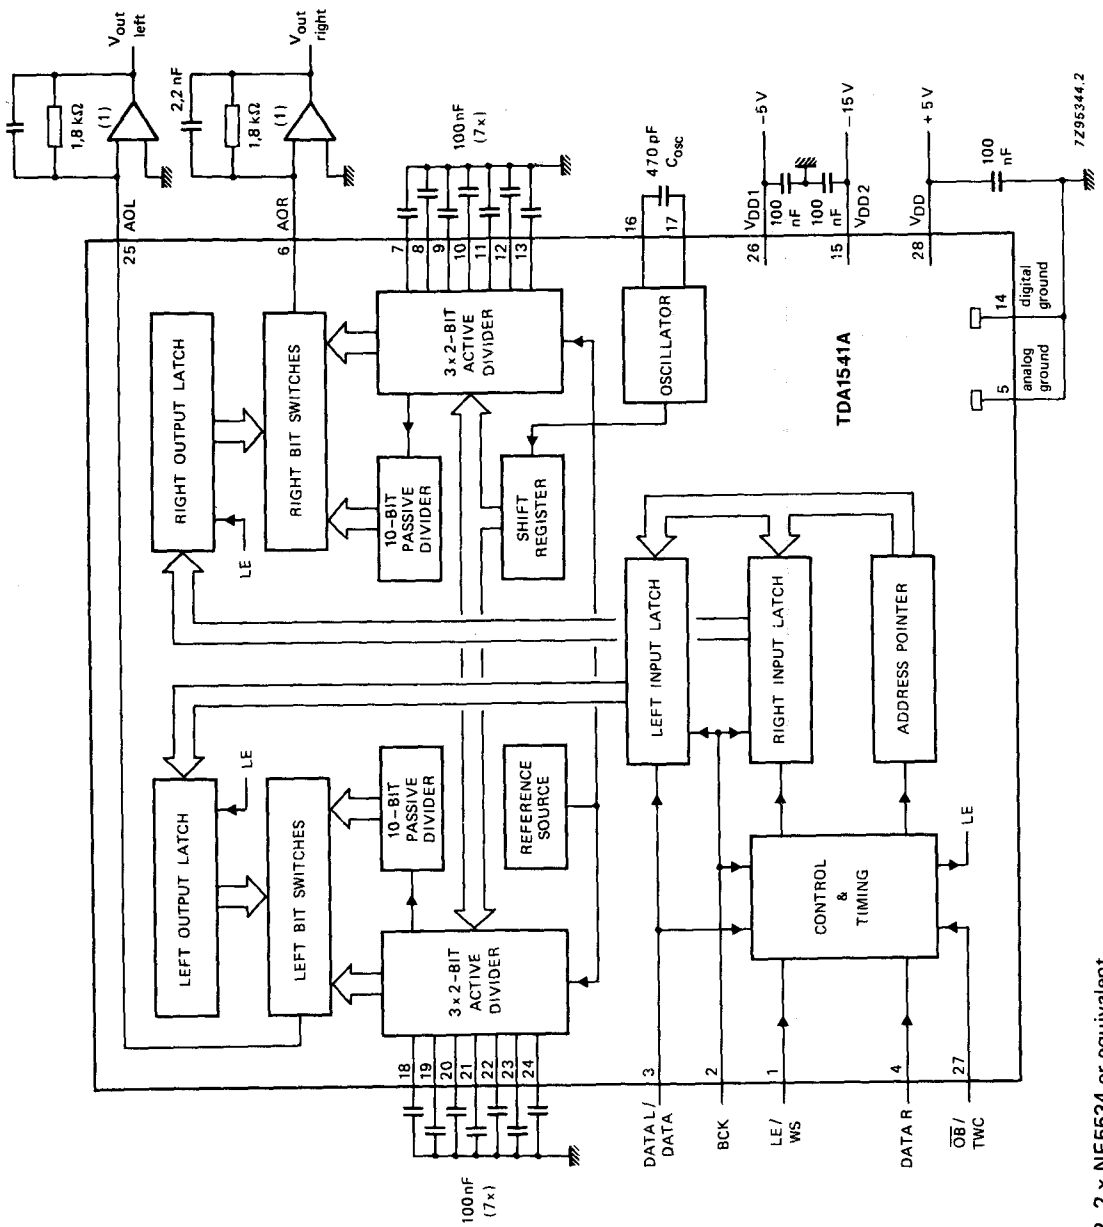

Fig. 1 Block diagram.

(1) TDA1542, 2 x NE5534 or equivalent.

## FUNCTIONAL DESCRIPTION

The TDA1541A accepts input sample formats in time multiplexed mode or simultaneous mode with any bit length. The most significant bit (MSB) must always be first.

This flexible input data format allows easy interfacing with signal processing chips such as interpolation filters, error correction circuits, pulse code modulation adaptors and audio signal processors (ASP).

The high maximum input bit-rate and fast settling time facilitates application in 4 x oversampling systems (44,1 kHz to 176,4 kHz or 48 kHz to 192 kHz) with the associated simple analogue filtering function (low order, linear phase filter).

### Input data selection (see also Table 1)

With input  $\overline{OB}/TWC$  connected to ground, data input (offset binary format) must be in time multiplexed mode. It is accompanied with a word select (WS) and a bit clock input (BCK) signal. The converted samples appear at the output, at the first positive going transition of the bit clock signal after a negative going transition of the word select signal.

With  $\overline{OB}/TWC$  connected to  $V_{DD}$  the mode is the same but the data format must be in two's complement.

When input  $\overline{OB}/TWC$  is connected to  $V_{DD1}$  the two channels of data (L/R) are input simultaneously via DATA L and DATA R, accompanied with BCK and a latch-enable input (LE). With this mode selected the data must be in offset binary. The converted samples appear at the output at the positive going transition of the latch enable signal.

The format of data input signals is shown in figures 3 and 4.

True 16-bit performance is achieved by each channel using three 2-bit active dividers, operating on the dynamic element matching principle, in combination with a 10-bit passive current-divider, based on emitter scaling.

All digital inputs are TTL compatible.

**Table 1** Input data selection

$\overline{OB}/TWC$	mode	pin 1	pin 2	pin 3	pin 4
-5 V	simultaneous	LE	BCK	DATA L	DATA R
0 V	time MUX OB	WS	BCK	DATA OB	not used
+5 V	time MUX TWC	WS	BCK	DATA TWC	not used

Where:

- LE = latch enable
- WS = word select, LOW = left channel; HIGH = right channel
- BCK = bit clock
- DATA L = data left
- DATA R = data right
- DATA OB = data offset binary
- DATA TWC = data two's complement
- MUX OB = multiplexed offset binary
- MUX TWC = multiplexed two's complement = I<sup>2</sup>S - format.

TDA1543

## DUAL 16-BIT DAC (ECONOMY VERSION)

### GENERAL DESCRIPTION

The TDA1543 is a monolithic integrated dual 16-bit digital-to-analogue converter (DAC) designed as an economy version for use in hi-fi digital audio equipment such as Compact Disc players, digital tape or cassette recorders.

### Features

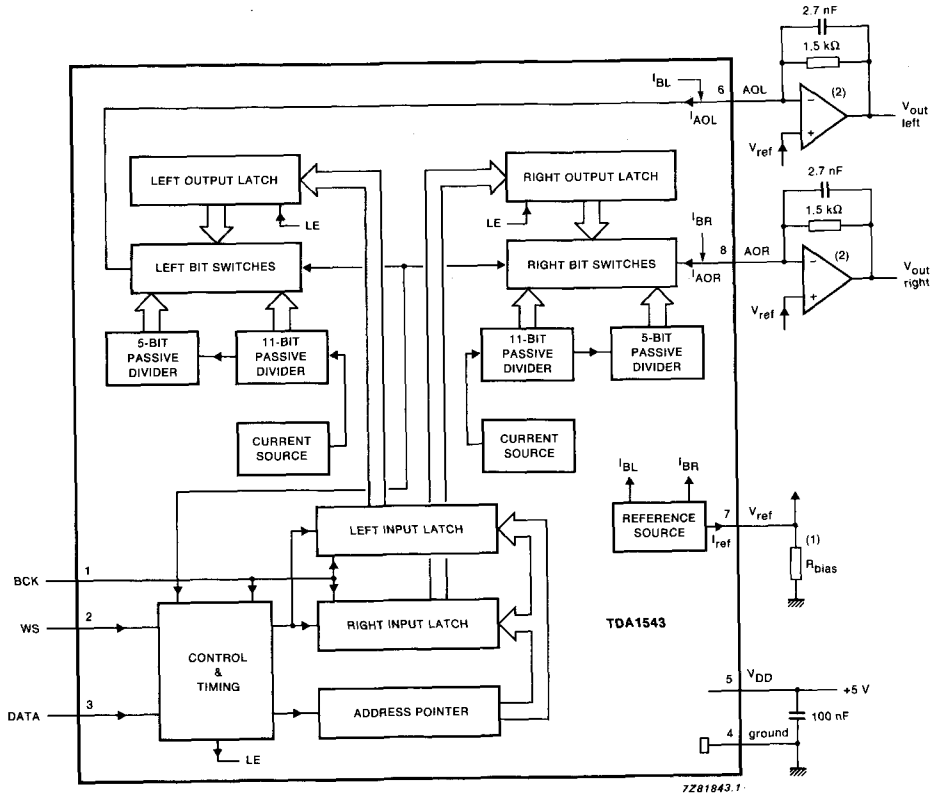

- Low distortion
- 16-bit dynamic range
- 4 x oversampling possible
- Single 5 V power supply
- No external components required
- No requirement for external deglitcher circuitry due to fast settling output current
- Adjustable bias current
- Internal timing and control circuits
- I<sup>2</sup>S input format: time multiplexed, two's complement, TTL

DEVELOPMENT DATA

(a) input pins BCK, WS and DATA.

(b) output pin  $V_{ref}$ .

(c) output pins AOL and AOR.

Fig. 3 Circuits at the input and output pins.

**FUNCTIONAL DESCRIPTION**

The TDA1543 accepts input serial data formats in two's complement with any bit length. Left and right data words are time multiplexed. The most significant bit (bit 1) must always be first. The format of data input is shown in Fig. 4.

This flexible input data format ( $I^2S$ ) allows easy interfacing with signal processing chips such as interpolation filters, error correction circuits and audio signal processors (ASP).

The high maximum input bit-rate and fast settling current facilitates application in 4 x oversampling systems. An adjustable current is added to the output currents to bias output operational amplifiers (OP1; OP2) for maximum dynamic range (see Fig. 1).

With a LOW level on the word select (WS) input data is placed in the left input register and with a HIGH level on the WS input data is placed in the right input register. The data in the input registers is simultaneously latched in the output registers which control the bit switches.

The output current of the DAC is a sink current. The current  $I_{ref}$  at the  $V_{ref}$  output is adjusted by a resistor or a current source. The current  $I_{ref}$  is amplified with gain  $A_{Ibias}$  to the bias currents ( $I_{BL}$ ;  $I_{BR}$ ) which are added to the output currents.

## PAL — NTSC ENCODER

## GENERAL DESCRIPTION

The TDA2501 encodes two colour-difference signals R-Y and B-Y onto one subcarrier. Quadrature modulation allows the coding to be in accordance with either the PAL or NTSC system.

## Features

- Generates two sinusoidal subcarriers with a relative phase of  $90^\circ$  (also accepts external subcarriers)
- Modulates the two subcarriers with the colour difference signals
- *Inverts the output from one modulator on command of an external signal (as in case of PAL)*
- Sums the output from the modulators to obtain a quadrature modulated output signal
- Clamps the output DC level to a reference voltage
- Divides the frequency of horizontal sync pulses by three so that the output level can be clamped and the balance of the two modulators sequentially controlled during the line-blanking minus burst-key period

## QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage range (pin 6)	$V_p$	5.5	6.8	10	V
Supply current range (pin 6)	$I_p$	28	40	64	mA
Chrominance output voltage (pin 9) (peak-to-peak value)	$V_{g(p-p)}$	—	—	1.4	V
Operating ambient temperature range	$T_{amb}$	-25	—	+70	$^\circ\text{C}$

## PACKAGE OUTLINES

TDA2501 : 16-lead DIL; plastic (with internal heat spreader) (SOT38).

TDA2501T: 16-lead mini-pack; plastic (SO16L; SOT162A).

7290239

(1)  $R = 0.885 (2 \pi fC)$ ; for PAL  $f = 4.433 619 \text{ MHz}$ ,  $R = 963 \Omega$  and  $C = 33 \text{ pF}$ .

Fig. 1 Block diagram; also test and application diagram.

**DESCRIPTION**

The colour difference signals B-Y and R-Y with a maximum amplitude of 1.4 volt are to be applied at pin 12 and pin 5. DC-coupling of the input signals is allowed if their DC levels are within specified limits from the DC level at pin 10 ( $V_{ref}$ ). The following table shows these limits as a function of supply voltage. The table also shows the limits of the reference voltage range as a function of the supply voltage.

supply voltage $V_{6-16}$ (V)	input DC (R-Y) (B-Y) min. (V)*	$V_{5-16}$ $V_{12-16}$ (V) max. (V)**	reference voltage $\Delta$ $V_{10-16}$ (V)		
			min	typ.	max.
5.5	2.4	3.3	2.3	3.0	3.5
6.0	$> V_{ref} - 1.4$ V	3.8	2.4	3.3	3.9
7.0	$> V_{ref} - 1.4$ V	4.8	2.6	4.0	4.7
8.0	$> V_{ref} - 1.4$ V	5.8	2.8	4.8	5.5
9.0	$> V_{ref} - 1.4$ V	6.8	3.0	5.5	6.3
10.0	$> V_{ref} - 1.4$ V	7.8	3.2	6.3	7.1

\* Minimum 2.4 V.

\*\* At  $V_S - 2.2$  V.

$\Delta$  Minimum values at  $0.2 V_S + 1.2$  V.

Typical values without pull-up or pull-down resistor.

Maximum values at  $0.8 V_S - 0.9$  V.

The inputs (B-Y) and (R-Y) should be zero, independent of their (limited) DC-levels, during the line-blanking minus burst-key period (LB – BK). Clamping the output and correcting the out-of-balance of the modulators, is achieved by applying a HIGH level to pin 7 within the (LB–BK) period (e.g. line sync pulse).

Modulation at output:

$V_g = \text{LOW}$ ; output =  $sc \times (B-Y) + sc' \times (R-Y)$

$V_g = \text{HIGH}$ ; output =  $sc \times (B-Y) - sc' \times (R-Y)$

in which  $sc'$  = subcarrier

$sc = 90^\circ$  phase-shifted subcarrier to  $sc'$  ( $sc$  lags).

The bandpass filter at the output suppresses the DC components of the (R-Y) + (B-Y) signal. Luminance (Y) is not processed by this circuit.

**Internal subcarrier**

The internal subcarrier oscillator is crystal controlled. The oscillator generates a sinewave with low harmonic distortion and an amplitude of about 500 mV peak-to-peak. The amplitude can be changed if necessary with a current input at pin 1. The adjustment range is 0 to 800 mV, with a corresponding current range of +250 to -150  $\mu\text{A}$ .

**Phase shift**

To obtain a  $90^\circ$  phase-shifted carrier, two low impedance subcarrier outputs are provided, pins 2 and 15, the last being the inverse of the first. Between pins 2 and 15 an external RC combination must be used to obtain the desired  $90^\circ$  shift. The capacitor value must be limited to 33 pF to minimize subcarrier distortion.

The resistor required between pins 2 and 14 is  $0.885 (2 \pi fC)$ .

### External subcarrier

The (B-Y) and (R-Y) signals can also be multiplied with an external subcarrier. In this event the external subcarrier is connected to pin 1. For maximum input impedance at pin 1  $V_3 = V_{16}$  ( $Z_{mi} > 1400 \Omega$ ). The same RC network generates the  $90^\circ$  phase-shifted subcarrier. For the use of an externally generated subcarrier, applied at pin 14, the DC level must be the same as that of an RC-network generated one.

### RATINGS

## SECAM ENCODER

### GENERAL DESCRIPTION

The TDA2506 converts colour-difference signals ( $D'_R$  and  $D'_B$ ) into sequential, frequency modulated signals according to the SECAM system. The signals ( $D'_R$ ) and ( $D'_B$ ) are the colour difference signals before low-frequency pre-emphasis;  $D'_R = -1,9 (R-Y)$  and  $D'_B = \pm 1,5(B-Y)$ . The circuit is intended for use in video cameras, games, recorders and players, PAL-SECAM transcoding circuits and SECAM test signal generators.

Synchronizing pulses required for operation of the TDA2506 may be obtained from a universal sync generator SAA1043 or other pulse generator. All pulses are to be active HIGH and are as follows:

Horizontal sync pulses to pin 11

Half-rate horizontal sync (H/2) pulses to pin 9

Vertical sync pulses to pin 12

Chrominance blanking pulses to pin 13 (may include colour-killer pulses)

Frequency modulation is performed in conjunction with modulator-controller TDA2507.

### Features

- Chrominance processor
- Vertical identification signal generator
- Timing pulse output to TDA2507
- Sample and hold circuit for control signal from TDA2507
- No adjustments of external components required (except high-frequency pre-emphasis (bell filter) stage)

### QUICK REFERENCE DATA

Supply voltage	V <sub>4-2</sub>	typ.	5 V
Supply current	I <sub>4</sub>	typ.	45 mA
Reference voltage	V <sub>7-2</sub> , V <sub>22-24</sub>	typ.	3,5 V
Operating ambient temperature range	T <sub>amb</sub>		-25 to +70 °C
Storage temperature range	T <sub>stg</sub>		-65 to +150 °C

### PACKAGE OUTLINES

24-lead DIL; plastic (with internal heat spreader) (SOT 101B).

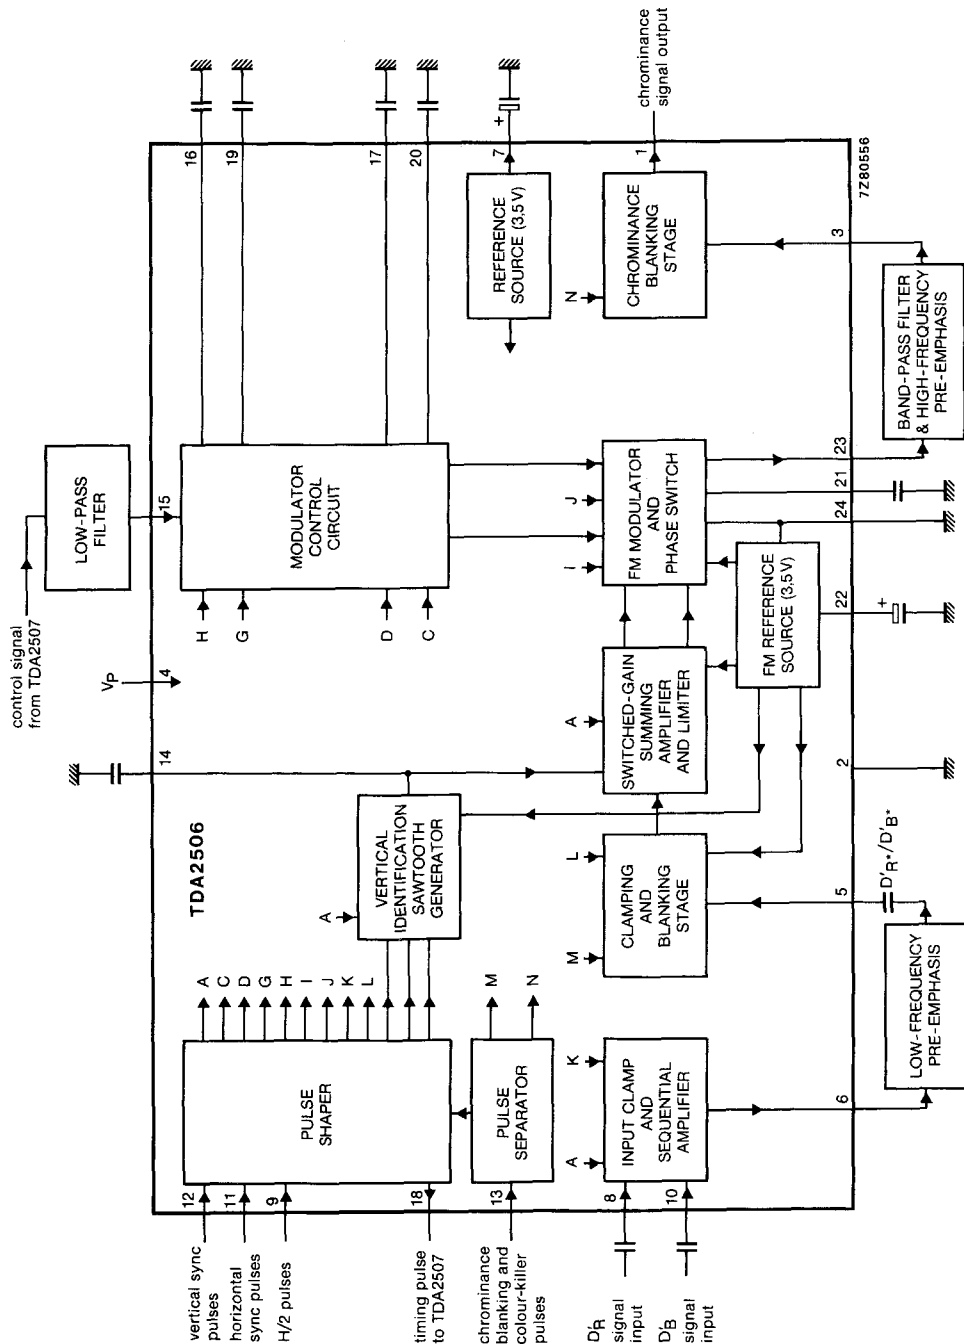

Fig. 1 Block diagram.

**Pin functions**

1. Chrominance signal output.
2. Ground.
3. Input to chrominance blanking stage from high-frequency pre-emphasis and band-pass filter.
4. Positive supply voltage.
5. Input to clamping and blanking stage from low-frequency pre-emphasis filter.
6. Output from sequential amplifier to low-frequency pre-emphasis filter.
7. Reference voltage output.
8.  $D'R$  signal input.
9. H/2 pulse input (required only if specific phase sequencing is desired).
10.  $D'B$  signal input.
11. Horizontal sync pulse input.
12. Vertical sync pulse input.
13. Chrominance blanking and colour-killer pulse input.
14. Capacitor for vertical identification sawtooth.
15. Control signal input from TDA2507 via low-pass filter.
16. 4 406,250 kHz frequency adjustment.
17. (R-Y) control.
18. Timing pulse output to TDA2507.
19. 4 250,000 kHz frequency adjustment.
20. (B-Y) control.
21. FM modulator tuning capacitor (fixed).
22. FM reference voltage output.
23. FM modulator output to high frequency pre-emphasis and band-pass filter.
24. Ground connection for FM modulator.

**FUNCTIONAL DESCRIPTION****Input clamp and sequential amplifier**

This circuit clamps the zero levels of the  $D'R$  and  $D'B$  input signals (pins 8 and 10) to the reference voltage from pin 7. The input signals are switched into the amplifier sequentially by an internally delayed H/2 waveform. The amplifier output at pin 6 is  $D'R$  when the delayed H/2 waveform is HIGH and  $D'B$  when it is LOW. The stage gain is 1,5.

**Clamping and blanking stage**

After external low-frequency pre-emphasis, the sequential  $D'R^*$  and  $D'B^*$  signals are returned to the IC at pin 5. The signal amplitude at pin 5 is typically 0,5 V (peak-to-peak value) for 75% colour bar (EBU). Black levels are clamped to the FM reference voltage (pin 22). Blanking takes place during the chrominance blanking pulse and, if required, during the video blanking and/or colour killing pulses.

FUNCTIONAL DESCRIPTION (continued)

Fig. 2 Survey of input signals in relation to composite sync.

Fig. 3 Timing pulse output (pin 18) and resulting control input (pin 15).

### Switched-gain summing amplifier and limiter

Inputs into the summing amplifier are the sequential  $D'R^*$  and  $D'B^*$  signals, the vertical identification sawtooth waveform and reference d.c. levels. The gain of the amplifier is switched by the internally delayed H/2 waveform to give the correct input amplitudes for the FM modulator ( $D'R^*$  gain =  $280/230 \times D'B^*$  gain). An offset is also introduced between the black levels of the  $D'R^*$  and  $D'B^*$  signals which corresponds to the upper and lower thresholds of the limiter.

### FM modulator and phase switch

The FM modulator provides accurate FM modulation which follows the amplitude envelopes of the sequential  $D'R^*$  and  $D'B^*$  waveforms. The centre frequencies of 4 406,250 kHz for the  $D'R^*$  signal and 4 250,000 kHz for the  $D'B^*$  signal are controlled by d.c. levels from the sample and hold circuit (which in turn are controlled by the TDA2507). The upper and lower frequency limits are  $4\,756,000 \pm 35$  kHz and  $3\,900,000 \pm 35$  kHz.

Reference d.c. levels are switched within the FM modulator to define the starting phase of the modulator output (pin 23) at the initiation of each horizontal and vertical scan. The starting phase sequence is as follows:

- vertical scan (frame to frame)  $0^\circ, 180^\circ, 0^\circ, 180^\circ$ , repeating;
- horizontal scan (line to line)  $0^\circ, 0^\circ, 180^\circ, 0^\circ, 0^\circ, 180^\circ$ , repeating.

### Chrominance blanking stage

The frequency modulated colour difference signals are passed via high-frequency pre-emphasis and band-pass filters to the chrominance blanking input at pin 3. The d.c. level of this input should be equal to the reference voltage at pin 7. Blanking occurs during the chrominance blanking pulse. The stage gain is 1,75.

### Vertical identification sawtooth generator

Vertical sync, horizontal sync and chrominance blanking pulses are used to determine vertical identification (see Fig. 4). The vertical identification sawtooth generator is driven in opposite directions for identification signals IdR and IdB; the capacitor for the generator is connected at pin 14. If no vertical identification is required, pin 14 should be connected to the FM reference voltage at pin 22.

### Pulse shaper

This stage develops all pulses that are required within the TDA2506 and also the timing pulses required for the modulator controller TDA2507 (see Fig. 3). Internal H/2 pulses are generated by a flip-flop working from the horizontal sync input (pin 11), this makes the H/2 input at pin 9 necessary only if it is required to lock the modulator into a specific phase sequence. If the H/2 input is not required, pin 9 should be connected to ground. A pulse separator at the chrominance blanking/colour-killer input (pin 13) allows this input to be used for blanking the sequential  $D'R^*/D'B^*$  signal.

### Sample and hold circuit

This circuit provides reference voltages to the FM modulator which set the centre modulation frequencies for the sequential  $D'R^*$  and  $D'B^*$  signals. The reference voltage levels are supplied to pin 15 from the TDA2507 in a sequence that is time-related to  $D'R^*/D'B^*$  switching. The levels are sampled and then held for  $D'R^*$  using capacitors at pins 16 and 17, and for  $D'B^*$  using capacitors at pins 19 and 20.

FUNCTIONAL DESCRIPTION (continued)

23. FM modulator output to high frequency pre-emphasis and band-pass filter.
24. Ground connection for FM modulator.

**FUNCTIONAL DESCRIPTION****Input clamp and sequential amplifier**

This circuit clamps the zero levels of the D'R and D'B input signals (pins 8 and 10) to the reference voltage from pin 7. The input signals are switched into the amplifier sequentially by an internally delayed H/2 waveform. The amplifier output at pin 6 is D'R when the delayed H/2 waveform is HIGH and D'B when it is LOW. The stage gain is 1,5.

**Clamping and blanking stage**

After external low-frequency pre-emphasis, the sequential D'R\* and D'B\* signals are returned to the IC at pin 5. The signal amplitude at pin 5 is typically 0,5 V (peak-to-peak value) for 75% colour bar (EBU). Black levels are clamped to the FM reference voltage (pin 22). Blanking takes place during the chrominance blanking pulse and, if required, during the video blanking and/or colour killing pulses.

FUNCTIONAL DESCRIPTION (continued)

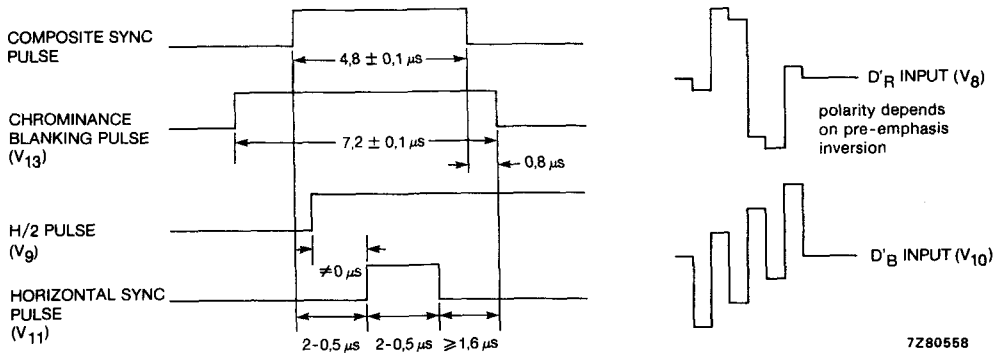

Fig. 2 Survey of input signals in relation to composite sync.

Fig. 3 Timing pulse output (pin 18) and resulting control input (pin 15).

### Switched-gain summing amplifier and limiter

Inputs into the summing amplifier are the sequential  $D'R^*$  and  $D'B^*$  signals, the vertical identification sawtooth waveform and reference d.c. levels. The gain of the amplifier is switched by the internally delayed H/2 waveform to give the correct input amplitudes for the FM modulator ( $D'R^*$  gain =  $280/230 \times D'B^*$  gain). An offset is also introduced between the black levels of the  $D'R^*$  and  $D'B^*$  signals which corresponds to the upper and lower thresholds of the limiter.

### FM modulator and phase switch

The FM modulator provides accurate FM modulation which follows the amplitude envelopes of the sequential  $D'R^*$  and  $D'B^*$  waveforms. The centre frequencies of 4 406,250 kHz for the  $D'R^*$  signal and 4 250,000 kHz for the  $D'B^*$  signal are controlled by d.c. levels from the sample and hold circuit (which in turn are controlled by the TDA2507). The upper and lower frequency limits are  $4\,756,250 \pm 35$  kHz and  $3\,900,000 \pm 35$  kHz.

Reference d.c. levels are switched within the FM modulator to define the starting phase of the modulator output (pin 23) at the initiation of each horizontal and vertical scan. The starting phase sequence is as follows:

vertical scan (frame to frame)  $0^\circ, 180^\circ, 0^\circ, 180^\circ$ , repeating;

horizontal scan (line to line)  $0^\circ, 0^\circ, 180^\circ, 0^\circ, 0^\circ, 180^\circ$ , repeating.

### Chrominance blanking stage

The frequency modulated colour difference signals are passed via high-frequency pre-emphasis and band-pass filters to the chrominance blanking input at pin 3. The d.c. level of this input should be equal to the reference voltage at pin 7. Blanking occurs during the chrominance blanking pulse. The stage gain is 1,75.

### Vertical identification sawtooth generator

Vertical sync, horizontal sync and chrominance blanking pulses are used to determine vertical identification (see Fig. 4). The vertical identification sawtooth generator is driven in opposite directions for identification signals IdR and IdB; the capacitor for the generator is connected at pin 14. If no vertical identification is required, pin 14 should be connected to the FM reference voltage at pin 22.

### Pulse shaper

This stage develops all pulses that are required within the TDA2506 and also the timing pulses required for the modulator controller TDA2507 (see Fig. 3). Internal H/2 pulses are generated by a flip-flop working from the horizontal sync input (pin 11), this makes the H/2 input at pin 9 necessary only if it is required to lock the modulator into a specific phase sequence. If the H/2 input is not required, pin 9 should be connected to ground. A pulse separator at the chrominance blanking/colour-killer input (pin 13) allows this input to be used for blanking the sequential  $D'R^*/D'B^*$  signal.

### Sample and hold circuit

This circuit provides reference voltages to the FM modulator which set the centre modulation frequencies for the sequential  $D'R^*$  and  $D'B^*$  signals. The reference voltage levels are supplied to pin 15 from the TDA2507 in a sequence that is time-related to  $D'R^*/D'B^*$  switching. The levels are sampled and then held for  $D'R^*$  using capacitors at pins 16 and 17, and for  $D'B^*$  using capacitors at pins 19 and 20.

\*\* Values are valid for 75% colour bar saturation (EBU) ( $V_5 = \pm 250$  mV deviation from clamping level).

APPLICATION INFORMATION

7280557

- (1) Signal amplitude for 75% colour bar (EBU) = 0,5 V (peak-to-peak value).
- (2) For  $V_p = 4,75$  to  $5,3$  V,  $C_{17} = C_{20} = 0,68 \mu F$ ; for  $V_p > 5,3$  V,  $C_{17} = C_{20} = 2,2 \mu F$ .

Fig. 6 Application using TDA2507 with PLL tuning:  $V_p = 5$  V.

## FM MODULATOR CONTROLLER

### GENERAL DESCRIPTION

The TDA2507 accepts FM signals that are sequentially modulated by two alternating subcarrier frequencies (SECAM signals) and provides sequential DC output levels to control the FM modulator.

The IC is intended for use with the SECAM encoder TDA2506 but can be adapted for other applications. Timing reference pulses from the modulator are required.

Two frequency reference phase-lock loops are contained within the IC; one for 4.40625 MHz, and one for 4.250 MHz. Other frequencies can be accomplished by using external reference sources.

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 3)		$V_p = V_{3-6}$	4.75	5.0	7.0	V
Supply current	$V_p = 5\text{ V}$ ; both PLL circuits on	$I_3$	—	40	—	mA
Reference voltage		$V_{2-6}$	3.38	3.5	3.6	V
Storage temperature range		$T_{stg}$	−65	—	+150	°C
Operating ambient temperature range		$T_{amb}$	−25	—	+70	°C

### PACKAGE OUTLINES

TDA2507 : 16-lead DIL; plastic (with internal heat spreader) (SOT38).

TDA2507T: 16-lead mini-pack; plastic (SO16L; SOT162A).

**PINNING****Pin functions**

pin	description
1	FM signal input (from TDA2506)
2	Reference voltage output
3	Positive supply voltage
4	Horizontal sync output ( $f_H = 4\,406.250/282 = 15.625$ kHz)
5	Timing pulse input (from TDA2506)
6	Ground
7	Control signal output to TDA2506 via low-pass filter
8	Input to synchronous demodulator from band-pass filter
9	Output to band-pass filter
10	Supply voltage for the divider stages and phase/frequency detectors of the two phase-lock loops (PLL)
11	Tuning capacitor for the 4.250 MHz reference oscillator
12	Filter for the phase/frequency detector of the 4.250 MHz phase-lock loop
13	Horizontal sync input ( $f_H$ )
14	Supply voltage for the two reference oscillators
15	Tuning capacitor for the 4.40625 MHz reference oscillator
16	Filter for the phase/frequency detector of the 4.40625 MHz phase-lock loop.

**FUNCTIONAL DESCRIPTION****Phase-lock loops**

The two phase-lock loops each comprise a voltage-controlled reference oscillator, two frequency divider stages and a phase/frequency detector circuit. The loops are closed by charge pumping the reference oscillators from the phase/frequency detector outputs. The centre frequencies of the loops are set by external capacitors at pin 15 (4.40625 MHz) and pin 11 (4.250 MHz). The divider stages which follow the reference oscillators reduce the frequencies of both the loops to 15.625 kHz ( $f_H$ ) at their respective inputs to the phase/frequency detectors. The reference signals to both phase/frequency detectors are obtained from the horizontal sync input at pin 13.

The divider and phase/frequency detector circuits can be switched off by connecting pin 10 to ground. This leaves only the VCO of each PLL in circuit and allows external signals to be injected at pins 15 and 11, or crystals to be used for tuning the oscillators.

The accuracy of crystal tuning using only one crystal can be obtained by connecting pins 10, 14 and 16 to the reference voltage at pin 2 and connecting a 4.40625 MHz crystal to pin 15. The 4.250 MHz PLL will follow the crystal-derived  $f_H$  reference from pin 4 via pin 13 and its phase/frequency detector.

**Multiplexer and pulse shaper**

The multiplexer receives the 4.40625 and 4.250 MHz reference frequencies from the two VCOs and the FM signals  $D'R^*$  and  $D'B^*$  from the TDA2506 modulator. The signals are gated one at a time to the multiplexer output in a sequence determined by the timing pulses from TDA2506. The levels of the timing pulses (pin 5) are used in the pulse shaper to generate enable pulses for the multiplexer (see Figs 2 and 3). The multiplexer output sequence is as follows:

4.40625 MHz (2 lines);  $D'R^*$  FM signal (1 line); 4.250 MHz (2 lines);  $D'B^*$  FM signal (1 line); repeating. The selection of  $D'R^*$  or  $D'B^*$  FM signal is a feature of the timing of the input at pin 5.

Fig.2 Timing pulse waveform for multiplexer output sequence.

Fig.3 Switching levels of the timing pulse at pin 5.

**Divide-by-two stage and synchronous demodulator**

The divide-by-two stage halves the frequencies present in the multiplexer output and equalizes the amplitude and pulse shapes of the sequential signals.

Demodulation of the multiplexed signal is performed by filtering the signal via a 2.17 MHz band-pass filter (between pins 8 and 9) and using this filtered signal as a synchronous switch for the main signal. The DC level of the signal from pin 9 is referred externally to the reference voltage from pin 2. An external low-pass filter is required for the output signal from pin 7.

## AM SOUND I.F. CIRCUIT FOR FRENCH STANDARD

### GENERAL DESCRIPTION

The TDA2543 is a monolithic integrated AM sound i.f. circuit in television receivers for the French standards L and L'.

The circuit incorporates the following functions:

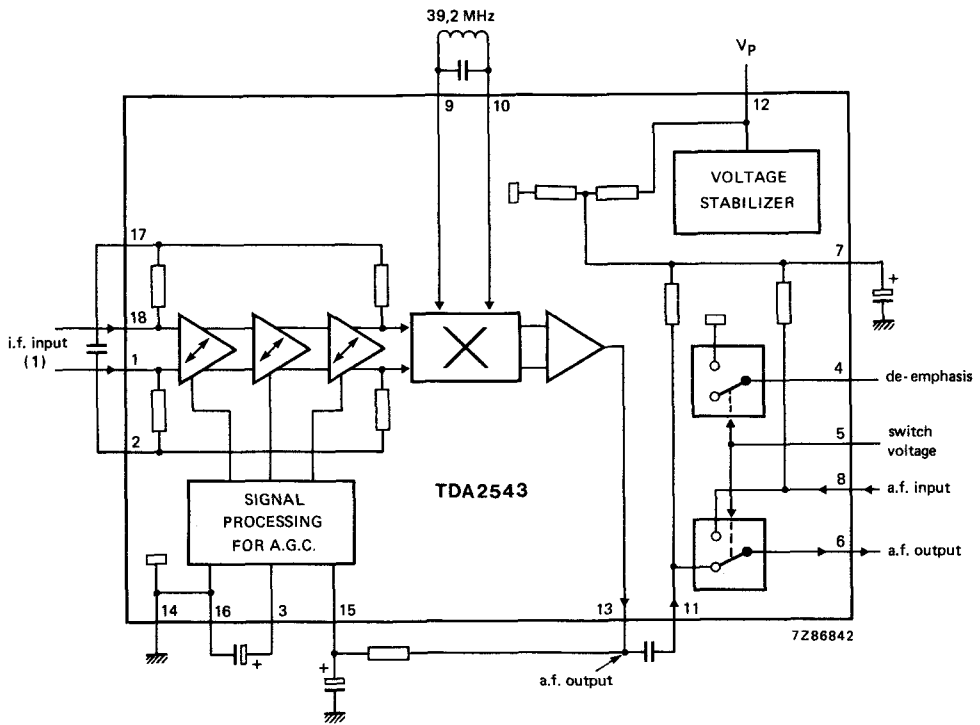

- 3-stage gain controlled i.f. amplifier, providing complete i.f. gain
- Synchronous AM demodulator
- A.G.C. circuit
- Audio input circuit with two external audio inputs and switching facilities to provide for either the demodulated i.f. or an external signal output
- Demodulated i.f. output is available from the input of the switching circuit

### QUICK REFERENCE DATA

Supply voltage (pin 12)	$V_{12-14} = V_P$	typ.	12 V
Minimum i.f. vision carrier input voltage (r.m.s. value) for an output signal $V_{13-14(rms)} = 480$ mV	$V_{VC1-18(rms)}$	max.	30 $\mu$ V
I.F. control range	$\Delta G_V$	min.	60 dB
A.F. output voltage (r.m.s. value)	$V_{13-14(rms)}$	typ.	680 mV
Distortion at $V_{VC1-18(rms)} = 5$ mV	$d_{tot}$	max.	1 %
Signal-to-weighted-noise ratio according to CCIR 468	S + N/N	min.	50 dB
Maximum signal amplitude for the a.f. switch (r.m.s. value)	$V_{8;11-14(rms)}$	min.	2 V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

(1) I.F. signal: vision carrier (V.C.) and sound carrier (S.C.).

## QUASI-SPLIT-SOUND CIRCUIT

### GENERAL DESCRIPTION

The TDA2545A is a monolithic integrated circuit for quasi-split-sound processing in television receivers.

### Features

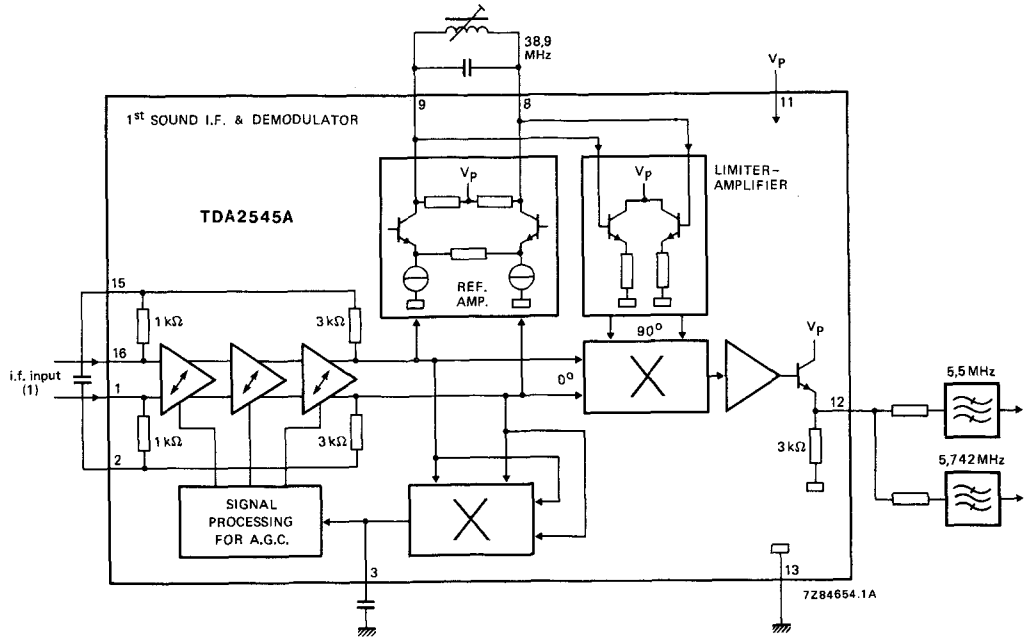

- 3-stage gain controlled i.f. amplifier
- A.G.C. circuit
- Reference amplifier and limiter amplifier for vision carrier (V.C.) processing
- Linear multiplier for quadrature demodulation

### QUICK REFERENCE DATA

Supply voltage (pin 11)	$V_P = V_{11-13}$	typ.	12 V
Supply current (pin 11)	$I_P = I_{11}$	typ.	45 mA
Minimum i.f. vision carrier input voltage (r.m.s. value)	$V_{VC1-16(rms)}$	typ.	150 $\mu$ V
Output voltage; 5,5 MHz (r.m.s. value)	$V_{12-13(rms)}$	typ.	100 mV
Output voltage; 5,742 MHz (r.m.s. value)	$V_{12-13(rms)}$	typ.	45 mV
I.F. control range	$\Delta G_V$	typ.	64 dB
Signal-to-weighted-noise ratio (rel. to 1 kHz; 30 kHz deviation)			
at 5,5 MHz	} for 2T/20T pulses with white bars	S + W/W	typ. 58 dB
at 5,742 MHz		S + W/W	typ. 56 dB

### PACKAGE OUTLINES

16-lead DIL; plastic (SOT38).

(1) I.F. signal: vision carrier (V.C.) and sound carrier (S.C.).

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 11)	$V_p = V_{11-13}$	max.	13,2 V
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

**CHARACTERISTICS**

$V_P = V_{11-13} = 12 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured at  $f_{VC} = 38,9 \text{ MHz}$ ,  $f_{SC1} = 33,4 \text{ MHz}$ ,  
 $f_{SC2} = 33,158 \text{ MHz}$ :

Vision carrier (V.C.) modulated with different video signals (see below); modulation depth 100%  
 (proportional to 10% residual carrier).

Vision carrier amplitude (r.m.s. value) is  $V_{VC} = 10 \text{ mV}$ .

Vision-to-sound carrier ratios are  $VC/SC1 = 13 \text{ dB}$  and  $VC/SC2 = 20 \text{ dB}$ .

Sound carriers (SC1, SC2) modulated with  $f = 1 \text{ kHz}$  and deviation  $\Delta f = \pm 30 \text{ kHz}$ .

For measuring circuit see Fig. 2; unless otherwise specified.

## QUASI-SPLIT-SOUND CIRCUIT WITH 5,5 MHz DEMODULATION

### GENERAL DESCRIPTION

The TDA2546A is a monolithic integrated circuit for quasi-split-sound processing, including 5,5 MHz demodulation, in television receivers.

#### Features

1st i.f. (V.C.: vision carrier plus S.C.: sound carrier)

- 3-stage gain controlled i.f. amplifier
- A.G.C. circuit
- Reference amplifier and limiter amplifier for vision carrier (V.C.) processing
- Linear multiplier for quadrature demodulation

2nd i.f. (5,5 MHz signal)

- 8-stage limiter amplifier
- Quadrature demodulator
- A.F. amplifier with de-emphasis
- AV switch

#### QUICK REFERENCE DATA

Supply voltage (pin 15)	$V_P = V_{15-16}$	typ.	12 V
Supply current (pin 15)	$I_P = I_{15}$	typ.	57 mA
Minimum i.f. vision carrier input voltage (r.m.s. value)	$V_{VC1-18(rms)}$	typ.	150 $\mu$ V
Output voltage; 5,5 MHz (r.m.s. value)	$V_{14-16(rms)}$	typ.	100 mV
Output voltage; 5,742 MHz (r.m.s. value)	$V_{14-16(rms)}$	typ.	45 mV
I.F. control range	$\Delta G_V$	typ.	64 dB
Signal-to-weighted-noise ratio (rel. to 1 kHz; 30 kHz deviation)			
at 5,5 MHz	S + W/W	typ.	58 dB
at 5,742 MHz	S + W/W	typ.	56 dB
A.F. output voltage (r.m.s. value)	$V_{O6-16(rms)}$	typ.	0,6 V

#### PACKAGE OUTLINES

18-lead DIL; plastic (SOT102).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 15)	$V_P = V_{15-16}$	max.	13,2 V
Input current (pin 4)	$I_4$	max.	7 mA
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

**CHARACTERISTICS**

$V_p = V_{15-16} = 12 \text{ V}$ ;  $T_{amb} = 25 \text{ }^\circ\text{C}$ ; measured at  $f_{VC} = 38,9 \text{ MHz}$ ,  $f_{SC1} = 33,4 \text{ MHz}$ ,  $f_{SC2} = 33,158 \text{ MHz}$ ;

Vision carrier (V.C.) modulated with different video signals (see below); modulation depth 100% (proportional to 10% residual carrier).

Vision carrier amplitude (r.m.s. value) is  $V_{VC} = 10 \text{ mV}$ .

Vision-to-sound carrier ratios are  $VC/SC1 = 13 \text{ dB}$  and  $VC/SC2 = 20 \text{ dB}$ .

Sound carriers (SC1, SC2) modulated with  $f = 1 \text{ kHz}$  and deviation  $\Delta f = \pm 30 \text{ kHz}$ .

For measuring circuit see Fig. 2; unless otherwise specified.

## I.F. AMPLIFIER AND DEMODULATOR FOR MULTISTANDARD TV RECEIVERS

### GENERAL DESCRIPTION

The TDA2549 is a complete i.f. circuit with a.f.c., a.g.c., demodulation and video preamplification facilities for multistandard television receivers. It is capable of handling positively and negatively modulated video signals in both colour and black/white receivers.

### Features

- Gain-controlled wide-band amplifier providing complete i.f. gain
- Synchronous demodulator for positive and negative modulation
- Video preamplifier with noise protection for negative modulation
- Auxiliary video input and output (75  $\Omega$ )
- Video switch to select between auxiliary video input signal and demodulated video signal
- A.F.C. circuit with on/off switch and inverter switch
- A.G.C. circuit for positive modulation (mean level) and negative modulation (noise gate)
- A.G.C. output for controlling MOSFET tuners

### QUICK REFERENCE DATA

Supply voltage (pins 13 and 21)	$V_P = V_{13;21-3}$	typ.	12 V
Supply current (pins 13 and 21)	$I_P = I_{13;21-3}$	typ.	82 mA
I.F. input signal at $V_O = 2$ V (between pins 6 and 7)	$V_i = V_{6-7}$	typ.	50 $\mu$ V
Video output voltage at $V_i = 0$ V (between pins 22 and 3)			
positive modulation	$V_O = V_{22-3}$	typ.	2 V
negative modulation	$V_O = V_{22-3}$	typ.	4 V
Gain control range	$G_V$	typ.	74 dB
Signal-to-noise ratio at $V_i = 10$ mV	S/N	typ.	57 dB
A.F.C. output voltage swing (pin 15)	$V_{15-3}$	min.	10 V
Max. tuner a.g.c. output current (pin 10)	$I_{10}$	min.	0,3 mA
Video bandwidth (3 dB)	B	typ.	5,5 MHz
Auxiliary video input voltage (pin 12) at $V_O = 2$ V (peak-to-peak value)	$V_{12-3(p-p)}$	typ.	1 V
Auxiliary video output impedance (pin 14)	$ Z_{14-3} $	typ.	7 $\Omega$
Auxiliary video output voltage (pin 14)	$V_{14-3}$	typ.	2 V

### PACKAGE OUTLINE

TDA2555  
TDA2557

# DUAL TV SOUND DEMODULATOR CIRCUITS

## GENERAL DESCRIPTION

The circuits incorporate two FM demodulator systems to perform the demodulator functions required in a dual sound carrier TV system for demodulating the sound carriers.

The difference between TDA2555 and TDA2557 is the number of stages of the limiting amplifier.

- Eight (TDA2555) or five (TDA2557) stage limiting amplifier
- Quadrature demodulator for FM detection
- De-emphasis stage
- Output amplifier
- Mute function for each FM demodulator

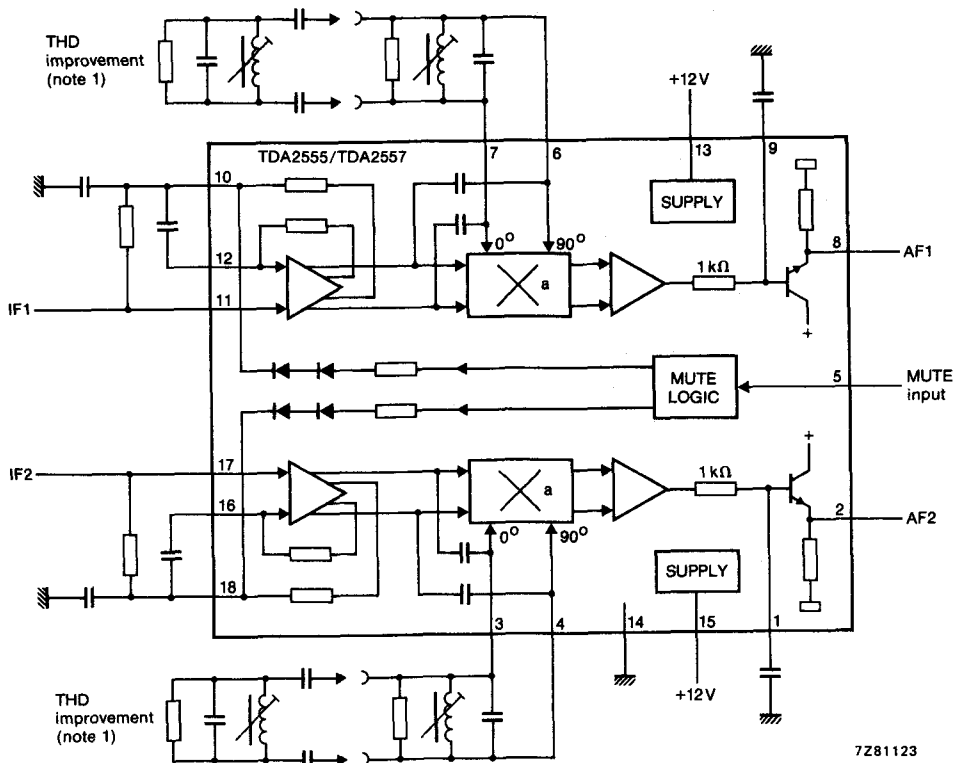

## QUICK REFERENCE DATA

Supply voltage (pins 13 and 15)	$V_p$	typ.	12 V
Supply current (pins 13 and 15)	$I_p$	typ.	24,5 mA
AF output voltage (pins 2 and 8)	$V_o(rms)$	typ.	600 mV
Total harmonic distortion (note 1)	THD	<	0,1 %
Signal to weighted noise ratio	$(S + N)/N$	typ.	70 dB

MUTE function $V_{i(rms)} < 60 \text{ mV}$	$\alpha$	60	—	—	dB
Switching input current $V_{5-14} = 0 \text{ V}$	$-I_5$	—	—	500	$\mu\text{A}$
$V_{5-14} = V_p$	$I_5$	—	—	500	$\mu\text{A}$
Internal d.c. voltage no mute (pin 5 not connected)	$V_{5-14}$	—	6,2	—	V

Notes to the characteristics

1. THD < 0,1% requires a double tuned demodulator circuit ( $Q_L = 20$ ). With a single tuned circuit a THD of < 0,5% is possible (see Figs 1 and 3).
2. If higher a.c. output current is required an external resistor must be applied from output (pins 2 and 8) to ground (min. 2 k $\Omega$ ) in order to improve the THD performance ( $-I_{2,8} < 4 \text{ mA}$ ).
3. The deemphasis time constant is 50  $\mu\text{s}$ .
4. Crosstalk attenuation is defined as:

$$\alpha_{12} = \frac{V_{2-14} \text{ unmodulated}}{V_{8-14}} \quad \alpha_{21} = \frac{V_{8-14} \text{ unmodulated}}{V_{2-14}}$$

5. In the MUTE state the a.f. output level attenuation is more than 60 dB. The MUTE function is only guaranteed for an r.m.s. value of the input voltage lower than 60 mV. See also Fig. 2.

Fig. 2 Mute function.

## QUASI-SPLIT-SOUND CIRCUIT WITH DUAL SOUND DEMODULATORS

### GENERAL DESCRIPTION

The TDA2556 is a monolithic integrated circuit for quasi-split-sound processing, including two FM demodulators, for two carrier stereo TV receivers and VTR.

### Features

First IF (vision carrier plus sound carrier).

- 3 stage gain controlled IF amplifier
- AGC circuit
- Reference amplifier and limiter amplifier for vision carrier (V.C.) processing
- Linear multiplier for quadrature demodulation

Second IF (two separate channels for both FM sound signals).

- 4-stage-limiting amplifier
- Quadrature demodulator
- AF amplifier with de-emphasis
- Output buffer
- Muting for one or both AF outputs

### QUICK REFERENCE DATA

Supply voltage, pin 23	$V_P = V_{23-24}$	typ.	12 V
Supply current, pin 23	$I_P = I_{23}$	typ.	73 mA
Minimum IF vision carrier input voltage (rms value)	$V_{VC} = V_{3-4}$	typ.	150 $\mu$ V
IF control range	$\Delta G_V$	typ.	64 dB
AF output voltage	$V_O$ 10, 15-24(rms)	typ.	600 mV
Signal-to-weighted-noise ratio (relative to 1 kHz; 30 kHz deviation)			
at 5,5 MHz	} for 2T/20T pulses with white bars	S + W/W	typ. 58 dB
at 5,74 MHz		S + W/W	typ. 56 dB

### PACKAGE OUTLINE

24-lead DIL; plastic (SOT101B).

Fig. 1 Block diagram.

SC = sound carrier at first IF  
 SC\* = sound carrier at second IF

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage, pin 23	$V_P = V_{23-24}$	max.	13,2 V
Supply current, pin 23	$I_P = I_{23}$	max.	95 mA
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

**CHARACTERISTICS**

$V_P = V_{23-24} = 12$  V;  $T_{amb} = 25$  °C; measured at  $f_{VC} = 38,9$  MHz,  $f_{SC1} = 33,4$  MHz,  $f_{SC2} = 33,158$  MHz.

Vision carrier (V.C.) modulated with different video signals (see below); modulation depth 100% (proportional to 10% residual carrier).

Vision carrier amplitude:  $V_{VC(rms)} = 10$  mV.

Vision-to-sound carrier ratios:  $VC/SC1 = 13$  dB,  $VC/SC2 = 20$  dB.

Sound carrier (SC1, SC2) modulated with  $f = 1$  kHz and deviation  $\Delta f = \pm 30$  kHz.

For measuring circuit see Fig. 2; unless otherwise specified.

Fig. 4 Mute function.

Fig. 5 Signal to weighted noise ratio depending on video modulation.

Fig. 6 Control voltage at pin 5 as a function of the input voltage  $V_{VC} = V_{3.4(rms)}$ .

**Notes to the characteristics**

1. Incidental phase on the vision carrier, caused by the TV transmitter, has to be less than 0,5 degrees for black and white transient; this is equivalent to  $S + W/W = 56$  dB for a 6 kHz sine wave.
2. Input signal second IF  $V_{8-24}/V_{17-24} = 10$  mVrms.
3. THD value is valid for ceramic bandpass filters of SC\* and single resonance circuits at pins 11 and 12 and pins 13 and 14.
4. THD value is valid for LC bandpass filters of SC\* and double resonance circuits at pins 11 and 12 and pins 13 and 14.
5. If higher a.c. output current is required an external resistor has to be applied from output (pins 10 and 15) to ground (minimum 2 k $\Omega$ ) in order to improve the THD performance.

## SYNCHRONIZATION CIRCUIT WITH VERTICAL OSCILLATOR AND DRIVER STAGES

### GENERAL DESCRIPTION

The TDA2577A separates the vertical and horizontal sync pulses from the composite TV video signal and uses them to synchronize horizontal and vertical oscillators.

#### Features

- Horizontal sync separator and noise inverter
- Horizontal oscillator
- Horizontal output stage
- Horizontal phase detector (sync to oscillator)
- Time constant switch for phase detector (fast time constant during catching)
- Slow time constant for noise only conditions
- Time constant externally switchable (e.g. fast for VCR)
- Inhibit of horizontal phase detector and video transmitter identification circuit during vertical oscillator flyback
- Second phase detector ( $\varphi_2$ ) for storage compensation of horizontal deflection stage
- Sandcastle pulse generator (3-levels)
- Video transmitter identification circuit
- Stabilizer and supply circuit for starting the horizontal oscillator and output stage directly from the mains rectifier
- Duty factor of horizontal output pulse is 50% when flyback pulse is absent
- Vertical sync separator
- Bandgap 6,5 V reference voltage for vertical oscillator and comparator
- Synchronized vertical oscillator/sawtooth generator (synchronization inhibited when no video transmitter is detected)
- Internal circuit for 3% parabolic pre-correction of the oscillator/sawtooth generator. Comparator supplied with pre-corrected sawtooth and external feedback input
- Vertical comparator with internal 3% pre-correction circuit for vertical oscillator/sawtooth generator
- Vertical driver stage
- Vertical blanking pulse generator with external adjustment of pulse duration (50 Hz: 21 lines; 60Hz: 17 lines)
- Vertical guard circuit

### QUICK REFERENCE DATA

#### Supply

Minimum current required to start horizontal oscillator and output stage (pin 16)

Main supply voltage (pin 10)

Supply current

$I_{16}$	>	4,5 mA
$V_P = V_{10-9}$	typ.	12 V
$I_P = I_{10}$	typ.	55 mA

#### Input signals

Sync pulse input voltage (peak-to-peak value; negative-going)

$V_{5-9(p-p)}$	0,15 to 1 V
----------------	-------------

#### Output signals

Horizontal output pulse (open collector) at  $I_{11} = 40$  mA

Vertical output pulse (emitter-follower) at  $I_1 = 10$  mA

$V_{11-9}$	<	0,5 V
$V_{1-9}$	>	4 V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

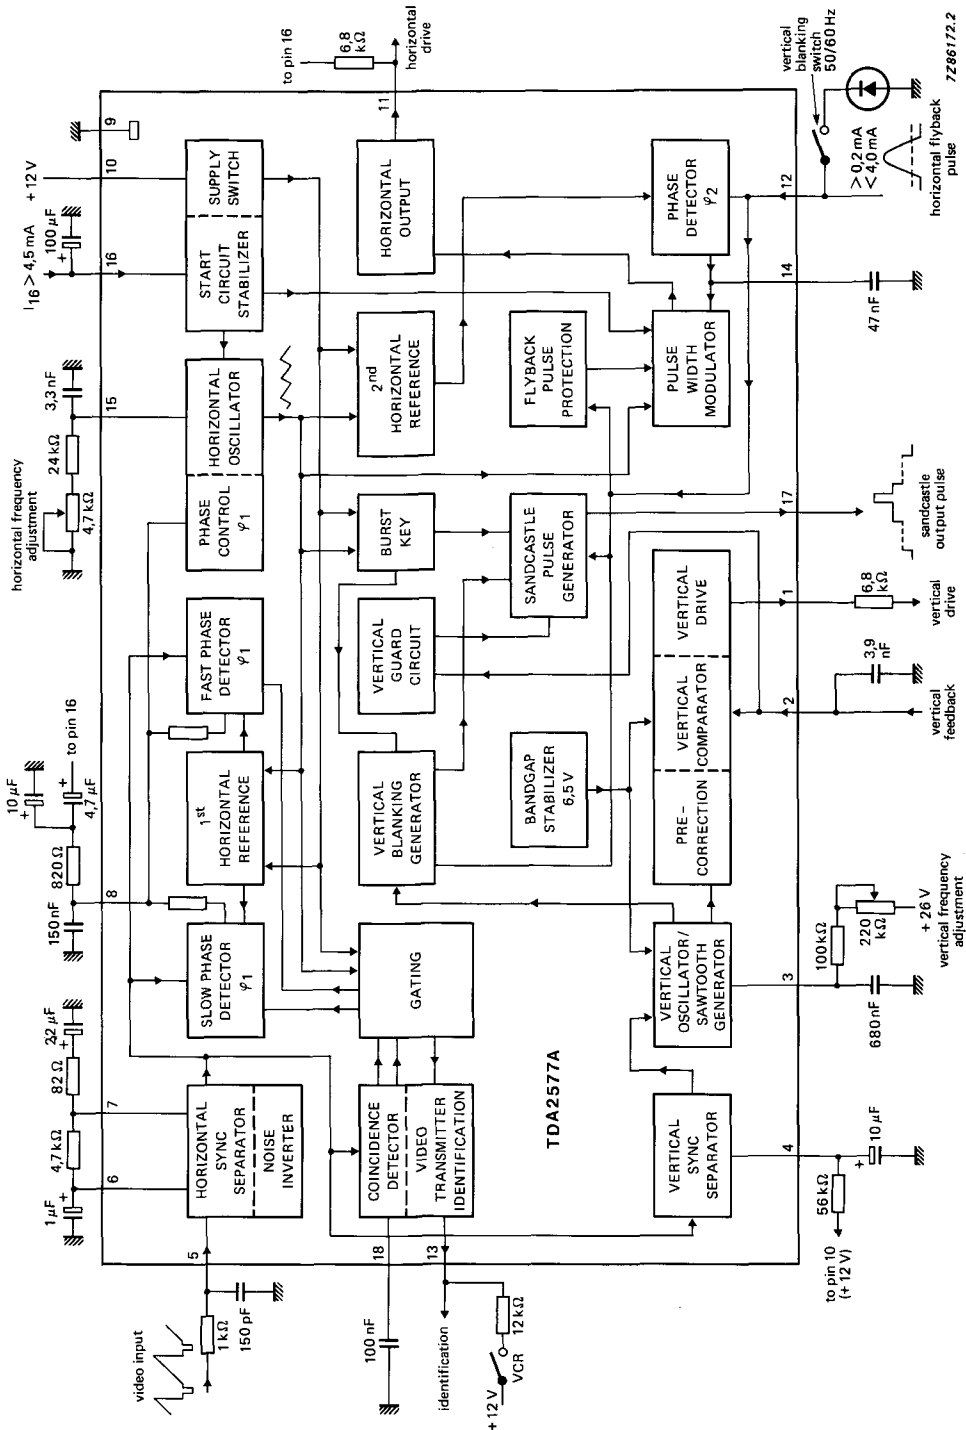

Fig. 1 Block diagram.

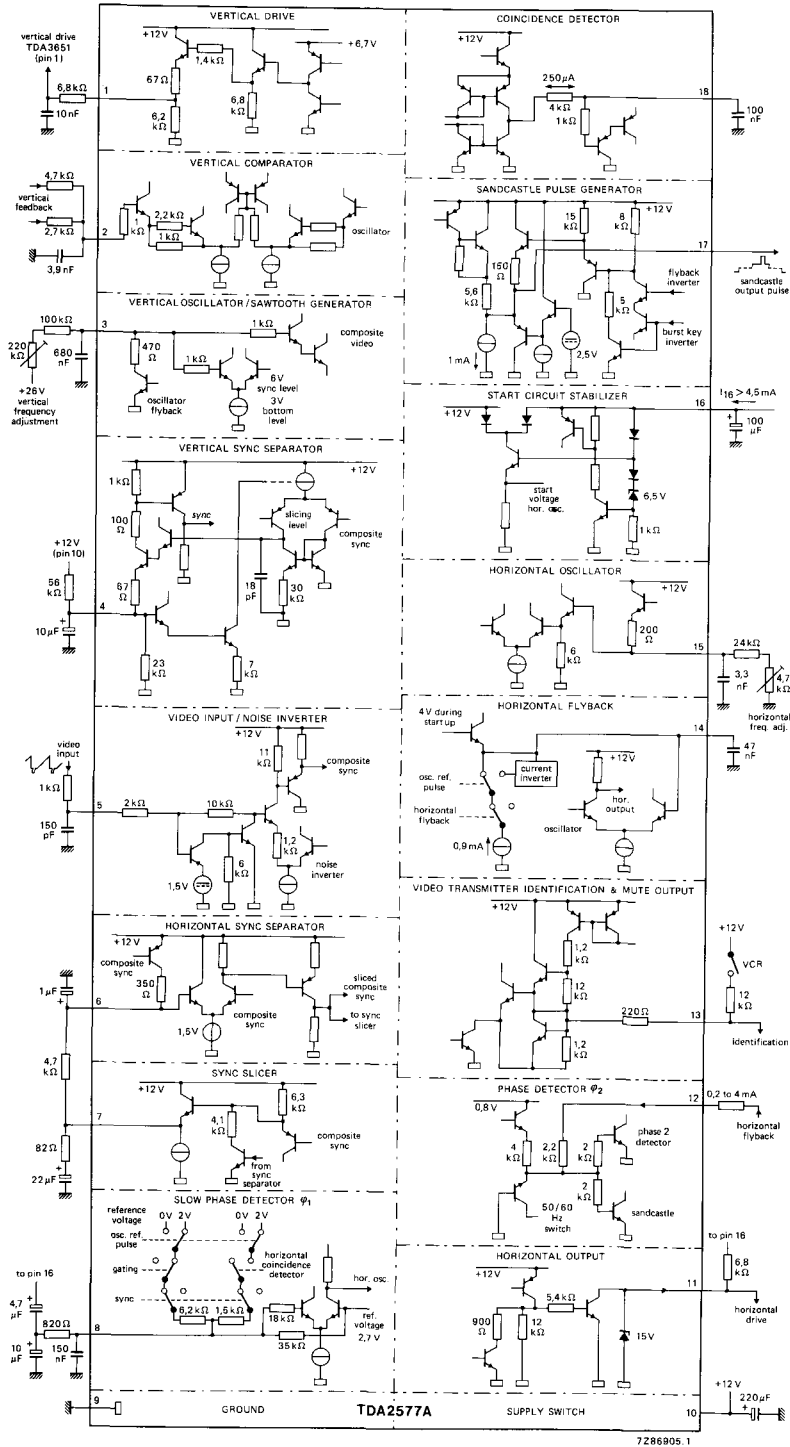

Fig. 2 TDA2577A circuit diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Start current (pin 16)	$I_{16}$	max.	8 mA
Supply voltage (pin 10)	$V_P = V_{10-9}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,1 W
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-25 to + 65 °C

**THERMAL RESISTANCE**

From junction to ambient in free air	$R_{th\ j-a}$	typ.	50 K/W
--------------------------------------	---------------	------	--------

**CHARACTERISTICS** $I_{16} = 5\text{ mA}$ ;  $V_P = 12\text{ V}$ ;  $T_{amb} = 25\text{ °C}$ ; unless otherwise specified**Supply**

Supply current at pin 16	$I_{16}$		4,5 to 8 mA
Stabilized supply voltage (pin 16)	$V_{16-9}$	typ.	8,7 V 8,0 to 9,5 V
Supply current (pin 10)	$I_{10}$	typ. <	55 mA 70 mA
Supply voltage (pin 10)	$V_P = V_{10-9}$	typ.	12 V 10 to 13,2 V

**Video input (pin 5)**

Top-sync level	$V_{5-9}$	typ.	3,1 V 1,5 to 3,75 V
Sync pulse amplitude (peak-to-peak value) (note 1)	$V_{5-9(p-p)}$	typ.	0,6 V 0,15 to 1 V
Slicing level		typ.	50 % 35 to 65 %
Delay between video input and detector output	$t_1$	typ.	0,35 $\mu\text{s}$

**Noise gate (pin 5)**

Switching level	$V_{5-9}$	typ. <	0,7 V 1 V
-----------------	-----------	-----------	--------------

**First control loop (sync to oscillator; pin 8)**

Holding range	$\Delta f$	typ.	$\pm 800\text{ Hz}$
Catching range	$\Delta f$	typ.	$\pm 800\text{ Hz}$ $\pm 600\text{ to } \pm 1100\text{ Hz}$

Control sensitivity video with respect to oscillator, burst key and flyback pulse

for slow time constant		typ.	1 kHz/ $\mu\text{s}$
for fast time constant		typ.	2,75 kHz/ $\mu\text{s}$

**Second control loop** (horizontal output to flyback; pin 14)

Control sensitivity; static (see note 2)	$\Delta t_d / \Delta t_o$	typ.	400 $\mu\text{s}/\mu\text{s}$
Control range	$t_d$		1 to 50 $\mu\text{s}$
Controlled edge	negative		

**Phase adjustment** (via 2nd control loop; pin 14)

Control sensitivity		typ.	25 $\mu\text{A}/\mu\text{s}$
Maximum permissible control current	$\pm I_{14}$	<	60 $\mu\text{A}$

**Horizontal oscillator** (pin 15)

Frequency (no sync)	$f_{\text{osc}}$	typ.	15 625 Hz
Frequency spread ( $C_{\text{osc}} = 3,3 \text{ nF}$ ; $R_{\text{osc}} = 24 \text{ k}\Omega$ )	$\Delta f_{\text{osc}}$	<	4 %
Frequency deviation between starting point of output signal and stabilized condition	$\Delta f_{\text{osc}}$	typ. <	6 % 8 %
Temperature coefficient	TC	typ.	$1 \cdot 10^{-4} \text{ K}^{-1}$

**Horizontal output** (pin 11)

Output voltage; high level	$V_{11-9}$	<	13,2 V
Voltage at which protection starts	$V_{11-9}$		13 to 15,8 V
Output voltage; low level start condition at $I_{11} = 10 \text{ mA}$	$V_{11-9}$	typ. <	0,3 V 0,5 V
normal condition at $I_{11} = 40 \text{ mA}$	$V_{11-9}$	typ. <	0,3 V 0,5 V
Duty factor of output signal during starting (no phase shift; voltage at pin 11 low)	$\delta$	typ.	65 %
Duty factor of output signal without flyback pulse	$\delta$	typ.	50 % 47 to 57 %
Controlled edge	negative		
Duration of output pulse (see Fig. 3)			$t_d + t_o + 2,5 \mu\text{s}$

**Sandcastle output pulse** (pin 17)

Output voltage during: burst key	$V_{17-9}$	>	10 V
horizontal blanking	$V_{17-9}$	typ.	4,6 V 4,2 to 5 V
vertical blanking	$V_{17-9}$	typ.	2,5 V 2 to 3 V
Pulse duration			
burst key	$t_p$	typ.	3,7 $\mu\text{s}$ 3,3 to 4,1 $\mu\text{s}$
horizontal blanking	flyback pulse (see note 3)		
vertical blanking			
for 50 Hz application ( $-I_{12} : 0$ to 0,1 mA)			21 lines
for 60 Hz application ( $-I_{12} : \text{typ. } 0,2 \text{ mA}$ )			17 lines

**CHARACTERISTICS** (continued)

Delay between the start of the sync at the video input and the rising edge of the burst key pulse	$t_2$	typ. 5,2 $\mu$ s 4,8 to 5,6 $\mu$ s
Delay between the start of the sync and the trailing edge of the burst key	$t_2$	typ. 8,8 $\mu$ s 8,1 to 9,3 $\mu$ s
<b>Coincidence detector; video transmitter identification circuit; time constant switches</b> (pin 18); see also Fig. 2		
Detector output current	$\pm I_{18}$	typ. 300 $\mu$ A
Voltage during noise (note 4)	$V_{18-9}$	typ. 0,3 V
Voltage level for in-sync condition	$V_{18-9}$	typ. 7,5 V
Switching level slow to fast	$V_{18-9}$	typ. 3,5 V 3,2 to 3,8 V
Switching level mute function active; $\varphi_1$ fast to slow	$V_{18-9}$	typ. 1,2 V 1,0 to 1,4 V
vertical period counter 3 periods fast	$V_{18-9}$	typ. 0,12 V 0,08 to 0,16 V
Switching level slow to fast (locking) mute function inactive	$V_{18-9}$	typ. 1,7 V 1,5 to 1,9 V
Switching level fast to slow (locking)	$V_{18-9}$	typ. 5,0 V 4,7 to 5,3 V
Switching level for VCR (fast time constant) without mute function	$V_{18-9}$	typ. 8,6 V 8,2 to 9,0 V
<b>Video transmitter identification output</b> (pin 13)		
Output voltage active (no sync) at $I_{13} = 1$ mA	$V_{13-9}$	> 10 V typ. 11 V
Output voltage active (no sync) at $I_{13} = 5$ mA	$V_{13-9}$	> 7 V typ. 10 V
Output voltage inactive	$V_{13-9}$	< 0,5 V typ. 0,1 V
<b>VCR switching</b> (pin 13)		
Input current for fast time constant phase detector $\varphi_1$ , with mute function active	$I_{13}$	typ. 0,6 mA 0,4 to 0,8 mA
<b>Flyback input pulse</b> (pin 12)		
Switching level	$V_{12-9}$	typ. 1 V
Input current	$I_{12}$	0,2 to 4 mA
Input pulse amplitude (peak-to-peak value)	$V_{12-9(p-p)}$	< 12 V
Input resistance	$R_{12-9}$	typ. 2,7 k $\Omega$
Delay time of sync pulse (measured in $\varphi_1$ ) to flyback at switching level; $t_{f1} = 12$ $\mu$ s (see also note 2 and Fig. 4)	$t_0$	typ. 1,3 $\mu$ s

**Duration of vertical blanking pulse (pin 12)**

Required input current (negative)		typ.	0,2 mA
for 50 Hz application; 21 lines blanking	-I <sub>12</sub>	> 0,15 to <	0,3 mA
for 60 Hz application; 17 lines blanking	-I <sub>12</sub>	<	0,1 mA
Maximum allowed input current	-I <sub>12</sub>	<	0,4 mA

**Vertical sawtooth generator (pin 3)**

Vertical frequency (no sync)	f <sub>s</sub>	typ.	46 Hz
Frequency spread (C <sub>osc</sub> = 680 nF; R <sub>osc</sub> = 187 kΩ; at + 26 V)	Δf <sub>s</sub>	<	4 %
Synchronization range		typ.	22 %
Input current at V <sub>3.9</sub> = 6 V	I <sub>3</sub>	<	2 μA
Frequency shift for V <sub>p</sub> = 10 to 13 V	Δf <sub>s</sub>	<	0,2 %
Temperature coefficient	TC	typ.	1 · 10 <sup>-4</sup> K <sup>-1</sup>

**Comparator (pin 2)**

Input voltage; d.c. level	V <sub>2.9</sub>	typ.	4,4 V
a.c. level (peak-to-peak value)	V <sub>2.9(p-p)</sub>	typ.	4,0 to 4,8 V
Input current at V <sub>2.9</sub> = 6 V	I <sub>2</sub>	<	2 μA
Sawtooth internal pre-correction (parabolic convex)		typ.	3 %

**Vertical output stage; emitter follower (pin 1)**

Output voltage at I <sub>1</sub> = 10 mA	V <sub>1.9</sub>	typ.	3,6 V
			3,2 to 5 V
Output current	I <sub>1</sub>	<	20 mA

**Vertical guard circuit**

Activating voltage levels (vertical blanking level is 2,5 V)

switching level low	V <sub>2.9</sub>	typ.	3 V
			2,7 to 3,3 V
switching level high	V <sub>2.9</sub>	typ.	5,8 V
			5,4 to 6,3 V

**Notes to characteristics**

- Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
- t<sub>d</sub> = delay between negative transient of horizontal output pulse and the rising edge of the flyback pulse.  
t<sub>o</sub> = delay between the rising edge of the flyback pulse and the start of the current in φ<sub>1</sub> (pin 8).
- The duration of the flyback pulse is measured at the input switching level, which is about 1 V (t<sub>fl</sub>).
- Depends on d.c. level at pin 5; value given applicable for V<sub>5.9</sub> ≈ 5 V.

Fig. 3 Voltage levels at pin 18 ( $V_{18-g}$ ).

### APPLICATION INFORMATION

The TDA2577A generates the signal for driving the horizontal deflection output circuit. It also contains a synchronized vertical sawtooth generator for direct drive of the vertical deflection output stage.

The horizontal oscillator and output stage can start operating on a very low supply current ( $I_{16} \geq 4,5 \text{ mA}$ ), which can be taken directly from the mains rectifier. Therefore, it is possible to derive the main supply (pin 10) from the horizontal deflection output stage. The duty factor of the horizontal output signal is about 65% during the starting-up procedure. After starting-up, the second phase detector ( $\varphi_2$ ) is activated to control the timing of the negative-going edge of the horizontal output signal.

A bandgap reference voltage (6,5 V) is provided for supply and reference of the vertical oscillator and comparator stage.

The slicing level of the horizontal sync separator is independent of the amplitude of the sync pulse at the input. The resistor between pins 6 and 7 determines its value. A 4,7 k $\Omega$  resistor gives a slicing level at the middle of the sync pulse. The nominal top sync level at the input is 3,1 V. The amplitude selective noise inverter is activated at a level of 0,7 V.

Good stability is obtained by means of the two control loops. In the first loop, the phase of the horizontal sync signal is compared with a waveform of which the rising edge refers to the top of the horizontal oscillator signal. In the second loop, the phase of the flyback pulse is compared with another reference waveform, the timing of which is such that the top of the flyback pulse is situated symmetrically on the horizontal blanking interval of the video signal. Therefore the first loop can be designed for a good noise immunity, whereas the second loop can be as fast as desired for compensation of switch-off delays in the horizontal output stage.

The first phase detector is gated with a pulse derived from the horizontal oscillator signal. This gating (slow time constant) is switched off during catching. Also, the output current of the phase detector is increased fivefold, during the catching time and VCR conditions (fast time constant). The first phase detector is inhibited during the retrace time of the vertical oscillator.

The in-sync, out-of-sync or no video condition is detected by the video transmitter identification/coincidence detector circuit (pin 18). The voltage on pin 18 defines the time constant and gating of the first phase detector. The relationship between this voltage and the various switching levels is shown in Fig. 3. The complete survey of the switching actions is given in Table 1.

## APPLICATION INFORMATION (continued)

Table 1 Switching levels at pin 18.

voltage at pin 18	first phase detector $\varphi_1$				mute output at pin 13		receiving conditions
	time constant		gating		on	off	
	slow	fast	on	off			
7,5 V	X		X			X	video signal detected
7,5 to 3,5 V	X		X			X	video signal detected
3,5 to 1,2 V		X		X		X	video signal detected
1,2 to 0,1 V	X		X		X		noise only
0,1 to 1,7 V	X	*	X	*	X		new video signal detected
1,7 to 5,0 V		X		X		X	horizontal oscillator locked VCR playback with mute function
5,0 to 7,5 V	X		X			X	horizontal oscillator locked
8,7 V		X		X		X	VCR playback without mute function

Where: \* = 3 vertical periods.

The stability of displayed video information (e.g. channel number), during noise only conditions, is improved by the first phase detector time constant being set to slow.

The average voltage level of the video input on pin 5 during noise only conditions should not exceed 5,5 V otherwise the time constant switch may be set to fast due to the average voltage level on pin 18 dropping below 0,1 V. When the voltage on pin 18 drops below 100 mV a counter is activated which sets the time constant switch to fast, and not gated for 3 vertical periods. This condition occurs when a new video signal is present at pin 5. When the horizontal oscillator is locked the voltage on pin 18 increases. Nominally a level of 5 V is reached within 15 ms (1 vertical period). The mute switching level of 1,2 V is reached within 5 ms ( $C_{18} = 47$  nF). If the video transmitter identification circuit is required to operate under VCR playback conditions the first phase detector can be set to fast by connecting a resistor of 180 k $\Omega$  between pin 18 and ground. Also a current of 0,6 mA into pin 13 sets the first phase detector to fast without affecting the mute output function (active HIGH with no video signal detected). For VCR playback without mute function, the first phase detector can be set to fast by connecting a resistor of 1 k $\Omega$  to the supply (pin 10).

The supply for the horizontal oscillator (pin 15) and horizontal output stage (pin 11) is derived from the voltage at pin 16 during the start condition. The horizontal output signal starts at a nominal supply current into pin 16 of 3,8 mA, which will result in a supply voltage of about 5,5 V (for guaranteed operation of all devices  $I_{16} > 4,5$  mA). It is possible that the main supply voltage at pin 10 is 0 V during starting, so the main supply of the IC can be taken from the horizontal deflection output stage. The start of the other IC functions depends on the value of the main supply voltage at pin 10. At 5,5 V all IC functions start operating except the second phase detector (oscillator to flyback pulse). The output voltage of the second phase detector at pin 14 is clamped by means of an internally loaded n-p-n emitter follower. This ensures that the duty factor of the horizontal output signal (pin 11) remains at about 65%. The second phase detector will close if the supply voltage at pin 10 reaches 8,8 V. At this value the supply current for the horizontal oscillator and output stage is delivered by pin 10, which also causes the voltage at pin 16 to change to a stabilized 8,7 V. This change switches off the n-p-n emitter follower at pin 14 and activates the second phase detector. The supply voltage for the horizontal oscillator will, however, still be referred to the stabilized voltage at pin 16, and the duty factor of the output signal at pin 12 is at the value required by the delay at the horizontal deflection stage. Thus switch-off delays

in the horizontal output stage are compensated. When no horizontal flyback signal is detected the duty factor of the horizontal output signal is 50%.

Horizontal picture shift is possible by externally charging or discharging the 47 nF capacitor connected to pin 14.

The IC also contains a synchronized vertical oscillator/sawtooth generator. The oscillator signal is connected to the internal comparator (the other side of which is connected to pin 2), via an inverter and amplitude divider stage. The output of the comparator drives an emitter-follower output stage at pin 1. For a linear sawtooth in the oscillator, the load resistor at pin 3 should be connected to a voltage source of 26 V or higher. The sawtooth amplitude is not influenced by the main supply at pin 10. The feedback signal is applied to pin 2 and compared to the sawtooth signal at pin 3. For an economical feedback circuit with less picture bounce the sawtooth signal is internally precorrected by 3% (convex) referred to pin 2. The linearity of the vertical deflection current depends upon the oscillator signal at pin 3 and the feedback signal at pin 2.

Synchronization of the vertical oscillator is inhibited when the mute output is present at pin 13.

To minimize the influence of the horizontal part on the vertical part a 6,5 V bandgap reference source is provided for supply and reference of the vertical oscillator and comparator.

The sandcastle pulse, generated at pin 17, has three different voltage levels. The highest level (11 V) can be used for burst gating and black level clamping. The second level (4,6 V) is obtained from the horizontal flyback pulse at pin 12 and used for horizontal blanking. The third level (2,5 V) is used for vertical blanking and is derived by counting the horizontal frequency pulses. For 50 Hz the blanking pulse duration is 21 lines and for 60 Hz it is 17 lines. The blanking pulse duration is set by the negative voltage value of the horizontal flyback pulse at pin 12.

The IC also incorporates a vertical guard circuit, which monitors the vertical feedback signal at pin 2. If this level is below 3 V or higher than 5,8 V, the guard circuit will insert a continuous level of 2,5 V into the sandcastle output signal. This will result in complete blanking of the screen if the sandcastle pulse is used for blanking in the TV set.

## SYNCHRONIZATION CIRCUIT WITH VERTICAL OSCILLATOR AND DRIVER STAGES

### GENERAL DESCRIPTION

The TDA2578A separates the vertical and horizontal sync pulses from the composite TV video signal and uses them to synchronize horizontal and vertical oscillators.

#### Features

- Horizontal sync separator and noise inverter
- Horizontal oscillator
- Horizontal output stage
- Horizontal phase detector (sync to oscillator)
- Time constant switch for phase detector (fast time constant during catching)
- Slow time constant for noise only conditions
- Time constant externally switchable (e.g. fast for VCR)
- Inhibit of horizontal phase detector and video transmitter identification circuit during vertical oscillator flyback
- Second phase detector ( $\varphi_2$ ) for storage compensation of horizontal deflection stage
- Sandcastle pulse generator (3-levels)
- Video transmitter identification circuit
- Stabilizer and supply circuit for starting the horizontal oscillator and output stage directly from the mains rectifier
- Duty factor of horizontal output pulse is 50% when flyback pulse is absent
- Vertical sync separator
- Bandgap 6,5 V reference voltage for vertical oscillator and comparator
- Synchronized vertical oscillator/sawtooth generator (synchronization inhibited when no video transmitter is detected)
- Internal circuit for 6% parabolic pre-correction of the oscillator/sawtooth generator. Comparator supplied with pre-corrected sawtooth and external feedback input
- Vertical driver stage
- Vertical blanking pulse generator
- 50/60 Hz detector
- 50/60 Hz identification output
- Automatic amplitude adjustment for 60 Hz
- Automatic adjustment of blanking pulse duration (50 Hz: 21 lines; 60 Hz: 17 lines)
- Vertical guard circuit

### QUICK REFERENCE DATA

#### Supply

Minimum current required to start horizontal oscillator and output stage (pin 16)

Main supply voltage (pin 10)	$I_{16}$	>	4,5 mA
Supply current	$V_P = V_{10-9}$	typ.	12 V
	$I_P = I_{10}$	typ.	55 mA

#### Input signals

Sync pulse input voltage (peak-to-peak value; negative-going)	$V_{5-9(p-p)}$		0,15 to 1 V
---	----------------	--	-------------

#### Output signals

Horizontal output pulse (open collector) at $I_{11} = 40$ mA	$V_{11-9}$	<	0,5 V
Vertical output pulse (emitter-follower) at $I_1 = 10$ mA	$V_{1-9}$	>	4 V

**Synchronization circuit  
with vertical oscillator and driver stages**

TDA2578A

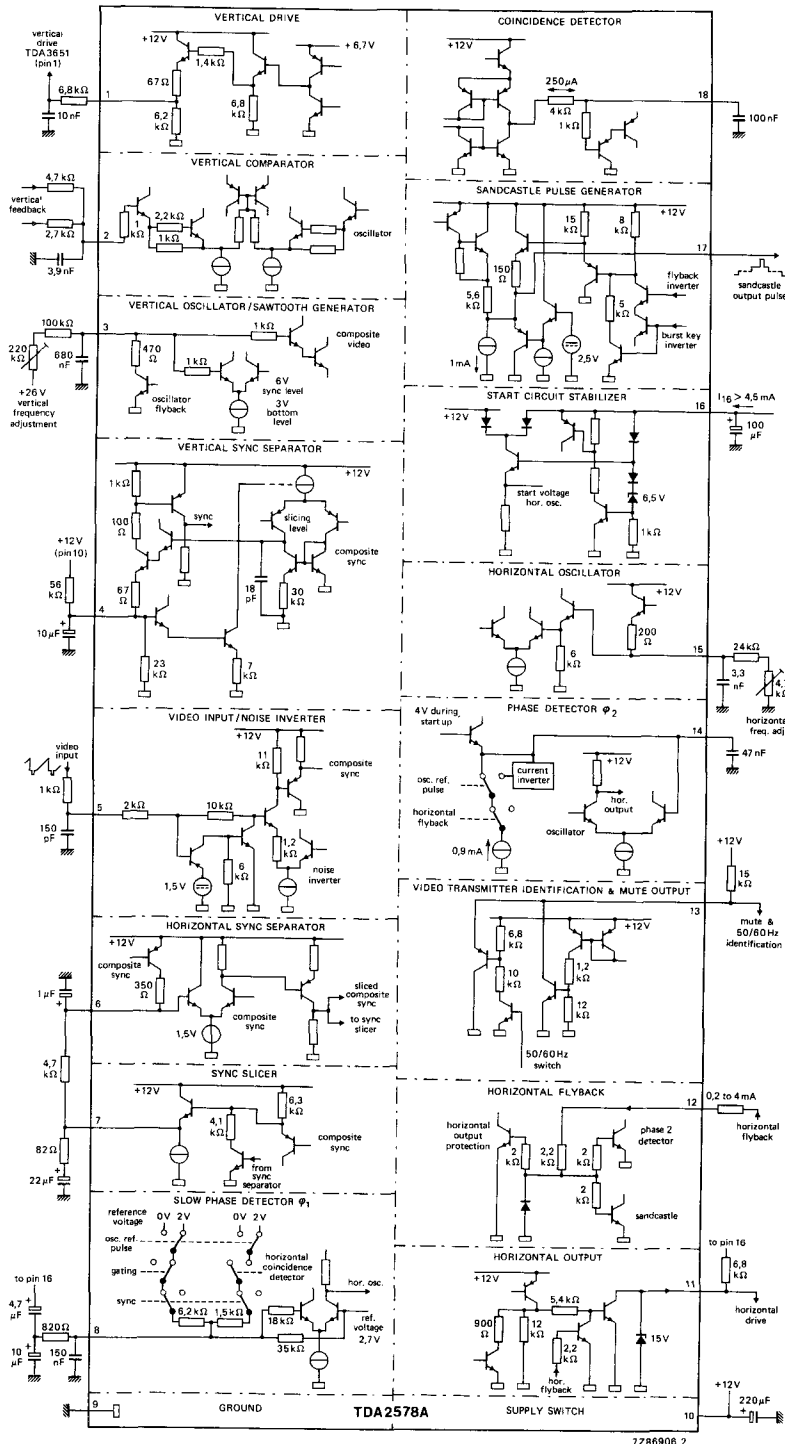

Fig. 2 TDA2578A circuit diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Start current (pin 16)	$I_{16}$	max.	8 mA
Supply voltage (pin 10)	$V_P = V_{10-9}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,1 W
Storage temperature range	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-25 to + 65 °C

**THERMAL RESISTANCE**

From junction to ambient in free air	$R_{th\ j-a}$	typ.	50 K/W
--------------------------------------	---------------	------	--------

**CHARACTERISTICS**

$I_{16} = 5\text{ mA}$ ;  $V_P = 12\text{ V}$ ;  $T_{amb} = 25\text{ °C}$ ; unless otherwise specified

**Supply**

Supply current at pin 16	$I_{16}$		4,5 to 8 mA
Stabilized supply voltage (pin 16)	$V_{16-9}$	typ.	8,7 V
			8,0 to 9,5 V
Supply current (pin 10)	$I_{10}$	typ.	55 mA
		<	70 mA
Supply voltage (pin 10)	$V_P = V_{10-9}$	typ.	12 V
			10 to 13,2 V

**Video input (pin 5)**

Top-sync level	$V_{5-9}$	typ.	3,1 V
			1,5 to 3,75 V
Sync pulse amplitude (peak-to-peak value) (note 1)	$V_{5-9(p-p)}$	typ.	0,6 V
			0,15 to 1 V
Slicing level		typ.	50 %
			35 to 65 %
Delay between video input and detector output	$t_1$	typ.	0,35 $\mu$ s

**Noise gate (pin 5)**

Switching level	$V_{5-9}$	typ.	0,7 V
		<	1 V

**First control loop (sync to oscillator; pin 8)**

Holding range	$\Delta f$	typ.	$\pm 800\text{ Hz}$
Catching range	$\Delta f$	typ.	$\pm 800\text{ Hz}$
			$\pm 600\text{ to } \pm 1100\text{ Hz}$

Control sensitivity video with respect to oscillator, burst key and flyback pulse

for slow time constant		typ.	1 kHz/ $\mu$ s
for fast time constant		typ.	2,75 kHz/ $\mu$ s

**Synchronization circuit  
with vertical oscillator and driver stages**

**TDA2578A**

**Second control loop (horizontal output to flyback; pin 14)**

Control sensitivity; static (see note 2)	$\Delta t_d / \Delta t_o$	typ.	400 $\mu s / \mu s$
Control range	$t_d$		1 to 45 $\mu s$
Controlled edge	positive		

**Phase adjustment (via 2nd control loop; pin 14)**

Control sensitivity		typ.	25 $\mu A / \mu s$
Maximum permissible control current	$\pm I_{14}$	<	60 $\mu A$

**Horizontal oscillator (pin 15)**

Frequency (no sync)	$f_{osc}$	typ.	15 625 Hz
Frequency spread ( $C_{osc} = 3,3 \text{ nF}$ ; $R_{osc} = 24 \text{ k}\Omega$ ; no sync)	$\Delta f_{osc}$	<	4 %
Frequency deviation between starting point of output signal and stabilized condition	$\Delta f_{osc}$	typ. <	6 % 8 %
Temperature coefficient	TC	typ.	$1 \cdot 10^{-4} \text{ K}^{-1}$

**Horizontal output (pin 11)**

Output voltage; high level	$V_{11-9}$	<	13,2 V
Voltage at which protection starts	$V_{11-9}$		13 to 15,8 V
Output voltage; low level start condition at $I_{11} = 10 \text{ mA}$	$V_{11-9}$	typ. <	0,3 V 0,5 V
normal condition at $I_{11} = 40 \text{ mA}$	$V_{11-9}$	typ. <	0,3 V 0,5 V
Duty factor of output signal during starting (no phase shift) $I_{16} = 4 \text{ mA}$ (voltage at pin 11 low)	$\delta$	typ.	65 %
Duty factor of output signal without flyback pulse	$\delta$	typ.	50 % 45 to 55 %
Controlled edge	positive		
Duration of output pulse (see Fig. 4)	$t_d$ + horizontal flyback pulse		

**Sandcastle output pulse (pin 17)**

Output voltage during: burst key	$V_{17-9}$	>	10 V
horizontal blanking	$V_{17-9}$	typ.	4,6 V 4,2 to 5 V
vertical blanking	$V_{17-9}$	typ.	2,5 V 2 to 3 V
Pulse duration burst key	$t_p$	typ.	3,7 $\mu s$ 3,3 to 4,1 $\mu s$
horizontal blanking			flyback pulse (see note 3)
vertical blanking at 50 Hz			21 lines
at 60 Hz			17 lines

## CHARACTERISTICS (continued)

Delay between the start of the sync at the video input and the rising edge of the burst key pulse	$t_2$	typ. 5,2 $\mu\text{s}$ 4,8 to 5,6 $\mu\text{s}$
Delay between start of sync and trailing edge of burst key	$t_2$	typ. 8,8 $\mu\text{s}$ 8,1 to 9,3 $\mu\text{s}$
<b>Coincidence detector; video transmitter identification circuit; time constant switches (pin 18); see also Fig. 3</b>		
Detector output current	$\pm I_{18}$	typ. 300 $\mu\text{A}$
Voltage during noise (note 4)	$V_{18-9}$	typ. 0,3 V
Voltage level for in-sync condition	$V_{18-9}$	typ. 7,5 V
Switching level slow to fast	$V_{18-9}$	typ. 3,5 V 3,2 to 3,8 V
Switching level mute function active; $\varphi_1$ fast to slow	$V_{18-9}$	typ. 1,2 V 1,0 to 1,4 V
vertical period counter 3 periods fast	$V_{18-9}$	typ. 0,12 V 0,08 to 0,16 V
Switching level slow to fast (locking) mute function inactive	$V_{18-9}$	typ. 1,7 V 1,5 to 1,9 V
Switching level fast to slow (locking)	$V_{18-9}$	typ. 5,0 V 4,7 to 5,3 V
Switching level for VCR (fast time constant) without mute function	$V_{18-9}$	typ. 8,6 V 8,2 to 9,0 V
<b>Video transmitter identification output (pin 13)</b>		
Output voltage active (no sync) at $I_{13} = 1 \text{ mA}$	$V_{13-9}$	< 0,5 V typ. 0,3 V
Sink current active (no sync)	$I_{13}$	$\leq$ 5 mA
Output current inactive (sync: 50 Hz)	$I_{13}$	< 1 $\mu\text{A}$
<b>50/60 Hz identification (pin 13)</b>		
R13 = 15 k $\Omega$ to + 12 V (note 5) at f = 50 Hz (in sync condition)	$V_{13-9}$	typ. $V_{10-9}$ V
at f = 60 Hz (in sync condition)	$V_{13-9}$	typ. 7,6 V 7,2 to 8 V
<b>Flyback input pulse (pin 12)</b>		
Switching level	$V_{12-9}$	typ. 1 V
Input current	$I_{12}$	0,2 to 4 mA
Input pulse amplitude (peak-to-peak value)	$V_{12-9(p-p)}$	< 12 V
Input resistance	$R_{12-9}$	typ. 2,7 k $\Omega$
Delay time of sync pulse (measured in $\varphi_1$ ) to flyback at switching level; $t_{f1} = 12 \mu\text{s}$ (see also note 2 and Fig. 4)	$t_0$	typ. 1,3 $\mu\text{s}$

**Vertical sawtooth generator (pin 3)**

Vertical frequency (no sync)	$f_s$	typ.	46 Hz
Frequency spread ( $C_{osc} = 680 \text{ nF}$ ; $R_{osc} = 187 \text{ k}\Omega$ ; at +26 V)	$\Delta f_s$	<	4 %
Synchronization range (note 6)		typ.	33 %
Input current at $V_{3.9} = 6 \text{ V}$	$I_3$	<	3 $\mu\text{A}$
Frequency shift for $V_p = 10$ to 13 V	$\Delta f_s$	<	0,2 %
Temperature coefficient	TC	typ.	$1 \cdot 10^{-4} \text{ K}^{-1}$

**Comparator (pin 2)**

Input voltage; d.c. level	$V_{2.9}$	typ.	4,4 V 4,0 to 4,8 V
a.c. level (peak-to-peak value)	$V_{2.9(p-p)}$	typ.	0,8 V
Input current at $V_{2.9} = 6 \text{ V}$	$I_2$	<	2 $\mu\text{A}$
Sawtooth internal pre-correction (parabolic convex)		typ.	6 %

**Vertical output stage; emitter follower (pin 1)**

Output voltage at $I_1 = 10 \text{ mA}$	$V_{1.9}$	typ.	3,6 V 3,2 to 5 V
Output current	$I_1$	<	20 mA

**Vertical guard circuit**

Activating voltage levels (vertical blanking level is 2,5 V) switching level low	$V_{2.9}$	typ.	3,35 V 3,0 to 3,7 V
switching level high	$V_{2.9}$	typ.	5,15 V 4,75 to 5,55 V

**Notes to characteristics**

- Up to 1 V peak-to-peak the slicing level is constant; at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
- $t_d$  = delay between positive transient of horizontal output pulse and the rising edge of the flyback pulse.  
 $t_o$  = delay between the rising edge of the flyback pulse and the start of the current in  $\varphi_1$  (pin 8).
- The duration of the flyback pulse is measured at the input switching level, which is about 1 V ( $t_{fl}$ ).
- Depends on d.c. level at pin 5; value given applicable for  $V_{5.9} \approx 5 \text{ V}$ .
- For 60 Hz a p-n-p emitter clamp is activated.
- When  $f_o = 46 \text{ Hz}$  the 50/60 Hz detector switches over to 60 Hz; video input signal at pin 5  $\approx 55 \text{ Hz}$ .

Fig. 3 Voltage levels at pin 18 (V<sub>18.g</sub>).

**APPLICATION INFORMATION**

The TDA2578A generates the signal for driving the horizontal deflection output circuit. It also contains a synchronized vertical sawtooth generator for direct drive of the vertical deflection output stage.

The horizontal oscillator and output stage can start operating on a very low supply current ( $I_{16} \geq 4,5 \text{ mA}$ ), which can be taken directly from the mains rectifier. Therefore, it is possible to derive the main supply (pin 10) from the horizontal deflection output stage. The duty factor of the horizontal output signal is about 65% during the starting-up procedure. After starting-up, the second phase detector ( $\varphi_2$ ) is activated to control the timing of the positive-going edge of the horizontal output signal.

A bandgap reference voltage (6,5 V) is provided for supply and reference of the vertical oscillator and comparator stage.

The slicing level of the horizontal sync separator is independent of the amplitude of the sync pulse at the input. The resistor between pins 6 and 7 determines its value. A 4,7 k $\Omega$  resistor gives a slicing level at the middle of the sync pulse. The nominal top sync level at the input is 3,1 V. The amplitude selective noise inverter is activated at a level of 0,7 V.

Good stability is obtained by means of the two control loops. In the first loop, the phase of the horizontal sync signal is compared with a waveform of which the rising edge refers to the top of the horizontal oscillator signal. In the second loop, the phase of the flyback pulse is compared with another reference waveform, the timing of which is such that the top of the flyback pulse is situated symmetrically on the horizontal blanking interval of the video signal. Therefore the first loop can be designed for a good noise immunity, whereas the second loop can be as fast as desired for compensation of switch-off delays in the horizontal output stage.

The first phase detector is gated with a pulse derived from the horizontal oscillator signal. This gating (slow time constant) is switched off during catching. Also, the output current of the phase detector is increased fivefold, during the catching time and VCR conditions (fast time constant). The first phase detector is inhibited during the retrace time of the vertical oscillator.

The in-sync, out-of-sync or no video condition is detected by the video transmitter identification/coincidence detector circuit (pin 18). The voltage on pin 18 defines the time constant and gating of the first phase detector. The relationship between this voltage and the various switching levels is shown in Fig. 3. The complete survey of the switching actions is given in Table 1.

**Table 1** Switching levels at pin 18.

voltage at pin 18	first phase detector $\varphi_1$				mute output at pin 13		receiving conditions
	time constant		gating		on	off	
	slow	fast	on	off			
7,5 V	X		X			X	video signal detected
7,5 to 3,5 V	X		X			X	video signal detected
3,5 to 1,2 V		X		X		X	video signal detected
1,2 to 0,1 V	X		X		X		noise only
0,1 to 1,7 V	X	*	X	*	X		new video signal detected
1,7 to 5,0 V		X		X		X	horizontal oscillator locked VCR playback with mute function
5,0 to 7,5 V	X		X			X	horizontal oscillator locked
8,7 V		X		X		X	VCR playback without mute function

Where: \* = 3 vertical periods.

**APPLICATION INFORMATION** (continued)

The stability of displayed video information (e.g. channel number), during noise only conditions, is improved by the first phase detector time constant being set to slow.

The average voltage level of the video input on pin 5 during noise only conditions should not exceed 5,5 V otherwise the time constant switch may be set to fast due to the average voltage level on pin 18 dropping below 0,1 V. When the voltage on pin 18 drops below 100 mV a counter is activated which sets the time constant switch to fast, and not gated for 3 vertical periods. This condition occurs when a new video signal is present at pin 5. When the horizontal oscillator is locked the voltage on pin 18 increases. Nominally a level of 5 V is reached within 15 ms (1 vertical period). The mute switching level of 1,2 V is reached within 5 ms ( $C_{18} = 47 \text{ nF}$ ). If the video transmitter identification circuit is required to operate under VCR playback conditions the first phase detector can be set to fast by connecting a resistor of 180 k $\Omega$  between pin 18 and ground (see Fig. 7).

The supply for the horizontal oscillator (pin 15) and horizontal output stage (pin 11) is derived from the voltage at pin 16 during the start condition. The horizontal output signal starts at a nominal supply current into pin 16 of 4,2 mA, which will result in a supply voltage of about 5,5 V (for guaranteed operation of all devices  $I_{16} > 4,5 \text{ mA}$ ). It is possible that the main supply voltage at pin 10 is 0 V during starting, so the main supply of the IC can be taken from the horizontal deflection output stage. The start of the other IC functions depends on the value of the main supply voltage at pin 10. At 5,5 V all IC functions start operating except the second phase detector (oscillator to flyback pulse). The output voltage of the second phase detector at pin 14 is clamped by means of an internally loaded n-p-n emitter follower. This ensures that the duty factor of the horizontal output signal (pin 11) remains at about 65%. The second phase detector will close if the supply voltage at pin 10 reaches 8,8 V. At this value the supply current for the horizontal oscillator and output stage is delivered by pin 10, which also causes the voltage at pin 16 to change to a stabilized 8,7 V. This change switches off the n-p-n emitter follower at pin 14 and activates the second phase detector. The supply voltage for the horizontal oscillator will, however, still be referred to the stabilized voltage at pin 16, and the duty factor of the output signal at pin 12 is at the value required by the delay at the horizontal deflection stage. Thus switch-off delays in the horizontal output stage are compensated. When no horizontal flyback signal is detected the duty factor of the horizontal output signal is 50%.

Horizontal picture shift is possible by externally charging or discharging the 47 nF capacitor connected to pin 14.

The IC also contains a synchronized vertical oscillator/sawtooth generator. The oscillator signal is connected to the internal comparator (the other side of which is connected to pin 2), via an inverter and amplitude divider stage. The output of the comparator drives an emitter-follower output stage at pin 1. For a linear sawtooth in the oscillator, the load resistor at pin 3 should be connected to a voltage source of 26 V or higher. The sawtooth amplitude is not influenced by the main supply at pin 10. The feedback signal is applied to pin 2 and compared to the sawtooth signal at pin 3. For an economical feedback circuit with less picture bounce the sawtooth signal is internally pre-corrected by 6% (convex) referred to pin 2. The linearity of the vertical deflection current depends upon the oscillator signal at pin 3 and the feedback signal at pin 2.

Synchronization of the vertical oscillator is inhibited when the mute output is present at pin 13.

To minimize the influence of the horizontal part on the vertical part a 6,7 V bandgap reference source is provided for supply and reference of the vertical oscillator and comparator.

The sandcastle pulse, generated at pin 17, has three different voltage levels. The highest level (11 V) can be used for burst gating and black level clamping. The second level (4,6 V) is obtained from the horizontal flyback pulse at pin 12 and used for horizontal blanking. The third level (2,5 V) is used for vertical blanking and is derived by counting the horizontal frequency pulses. For 50 Hz the blanking pulse duration is 21 lines and for 60 Hz it is 17 lines. The blanking pulse duration and sawtooth amplitude is automatically adjusted via the 50/60 Hz detector.

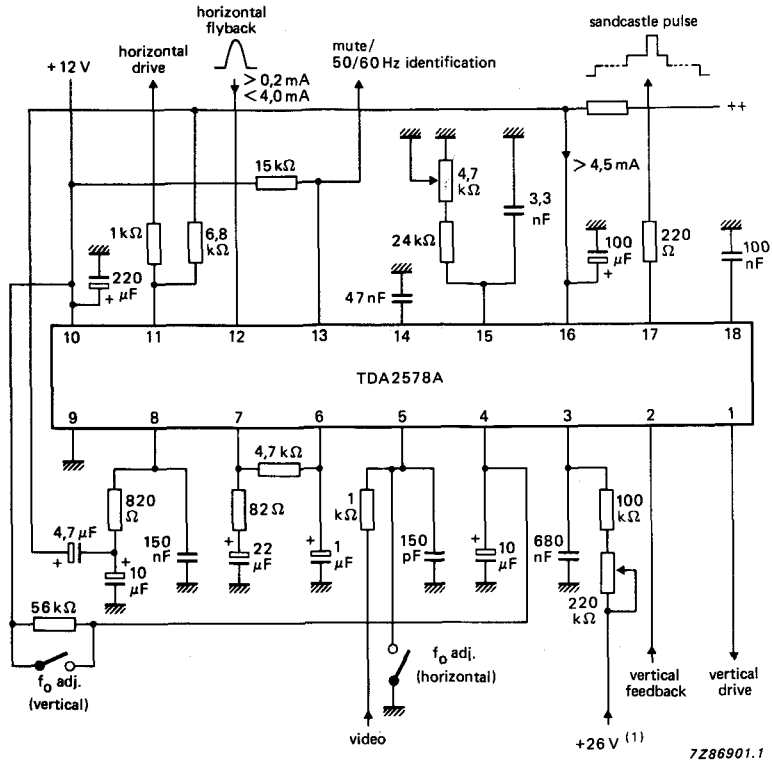

The IC also incorporates a vertical guard circuit, which monitors the vertical feedback signal at pin 2. If this level is below 3,35 V or higher than 5,15 V, the guard circuit will insert a continuous level of 2,5 V into the sandcastle output signal. This will result in complete blanking of the screen if the sandcastle pulse is used for blanking in the TV set.

TDA2579A

## HORIZONTAL/VERTICAL SYNCHRONIZATION CIRCUIT

### GENERAL DESCRIPTION

The TDA2579A generates and synchronizes horizontal and vertical signals. The device has a 3 level sandcastle output; a transmitter identification signal and also 50/60 Hz identification.

#### Features

- Horizontal phase detector, (sync to oscillator), sync separator and noise inverter
- Triple current source in the phase detector with automatic selection
- Second phase detector for storage compensation of the horizontal output
- Stabilized direct starting of the horizontal oscillator and output stage from mains supply
- Horizontal output pulse with constant duty cycle value of 29  $\mu$ s
- Internal vertical sync separator, and two integration selection times
- Divider system with three different reset enable windows
- Synchronization is set to 628 divider ratio when no vertical sync pulses and no video transmitter is identified
- Vertical comparator with a low DC feedback signal
- 50/60 Hz identification output combined with mute function
- Automatic amplitude adjustment for 50 and 60 Hz and blanking pulse duration
- Automatic adaption of the burst-key pulsewidth

### PACKAGE OUTLINE

18-lead dual in line; plastic (SOT102).

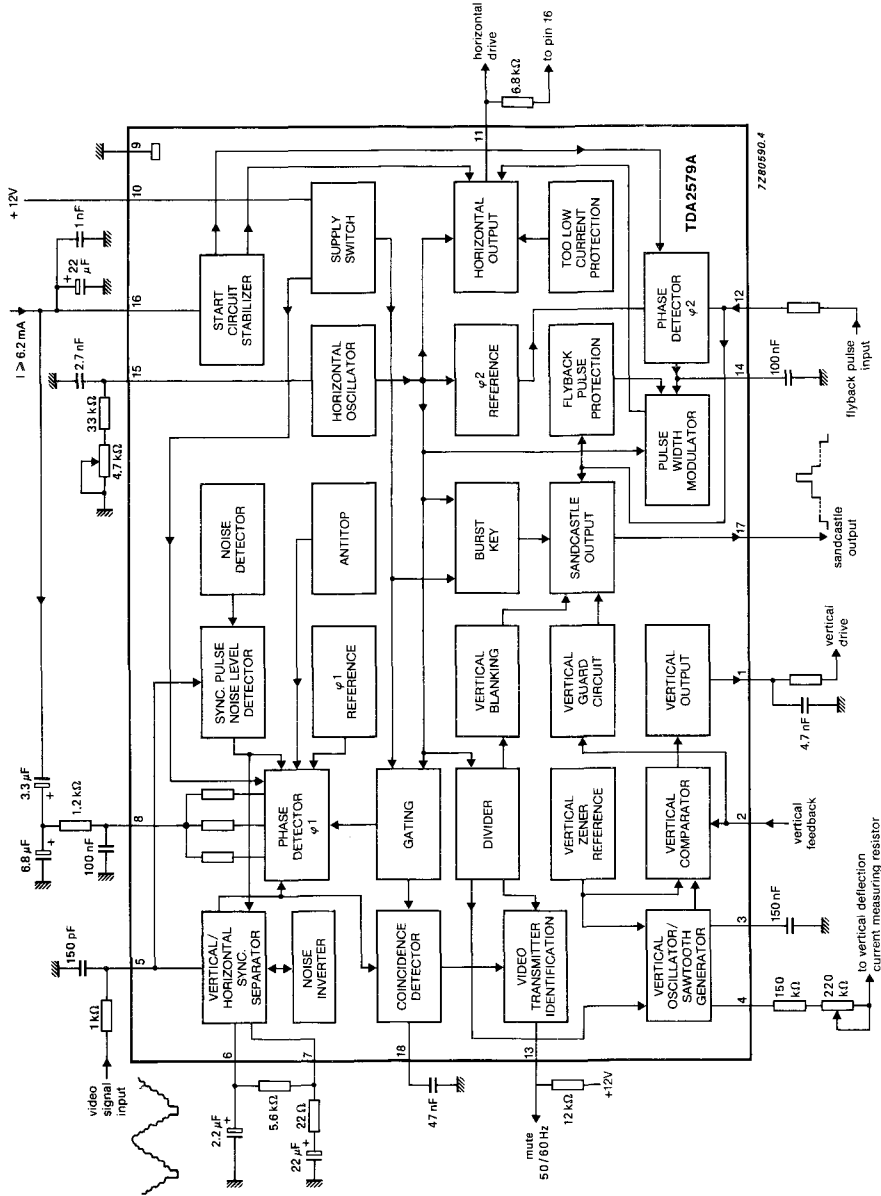

Fig. 1 Block diagram.

**FUNCTIONAL DESCRIPTION****Vertical part (pins 1,2,3,4)**

The IC embodies a synchronized divider system for generating the vertical sawtooth at pin 3. The divider system has an internal frequency doubling circuit, so the horizontal oscillator is working at its normal line frequency and one line period equals 2 clock pulses. Due to the divider system no vertical frequency adjustment is needed. The divider has a discriminator window for automatically switching over from the 60 Hz to 50 Hz system. The divider system operates with 3 different divider reset windows for maximum interference/disturbance protection.

The windows are activated via an up/down counter. The counter increases its counter value by 1 for each time the separated vertical sync pulse is within the searched window. The count is decreased by 1 when the vertical sync pulse is not present.

**Large (search) window:** divider ratio between 488 and 722

This mode is valid for the following conditions:

1. Divider is looking for a new transmitter.
2. Divider ratio found, not within the narrow window limits.
3. Non standard TV-signal condition detected while a double or enlarged vertical sync. pulse is still found after the internally generated anti-top-flutter pulse has ended. This means a vertical sync pulse width larger than 8 clock pulses (50 Hz), that is, 10 clock pulses (60 Hz). In general this mode is activated for video tape recorders operating in the feature/trick mode.
4. Up/down counter value of the divider system operating in the narrow window mode decreases below count 1.
5. Externally setting. This can be reached by loading pin 18 with a resistor of 220 k $\Omega$  to earth or connecting a 3.6 V diode stabistor between pin 18 and ground.

**Narrow window:** divider ratio between 522-528 (60 Hz) or 622-628 (50 Hz).

The divider system switches over to this mode when the up/down counter has reached its maximum value of 12 approved vertical sync pulses. When the divider operates in this mode and a vertical sync pulse is missing within the window the divider is reset at the end of the window and the counter value is decreased by 1. At a counter value below count 1 the divider system switches over to the large window mode.

**Standard TV-norm**

When the up/down counter has reached its maximum value of 12 in the narrow window mode, the information applied to the up/down counter is changed such that the standard divider ratio value is tested. When the counter has reached a value of 14 the divider system is changed over to the standard divider ratio mode. In this mode the divider is always reset at the standard value even if the vertical sync pulse is missing. A missed vertical sync pulse decreases the counter value by 1. When the counter reaches the value of 10 the divider system is switched over to the large window mode. The standard TV-norm condition gives maximum protection for video recorders playing tapes with anti-copy guards.

**No-TV-transmitter found:** (pin 18 < 1.2 V)

In this condition, only noise is present, the divider is reset to count 628. In this way a stable picture display at normal height is achieved.

### Video tape recorders in feature mode

It should be noted that some VTRs operating in the feature modes, such as picture search, generate such distorted pictures that the no-TV-transmitter detection circuit can be activated as pin V<sub>18</sub> drops below 1.2 V. This would imply a rolling picture (see Phase detector, sub paragraph d). In general VTR-machines use a re-inserted vertical sync pulse in the feature mode. Therefore the divider system has been made such that the automatic reset of the divider at count 628 when V<sub>18</sub> is below 1.2 V is inhibited when a vertical sync pulse is detected.

The divider system also generates the anti-top-flutter pulse which inhibits the Phase 1 detector during the vertical sync. pulse. The width of this pulse depends on the divider mode. For the divider mode a the start is generated at the reset of the divider. In mode b and c the anti-top-flutter pulse starts at the beginning of the first equalizing pulse. The anti-top-flutter pulse ends at count 8 for 50 Hz and count 10 for 60 Hz. The vertical blanking pulse is also generated via the divider system. The start is at the reset of the divider while the blanking pulse ends at count 34 (17 lines) for 60 Hz, and at count 42 (21 lines) for 50 Hz systems. The vertical blanking pulse generated at the sandcastle output pin 17 is made by adding the anti-top-flutter pulse and the blanking pulse. In this way the vertical blanking pulse starts at the beginning of the first equalizing pulse when the divider operates in the b or c mode. For generating a vertical linear sawtooth voltage a capacitor should be connected to pin 3. The recommended value is 150 nF to 330 nF (see Fig. 1).

The capacitor is charged via an internal current source starting at the reset of the divider system. The voltage on the capacitor is monitored by a comparator which is activated also at reset. When the capacitor has reached a voltage value of 5.85 V for the 50 Hz system or 5.0 V for the 60 Hz system the voltage is kept constant until the charging period ends. The charge period width is 26 clock pulses. At clock pulse 26 the comparator is switched off and the capacitor is discharged by an npn transistor current source, the value of which can be set by an external resistor between pin 4 and ground (pin 9). Pin 4 is connected to a pnp transistor current source which determines the current of the npn current source at pin 3. The pnp current source on pin 4 is connected to an internal zener diode reference voltage which has a typical voltage of  $\approx 7.7$  volts. The recommended operating current range is 10 to 75  $\mu$ A. The resistance at pin R<sub>4</sub> should be 100 to 770 k $\Omega$ . By using a double current mirror concept the vertical sawtooth pre-correction can be set on the desired value by means of external components between pin 4 and pin 3, or by connecting the pin 4 resistor to the vertical current measuring resistor of the vertical output stage. The vertical amplitude is set by the current of pin 4. The vertical feedback voltage of the output stage has to be applied to pin 2. For the normal amplitude adjustment the values are DC = 1 V and AC = 0.8 V. Due to the automatic system adaption both values are valid for 50 Hz and 60 Hz.

The low DC voltage value improves the picture bounce behaviour as less parabola compensation is necessary. Even a fully DC coupled feedback circuit is possible.

### Vertical guard

The IC also contains a vertical guard circuit. This circuit monitors the vertical feedback signal on pin 2. When the level on pin 2 is below 0.35 V or higher than 1.85 V the guard circuit inserts a continuous level of 2.5 V in the sandcastle output signal of pin 17. This results in the blanking of the picture displayed, thus preventing a burnt-in horizontal line. The guard levels specified refer to the zener diode reference voltage source level.

### Driver output

The driver output is at pin 1, it can deliver a drive current of 1.5 mA at 5 V output. The internal impedance is approximately 150  $\Omega$ . The output pin is also connected to an internal current source with a sink current of 0.35 mA.

**Sync separator, phase detector and TV-station identification** (pins 5,6,7,8 and 18)

The video input signal is connected to pin 5. The sync separator is designed such that the slicing level is independent of the amplitude of the sync pulse. The black level is measured and stored in the capacitor at pin 7. The slicing level value is stored in the capacitor at pin 6. The slicing level value can be chosen by the value of the external resistor between pins 6 and 7. The value is given by the formula:

$$P = \frac{R_s}{5.3 + R_s} \times 100 \quad (R_s \text{ value in } k\Omega)$$

Where  $R_s$  is the resistor between pins 6 and 7 and top sync level equals 100%. The recommended resistor value is 5.6 k $\Omega$ .

**Black level detector**

A gating signal is used for the black level detector. This signal is composed of an internal horizontal reference pulse with a duty factor of 50% and the flyback pulse at pin 12. In this way the TV-transmitter identification operates also for all DC conditions at input pin 5 (no video modulation, plain carrier only).

During the frame interval the slicing level detector is inhibited by a signal which starts with the anti-top flutter pulse and ends with the reset vertical divider circuit. In this way shift of the slicing level due to the vertical sync signal is reduced and separation of the vertical sync pulse is improved.

**Noise inverter**

An internal noise inverter is activated when the video level at pin 5 decreases below 0.7 V. The IC also embodies a built-in sync pulse noise level detection circuit. This circuit is directly connected to pin 5 and measures the noise level at the middle of the horizontal sync pulse. When a signal-to-noise level of 19 dB is detected a counter circuit is activated. A video input signal is processed as "acceptable noise free" when 12 out of 16 sync pulses have a noise level below 19 dB for two successive frame periods. The sync pulses are processed during a 16 line width gating period generated by the divider system. The measuring circuit has a built-in noise level hysteresis of approximately 3 dB.

When the "acceptable noise free" condition is found the phase detector of pin 8 is switched to not gated and normal time constant. When a higher sync pulse noise level is found the phase detector is switched over to slow time constant and gated sync pulse phase detection. At the same time the integration time of the vertical sync pulse separator is adapted.

$$S/N = 20 \text{ Log } \frac{\text{Video voltage (black to white p-p)}}{\text{Noise}_{\text{rms}}}$$

**Phase detector**

The phase detector circuit is connected to pin 8. This circuit consists of 3 separate phase detectors which are activated depending on the voltage of pin 18 and the state of the sync pulse noise detection circuit. For normal and fast time constants all three phase detectors are activated during the vertical blanking period, this with the exception of the anti-top-flutter pulse period, and the separated vertical sync-pulse time. As a result, phase jumps in the video signal related to the video head, take over of video recorders are quickly restored within the vertical blanking period. At the end of the blanking period the phase detector time constant is increased by 1.5 times. In this way there is no requirement for external VTR time constant switching, and so all station numbers are suitable for signals from VTR, video games or home computers.

For quick locking of a new TV station starting from a noise only signal condition (normal time constant) a special circuit is incorporated. A new TV station which is not locked to the horizontal oscillator will result in a voltage decrease below 0.1 V at pin 18. This will activate a frame period counter which switches the phase detector to fast for 3 frame periods during the vertical scan period.

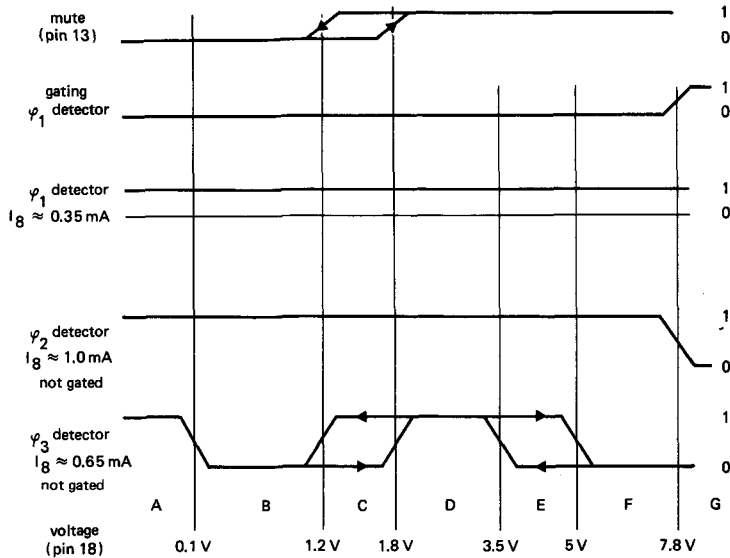

The horizontal oscillator will now lock to the new TV-station and as a result, the voltage on pin 18 will increase to approximately 6.5 V. When pin 18 reaches a level of 1.8 V the mute output transistor of pin 13 is switched OFF and the divider is set to the large window. In general the mute signal is switched OFF within 5 ms (pin C<sub>18</sub> = 47 nF) after reception of a new TV-signal. When the voltage on pin 18 reaches a level of 5 V, usually within 15 ms, the frame counter is switched OFF and the time constant is switched from fast to normal during the vertical scan period.

If the new TV station is weak, the sync-noise detector is activated. This will result in a change over of pin 18 voltage from 6.5 V to  $\approx 10$  V. When pin 18 exceeds the level of 7.8 V the phase detector is switched to slow time constant and gated sync pulse condition. The current is also reduced during the vertical blanking period by 1 mA. When desired, most conditions of the phase detector can also be set by external means in the following way:

- Fast time constant TV transmitter identification circuit not active, connect pin 18 to earth (pin 9).
- Fast time constant TV transmitter identification circuit active, connect a resistor of 220 k $\Omega$  between pin 18 and ground.  
This condition can also be set by using a 3.6 V stabistor diode instead of a resistor.
- Slow time constant, (with exception of frame blanking period), connect pin 18 via a resistor of 10 k $\Omega$  to +12 V, pin 10. In this condition the transmitter identification circuit is not active.
- No switching to slow time constant desired (transmitter identification circuit active), connect a 6.8 V zener diode between pin 18 and ground.

Fig. 2 illustrates the operation of the 3 phase detector circuits.

Fig. 2 Timing diagram, phase detectors.

**Supply (pins 9, 10 and 16)**

The IC has been designed such that the horizontal oscillator and output stage can start operating by application of a very low supply current into pin 16.

The horizontal oscillator starts at a supply current of approximately 4 mA. The horizontal output stage is forced into the non-conducting stage until the supply current has a typical value of 5 mA. The circuit has been designed so that after starting the horizontal output function a current drop of  $\approx 1$  mA is allowed. The starting circuit has the ability to derive the main supply (pin 10) from the horizontal output stage. The horizontal output signal can also be used as the oscillator signal for synchronized switched mode power supplies. The maximum allowed starting current is 9.7 mA ( $T_{amb} = 25^\circ\text{C}$ ). The main supply should be connected to pin 10, and pin 9 should be used as ground. When the voltage on pin 10 increases from zero to its final value (typically 12 V) a part of the supply current of the starting circuit is taken from pin 10 via internal diodes, and the voltage on pin 16 will stabilize to a typical value of 9.4 V.

In a stabilized condition (pin  $V_{10} > 10$  V) the minimum required supply current to pin 16 is  $\approx 2.5$  mA. All other IC functions are switched on via the main supply voltage on pin 10. When the voltage on pin 10 reaches a value of  $\approx 7$  V the horizontal phase detector circuit is activated and the vertical ramp on pin 3 is started. The second phase detector circuit and burst pulse circuit are started when the voltage on pin 10 reaches the stabilized voltage value of pin 16 which is typically 9.4 V.

To close the second phase detector loop, a flyback pulse must be applied to pin 12. When no flyback pulse is detected the duty factor of the horizontal output stage is 50%.

For remote switch-off pin 16 can be connected to ground (via a npn transistor with a series resistor of  $\approx 500 \Omega$ ) which switches off the horizontal output.

**Horizontal oscillator, horizontal output transistor, and second phase detector (pins 11, 12, 14 and 15)**

The horizontal oscillator is connected to pin 15. The frequency is set by an external RC combination between pin 15 and ground, pin 9. The open collector horizontal output stage is connected to pin 11. An internal zener diode configuration limits the open voltage of pin 11 to  $\approx 14.5$  V.

The horizontal output transistor at pin 11 is blocked until the current into pin 16 reaches a value of  $\approx 5$  mA.

A higher current results in a horizontal output signal at pin 11, which starts with a duty factor of  $\approx 40\%$  HIGH.

The duty factor is set by an internal current-source-loaded npn emitter follower stage connected to pin 14 during starting. When pin 16 changes over to voltage stabilization the npn emitter follower and current source load at pin 14 are switched OFF and the second phase detector circuit is activated, provided a horizontal flyback pulse is present at pin 12. When no flyback pulse is detected at pin 12 the duty factor of the horizontal output stage is set to 50%.

The phase detector circuit at pin 14 compensates for storage time in the horizontal deflection output stage. The horizontal output pulse duration is  $29 \mu\text{s}$  HIGH for storage times between  $1 \mu\text{s}$  and  $17 \mu\text{s}$  ( $29 \mu\text{s}$  flyback pulse of  $12 \mu\text{s}$ ). A higher storage time increases the HIGH time. Horizontal picture shift is possible by forcing an external charge or discharge current into the capacitor at pin 14.

**Mute output and 50/60 Hz identification (pin 13)**

The collector of an npn transistor is connected to pin 13. When the voltage on pin 18 drops below 1.2 V (no TV-transmitter) the npn transistor is switched ON.

When the voltage on pin 18 increases to a level of  $\approx 1.8$  V (new TV-transmitter found) the npn transistor is switched OFF.

Pin 13 has also the possibility for 50/60 Hz identification. This function is available when pin 13 is connected to pin 10 (+ 12 V) via an external pull-up resistor of 10 to 20 k $\Omega$ . When no TV-transmitter is identified the voltage on pin 13 will be LOW ( $< 0.5$  V). When a TV-transmitter with a divider ratio  $> 576$  (50 Hz) is detected the output voltage of pin 13 is HIGH (+ 12 V).

When a TV-transmitter with a divider ratio  $< 576$  (60 Hz) is found an internal npn transistor with its emitter connected to pin 13 will force this pin output voltage down to  $\approx 7.6$  V.

**Sandcastle output (pin 17)**

The sandcastle output pulse generated at pin 17, has three different voltage levels. The highest level, (10.4 V), can be used for burst gating and black level clamping. The second level (4.5 V) is obtained from the horizontal flyback pulse at pin 12, and is used for horizontal blanking. The third level (2.5 V) is used for vertical blanking and is derived via the vertical divider system. For 50 Hz the blanking pulse duration is 42 clock pulses and for 60 Hz it is 34 clock pulses started from the vertical divider reset. For TV-signals which have a divider ratio between 622 and 628 or between 522 and 528 the pulse is started at the first equalizing pulse. With the 50/60 Hz information the burst-key pulse width is switched to improve the behaviour in multi-norm concepts.

**RATINGS**

## Notes to the characteristics

- Up to 1 V peak-to-peak the slicing level is constant, at amplitudes exceeding 1 V peak-to-peak the slicing level will increase.
- The slicing level is fixed by the formula:

$$P = \frac{R_s}{5.3 + R_s} \times 100\% \quad (R_s \text{ value in } \text{k}\Omega)$$

- $S/N = 20 \log \frac{\text{video voltage black to white (p-p)}}{\text{noise (rms)}}$

measured with 1 V<sub>p-p</sub> video input

- Measured between pin 5 and sandcastle output pin 17.
- Divider in search (large) mode:

start: reset divider = start vertical sync plus 1 clock pulse

$$\text{stop: } \frac{n = 2 \times f_H}{f_V} > 576 \text{ clock pulse } 42$$

$$\frac{n = 2 \times f_H}{f_V} < 576 \text{ clock pulse } 34$$

Divider in small window mode:

start: clock pulse 517 (60 Hz) clock pulse 619 (50 Hz)

stop: clock pulse 34 (60 Hz) clock pulse 42 (50 Hz)

- Depends on DC level of pin 5, given value is valid for  $V_5 \approx 5 \text{ V}$ .
- Value related to internal zener diode reference voltage source spread includes the complete spread of reference voltage.

## CONTROL CIRCUIT FOR POWER SUPPLIES

The TDA2582 is a monolithic integrated circuit for controlling power supplies which are provided with the drive for the horizontal deflection stage.

The circuit features the following:

- Voltage controlled horizontal oscillator.
- Phase detector.
- Duty factor control for the negative-going transient of the output signal.
- Duty factor increases from zero to its normal operation value.
- Adjustable maximum duty factor.
- Over-voltage and over-current protection with automatic re-start after switch-off.
- Counting circuit for permanent switch-off when n-times over-current or over-voltage is sensed.
- Protection for open-reference voltage.
- Protection for too low supply voltage.
- Protection against loop faults.
- Positive tracking of duty factor and feedback voltage when the feedback voltage is smaller than the reference voltage minus 1,5 V.
- Normal and 'smooth' remote ON/OFF possibility.

### QUICK REFERENCE DATA

Supply voltage	$V_{9-16}$	typ.	12 V
Supply current	$I_g$	typ.	14 mA
<b>Input signals</b>			
Horizontal drive pulse (peak-to-peak value)	$V_{3-16(p-p)}$		5 to 11 V
Flyback pulse (differentiated deflection current); peak-to-peak value	$V_{2-16(p-p)}$		1 to 5 V
External reference voltage	$V_{10-16}$	typ.	6,1 V
<b>Output signals</b>			
Duty factor of output pulse	$\delta$	> <	0 % 98 ± 0,8 %
Output voltage at $I_o < 20$ mA (peak value)	$V_{11-16M}$	typ.	11,8 V
Output current (peak value)	$I_{11M}$	<	40 mA

### PACKAGE OUTLINES

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage at pin 9	V <sub>9-16</sub>	max.	14 V
Voltage at pin 11	V <sub>11-16</sub>		0 to 14 V
Output current (peak value)	I <sub>11M</sub>	max.	40 mA
Total power dissipation	P <sub>tot</sub>	max.	280 mW
Storage temperature	T <sub>stg</sub>		-25 to + 125 °C
Operating ambient temperature	T <sub>amb</sub>		-25 to + 80 °C

**CHARACTERISTICS**V<sub>9-16</sub> = 12 V; V<sub>10-16</sub> = 6,1 V; T<sub>amb</sub> = 25 °C; measured in Fig. 4

Supply voltage range	V <sub>9-16</sub>	typ.	12 V
			10 to 14 V
Protection voltage too low supply voltage	V <sub>9-16</sub>	typ.	9,4 V
			8,6 to 9,9 V
Supply current at $\delta = 50\%$	I <sub>g</sub>	typ.	14 mA
Supply current during protection	I <sub>g</sub>	typ.	14 mA
Minimum required supply current (note 1)	I <sub>g</sub>	<	17 mA
Power consumption	P	typ.	170 mW

**Required input signals**

Reference voltage (note 2)	V <sub>10-16</sub>	typ.	6,1 V
			5,6 to 6,6 V
Feedback input impedance	Z <sub>8-16</sub>	typ.	200 k $\Omega$
High reference voltage protection: threshold voltage	V <sub>10-16</sub>	typ.	8,4 V
			7,9 to 8,9 V
Horizontal reference signal (square-wave or differentiated; negative transient is reference)			
Voltage driven (peak-to-peak value)	V <sub>3-16(p-p)</sub>		5 to 12 V
Current driven (peak value)	I <sub>3M</sub>		-1 to + 1,5 mA
Switching level current	$\pm I_3$	<	100 $\mu$ A
Flyback pulse or differential deflection current	V <sub>2-16</sub>		1 to 5 V
Flyback pulse current (peak value)	I <sub>2M</sub>	<	1,5 mA
Over-current protection: (note 3)			
threshold voltage	-V <sub>6-16</sub>	typ.	640 mV
			600 to 695 mV
	+V <sub>6-16</sub>	typ.	680 mV
			640 to 735 mV

**Notes**

1. This value refers to the minimum required supply current that will start all devices under the following conditions: V<sub>9-16</sub> = 10 V; V<sub>10-16</sub> = 6,2 V;  $\delta = 50\%$ .
2. Voltage obtained via an external reference diode. Specified voltages do not refer to the nominal voltages of reference diodes.
3. This spread is inclusive temperature rise of the IC due to warming up. For other ambient temperatures the values must be corrected by using a temperature coefficient of typical -1,85 mV/°C.

**CHARACTERISTICS** (continued)

Over-voltage protection:

( $V_{ref} = V_{10-16}$ ) threshold voltage	V7-16	typ. $V_{ref}-130$ to $V_{ref}-0$ mV	$V_{ref}-60$ mV

APPLICATION INFORMATION

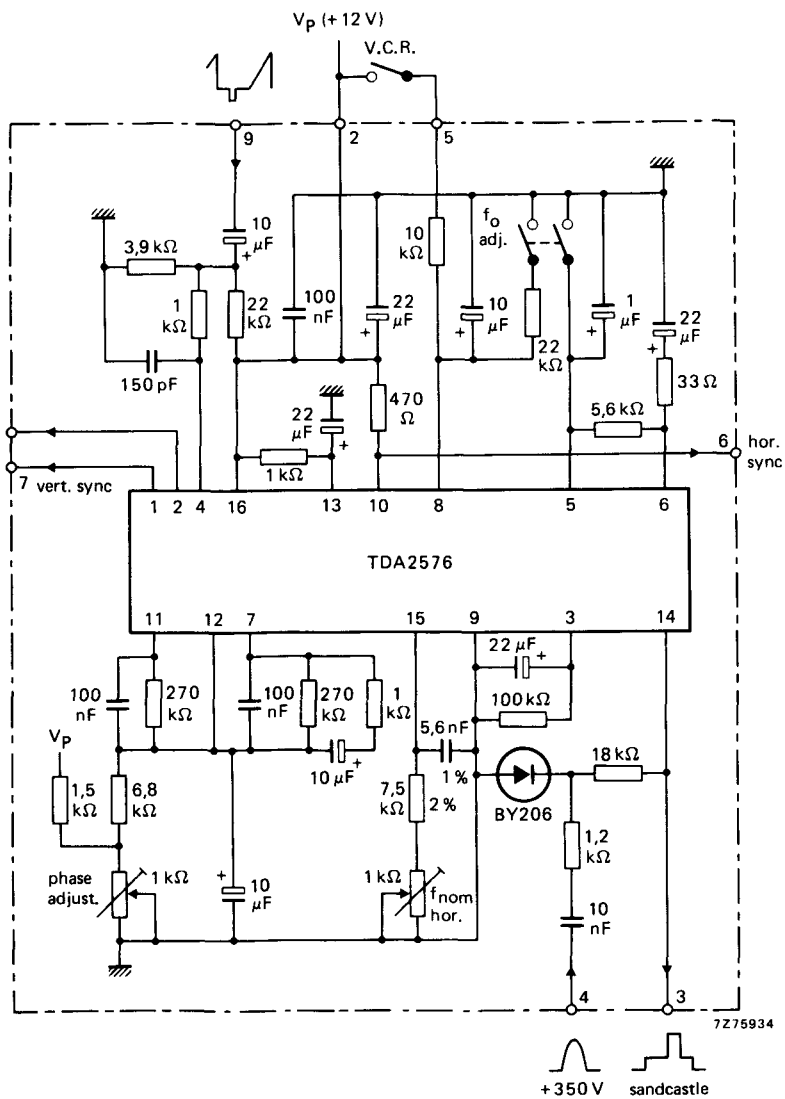

Fig. 3a.

APPLICATION INFORMATION

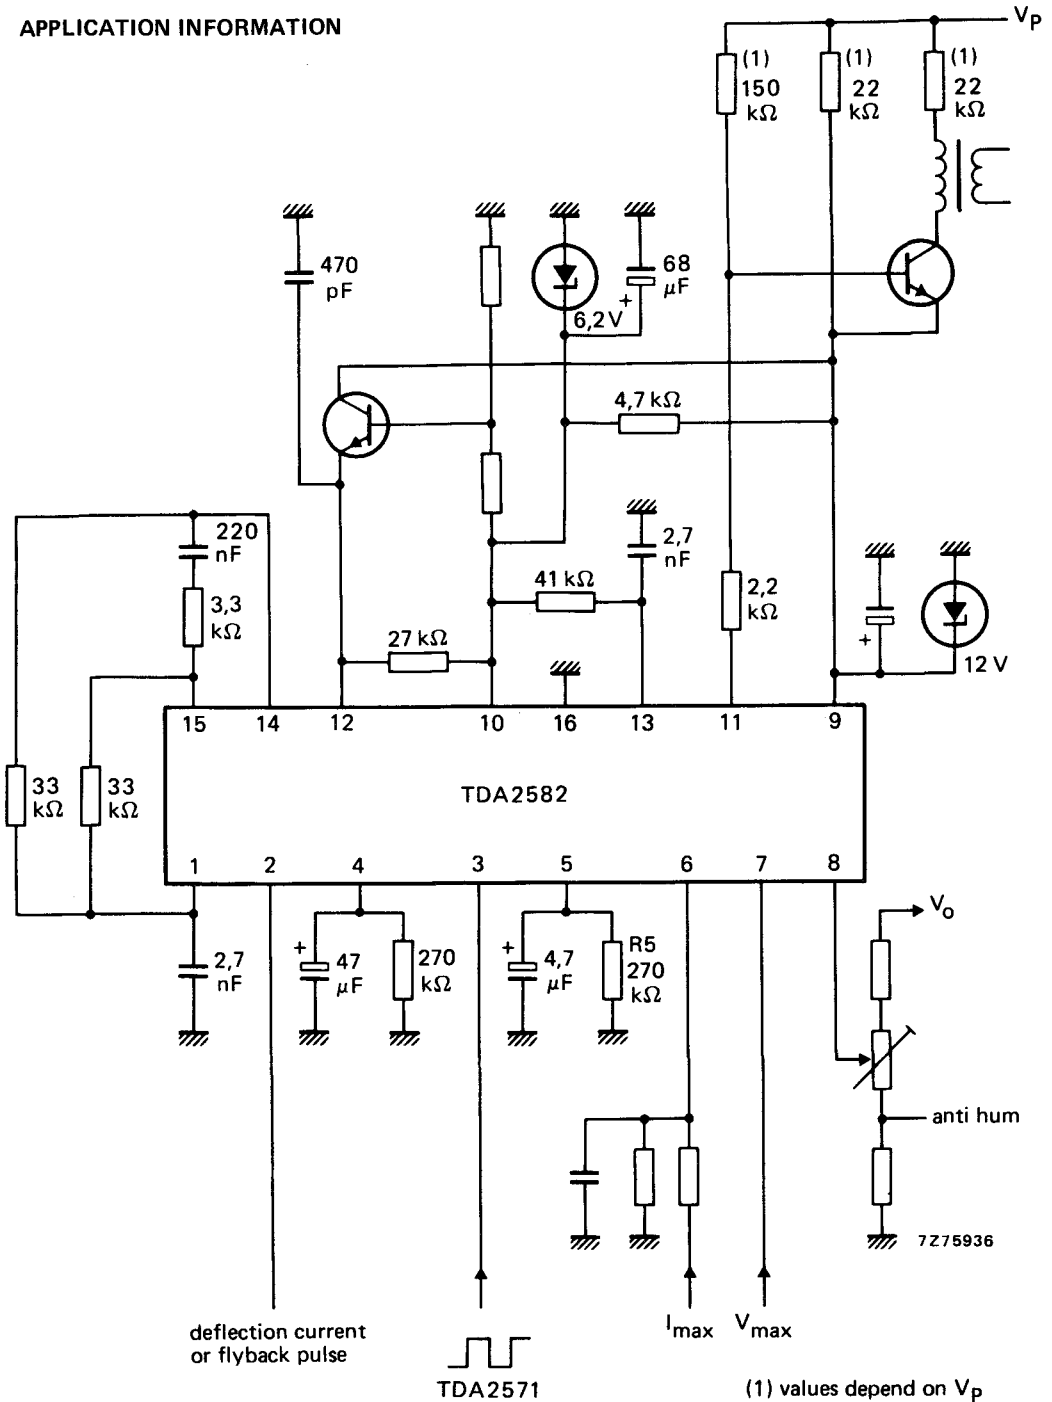

Fig. 4 Circuit diagram.

The function is described against the corresponding pin number

### 1. Phase detector output

The output circuit consists of a bidirectional current source which is active for the time that the signal on pin 2 exceeds 1 V.

The current values are chosen such that the correct phase relation is obtained when the output signal of the TDA2571 is applied to pin 3.

With a resistor of  $2 \times 33 \text{ k}\Omega$  and a capacitor of 2,7 nF the control steepness is  $0,55 \text{ V}/\mu\text{s}$  (Fig. 4).

### 2. Flyback pulse input

The signal applied to pin 2 is normally a flyback pulse with a duration of about  $12 \mu\text{s}$ . However, the phase detector system also accepts a signal derived by differentiating the deflection current by means of a small toroidal core (pulse duration  $> 3 \mu\text{s}$ ).

Fig. 5a.

Fig. 5b.

The toroidal transformer in Fig. 5a is for obtaining a pulse representing the mid-flyback from the deflection current. The connection of the picture phase information is shown in Fig. 5b.

### 3. Reference frequency input

The input circuit can be driven directly by the square-wave output voltage from pin 8 of the TDA2571.

The negative-going transient switches the current source connected to pin 1 from positive to negative. The input circuit is made such that a differentiated signal of the square-wave from the TDA2571 is also accepted (this enables mains isolation). The input circuit switching level is about 3 V and the input impedance is about  $8 \text{ k}\Omega$ .

### 4. Re-start count capacitor/remote control input

#### Counting

An external capacitor ( $C4 = 47 \mu\text{F}$ ) is connected between pins 4 and 16. This capacitor controls the characteristics of the protection circuits as follows.

If the protection circuits are required to operate, e.g. over-current at pin 6, the duty factor will be set to zero thus turning off the power supply.

After a short interval (determined by the time constant on pin 5) the power supply will be restarted via the slow start circuit.

If the fault condition has cleared, then normal operation will be resumed. If the fault condition is persistent, the duty factor of the pulses is again reduced to zero and the protection cycle is repeated.

The number of times this action is repeated ( $n$ ) for a persisting fault condition is now determined by:  $n = C4/C5$ .

## APPLICATION INFORMATION (continued)

### *Remote control input*

For this application the capacitor on pin 4 has to be replaced by a resistor with a value between 4,7 and 18 k $\Omega$ . When the externally applied voltage  $V_{4-16} > 5,6$  V, the circuit switches off; switching on occurs when  $V_{4-16} < 4,5$  V and the normal starting-up procedure is followed. Pin 4 is internally connected to an emitter-follower, with an emitter voltage of 1,5 V.

## 5. Slow start and transfer characteristics for low feedback voltages

### *Slow start*

An external shunt capacitor ( $C5 = 4,7$   $\mu$ F) and resistor ( $R5 = 270$  k $\Omega$ ) are connected between pins 5 and 16. The network controls the rate at which the duty factor increases from zero to its steady-state value after switch-on. It provides protection against surges in the power transistor.

### *Transfer characteristic for low feedback voltages*

The duty factor transfer characteristic for low feedback voltages can be influenced by R5. The transfer for three different resistor values is given in Fig. 7.

### *'Smooth' remote ON/OFF*

The ON/OFF information should be applied to pin 5 via a high ohmic resistor, a high OFF-level gives a slow rising voltage at pin 5, which results in a slowly decreasing duty factor.

## 6. Over-current protection input

A voltage proportional to the current in the power switching device is applied to the integrated circuit between pins 6 and 16. The circuit trips on both positive and negative polarity. When the tripping level is reached, the output pulse is immediately blocked and the starting circuit is activated again.

## 7. Over-voltage protection input

When the voltage applied to this pin exceeds the threshold level the protection circuit will operate. The tripping level is about the same as the reference voltage on pin 10.

## 8. Feedback voltage input

The control loop input is applied to pin 8. This pin is internally connected to one input of a differential amplifier, functioning as an amplitude comparator, the other input of which is connected to the reference source on pin 10.

Under normal operating conditions, the voltage on pin 8 will be about equal to the reference voltage on pin 10. For further information refer to the Figs 7 and 8.

## 9. 12 V positive supply

The maximum voltage that may be applied is 14 V. Where this is derived from an unstabilized supply rail, a regulator diode (12 V) should be connected between pins 9 and 16 to ensure that the maximum voltage does not exceed 14 V. When the voltage on this pin falls below a minimum of 8,6 V (typically 9,4 V), the protection circuit will switch-off the power supply.

**10. Reference input**

An external reference diode must be connected between this pin and pin 16.

The reference voltage must be between 5,6 and 6,6 V. The IC delivers about 1 mA into the external regulator diode. When the external load on the regulator diode approaches this current, replenishment of the current can be obtained by connecting a suitable resistor between pins 9 and 10. A higher reference voltage value up to 7,5 V is allowed when use is made of a duty factor limiting resistor  $< 27 \text{ k}\Omega$  between pins 12 and 16.

**11. Output**

An external resistor determines the output current fed into the base of the driver transistor. The output circuit uses an n-p-n transistor with 3 series-connected clamping diodes to the internal 12 V supply rail. This provides a low impedance in the "ON" state, that is with the drive transistor turned-off.

**12. Maximum duty factor adjustment/smoothing***Maximum duty factor adjustment*

Pin 12 is connected to the output voltage of the amplitude comparator ( $V_{10-8}$ ). This voltage is internally connected to one input of a differential amplifier, the other input of which is connected to the sawtooth voltage of the horizontal oscillator. A high voltage on pin 12 results in a low duty factor. This enables the maximum duty factor to be adjusted by limiting the voltage by connecting pin 12 to the emitter of an n-p-n transistor used as a voltage source.

Fig. 9 plots the maximum duty factor as a function of the voltage applied to pin 12. If some spread is acceptable the maximum duty factor can also be limited by connecting a resistor from pin 12 to pin 16. A resistor of  $12 \text{ k}\Omega$  limits the maximum duty factor to about 50%. This application also reduces the total IC gain.

*Smoothing*

Any double pulsing of the IC due to circuit layout can be suppressed by connecting a capacitor of about 470 pF between pins 12 and 16.

**13. Oscillator timing network**

The timing network comprises a capacitor between pins 13 and 16, and a resistor between pin 13 and the reference voltage on pin 10.

The charging current for the capacitor (C13) is derived from the voltage reference diode connected to pin 10 and discharged via an internal resistor of about  $330 \Omega$ .

**14. Reactance stage reference voltage**

This pin is connected to an emitter follower which determines the nominal reference voltage for the reactance stage (1,4 V for reference voltage  $V_{10-16} = 6,1 \text{ V}$ ). Free-running frequency is obtained when pins 14 and 15 are short-circuited.

**15. Reactance stage input**

The output voltage of the phase detector (pin 1) is connected to pin 15 via a resistor. The voltage applied to pin 15 shifts the upper level of the voltage sensor of the oscillator thus changing the oscillator frequency and phase. The time constant network is connected between 14 and 15. Control sensitivity is typically 5 kHz/V.

**16. Negative supply (ground)**

Fig. 6 Duty factor change as a function of initial duty factor; at 1 mV error amplifier input change;  $\Delta V_{8-10(p-p)} = 1$  mV.

Fig. 7 Duty factor of output pulses as a function of feedback input voltage ( $V_{8-16}$ ) with  $R_5$  as a parameter and  $V_{12-16}$  as a limiting value;  $V_{10-16} = 6,1$  V.

Fig. 8 Duty factor of output pulses as a function of error amplifier input ( $V_{8-10}$ );  $V_{10-16} = 6,1$  V.

Fig. 9 Maximum duty factor limitation as a function of the voltage applied to pin 12;  $V_{10-16} = 6,1$  V.

## HORIZONTAL COMBINATION

The TDA2593 is a monolithic integrated circuit intended for use in colour television receivers in combination with TDA2510, TDA2520, TDA2560 as well as with TDA3500, TDA3510 and TDA3520. The circuit incorporates the following functions:

- horizontal oscillator based on the threshold switching principle
- phase comparison between sync pulse and oscillator voltage ( $\varphi_1$ )
- internal key pulse for phase detector ( $\varphi_1$ ) (additional noise limiting)
- phase comparison between line flyback pulse and oscillator voltage ( $\varphi_2$ )
- larger catching range obtained by coincidence detector ( $\varphi_3$ : between sync and key pulse)
- switch for changing the filter characteristic and the gate circuit (VCR-operation)
- sync separator
- noise separator
- vertical sync separator and output stage
- colour burst keying and line flyback blanking pulse generator
- phase shifter for the output pulse
- output pulse duration switching
- output stage with separate supply voltage for direct drive of thyristor deflection circuits
- low supply voltage protection

Output current (peak value)			
without coincidence	$I_{11M}$	typ.	0,1 mA
with coincidence	$-I_{11M}$	typ.	0,5 mA
<b>Time constant switch</b>			
Output voltage	$V_{12-16}$	typ.	6 V
Output current (limited)	$\pm I_{12}$	<	1 mA
Output resistance			
at $V_{11-16} = 2,5$ to $7$ V	$R_{12}$	typ.	0,1 k $\Omega$
at $V_{11-16} < 1,5$ V or $> 9$ V	$R_{12}$	typ.	60 k $\Omega$
<b>Internal gating pulse</b>			
Pulse duration	$t_p$	typ.	7,5 $\mu$ s

\* Current source.

## HORIZONTAL COMBINATION

The TDA2594 is a monolithic integrated circuit intended for use in colour television receivers. The circuit incorporates the following functions:

- Horizontal oscillator based on the threshold switching principle.
- Phase comparison between sync pulse and oscillator voltage ( $\varphi_1$ ).
- Internal key pulse for phase detector ( $\varphi_1$ ) (additional noise limiting).
- Phase comparison between line flyback pulse and oscillator voltage ( $\varphi_2$ ).
- Larger catching range obtained by coincidence detector ( $\varphi_3$ ; between sync and key pulse).
- Switch for changing the filter characteristic and the gate circuit (VCR-operation).
- Sync separator.
- Noise separator.
- Vertical sync separator and output stage.
- Colour burst keying and line flyback blanking pulse generator and clamp circuit for vertical blanking.
- Phase shifter for the output pulse.
- Output pulse duration for transistor deflection systems.
- External switching off of the line trigger pulse.
- Output stage with separate supply voltage.
- Low supply voltage protection.
- Transmitter identification and muting circuit, and vertical sync switch-off.

### QUICK REFERENCE DATA

Supply voltage	$V_{1-18} = V_S$	typ. 12 V
Supply current	$I_1$	typ. 30 mA
<b>Input signals</b>		
Sync separator input voltage (peak-to-peak value)	$V_{11-18(p-p)}$	typ. 3 V*
Noise separator input voltage (peak-to-peak value)	$V_{12-18(p-p)}$	typ. 3 V*
Pulse duration switch input voltage		
at $t = 14 \mu s + t_d$ (transistor driving)	$V_{4-18}$	0 to 3,5 V
at $t = 0$ ( $V_{3-18} = 0$ ); input 4 open ( $I_4 = 0$ )	$V_{4-18}$	5,4 to 6,6 V
<b>Output signals</b>		
Vertical sync output pulse (peak-to-peak value)	$V_{8-18(p-p)}$	typ. 11 V
Burst key output pulse (peak-to-peak value)	$V_{7-18(p-p)}$	typ. 11 V
Line drive-pulse (peak-to-peak value)	$V_{3-18(p-p)}$	typ. 10 V

\* Permissible range: 1 to 7 V.

### PACKAGE OUTLINE

18-lead D1L; plastic (SOT102).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage			
at pin 1 (voltage source)	$V_{1-18} = V_S$	max.	13,2 V
at pin 2	$V_{2-18}$	max.	18 V
Voltages			
Pin 4	$V_{4-18}$	max.	13,2 V
Pin 9	$V_{9-18}$	max.	18 V
	$-V_{9-18}$	max.	0,5 V
Pin 11	$\pm V_{11-18}$	max.	6 V
Pin 12	$\pm V_{12-18}$	max.	6 V
Pin 13	$V_{13-18}$	max.	13,2 V
Currents			
Pins 2 and 3 (transistor driving) (peak value)	$I_{2M}, -I_{3M}$	max.	400 mA
Pin 4	$I_4$	max.	1 mA
Pin 6	$\pm I_6$	max.	10 mA
Pin 7	$-I_7$	max.	5 mA
Pin 9	$I_9$	max.	10 mA
Pin 13	$I_{13}$	max.	2 mA
Total power dissipation	$P_{tot}$	max.	800 mW
Storage temperature range	$T_{stg}$		-25 to +125 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

**CHARACTERISTICS** at  $V_{1-18} = 12$  V;  $T_{amb} = 25$  °C; measured in Fig. 1**Sync separator (pin 11)**

Input switching voltage	$V_{11-18}$	typ.	0,8 V
Input keying current	$I_{11}$		5 to 100 $\mu$ A
Input leakage current at $V_{11-18} = -5$ V	$I_{11}$	$\leq$	1 $\mu$ A
Input switching current	$I_{11}$	$\leq$	5 $\mu$ A
Switch off current	$I_{11}$	$\geq$	100 $\mu$ A
		typ.	150 $\mu$ A
Input signal (peak-to-peak value)	$V_{11-18}(p-p)$		3 to 4 V*

\* Permissible range 1 to 7 V.

**Noise separator (pin 12)**

Input switching voltage	$V_{12-18}$	typ.	1,4 V
Input keying current	$I_{12}$		5 to 100 $\mu$ A
Input switching current	$I_{12}$	$\geq$	100 $\mu$ A
		typ.	150 $\mu$ A
Input leakage current at $V_{12-18} = -5$ V	$I_{12}$	$\leq$	1 $\mu$ A
Input signal (peak-to-peak value)	$V_{12-18(p-p)}$		3 to 4 V*
Permissible superimposed noise signal (peak-to-peak value)	$V_{12-18(p-p)}$	$\leq$	7 V

**Line flyback pulse (pin 6)**

Input current	$I_6$	$\geq$	0,02 mA
		typ.	1 mA
Input switching voltage	$V_{6-18}$	typ.	1,4 V
Input limiting voltage	$V_{6-18}$		-0,7 to +1,4 V

**Switching on VCR (pin 13)**

Input voltage	$V_{13-18}$ or: $V_{13-18}$		0 to 2,5 V 9 to $V_S$ V
Input current	$-I_{13}$ or: $I_{13}$	$\leq$	200 $\mu$ A 2 mA

**Pulse switching off (pin 4)**

For  $t = 0$ ; input pin 4 open or  $V_{3-18} = 0$

Input voltage	$V_{4-18}$		5,4 to 6,6 V
Input current	$I_4$	typ.	0 $\mu$ A

**Vertical sync pulse (positive-going) (pin 8)**

Output voltage (peak-to-peak value)	$V_{8-18(p-p)}$	$\geq$	10 V
		typ.	11 V
Output resistance	$R_8$	typ.	2 k $\Omega$
Delay between leading edge of input and output signal	$t_{on}$	typ.	15 $\mu$ s
Delay between trailing edge of input and output signal	$t_{off}$	$\geq$	$t_{on}$ $\mu$ s
Switching off the vertical sync pulse	$V_{10-18}$	$\leq$	3 V

**Burst key pulse (positive-going) (pin 7)**

Output voltage	$V_{7-18}$	$\geq$	10 V
		typ.	11 V
Output resistance	$R_7$	typ.	70 $\Omega$
Pulse duration; $V_{7-18} = 7$ V	$t_p$	typ.	4 $\mu$ s
			3,7 to 4,3 $\mu$ s
Phase relation between middle of sync pulse at the input and the leading edge of the burst key pulse; $V_{7-18} = 7$ V	$t$	typ.	2,65 $\mu$ s
			2,15 to 3,15 $\mu$ s
Output trailing edge current	$I_7$	typ.	2 mA
Saturation voltage during line scan	$V_{7-18}$	$\leq$	1 V

\* Permissible range 1 to 7 V.

**Line flyback-blanking pulse (positive-going) (pin 7)**

Output voltage	V <sub>7-18</sub>	4,1 to 4,9 V
Output resistance	R <sub>7</sub>	typ. 70 Ω
Output trailing edge current	I <sub>7</sub>	typ. 2 mA

**Field flyback/blanking pulse (pin 7)**

Output voltage with externally forced in current I <sub>7</sub> = 2,4 to 3,6 mA	V <sub>7-18</sub>	2 to 3 V
Output resistance at I <sub>7</sub> = 3 mA	R <sub>7</sub>	typ. 70 Ω

**TV-transmitter identification output (pin 9; open collector)**

Output voltage at I <sub>9</sub> = 3 mA; no TV-transmitter	V <sub>9-18</sub>	≤ 0,5 V
Output resistance at I <sub>9</sub> = 3 mA; no TV-transmitter	R <sub>9</sub>	≤ 100 Ω
Output current at V <sub>10-18</sub> ≥ 3 V; TV-transmitter identified	I <sub>9</sub>	≤ 5 μA

**TV-transmitter identification (pin 10)**

When receiving a TV signal the voltage V<sub>10-18</sub> will change from ≤ 1 V to ≥ 7 V.

**Line drive pulse (positive-going)**

Output voltage (peak-to-peak value)	V <sub>3-18(p-p)</sub>	typ. 10 V
Output resistance		
for leading edge of line pulse	R <sub>3</sub>	typ. 2,5 Ω
for trailing edge of line pulse	R <sub>3</sub>	typ. 20 Ω
Pulse duration (transistor driving)		
V <sub>4-18</sub> = 0 to 3,5 V; -I <sub>4</sub> ≥ 200 μA; t <sub>fp</sub> = 12 μs	t <sub>p</sub>	14 + t <sub>d</sub> μs*
Supply voltage for switching off the output pulse	V <sub>1-18</sub>	typ. 4 V

**Overall phase relation**

Phase relation between middle of sync pulse and the middle of the flyback pulse	Δt	typ. 2,6 ± 0,7 μs**
--	----	---------------------

The adjustment of the overall phase relation and consequently the leading edge of the line drive pulse occurs automatically by phase control φ<sub>2</sub>.

If additional adjustment is applied it can be arranged by current supply at pin 5, such that:

Supplying current	ΔI/Δt	typ. 30 μA/μs
-------------------	-------	---------------

\* t<sub>d</sub> = switch-off delay of line output stage.

\*\* Line flyback pulse duration t<sub>fp</sub> = 12 μs.

**Oscillator** (pins 16 and 17)

Threshold voltage low level	V <sub>16-18</sub>	typ.	4,4 V
Threshold voltage high level	V <sub>16-18</sub>	typ.	7,6 V
Charging current	±I <sub>16</sub>	typ.	0,47 mA
Frequency; free running (C <sub>Osc</sub> = 4,7 nF; R <sub>Osc</sub> = 12 kΩ)	f <sub>o</sub>	typ.	15,625 kHz
Spread of frequency	Δf <sub>o</sub>	≤	± 5 % <sup>▲</sup>
Frequency control sensitivity	Δf <sub>o</sub> /ΔI <sub>17</sub>	typ.	31 Hz/μA
Adjustment range of network in circuit (Fig. 1)	Δf <sub>o</sub>	typ.	± 10 %
Influence of supply voltage on frequency; reference at V <sub>S</sub> = 12 V	$\frac{\Delta f_o/f_o}{\Delta V/V_{nom}}$	≤	± 0,05 % <sup>▲</sup>
Change of frequency when V <sub>S</sub> drops to 5 V; reference at V <sub>S</sub> = 12 V	Δf <sub>o</sub>	≤	± 10 % <sup>▲</sup>
Temperature coefficient of oscillator frequency	TC	≤	± 10 <sup>-4</sup> K <sup>-1</sup> <sup>▲</sup>

**Phase comparison φ<sub>1</sub>** (pin 15)

Control voltage range	V <sub>15-18</sub>	4,1 to 7,9 V
Control current (peak value)	±I <sub>15M</sub>	1,8 to 2,2 mA
Output leakage current at V <sub>15-18</sub> = 4,3 to 7,7 V	I <sub>15</sub>	≤ 1 μA
Output resistance at V <sub>15-18</sub> = 4,3 to 7,7 V at V <sub>15-18</sub> ≤ 4,1 V or ≥ 7,9 V	R <sub>13</sub> R <sub>13</sub>	high ohmic * low ohmic **
Control sensitivity		typ. 2 kHz/μs
Catching and holding range (82 kΩ between pins 15 and 17)	Δf	typ. ± 680 Hz
Spread of catching and holding range	Δ(Δf)	typ. ± 12 % <sup>▲</sup>

**Phase comparison φ<sub>2</sub> and phase shifter** (pin 5)

Control voltage range	V <sub>5-18</sub>	5,4 to 7,6 V
Control current (peak value)	±I <sub>5M</sub>	typ. 1 mA
Output resistance at V <sub>5-18</sub> = 5,4 to 7,6 V	R <sub>5</sub>	high ohmic *
Input leakage current at V <sub>5-18</sub> = 5,4 to 7,6 V	I <sub>5</sub>	≤ 5 μA
Permissible delay between leading edge of output pulse and leading edge of flyback pulse (t <sub>fp</sub> = 12 μs)	t <sub>d</sub>	≤ 15,5 μs
Static control error	Δt/Δt <sub>d</sub>	≤ 0,2 %

**Coincidence detector φ<sub>3</sub>** (pin 13)

Output voltage	V <sub>13-18</sub>	0,5 to 6 V
Output current (peak value) without coincidence	I <sub>13M</sub>	typ. 0,1 mA
with coincidence	-I <sub>13M</sub>	typ. 0,5 mA

\* Current source.

\*\* Emitter follower.

▲ Excluding external component tolerances.

**Time constant switch (pin 14)**

Output voltage	$V_{14-18}$	typ.	6 V
Output current (limited)	$\pm I_{14}$	typ.	1 mA
Output resistance			
at $V_{13-18} = 3,5$ to 7 V	$R_{14}$	typ.	0,1 k $\Omega$
at $V_{13-18} \leq 2,5$ V or $\geq 9$ V	$R_{14}$	typ.	60 k $\Omega$
<b>Internal keying pulse</b>			
Pulse duration	$t_p$	typ.	7,5 $\mu$ s

## HORIZONTAL COMBINATION

### GENERAL DESCRIPTION

The TDA2595 is a monolithic integrated circuit intended for use in colour television receivers.

#### Features

- Positive video input; capacitively coupled (source impedance  $< 200 \Omega$ )
- Adaptive sync separator; slicing level at 50% of sync amplitude
- Internal vertical pulse separator with double slope integrator
- Output stage for vertical sync pulse or composite sync depending on the load; both are switched off at muting
- $\varphi_1$  phase control between horizontal sync and oscillator
- Coincidence detector  $\varphi_3$  for automatic time-constant switching; overruled by the VCR switch
- Time-constant switch between two external time-constants or loop-gain; both controlled by the coincidence detector  $\varphi_3$
- $\varphi_1$  gating pulse controlled by coincidence detector  $\varphi_3$
- Mute circuit depending on TV transmitter identification
- $\varphi_2$  phase control between line flyback and oscillator; the slicing levels for  $\varphi_2$  control and horizontal blanking can be set separately
- Burst keying and horizontal blanking pulse generation, in combination with clamping of the vertical blanking pulse (three-level sandcastle)
- Horizontal drive output with constant duty cycle inhibited by the protection circuit or the supply voltage sensor
- Detector for too low supply voltage
- Protection circuit for switching off the horizontal drive output continuously if the input voltage is below 4 V or higher than 8 V
- Line flyback control causing the horizontal blanking level at the sandcastle output continuously in case of a missing flyback pulse
- Spot-suppressor controlled by the line flyback control

#### QUICK REFERENCE DATA

Supply voltage (pin 15)	$V_{15.5} = V_p$	typ.	12 V
Sync pulse amplitude (positive video)	$V_{i(p-p)}$	min.	50 mV
Horizontal output current	$I_4$	typ.	50 mA

#### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

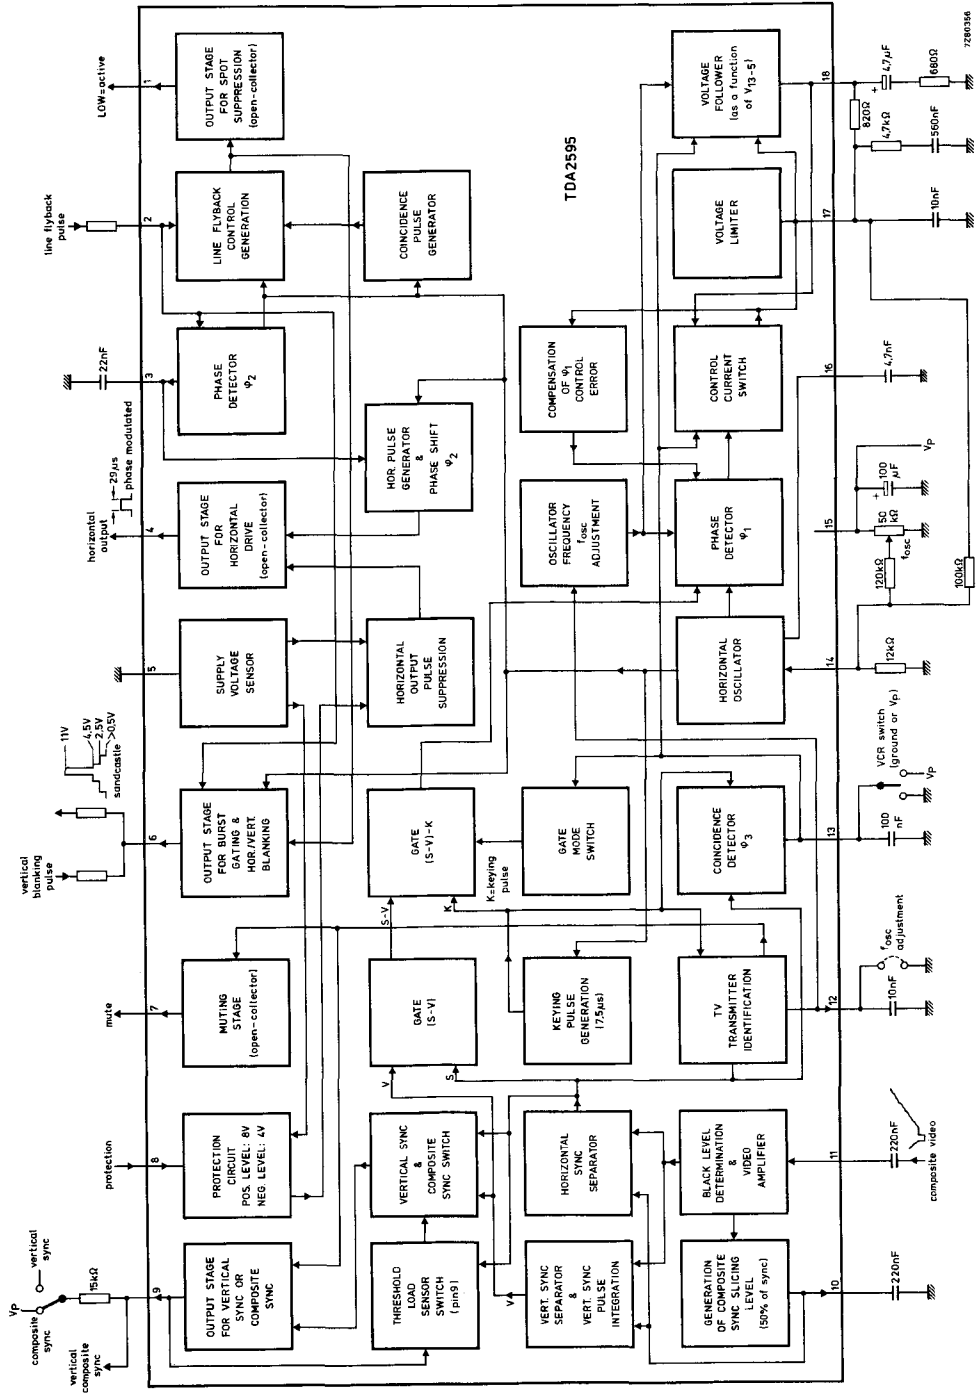

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 15)	$V_{15-5} = V_P$	max.	13,2 V
Voltages at:			
pins 1, 4 and 7	$V_{1;4;7-5}$	max.	18 V
pins 8, 13 and 18	$V_{8;13;18-5}$	max.	$V_P$ V
pin 11 (range)	$V_{11-5}$		-0,5 to +6 V
Currents at:			
pin 1	$I_1$	max.	10 mA
pin 2 (peak value)	$\pm I_{2M}$	max.	10 mA
pin 4	$I_4$	max.	100 mA
pin 6 (peak value)	$\pm I_{6M}$	max.	6 mA
pin 7	$I_7$	max.	10 mA
pin 8 (range)	$I_8$		-5 to +1 mA
pin 9 (range)	$I_9$		-10 to +3 mA
pin 18	$\pm I_{18}$	max.	10 mA
Total power dissipation	$P_{tot}$	max.	800 mW
Storage temperature range	$T_{stg}$		-25 to +125 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

## CHARACTERISTICS

$V_p = 12\text{ V}$ ;  $T_{amb} = 25\text{ }^\circ\text{C}$ ; measured in Fig. 1; unless otherwise specified

parameter	symbol	min.	typ.	max.	unit
<b>Composite video input and sync separator (pin 11)</b> (internal black level determination)					
Input signal (positive video; standard signal; peak-to-peak value)	$V_{11-5(p-p)}$	0,2	1	3	V
Sync pulse amplitude (independent of video content)	$V_{11-5(p-p)}$	50	—	—	mV
Generator resistance	$R_G$	—	—	200	$\Omega$
Input current during:					
video	$I_{11}$	—	5	—	$\mu\text{A}$
sync pulse	$-I_{11}$	—	40	—	$\mu\text{A}$
black level	$-I_{11}$	—	25	—	$\mu\text{A}$
<b>Composite sync generation (pin 10)</b> horizontal slicing level at 50% of the sync pulse amplitude for $V_{11-5(p-p)} < 1,5\text{ V}$					
Capacitor current during:					
video	$I_{10}$	—	16	—	$\mu\text{A}$
sync pulse	$-I_{10}$	—	170	—	$\mu\text{A}$
<b>Vertical sync pulse generation</b> slicing level at 30% (60% between black level and horizontal slicing level); pin 9					
Output voltage	$V_{9-5}$	10	—	—	V
Pulse duration	$t_p$	—	190	—	$\mu\text{s}$
Delay with respect to the vertical sync pulse (leading edge)	$t_d$	—	45	—	$\mu\text{s}$
<b>Pulse-mode control</b>					
output current for vertical sync pulse (dual integrated)		no current applied at pin 9			
output current for horizontal and vertical sync pulse (non-integrated separated signal)		current applied via a resistor of $15\text{ k}\Omega$ from $V_p$ to pin 9			

parameter	symbol	min.	typ.	max.	unit
<b>Horizontal oscillator</b> (pins 14 and 16)					
Frequency; free running	$f_{osc}$	—	15 625	—	Hz
Reference voltage for $f_{osc}$	V <sub>14-5</sub>	—	6	—	V
Frequency control sensitivity	$\Delta f_{osc}/\Delta I_{14}$	—	31	—	Hz/ $\mu$ A
Adjustment range of circuit Fig. 1	$\Delta f_{osc}$	—	$\pm 10$	—	%
Spread of frequency	$\Delta f_{osc}$	—	—	5	%
Frequency dependency (excluding tolerance of external components)	$\Delta f_{osc}/f_{osc}$	—	$\pm 0,05$	—	
with supply voltage ( $V_P = 12$ V)	$\Delta V_{15-5}/V_{15-5}$	—			
with supply voltage drop of 5 V	$\Delta f_{osc}$	—	—	10	%
with temperature	TC	—	—	$\pm 10^{-4}$	K <sup>-1</sup>
Capacitor current during:					
discharging	+I <sub>16</sub>	—	1024	—	$\mu$ A
charging	-I <sub>16</sub>	—	313	—	$\mu$ A
Sawtooth voltage timing (pin 14)					
rise time	$t_r$	—	49	—	$\mu$ s
fall time	$t_f$	—	15	—	$\mu$ s
<b>Horizontal output pulse (pin 4)</b>					
Output voltage LOW at $I_4 = 50$ mA	V <sub>4-5</sub>	—	—	0,5	V
Pulse duration (HIGH)	$t_p$	—	$29 \pm 1,5$	—	$\mu$ s
Supply voltage for switching off the output pulse (pin 15)	V <sub>P</sub>	—	4	—	V
Hysteresis for switching on the output pulse	$\Delta V_P$	—	250	—	mV

## CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
<b>Phase comparison <math>\varphi_1</math> (pin 17)</b>					
Control voltage range	$V_{17.5}$	3,55	—	8,3	V
Leakage current at $V_{17.5} = 3,55$ to $8,3$ V	$I_{17}$	—	—	1	$\mu\text{A}$
Control current for external time-constant switch	$\pm I_{17}$	1,8	2	2,2	mA
Control current at $V_{18.5} = V_{15.5}$ and $V_{13.5} < 2$ V or $V_{13.5} > 9,5$ V	$\pm I_{17}$	—	8	—	mA
Control current at $V_{18.5} = V_{15.5}$ and $V_{13.5} = 2$ to $9,5$ V	$\pm I_{17}$	1,8	2	2,2	mA
Horizontal oscillator control					
control sensitivity	$S_\varphi$	6	—	—	kHz/ $\mu\text{s}$
catching and holding range	$\pm \Delta f_{\text{osc}}$	—	680	—	Hz
spread of catching and holding range	$\pm \Delta f_{\text{osc}}$	—	10	—	%
Internal keying pulse					
at $V_{13.5} = 2,9$ to $9,5$ V	$t_p$	—	7,5	—	$\mu\text{s}$
Time-constant switch					
slow time-constant at	$V_{13.5}$	9,5	—	2	V
fast time-constant at	$V_{13.5}$	2	—	9,5	V
Impedance converter offset voltage (slow time-constant)	$\pm V_{17-18}$	—	—	3	mV
Output resistance					
slow time-constant	$R_{18-5}$	—	—	10	$\Omega$
fast time-constant	$R_{18-5}$	high impedance			
Leakage current	$I_{18}$	—	—	1	$\mu\text{A}$

parameter	symbol	min.	typ.	max.	unit
<b>Coincidence detector <math>\varphi_3</math> (pin 13)</b>					
Output voltage					
without coincidence with composite video signal	$V_{13-5}$	—	—	1	V
without coincidence without composite video signal (noise)	$V_{13-5}$	—	—	2	V
with coincidence with composite video signal	$V_{13-5}$	—	6	—	V
Output current					
without coincidence with composite video signal	$I_{13}$	—	50	—	$\mu A$
with coincidence with composite video signal	$-I_{13}$	—	300	—	$\mu A$
Switching current					
at $V_{13-5} = V_p - 0,5 V$	$I_{13}$	—	—	100	$\mu A$
at $V_{13-5} = 0,5 V$ (average value)	$I_{13(av)}$	—	—	100	$\mu A$

**Notes to the characteristics**

1. Phase comparison between horizontal oscillator and the line flyback pulse. Generation of a phase modulated ( $\varphi_2$ ) horizontal output pulse with constant duration.
2.  $t_{fp}$  is the line flyback pulse duration.
3. Three-level sandcastle pulse.
4. If pin 12 is connected to  $V_p$  the vertical output is active independent of synchronization state.

## 5 W AUDIO POWER AMPLIFIER

The TDA2611A is a monolithic integrated circuit in a 9-lead single in-line (SIL) plastic package with a high supply voltage audio amplifier. Special features are:

- possibility for increasing the input impedance
- single in-line (SIL) construction for easy mounting
- very suitable for application in mains-fed apparatus
- extremely low number of external components
- thermal protection
- well defined open loop gain circuitry with simple quiescent current setting and fixed integrated closed loop gain

## QUICK REFERENCE DATA

Supply voltage range	$V_P$	6 to 35 V

## PACKAGE OUTLINE

9-lead SIL; plastic (SOT110B).

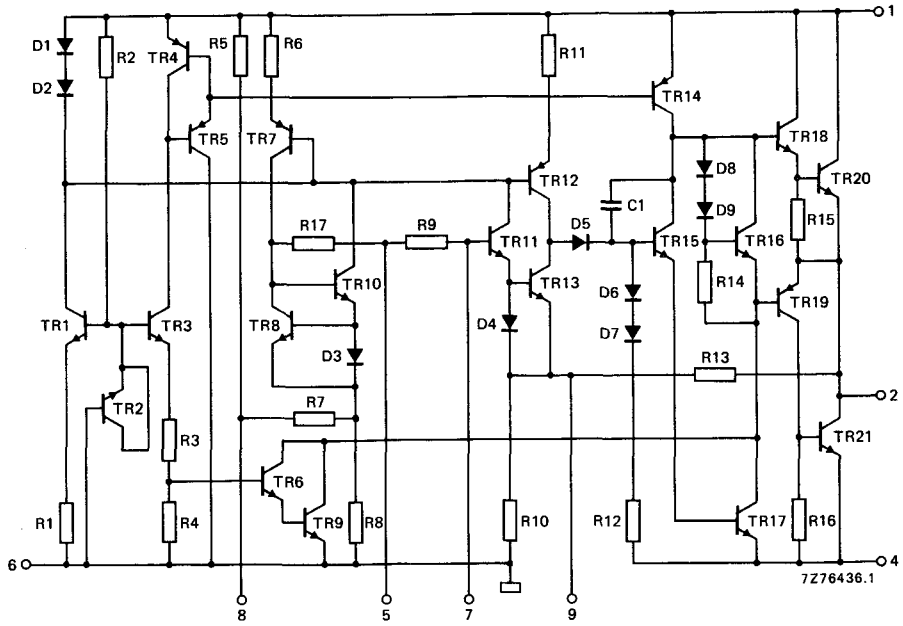

Fig. 1 Circuit diagram; pin 3 not connected.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_p$	max.	35 V
Non-repetitive peak output current	$I_{OSM}$	max.	3 A
Repetitive peak output current	$I_{ORM}$	max.	1,5 A
Total power dissipation			see derating curves Fig. 2
Storage temperature	$T_{stg}$		-55 to + 150 °C
Operating ambient temperature	$T_{amb}$		-25 to + 150 °C

Fig. 2 Power derating curves.

## HEATSINK EXAMPLE

Assume  $V_p = 18$  V;  $R_L = 8 \Omega$ ;  $T_{amb} = 60$  °C maximum;  $T_j = 150$  °C (max. for a 4 W application into an  $8 \Omega$  load, the maximum dissipation is about 2,2 W).

The thermal resistance from junction to ambient can be expressed as:

$$R_{th j-a} = R_{th j-tab} + R_{th tab-h} + R_{th h-a} = \frac{150 - 60}{2,2} = 41 \text{ K/W.}$$

Since  $R_{th j-tab} = 11$  K/W and  $R_{th tab-h} = 1$  K/W,  $R_{th h-a} = 41 - (11 + 1) = 29$  K/W.

TDA2613

## 6 W HI-FI AUDIO POWER AMPLIFIER

### GENERAL DESCRIPTION

The TDA2613 is a hi-fi audio power amplifier encapsulated in a 9-lead SIL plastic power package. The device is especially designed for mains fed applications (e.g. tv and radio).

### Features

- Requires very few external components
- Input muted during power-on and off (no switch-on or switch-off clicks)
- Low offset voltage between output and ground
- Hi-fi according to IEC 268 and DIN 45500
- Short-circuit-proof
- Thermally protected

### QUICK REFERENCE DATA

---

Supply voltage range	$V_p$		15 to 40 V
Output power at THD = 0,5%, $V_p = 24$ V	$P_o$	typ.	6 W
Voltage gain	$G_v$	typ.	30 dB
Supply voltage ripple rejection	SVRR	typ.	60 dB
Noise output voltage	$V_{no(rms)}$	typ.	70 $\mu$ V

---

### PACKAGE OUTLINE

TDA2613: 9-lead SIL; plastic power (SOT110B).

## FUNCTIONAL DESCRIPTION

This hi-fi power amplifier is designed for mains fed applications. The device is intended for asymmetrical power supplies, but a symmetrical supply may also be used. An output power of 6 watts (THD = 0,5%) can be delivered into an  $8 \Omega$  load with an asymmetrical power supply of 24 V.

The gain is fixed internally at 30 dB. Internal gain fixing gives low gain spread.

A special feature of this device is a mute circuit which suppresses unwanted input signals during switching on and off. Referring to Fig. 4, the  $100 \mu\text{F}$  capacitor creates a time delay when the voltage at pin 3 is lower than an internally fixed reference voltage. During the delay the amplifier remains in the DC operating mode but is isolated from the non-inverting input on pin 9.

Two thermal protection circuits are provided, one monitors the average junction temperature and the other the instantaneous temperature of the power transistors. Both protection circuits activate at  $150^\circ\text{C}$  allowing safe operation to a maximum junction temperature of  $150^\circ\text{C}$  without added distortion.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage		$V_p$	—	40	V
Non-repetitive peak output current		$I_{OSM}$	—	4	A
Total power dissipation	see Fig. 2	$P_{tot}$			
Storage temperature range		$T_{stg}$	-65	+ 150	$^\circ\text{C}$
Junction temperature		$T_j$	—	150	$^\circ\text{C}$
Short-circuit time: outputs short-circuited to ground (full signal drive)	see note	$t_{sc}$	—	1	hour

DEVELOPMENT DATA

### Note to the Ratings

For asymmetrical power supplies (at short-circuiting of the load) the maximum supply voltage is limited to  $V_p = 28 \text{ V}$ . If the total internal resistance of the supply ( $R_S$ )  $\geq 4 \Omega$ , the maximum unloaded supply voltage is increased to 32 V. For symmetrical power supplies the circuit is short-circuit proof to  $V_p = \pm 20 \text{ V}$ .

Fig. 2 Power derating curve.

**THERMAL RESISTANCE**

From junction to case

$$R_{th\ j-c} = 8\ K/W$$

**HEATSINK DESIGN EXAMPLE**

With derating of 8 K/W, the value of heatsink thermal resistance is calculated as follows:

given  $R_L = 8\ \Omega$  and  $V_p = 24\ V$ , the measured maximum dissipation is 4,1 W; then, for a maximum ambient temperature of  $60^{\circ}C$ , the required thermal resistance of the heatsink is:

$$R_{th\ h-a} = \frac{150 - 60}{4,1} - 8 \approx 14\ K/W$$

Note: The metal tab (heatsink) has the same potential as pin 5 (GND).

## Notes to the characteristics

- Power bandwidth at  $P_o \text{ max} -3 \text{ dB}$ .
- Ripple rejection at  $R_S = 0 \Omega$ ,  $f = 100 \text{ Hz}$  to  $20 \text{ kHz}$ ;  
ripple voltage =  $200 \text{ mV}$  (r.m.s. value) applied to positive or negative supply rail.

APPLICATION INFORMATION

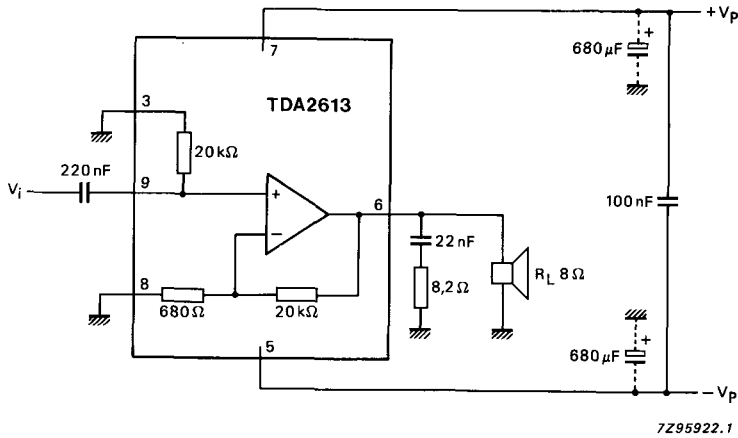

Fig. 3 Test and application circuit; symmetrical power supply.

DEVELOPMENT DATA

Fig. 4 Test and application circuit; asymmetrical power supply.

**APPLICATION INFORMATION** (continued)**Input mute circuit**

The input mute circuit operates only during switching on and off of the supply voltage. The circuit compares the  $\frac{1}{2}$  supply voltage (at pin 3) with an internally fixed reference voltage ( $V_{ref}$ ), derived directly from the supply voltage. When the voltage at pin 3 is lower than  $V_{ref}$  the non-inverting input (pin 9) is disconnected from the amplifier. The voltage at pin 3 is determined by an internal voltage divider and the external  $100\ \mu\text{F}$  capacitor.

During switching on, a time delay is created between the reference voltage and the voltage at pin 3, during which the input terminal is disconnected, (as illustrated in Fig. 5).

Fig. 5 Input mute circuit; time delay.

## VERTICAL DEFLECTION CIRCUIT

The TDA2653A is a monolithic integrated circuit for vertical deflection in large screen colour television receivers, e.g. 30AX and PIL-S4 systems.

The circuit incorporates the following functions:

- Oscillator; switch capability for 50 Hz/60 Hz operation.
- Synchronization circuit.
- Blanking pulse generator with guard circuit.
- Sawtooth generator with buffer stage.
- Preamplicifier with fed-out inputs.
- Output stage with thermal and short-circuit protection.
- Flyback generator.
- Voltage stabilizer.

### QUICK REFERENCE DATA

For 30AX system

Supply voltage (pin 9)	$V_{9-8} = V_S$	typ.	26 V
Supply current (pin 5 + pin 9)	$I_5 + I_9 = I_S$	typ.	325 mA
Output current (peak-to-peak value)	$I_6(p-p)$	typ.	2,2 A
Picture frequency	f		50 Hz/60 Hz
Sync input pulse (peak-to-peak value)	$V_{2-8}(p-p)$	$\geq$	1 V
Thermal resistance from junction to mounting base	$R_{th\ j-mb}$	$\leq$	5 K/W

### PACKAGE OUTLINE

13-lead SIL; plastic power (SOT 141B).

**APPLICATION INFORMATION**

The function is described against the corresponding pin number

- 1, 13. Oscillator  
The oscillator frequency is determined by a potentiometer at pin 1 and a capacitor at pin 13.
2. Sync input/blanking output  
Combination of sync input and blanking output. The oscillator has to be synchronized by a positive-going pulse between 1 and 12 V. The integrated frequency detector delivers a switching level at pin 12.  
The blanking pulse amplitude is 20 V with a load of 1 mA.
3. Sawtooth generator output  
The sawtooth signal is fed via a buffer stage to pin 3. It delivers the signal which is used for linearity control, and drive of the preamplifier. The sawtooth is applied via a shaping network to pin 11 (linearity) and via a resistor to pin 4 (preamplifier).
4. Preamplicifier input  
The d.c. voltage is proportional to the output voltage (d.c. feedback). The a.c. voltage is proportional to the sum of the buffered sawtooth voltage at pin 3 and the voltage, with opposite polarity, at the feedback resistor (a.c. feedback).
5. Positive supply of output stage  
This supply is obtained from the flyback generator. An electrolytic capacitor between pins 7 and 5, and a diode between pins 5 and 9 have to be connected for proper operation of the flyback generator.
6. Output of class-B power stage  
The vertical deflection coil is connected to this pin, via a series connection of a coupling capacitor and a feedback resistor, to ground.
7. Flyback generator output  
An electrolytic capacitor has to be connected between pins 7 and 5 to complete the flyback generator.
8. Negative supply (ground)  
Negative supply of output stage and small signal part.
9. Positive supply  
The supply voltage at this pin is used to supply the flyback generator, voltage stabilizer, blanking pulse generator and buffer stage.

## APPLICATION INFORMATION (continued)

## 10. Reference voltage of preamplifier

External adjustment and decoupling of reference voltage of the preamplifier.

## 11. Sawtooth capacitor

This sawtooth capacitor has been split to realize linearity control.

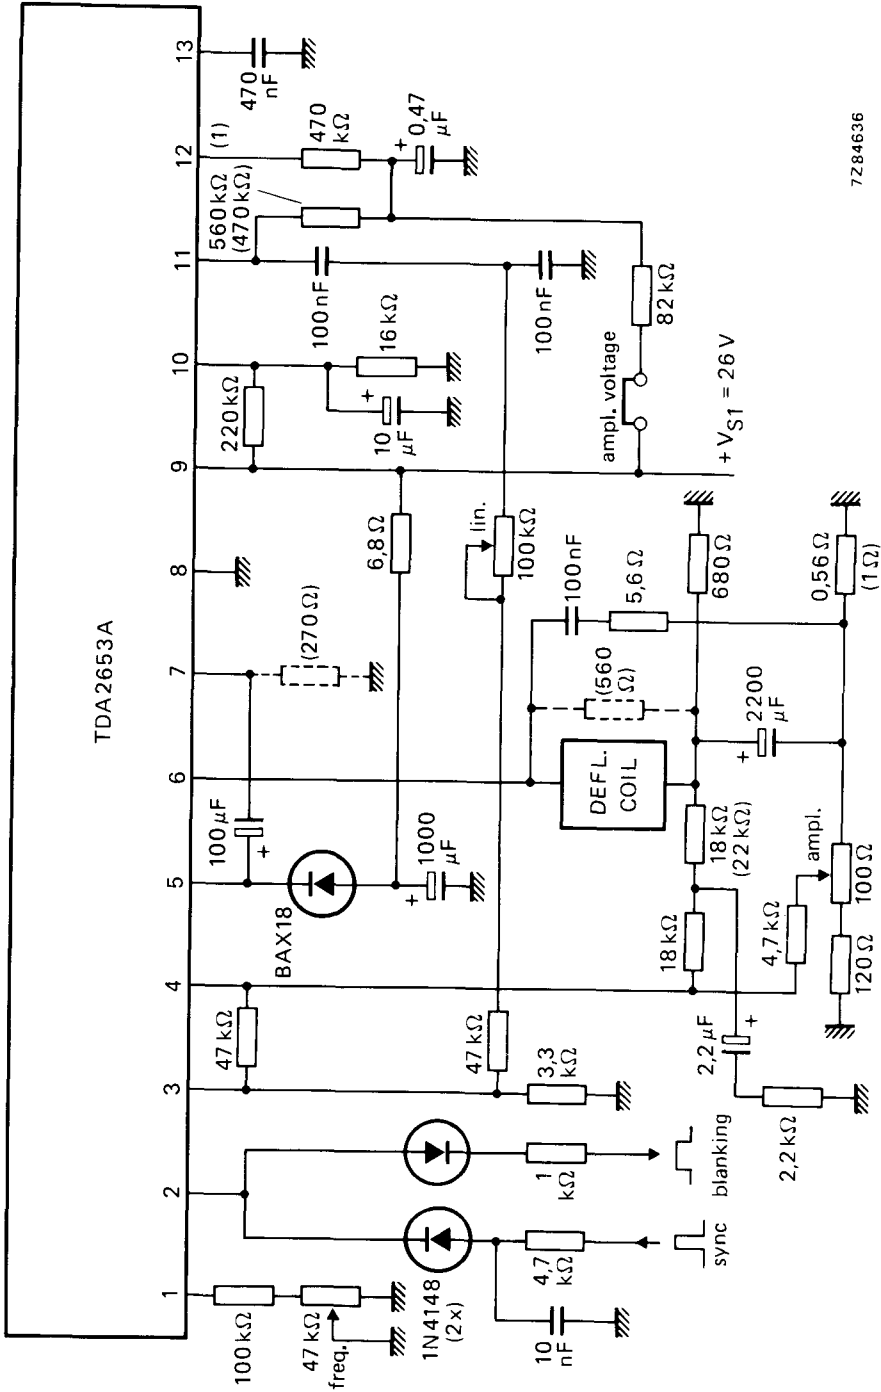

## 12. 50 Hz/60 Hz switching level

This pin delivers a LOW voltage level for 50 Hz and a HIGH voltage level for 60 Hz. The amplitudes of the sawtooth signals can be made equal for 50 Hz and 60 Hz with these levels.

The following application data are measured in Figs 3 and 4.

		30AX system (26 V) Fig. 3	30AX system (26 V/12 V) Fig. 4	PIL-S4 system Fig. 3

## VERTICAL DEFLECTION CIRCUIT

The TDA2654 is a monolithic integrated circuit for vertical deflection in monochrome and tiny-vision colour television receivers.

The circuit incorporates the following functions:

- Oscillator
- Synchronization circuit
- Blanking pulse generator
- Sawtooth generator
- S-correction and linearity circuit
- Comparator and drive circuit
- Output stage
- Flyback dissipation limiting circuit
- Supply for pre-stages via internal voltage divider
- Thermal protection circuit
- Controlled switch-on

### QUICK REFERENCE DATA

Supply voltage range (ref. to tab = ground)	$V_p$	10 to 35 V
Output current (peak-to-peak value)	$I_{g(p-p)}$	max. 2 A
Total power dissipation	$P_{tot}$	max. 5 W
Operating junction temperature	$T_j$	max. 150 °C
Thermal resistance from junction to tab	$R_{th j-tab}$	= 12 °C/W

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT110B).

7Z75687

| 5. S-correction and linearity control | Tab. Negative supply (ground) |

## APPLICATION INFORMATION (see also Fig. 1)

The function is described against the corresponding pin number

## 1. Blanking pulse output

When the IC is adjusted on a free running frequency of 46 Hz the internal blanking pulse generator delivers a blanking pulse with a duration between 1,2 ms and 1,5 ms. The circuit is, however, made such that when the flyback time of the deflection current is longer, the blanking pulse corresponds to the flyback time. The output voltage is also high when the voltage at pin 9 is lower than nominal 5 V. An external blanking circuit is recommended when tiny-vision receivers are operated from a car-battery.

## 2. Synchronization input

The oscillator has to be synchronized by a positive-going pulse. The circuit is made such that synchronization is inhibited during the flyback time.

**APPLICATION INFORMATION** (continued)**3. Oscillator**

The oscillator frequency is set by the potentiometer P1 and resistor R2 between pins 3 and 7 and capacitor C1 between pin 3 and ground. For 50 Hz systems the free running frequency is preferably adjusted to 46 Hz.

**4. Sawtooth generator**

This pin supplies the charging and discharging currents of the capacitor between pin 4 and ground (C2).

**5. S-correction and linearity control**

The amount of S-correction can be set by the value of C3. For 110° deflection coils, e.g. AT1040/15, a capacitor of 15  $\mu\text{F}$  will give the right value for S-correction. For 90° deflection systems (e.g. AT1235/00) a nearly linear deflection current is required, this can be achieved by increasing C3 to 100  $\mu\text{F}$ . The linearity can be adjusted by potentiometer P2.

**6. Output current feedback**

To this pin is applied a part of the output current measured across R6 and superimposed on a d.c. voltage derived from the voltage across the output coupling capacitor. This signal is compared with the internal reference sawtooth. The internal reference sawtooth has an amplitude of about 0,6 V peak to peak and a d.c. level of about 3,4 V, for a supply voltage of 25 V at pin 8.

**7. Internal voltage divider decoupling**

The voltage on this pin is about half the supply voltage at pin 8 and is applied to the bases of emitter followers supplying the pre-stages of the IC. This voltage controls the amplitude of the internal reference sawtooth. In this way tracking with the line deflection system is achieved when the supply voltage at pin 8 is derived from the line output transformer.

**8. Positive supply**

The value depends on the deflection coil.

**9. Output**

The deflection coil is connected to ground via coupling capacitor C9 and current sensing resistor R6. The line frequency superimposed on the output voltage may be too high due to the current feedback system. The line frequency ripple can be decreased by connecting a resistor across the deflection coil. The flyback time can be influenced by the resistor divider (R4, R5) for the d.c. feedback to pin 6. It should be noted that the output voltage shows a negative swing of about 1 V during the first (positive current) part of the flyback.

**Tab**

The tab is used as negative supply (ground) connection. Therefore, the tab should be well connected to the negative side of the power supply.

**Controlled switch-on**

This feature is achieved by charging the a.c. coupling capacitor (C4; connected to pin 6) from an internal current source of about 2 mA (voltage limited to maximum 15 V) for a short period after switch-on. The charging time can be influenced by the value of C5 (connected to pin 7). Discharging of C4 results in a slowly increasing deflection current after a delay of about 1 second. The blanking voltage at pin 1 is high during this delay.

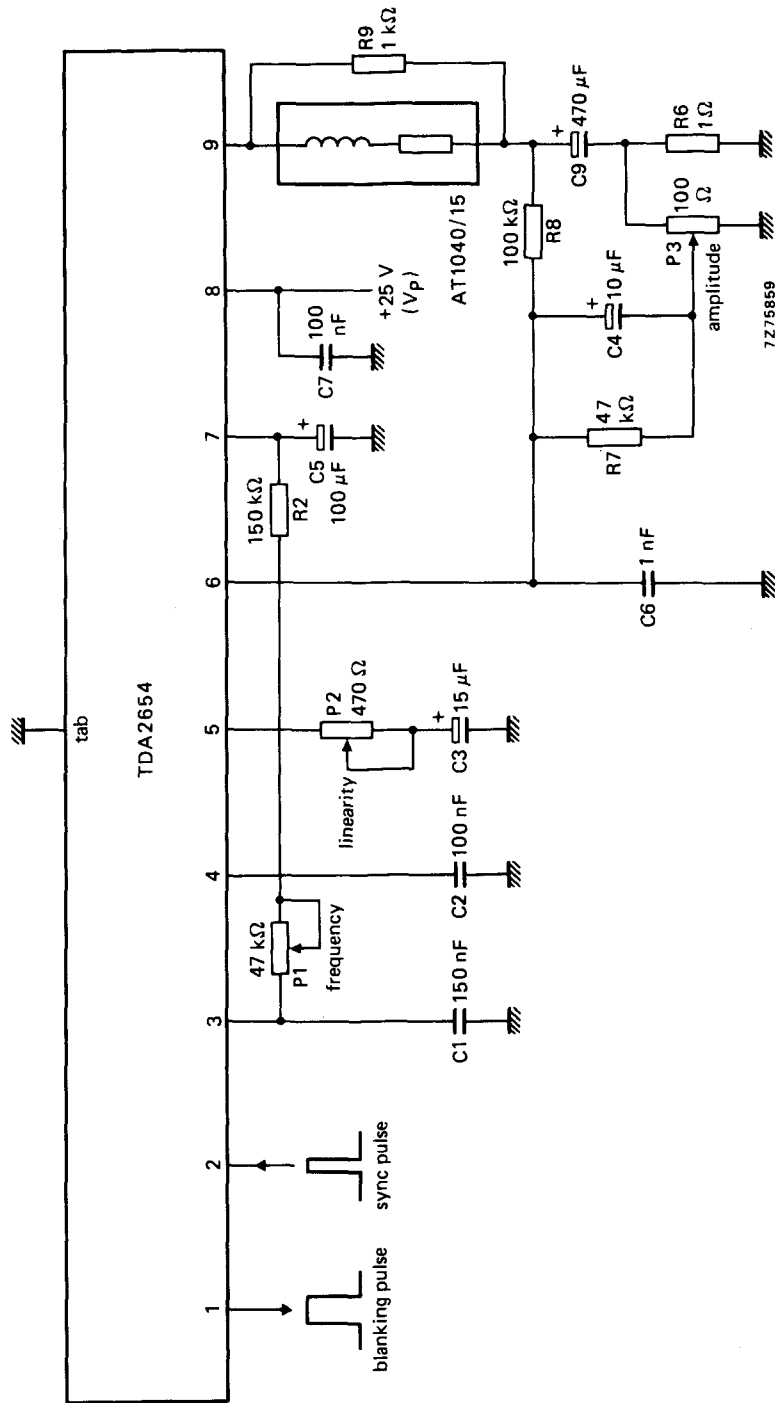

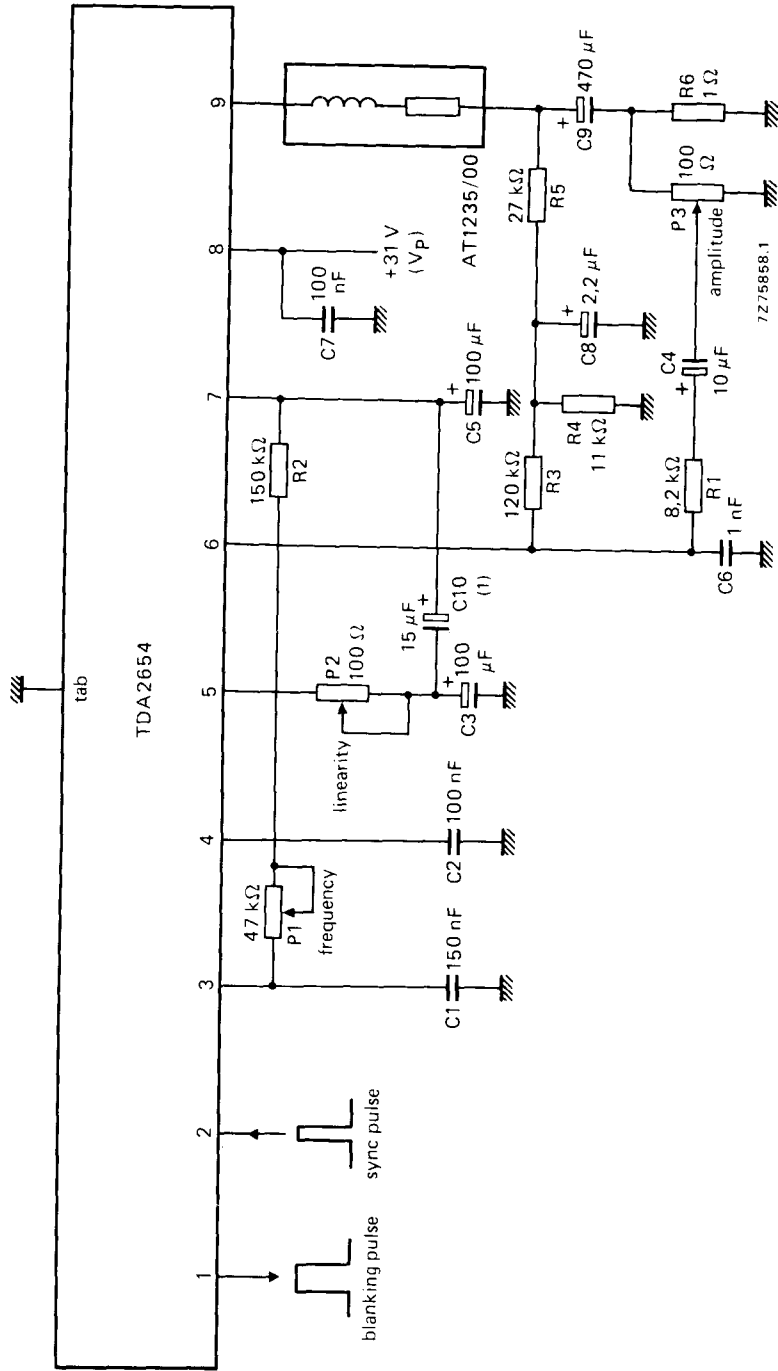

Fig. 3 Monochrome 110° vertical deflection system.

APPLICATION INFORMATION (continued)

(1) Only required when rapid variations in the supply voltage are expected.

Fig. 4 Colour 90° vertical deflection system.

## VERTICAL DEFLECTION CIRCUIT

### GENERAL DESCRIPTION

The TDA2655B is a monolithic integrated circuit for vertical deflection in colour television receivers with 90° picture tubes.

### Features

- Synchronization circuit
- Vertical oscillator; 50/60 Hz switch
- Sawtooth generator with buffer stage
- Preamplifier with fed-out inputs
- Output stage with thermal and short-circuit protection
- Flyback generator
- Blanking pulse generator with guard circuit
- Voltage stabilizer
- Frequency detector with memory and storage

### QUICK REFERENCE DATA

For 90° deflection; measured with respect to cooling fin (ground)

			concept 1*	concept 2*	
System supply voltages	V <sub>P1</sub>	typ.	22	22	V

\*Concept 1 : with two supply voltages; concept 2 : with one supply voltage.

**Note**

Calculated with  $\Delta V_{p1}$  of +5% and  $\Delta R_{defl}$  of -7%.

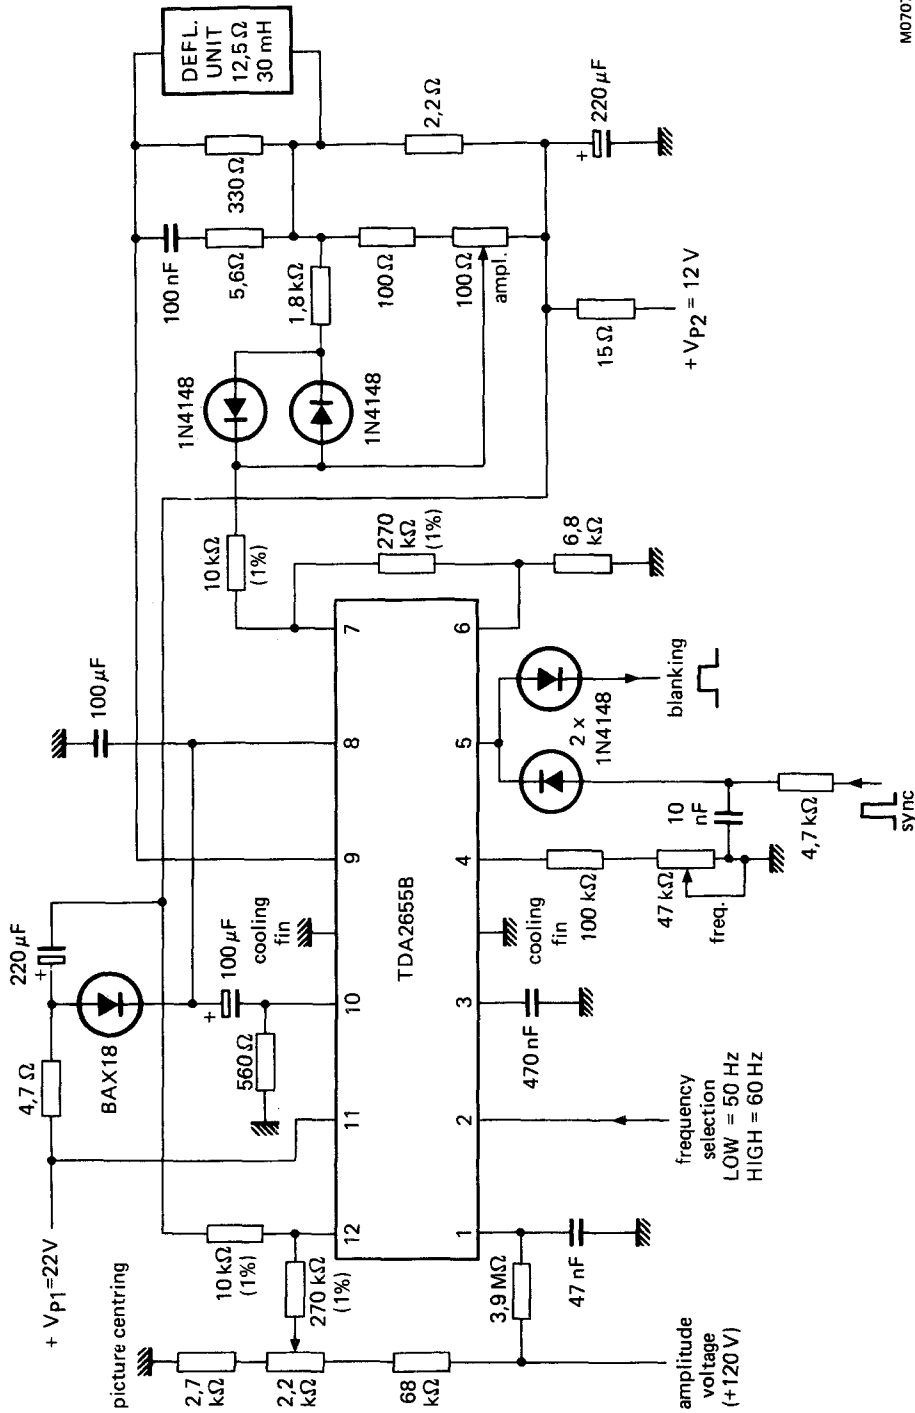

Fig. 2 Typical application circuit with two supply voltages; for use with 90° picture tubes.

## VERTICAL DEFLECTION CIRCUIT

The TDA2658 is a monolithic integrated circuit for vertical deflection in small screen colour television receivers and monitors.

The circuit incorporates the following functions:

- Oscillator; switch capability for 50 Hz/60 Hz operation.
- Synchronization circuit.
- Blanking pulse generator with guard circuit.
- Sawtooth generator with buffer stage.
- Preamplifier with fed-out inputs.
- Output stage with thermal and short-circuit protection.
- Flyback generator.
- Voltage stabilizer.

### QUICK REFERENCE DATA

Supply voltage (pin 9)	$V_{9-8} = V_S$	typ.	26 V
Supply current (pin 5 + pin 9)	$I_5 + I_9 = I_S$	typ.	250 mA
Output current (peak-to-peak value)	$I_6(p-p)$	typ.	1,6 A
Picture frequency	f		50 Hz/60 Hz
Sync input pulse (peak-to-peak value)	$V_{2-8}(p-p)$	$\geq$	1 V
Thermal resistance from junction to mounting base	$R_{th j-mb}$	$\leq$	5 K/W

### PACKAGE OUTLINE

13-lead SIL; plastic power (SOT141B).

**APPLICATION INFORMATION**

The function is described against the corresponding pin number

- 1, 13. Oscillator  
The oscillator frequency is determined by a potentiometer at pin 1 and a capacitor at pin 13.
2. Sync input/blanking output  
Combination of sync input and blanking output. The oscillator has to be synchronized by a positive-going pulse between 1 and 12 V. The integrated frequency detector delivers a switching level at pin 12.  
The blanking pulse amplitude is 20 V with a load of 1 mA ( $V_G = 26$  V).
3. Sawtooth generator output  
The sawtooth signal is fed via a buffer stage to pin 3. It delivers the signal which is used for linearity control, and drive of the preampifier. The sawtooth is applied via a shaping network to pin 11 (linearity) and via a resistor to pin 4 (preampifier).
4. Preampifier input  
The d.c. voltage is proportional to the output voltage (d.c. feedback). The a.c. voltage is proportional to the sum of the buffered sawtooth voltage at pin 3 and the voltage, with opposite polarity, at the feedback resistor (a.c. feedback).
5. Positive supply of output stage  
This supply is obtained from the flyback generator. An electrolytic capacitor between pins 7 and 5, and a diode between pins 5 and 9 have to be connected for proper operation of the flyback generator.
6. Output of class-B power stage  
The vertical deflection coil is connected to this pin, via a series connection of a coupling capacitor and a feedback resistor, to ground.
7. Flyback generator output  
An electrolytic capacitor has to be connected between pins 7 and 5 to complete the flyback generator.
8. Negative supply (ground)  
Negative supply of output stage and small signal part.
9. Positive supply  
The supply voltage at this pin is used to supply the flyback generator, voltage stabilizer, blanking pulse generator and buffer stage.

**APPLICATION INFORMATION** (continued)

## 10. Reference voltage of preamplifier

External adjustment and decoupling of reference voltage of the preamplifier.

## 11. Sawtooth capacitor

This sawtooth capacitor has been split to realize linearity control.

## 12. 50 Hz/60 Hz switching level

This pin delivers a LOW voltage level for 50 Hz and a HIGH voltage level for 60 Hz. The amplitudes of the sawtooth signals can be made equal for 50 Hz and 60 Hz with these levels.

The following application data are measured in Fig. 3

System supply voltages	V <sub>S1</sub>	typ.	24 V
System supply currents	I <sub>S1</sub>	typ.	145 mA
Output voltage	V <sub>6-8</sub>	typ.	14 V
Output voltage (peak value)	V <sub>6-8</sub>	typ.	44 V
Deflection current (peak-to-peak value)	I <sub>6(p-p)</sub>	typ.	1 A
Flyback time	t <sub>fl</sub>	typ.	1 ms
Total power dissipation per package	P <sub>tot</sub>	typ. max.	1,7 W 2,2 W
Oscillator frequency unsynchronized	f	typ.	46,5 Hz

## TV STEREO/DUAL SOUND IDENTIFICATION DECODER

The TDA2795 is a monolithic integrated circuit for stereo/dual sound in television receivers.

The circuit incorporates the following functions:

- Controlled pilot signal amplifier,
- Envelope demodulator.
- Two separate signal paths for processing the identification frequencies: operational amplifier for active filter, integral evaluation circuit with TTL compatible 'open collector' outputs.
- Stereo indicator driver.

### QUICK REFERENCE DATA

Supply voltage	$V_S$	typ.	12 V
Supply current	$I_S$	typ.	8 mA
Nominal input voltage at $f = 54,6875$ kHz	$V_i$	typ.	10 mV
Input impedance	$ Z_i $	$\geq$	500 k $\Omega$
Operational amplifier

Fig. 3 Controlled output voltage as a function of the input signal ( $Q_o = 80$ ); pilot frequency  $f_o = 54,6875$  kHz;  $R_S$  is source resistance.

**GENERAL FILTER CALCULATIONS**

1. Gain

Amplifier conditions:  $G_o \gg G_v$  and  $G_o \gg 2 \cdot Q^2$

$$G_v = - \frac{\frac{p}{R1 \cdot C1}}{p^2 + p \frac{C1 + C2}{R3 \cdot C1 \cdot C2} + \frac{R1 + R2}{R1 \cdot R2 \cdot R3 \cdot C1 \cdot C2}}, \text{ in which: } p = j\omega; G_v = \frac{V_o}{V_i}$$

2. Resonance frequency

$$\omega_r = \frac{1}{\sqrt{\frac{R1 \cdot R2}{R1 + R2} \cdot R3 \cdot C1 \cdot C2}}$$

3. Gain at  $\omega = \omega_r$

$$-G_{vr} = \frac{C2}{C1 + C2} \cdot \frac{R3}{R1}$$

4. Quality

$$Q = \frac{\sqrt{C1 \cdot C2}}{C1 + C2} \cdot \sqrt{\frac{R3 (R1 + R2)}{R1 \cdot R2}}$$

5. Recommended components

- C1 and C2: 5% MKC (metallized polycarbonate film capacitor)
- R1, R2 and R3: 2% MR (metal film resistor)

or:

- C1 and C2: 5% MKT (metallized polyester film capacitor)
- R1, R2 and R3: 2% CR (carbon film resistor)

## INFRARED RECEIVER

The TDA3047 is for infrared reception with low power consumption.  
The difference between the TDA3047 and TDA3048 is the polarity of the output signal.

### Features

- H.F. amplifier with a control range of 66 dB
- Synchronous demodulator and reference amplifier
- A.G.C. detector
- Pulse shaper
- Q-factor killing of the input selectivity, which is controlled by the a.g.c. circuit
- Input voltage limiter

### QUICK REFERENCE DATA

Supply voltage (pin 8)	$V_{P} = V_{8-16}$	typ.	5 V
Supply current (pin 8)	$I_{P} = I_{8}$	typ.	2,1 mA
Input signal (peak-to-peak value) (100% AM; $f = 36$ kHz)	$V_{2-15(p-p)}$		0,03 to 200 mV
Output signal (peak-to-peak value)	$V_{9-16(p-p)}$	typ.	4,5 V

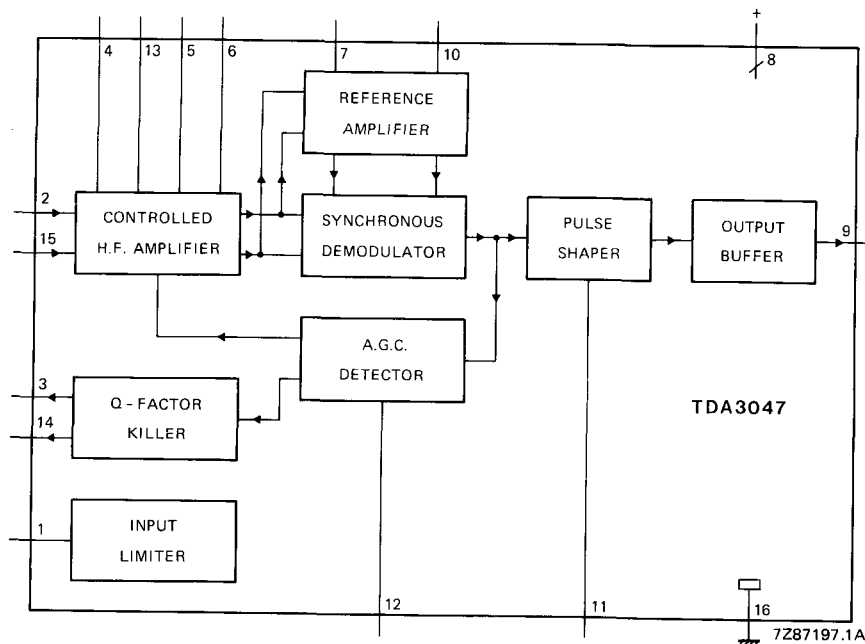

Fig. 1 Block diagram of TDA3047.

### PACKAGE OUTLINES

TDA3047P: 16-lead DIL; plastic (SOT38).

TDA3047T: 16-lead mini-pack; plastic (SO16L; SOT162A).

## FUNCTIONAL DESCRIPTION

### General

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of  $> 75 \mu\text{A}$  with a voltage swing of 4.5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of  $> 600 \text{ mV}$  by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

### Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

### Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

### Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is  $25 \mu\text{A}$  peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

### A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

### Pulse-shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse-shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

### Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *high*.

### Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

**Input limiter**

In the narrow-band application high voltage peaks can occur on the input of the selectivity circuit. The input limiter limits these voltage peaks to approximately 0,7 V. Limiting is 0,9 V max. at  $I_1 = 3 \text{ mA}$ .

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 8)	$V_p = V_{8-16}$	max.	13,2 V
Output current pulse shaper (pin 11)	$I_{11}$	max.	10 mA
<i>Voltages between pins*</i>			
pins 2 and 15	$V_{2-15}$	max.	4,5 V
pins 4 and 13	$V_{4-13}$	max.	4,5 V
pins 5 and 6	$V_{5-6}$	max.	4,5 V
pins 7 and 10	$V_{7-10}$	max.	4,5 V
pins 9 and 11	$V_{9-11}$	max.	4,5 V
Storage temperature range	$T_{stg}$	-65 to + 150 °C	
Operating ambient temperature range	$T_{amb}$	-25 to + 125 °C	

\* All pins except pin 11 are short-circuit protected.

## CHARACTERISTICS

$V_P = V_{8-16} = 5 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in Fig. 4; unless otherwise specified

parameter	symbol	min.	typ.	max.	unit
<b>Supply (pin 8)</b>

## FUNCTIONAL DESCRIPTION

### General

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of  $> 75 \mu\text{A}$  with a voltage swing of 4,5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of  $> 600 \text{ mV}$  by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

### Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

### Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

### Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is  $25 \mu\text{A}$  peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

### A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

### Pulse-shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse-shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

### Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *low*.

### Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

**Input limiter**

In the narrow-band application high voltage peaks can occur on the input of the selectivity circuit. The input limiter limits these voltage peaks to approximately 0,7 V. Limiting is 0,9 V max. at  $I_1 = 3 \text{ mA}$ .

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 8)	$V_P = V_{8-16}$	max.	13,2 V
Output current pulse shaper (pin 11)	$I_{11}$	max.	10 mA
Voltages between pins*			
pins 2 and 15	$V_{2-15}$	max.	4,5 V
pins 4 and 13	$V_{4-13}$	max.	4,5 V
pins 5 and 6	$V_{5-6}$	max.	4,5 V
pins 7 and 10	$V_{7-10}$	max.	4,5 V
pins 9 and 11	$V_{9-11}$	max.	4,5 V
Storage temperature range	$T_{stg}$		-65 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-25 to + 125 °C

\* All pins except pin 11 are short-circuit protected.

## CHARACTERISTICS

$V_P = V_{8-16} = 5 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; measured in Fig. 4; unless otherwise specified

parameter	symbol	min.	typ.	max.	unit
<b>Supply (pin 8)</b>					
Supply voltage	$V_P = V_{8-16}$	4,65	5,0	5,35	V
Supply current	$I_P = I_8$	1,2	2,1	3,0	mA
<b>Controlled h.f. amplifier (pins 2 and 15)</b>					
Minimum input signal (peak-to-peak value) at $f = 36 \text{ kHz}$ (note 1)	$V_{2-15(p-p)}$	—	15	25	$\mu\text{V}$
at $f = 36 \text{ kHz}$ (note 2)	$V_{2-15(p-p)}$	—	—	5	$\mu\text{V}$
A.G.C. control range (without Q-killing)		60	66	—	dB
Input signal for correct operation (peak-to-peak value; note 3)	$V_{2-15(p-p)}$	0,03	—	200	mV
Q-killing inactive ( $I_3 = I_{14} < 0,5 \mu\text{A}$ ) (peak-to-peak value)	$V_{2-15(p-p)}$	—	—	140	$\mu\text{V}$
Q-killing active ( $I_{14} = I_3 = \text{max.}$ ) (peak-to-peak value)	$V_{2-15(p-p)}$	28	—	—	mV
Q-killing range		see Fig. 2			
<b>Inputs</b>					
Input voltage (pin 2)	$V_{2-16}$	2,25	2,45	2,65	V
Input voltage (pin 15)	$V_{15-16}$	2,25	2,45	2,65	V
Input resistance (pin 2)	$R_{2-15}$	10	15	20	$\text{k}\Omega$
Input capacitance (pin 2)	$C_{2-15}$	—	3	—	pF
Input limiting (pin 1) at $I_1 = 3 \text{ mA}$	$V_{1-16}$	—	0,8	0,9	V
<b>Outputs</b>					
Output voltage <i>high</i> (pin 9) at $-I_9 = 75 \mu\text{A}$	$-V_{9-8}$	—	0,1	0,5	V
Output voltage <i>low</i> (pin 9) at $I_9 = 75 \mu\text{A}$	$V_{9-16}$	—	0,1	0,5	V
Output current; output voltage <i>low</i> $-V_{9-8} = 4,5 \text{ V}$	$I_9$	75	120	—	$\mu\text{A}$
$-V_{9-8} = 3,0 \text{ V}$	$I_9$	75	130	—	$\mu\text{A}$
$-V_{9-8} = 1,0 \text{ V}$	$I_9$	75	140	—	$\mu\text{A}$
Output current; output voltage <i>high</i> $-V_{9-8} = 0,5 \text{ V}$	$-I_9$	75	120	—	$\mu\text{A}$
Output resistance between pins 7 and 10	$R_{7-10}$	3,1	4,7	6,2	$\text{k}\Omega$

## Notes

1. Voltage pin 9 is *low*;  $I_9 = 75 \mu\text{A}$ .
2. Voltage pin 9 remains *high*.
3. Undistorted output pulse with 100% AM input.

parameter	symbol	min.	typ.	max.	unit
<b>Pulse shaper (pin 11)</b>					
Trigger level in positive direction (voltage pin 9 changes from <i>high</i> to <i>low</i> )	$V_{11-16}$	3,75	3,9	4,05	V
Trigger level in negative direction (voltage pin 9 changes from <i>low</i> to <i>high</i> )	$V_{11-16}$	3,4	3,55	3,7	V
Hysteresis of trigger levels	$\Delta V_{11-16}$	0,25	0,35	0,45	V
<b>A.G.C. detector (pin 12)</b>					
A.G.C. capacitor charge current	$-I_{12}$	3,4	5,0	6,6	$\mu A$
A.G.C. capacitor discharge current	$I_{12}$	67	100	133	$\mu A$
<b>Q-factor killer (pins 3 and 14)</b>					
Output current (pin 3) at $V_{12-16} = 2$ V	$-I_3$	2,5	7,5	20	$\mu A$
Output current (pin 14) at $V_{12-16} = 2$ V	$-I_{14}$	2,5	7,5	20	$\mu A$

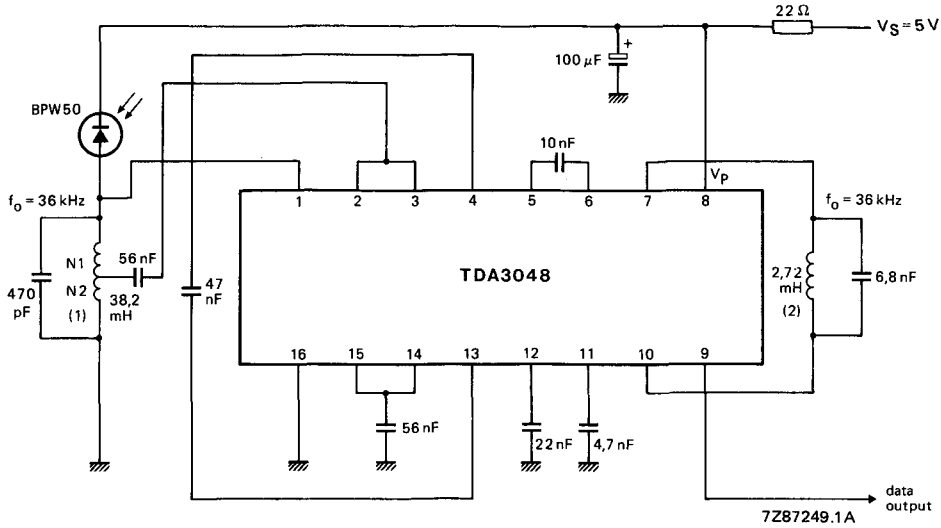

Fig. 2 Typical Q-factor killer current (pins 3 and 14) as a function of the peak-to-peak input voltage ( $V_{2-15}$ );  $I_{3, 14}$  is measured to ground,  $V_{2-15(p-p)}$  is a symmetrical square wave. Measured in Fig. 4;  $V_p = 5$  V.

APPLICATION INFORMATION

- (1) N1 = 3,21
- N2 = 1
- Q = 16

- (2) Q = 6

Fig. 3 Narrow-band receiver using TDA3048.

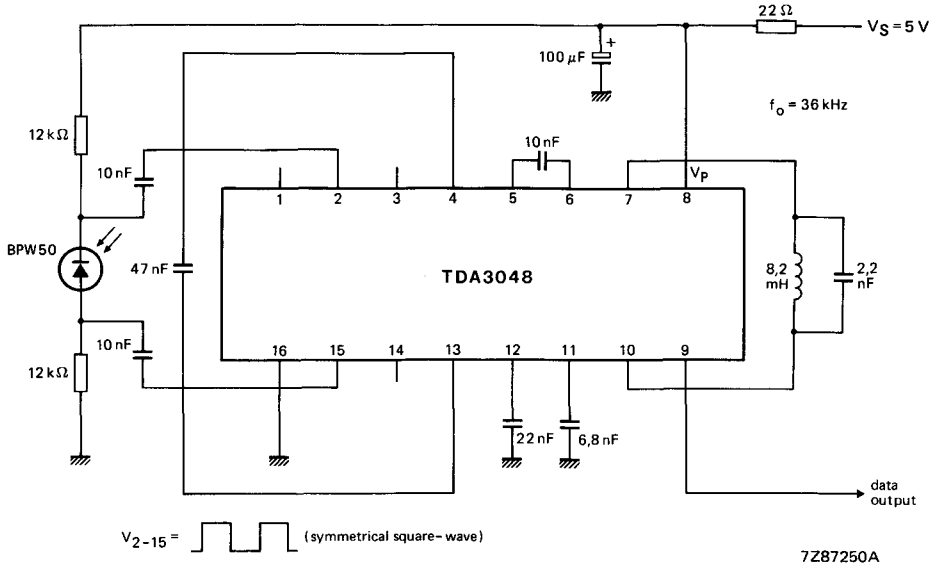

Fig. 4 Wide-band receiver with TDA3048.

For better sensitivity both 12 kΩ resistors may have a higher value.

## VIDEO CONTROL COMBINATION

The TDA3501 is a monolithic integrated circuit performing the control functions in a PAL/SECAM decoder which additionally comprises the integrated circuits TDA3510 (PAL decoder) and/or TDA3520 (SECAM decoder).

The required input signals are: luminance and colour difference  $-(R-Y)$  and  $-(B-Y)$ , while linear RGB signals can be inserted from an external source.

RGB signals are provided at the output to drive the video output stages.

The TDA3501 has the following features:

- capacitive coupling of the input signals
- linear saturation control
- (G-Y) and RGB matrix
- insertion possibility of linear RGB signals, e.g. video text, video games, picture-in-picture, camera or slide-scanner
- equal black level for inserted and matrixed signals by clamping
- 3 identical channels for the RGB signals
- linear contrast and brightness control, operating on both the inserted and matrixed RGB signals
- horizontal and vertical blanking (black and ultra-black respectively) and black-level clamping obtained via a 3-level sandcastle pulse
- differential amplifiers with feedback-inputs for stabilization of the RGB output stages
- 2 d.c. gain controls for the green and blue output signals (white point adjustment)
- beam current limiting possibility

### QUICK REFERENCE DATA

Supply voltage	V <sub>6-24</sub>	typ.	12 V
Supply current	I <sub>6</sub>	typ.	100 mA
Luminance input signal (peak-to-peak value)	V <sub>15-24(p-p)</sub>	typ.	0,45 V

 $d_{2,5,27-15}$ 

&lt; 3 dB

Voltage gain between colour difference  
inputs (pins 17 and 18) and feedback  
inputs (pin 5 and 27) $G_{5-18} = G_{27-17}$ 

typ. 0 dB

Frequency response (0 to 2 MHz)

 $d_{5-18} = d_{27-17}$ 

&lt; 3 dB

Voltage gain between signal display inputs  
(pins 12,13,14) and feedback inputs  
(pins 2,5,27) $G_{2-13} = G_{5-12} = G_{27-14}$ 

typ. 0 dB

Frequency response (0 to 5 MHz)

 $d_{2-13} = d_{5-12} = d_{27-14}$ 

&lt; 3 dB

\* Brightness, contrast and saturation control in nominal position.

\*\* With input pins 21 and 22 not connected an internal bias voltage of 6 V is supplied.

**CHARACTERISTICS** (continued)**Sandcastle detector**

There are 3 internal thresholds (proportional to  $V_p$ )  
the following amplitudes are required for  
separating the various pulses:

horizontal and vertical blanking pulses (note 1)	$V_{10-24}$	>	2 V
		<	3 V
horizontal pulse (note 2)	$V_{10-24}$	>	4 V
		<	5 V
clamping pulse (note 3)	$V_{10-24}$	>	7,5 V
d.c. voltage for artificial black level (note 4) (scan and flyback)	$V_{10-24}$	>	7,5 V
no keying	$V_{10-24}$	<	1 V
Input current	-I <sub>10</sub>	<	100 $\mu$ A

**Notes**

1. Blanking to ultra-black (-20%).
2. Insertion of artificial black level.
3. Pulse duration > 3,5  $\mu$ s.
4. This function will also be obtained by leaving pin 10 open.

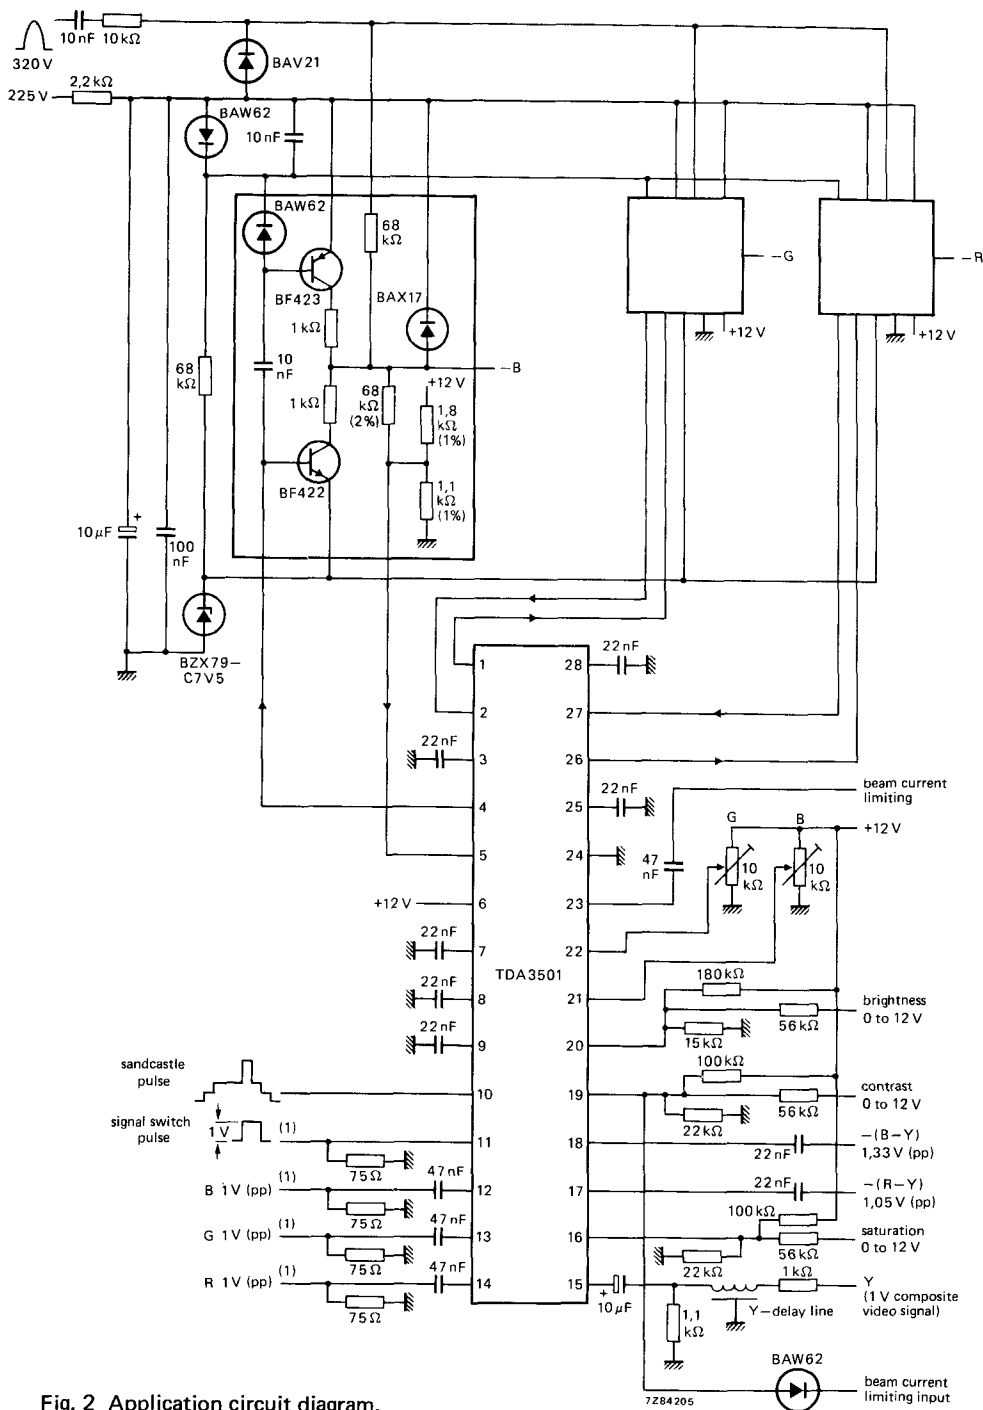

Fig. 2 Application circuit diagram.

## VIDEO CONTROL COMBINATION CIRCUIT WITH AUTOMATIC CUT-OFF CONTROL

### GENERAL DESCRIPTION

The TDA3505 and TDA3506 are monolithic integrated circuits which perform video control functions in a PAL/SECAM decoder. The TDA3505 is for negative colour difference signals  $-(R-Y)$ ,  $-(B-Y)$  and the TDA3506 is for positive colour difference signals  $+(R-Y)$ ,  $+(B-Y)$ .

The required input signals are: luminance and colour difference (negative or positive) and a 3-level sandcastle pulse for control purposes. Linear RGB signals can be inserted from an external source. RGB output signals are available for driving the video output stages. The circuits provide automatic cut-off control of the picture tube.

### Features

- Capacitive coupling of the colour difference and luminance input signals with black level clamping in the input stages
- Linear saturation control acting on the colour difference signals
- (G-Y) and RGB matrix
- Linear transmission of inserted signals
- Equal black levels for inserted and matrixed signals
- 3 identical channels for the RGB signals
- Linear contrast and brightness controls, operating on both the inserted and matrixed RGB signals
- Peak beam current limiting input
- Clamping, horizontal and vertical blanking of the three input signals controlled by a 3-level sandcastle pulse
- 3 DC gain controls for the RGB output signals (white point adjustment)
- Emitter-follower outputs for driving the RGB output stages
- Input for automatic cut-off control with compensation for leakage current of the picture tube

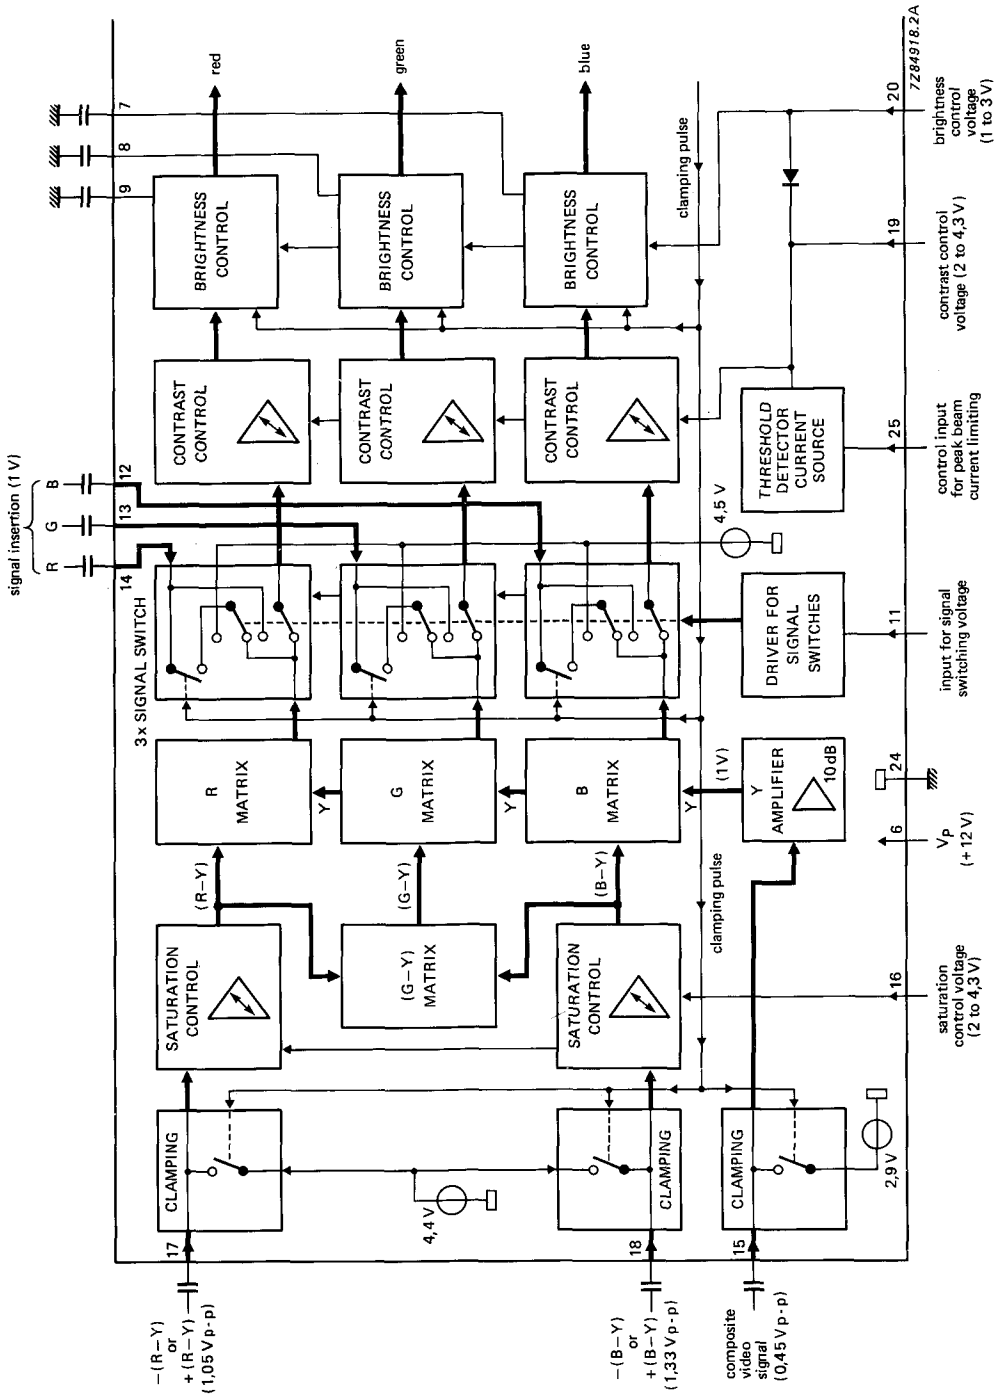

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
<b>Sandcastle pulse detector</b> (pin 10)	note 7					
Levels for separating the following pulses:						
horizontal and vertical blanking pulses	note 8	V <sub>10</sub>	1,0	1,5	2,0	V
required pulses (H+V)		V <sub>10</sub>	2,1	2,5	2,9	V
horizontal pulses		V <sub>10</sub>	3,0	3,5	4,0	V
required pulses (H)		V <sub>10</sub>	4,1	4,5	5,0	V
clamping pulses	note 9	V <sub>10</sub>	6,5	7,0	7,5	V
required pulses		V <sub>10</sub>	7,6	—	12,0	V
no keying		V <sub>10</sub>	—	—	1,0	V
Input current		-I <sub>10</sub>	—	—	110	μA

**Notes to the characteristics**

- Values are proportional to the supply voltage.
- When  $V_{11-24} < 0,4$  V during clamping time - the black levels of the inserted RGB signals are clamped on the black levels of the internal RGB signals.  
When  $V_{11-24} > 0,9$  V during clamping time - the black levels of the inserted RGB signals are clamped on an internal DC voltage (correct clamping of the external RGB signals is possible only when they are synchronous with the sandcastle pulse).
- When pins 21, 22 and 23 are not connected, an internal bias voltage of 5,5 V is supplied.
- Automatic cut-off control measurement occurs in the following lines after start of the vertical blanking pulse:
  - line 20: measurement of leakage current (R + G + B)
  - line 21: measurement of red cut-off current
  - line 22: measurement of green cut-off current
  - line 23: measurement of blue cut-off current
- Black level of the measured channel is nominal; the other two channels are blanked to ultra-black.
- All three channels blanked to ultra-black.  
The cut-off control cycle occurs when the vertical blanking part of the sandcastle pulse contains more than 3 line pulses.  
The internal blanking continues until the end of the last measured line.  
The vertical blanking pulse is not allowed to contain more than 34 line pulses, otherwise another control cycle begins.
- The sandcastle pulse is compared with three internal thresholds (proportional to  $V_p$ ) and the given levels separate the various pulses.
- Blanked to ultra-black (-25%).
- Pulse duration  $\geq 3,5$  μs.

# TDA3505 TDA3506

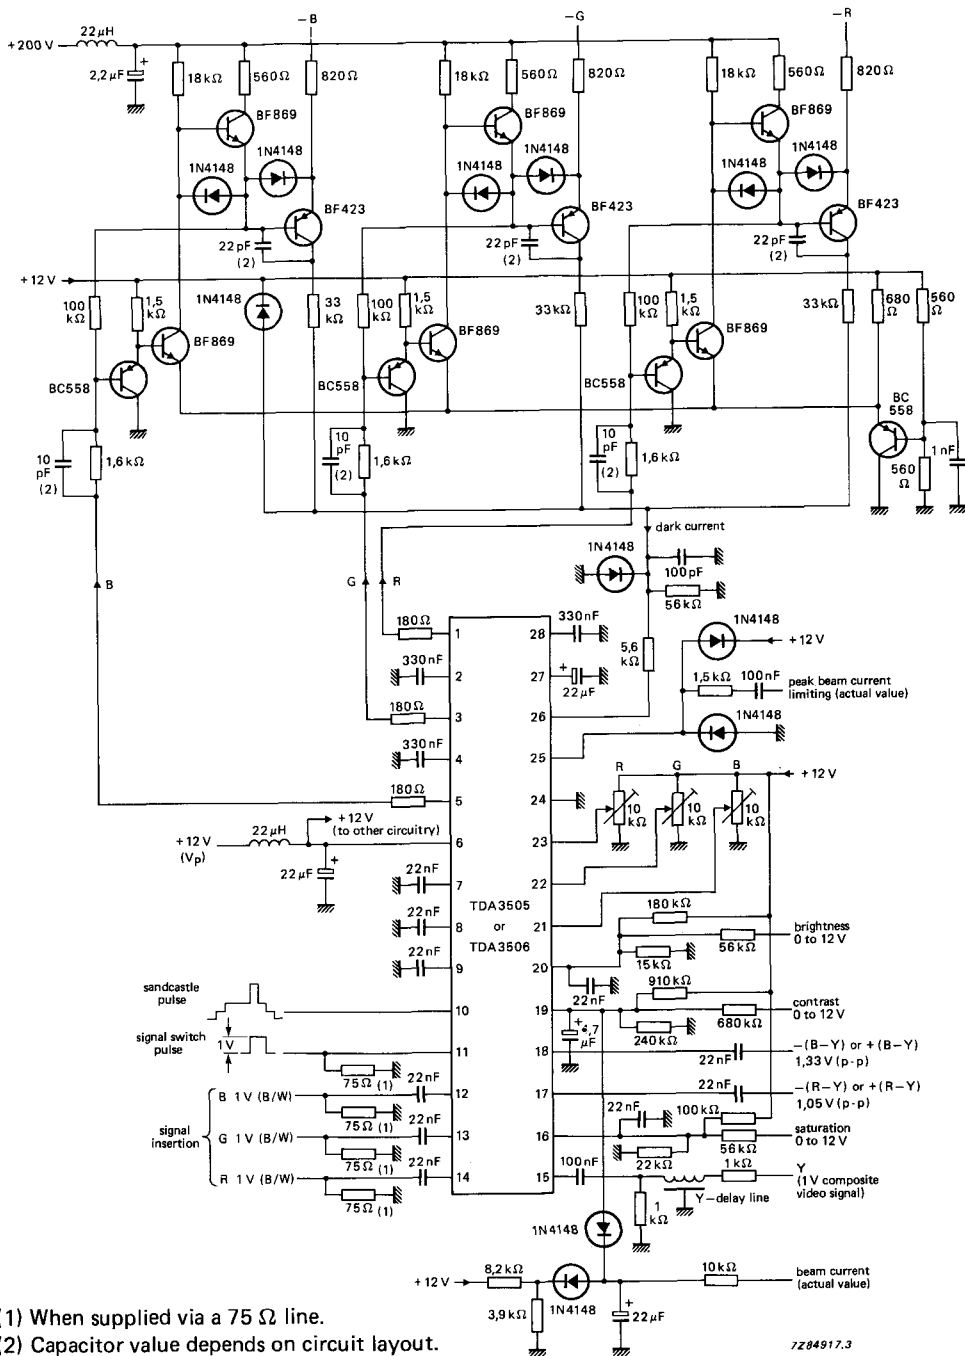

Fig. 2 Typical application circuit diagram using TDA3505 or TDA3506; colour difference inputs are negative for TDA3505 or positive for TDA3506.

## VIDEO CONTROL COMBINATION CIRCUIT WITH AUTOMATIC CUT-OFF CONTROL

### GENERAL DESCRIPTION

The TDA3507 is a monolithic integrated circuit which performs video control functions in a PAL/SECAM decoder.

The required input signals are: luminance and negative colour difference  $-(R-Y)$  and  $-(B-Y)$ , and a 3-level sandcastle pulse for control purposes. Linear RGB signals can be inserted from an external source. RGB output signals are available for driving the video output stages. This circuit provides automatic cut-off control of the picture tube.

The TDA3507 is the same as the TDA3505 but with RGB channel bandwidths of (typical) 16 MHz and an automatic cut-off cycle that ends in line 15.

### Features

- Capacitive coupling of the colour difference and luminance input signals with black level clamping in the input stages
- Linear saturation control acting on the colour difference signals
- $(G-Y)$  and RGB matrix
- Linear transmission of inserted signals
- Equal black levels for inserted and matrixed signals
- 3 identical channels for the RGB signals
- Linear contrast and brightness controls, operating on both the inserted and matrixed RGB signals
- Peak beam current limiting input
- Clamping, horizontal and vertical blanking of the three input signals controlled by a 3-level sandcastle pulse
- 3 DC gain controls for the RGB output signals (white point adjustment)
- Emitter-follower outputs for driving the RGB output stages
- Input for automatic cut-off control with compensation for leakage current of the picture tube

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

no keying		$V_{10}$	-	-	1,0	V
Input current		$-I_{10}$	-	-	110	$\mu A$

## Notes to the characteristics

- Values are proportional to the supply voltage.
- When  $V_{11-24} < 0,4$  V during clamping time – the black levels of the inserted RGB signals are clamped on the black levels of the internal RGB signals.  
When  $V_{11-24} > 0,9$  V during clamping time – the black levels of the inserted RGB signals are clamped on an internal DC voltage (correct clamping of the external RGB signals is possible only when they are synchronous with the sandcastle pulse).
- When pins 21, 22 and 23 are not connected, an internal bias voltage of 5,5 V is supplied.
- Automatic cut-off control measurement occurs in the following lines after start of the vertical blanking pulse:
  - line 12: measurement of leakage current (R + G + B)
  - line 13: measurement of red cut-off current
  - line 14: measurement of green cut-off current
  - line 15: measurement of blue cut-off current
- Black level of the measured channel is nominal; the other two channels are blanked to ultra-black.
- All three channels blanked to ultra-black.  
The cut-off control cycle occurs when the vertical blanking part of the sandcastle pulse contains more than 3 line pulses.  
The internal blanking continues until the end of the last measured line.  
The vertical blanking pulse is not allowed to contain more than 34 line pulses, otherwise another control cycle begins.

7. The sandcastle pulse is compared with three internal thresholds (proportional to  $V_p$ ) and the given levels separate the various pulses.
8. Blanked to ultra-black ( $-25\%$ ).
9. Pulse duration  $\geq 3,5 \mu s$ .

DEVELOPMENT DATA

## PAL DECODER

The TDA3510 is a monolithic integrated colour decoder for the PAL standard. The circuit incorporates the following functions:

### Chrominance part

- Controlled chrominance amplifier
- Chrominance output stage with automatic standard switch for driving the 64  $\mu$ s delay line
- Blanking circuit for the colour burst signal

### Reference voltage and control voltage part

- 8,8 MHz reference oscillator with divider stage to obtain both the 4,4 MHz reference signals
- Gated phase comparison for an optimum noise ratio
- Circuit for obtaining the chrominance control voltage and a reference voltage
- Circuit for generating the colour killer signal and the identification signal

### Demodulator part

- Two synchronous demodulators for the (B-Y) and (R-Y) signals
- PAL flip-flop and PAL switch
- Flyback blanking incorporated in the synchronous demodulators
- (R-Y) and (B-Y) signal output stages, which are controlled by the colour killer with switchable d.c. voltage levels

Chrominance input signal (peak-to-peak value)	$V_{1-24(p-p)}$		10 to 200 mV
Sandcastle pulse			
burst gating level	$V_{20-24}$	>	7,5 V
blanking level	$V_{20-24}$	>	1,8 V
Colour difference output signals			
peak-to-peak values			
-(R-Y) signal	$V_{11-24(p-p)}$	typ.	1,05 V $\pm$ 3 dB
-(B-Y) signal	$V_{10-24(p-p)}$	typ.	1,33 V $\pm$ 3 dB

### PACKAGE OUTLINE

24-lead DIL; plastic (SOT101A).

7284202

Fig. 1 Block diagram; for external capacitors see next page.

External capacitors in Fig. 1

capacitor	pins	
C1	22 - 24	filter capacitor for control voltage
C2	17 - 24	time constant for control voltage
C3	19 - 24	time constant for colour ON
C4	16 - 24	identification signal and colour OFF time constant
C5	18 - 24	load capacitor for the reference voltage
C6	8 - 24	time constant for the rise or fall time of the d.c. voltage level of the colour difference signal

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range	$V_P = V_{9-24}$	10,8 to 13,2 V
Currents		
at pin 5	$-I_5$	max. 10 mA
at pins 10 and 11	$-I_{10}, -I_{11}$	max. 1 mA
at pin 21	$I_{21}$	max. 10 mA
Total power dissipation	$P_{tot}$	max. 1,1 W
Storage temperature	$T_{stg}$	-20 to + 125 °C
Operating ambient temperature	$T_{amb}$	0 to + 70 °C

**CHARACTERISTICS** $V_P = 12 \text{ V}; T_{amb} = 25 \text{ °C}$ 

Supply current	$I_g$	typ. 58 mA
----------------	-------	------------

**Chrominance part**

Chrominance signal is asymmetric (pins 1, 2)

Input voltage range (peak-to-peak value)	$V_{1-24(p-p)}$	10 to 200 mV
--	-----------------	--------------

Nominal input voltage (peak-to-peak value) with 75% colour bar signal	$V_{1-24(p-p)}$	typ. 100 mV
--	-----------------	-------------

Input impedance	$ Z_i $	typ. 3,3 kΩ
-----------------	---------	-------------

**Colour ON**chrominance output voltage (peak-to-peak value)  
with 75% colour bar signal

$V_{5-24(p-p)}$	typ.	2 V
-----------------	------	-----

d.c. voltage at chrominance output

$V_{5-24}$	typ.	8 V
------------	------	-----

**Colour OFF**

chrominance suppression

>	56 dB
---	-------

d.c. voltage at chrominance output

$V_{5-24}$	typ.	4 V
------------	------	-----

**CHARACTERISTICS** (continued)**Reference voltage and control voltage part**

## Oscillator (8,8 MHz)

Gain	G <sub>14-15</sub>	>	8 dB
Input resistance	R <sub>15-24</sub>	typ.	270 Ω
Output resistance	R <sub>14-24</sub>	<	200 Ω
Catching range	Δf	typ.	500 Hz

## Sandcastle pulse (pin 20)

Burst gating level	V <sub>20-24</sub>	>	7,5 V
Blanking level	V <sub>20-24</sub>	>	1,8 V

## Colour switching voltage (open collector)

Maximum output current	I <sub>21max</sub>	typ.	10 mA
Colour ON	V <sub>21-24</sub>	typ.	V <sub>P</sub>
Colour OFF	V <sub>21-24</sub>	<	0,5 V
Reference output voltage	V <sub>18-24</sub>	typ.	5,5 V

## Colour killer voltages

colour OFF at	V <sub>18-16</sub>	typ.	0 V
or at	V <sub>19-24</sub>	>	6 V
colour ON at	V <sub>18-16</sub>	typ.	1,5 V
or at	V <sub>19-24</sub>	<	4 V

## Colour unkill delay; depends on C3

t <sub>d</sub>	typ.	20 ms/μF
----------------	------	----------

## Identification ON

V <sub>16-18</sub>	<	200 mV
--------------------	---	--------

**Demodulator part**Delayed chrominance input signal (peak-to-peak value)  
with 75% colour bar signal

V <sub>7-24(p-p)</sub>	typ.	250 mV
------------------------	------	--------

## Colour difference output signals (peak-to-peak values)

-(R-Y) signal	V <sub>11-24(p-p)</sub>	typ.	1,05 V ± 3 dB
-(B-Y) signal	V <sub>10-24(p-p)</sub>	typ.	1,33 V ± 3 dB

Ratio of colour difference output signals  
(R-Y)/(B-Y)

$\frac{V_{11-24}}{V_{10-24}}$	typ.	0,79 ± 10 %
-------------------------------	------	-------------

## D.C. voltage at colour difference outputs

at colour ON	V <sub>10; 11-24</sub>	typ.	8 V
at colour OFF	V <sub>10; 11-24</sub>	typ.	4 V

## Signal attenuation at colour OFF

>	60 dB

## Residual 4,4 MHz signal

V <sub>10; 11-24</sub>	<	20 mV
------------------------	---	-------

H/2 ripple at (R-Y) output (peak-to-peak value)  
without input signal

V <sub>11-24(p-p)</sub>	<	10 mV
-------------------------	---	-------

## PAL DECODER

The TDA3561A is a decoder for the PAL colour television standard. It combines all functions required for the identification and demodulation of PAL signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 5 V peak-to-peak (picture information) enabling direct drive of the discrete output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. Teletext/broadcast antiope), channel number display, etc. Additional to the TDA3560, the circuit includes the following features:

- The peak white limiter is only active during the time that the 9,3 V level at the output is exceeded. The start of the limiting function is delayed by one line period. This avoids peak white limiting by test patterns which have abrupt transitions from colour to white signals.
- The brightness control is obtained by inserting a variable pulse in the luminance channel. Therefore the ratio of brightness variation and signal amplitude at the three outputs will be identical and independent of the difference in gain of the three channels. Thus discolouring due to adjustment of contrast and brightness is avoided.
- Improved suppression of the internal RGB signals when the device is switched to external signals, and vice versa.
- Non-synchronized external RGB signals do not disturb the black level of the internal signals.
- Improved suppression of the residual 4,4 MHz signal in the RGB output stages.
- Cascoded stages in the demodulators and burst phase detector minimize the radiation of the colour demodulator inputs.
- High current capability of the RGB outputs and the chrominance output.

### QUICK REFERENCE DATA

Supply voltage	V <sub>1-27</sub>	typ.	12 V
Supply current	I <sub>1</sub>	typ.	85 mA
Luminance input signal (peak-to-peak value)	V <sub>10-27(p-p)</sub>	typ.	0,45 V
Chrominance input signal (peak-to-peak value)	V <sub>3-27(p-p)</sub>		55 to 1100 mV
Data input signals (peak-to-peak value)	V <sub>13,15,17-27(p-p)</sub>	typ.	1 V
RGB output signals at nominal contrast and saturation (peak-to-peak value)	V <sub>12,14,16-27(p-p)</sub>	typ.	5,25 V
Contrast control range		typ.	20 dB
Saturation control range		min.	50 dB
Input voltage for data insertion	V <sub>9-27</sub>	min.	0,9 V
Blanking input voltage	V <sub>8-27</sub>	typ.	1,5 V
Burst gating and black-level gating input voltage	V <sub>8-27</sub>	typ.	7 V

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

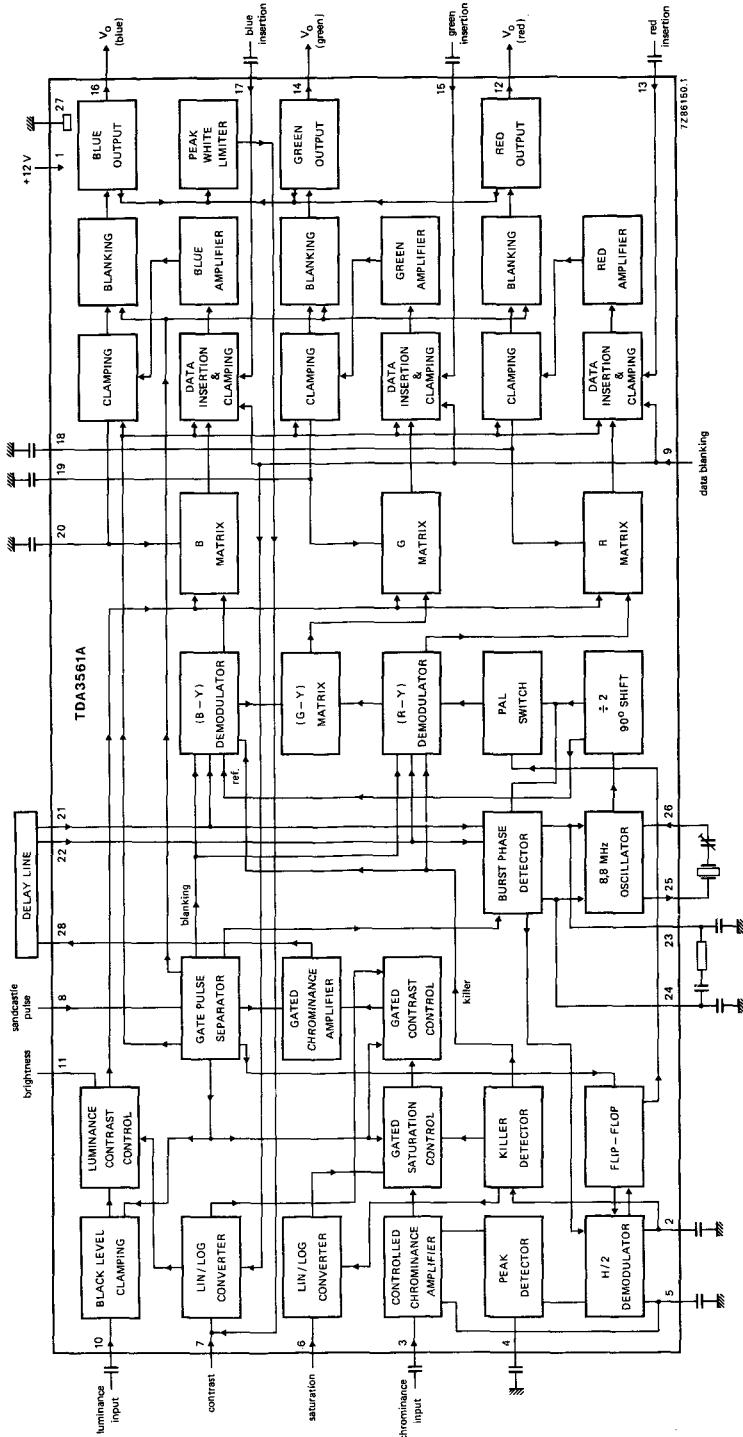

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P = V_{1-27}$	max.	13,2 V
Total power dissipation; see also Fig. 2	$P_{tot}$	max.	1,7 W
Storage temperature range	$T_{stg}$		-25 to + 150 °C
Operating ambient temperature range	$T_{amb}$		-25 to + 65 °C

**THERMAL RESISTANCE**

From junction to ambient	$R_{thj-a}$	=	50 K/W
--------------------------	-------------	---	--------

**CHARACTERISTICS** $V_P = V_{1-27} = 12 V$ ;  $T_{amb} = 25 °C$ ; unless otherwise specified

Supply voltage	$V_P = V_{1-27}$	typ.	12 V
			8 to 13,2 V
Supply current		typ.	85 mA
		<	115 mA
Total power dissipation	$P_{tot}$	typ.	1,0 W
		<	1,4 W
<b>Luminance input (pin 10)</b>			
Input voltage (peak-to-peak value); note 1	$V_{10-27(p-p)}$	typ.	0,45 V
Input level before clipping	$V_{10-27}$	<	2 V
Input current; input level 2 V, clamp not active	$I_{10}$	typ.	0,15 $\mu A$
		<	1 $\mu A$
Contrast control range (see Fig. 3)			-17 to + 3 dB
Control voltage for 40 dB attenuation	$V_{7-27}$	typ.	1,2 V
Input current contrast control at $V_{7-27} = 3 V$	$I_7$	<	10 $\mu A$

**Chrominance amplifier**

Input voltage (peak-to-peak value); note 2	$V_{3-27(p-p)}$	typ.	550 mV
			55 to 1100 mV
Input impedance	$ Z_{3-27} $	typ.	9 k $\Omega$
			6 to 12 k $\Omega$
Input capacitance	$C_{3-27}$	typ.	4 pF
		<	6 pF
A.C.C. control range		>	30 dB
Change of the burst signal at the output over the whole control range		<	1,5 dB
Gain at nominal contrast/saturation pin 3 to pin 28; note 3		>	32 dB
Output signal (peak-to-peak value) at nominal contrast/saturation; burst signal: 0,5 V peak to peak	$V_{28-27(p-p)}$	typ.	1,7 V
Maximum output voltage (peak-to-peak value) $R_L = 2 k\Omega$	$V_{28-27(p-p)}$	typ.	4,0 V

**CHARACTERISTICS** (continued)**Chrominance amplifier** (continued)

Distortion of chrominance amplifier at $V_{28-27(p-p)} = 2\text{ V}$ up to $V_{3-27(p-p)} = 1\text{ V}$	d	typ. <	1,5 % 5 %
Frequency response between 0 and 5 MHz			-2 dB
Saturation control range (see Fig. 4)		>	50 dB
Input current saturation control at $V_{6-27} = 3\text{ V}$	I <sub>6</sub>	<	15 $\mu\text{A}$
Tracking between luminance and chrominance with contrast control over a range of 10 dB		<	2 dB
Cross-coupling between luminance and chrominance amplifier; note 10		<	-46 dB
Signal-to-noise ratio at nominal input signal; note 11	S/N	>	56 dB
Phase shift between burst and chrominance at nominal contrast/saturation	$\Delta\phi$	<	$\pm 5^\circ$
Output impedance of chrominance amplifier	$ Z_{28-27} $	typ.	25 $\Omega$
Maximum output current	I <sub>28</sub>	<	15 mA

**Reference part**

Phase locked loop:		>	500 Hz
- catching range; note 4		typ.	700 Hz
- phase shift; note 5		<	$5^\circ$
Oscillator:			
- temperature coefficient of oscillator frequency; note 4		typ.	-1,5 Hz/K
- frequency deviation for $V_p$ changing from 10 to 13,2 V; note 4		typ.	40 Hz
- input resistance (pin 26)	R <sub>26-27</sub>	typ.	340 $\Omega$
- input capacitance (pin 26)	C <sub>26-27</sub>	<	260 to 420 $\Omega$ 10 pF
- output resistance (pin 25)	R <sub>25-27</sub>	typ.	150 $\Omega$
- output voltage (peak-to-peak value; pin 25)	$V_{25-27(p-p)}$	typ.	100 to 200 $\Omega$ 700 mV
A.C.C. generation:			
- reference voltage (pin 4)	V <sub>4-27</sub>	typ.	4,9 V
- control voltage at nominal input signal (pin 2)	V <sub>2-27</sub>	typ.	5,1 V
- control voltage without chrominance input (pin 2)	V <sub>2-27</sub>	typ.	2,65 V
- colour-off voltage (pin 2)	V <sub>2-27</sub>	typ.	3,15 V
- colour-on voltage (pin 2)	V <sub>2-27</sub>	typ.	3,4 V
- identification-on voltage (pin 2)	V <sub>2-27</sub>	typ.	1,9 V
- change in burst amplitude with supply voltage ( $\pm 10\%$ )			proportional
- change in burst amplitude with temperature		typ.	0,1 %/K
- voltage at pin 5 at nominal input signal	V <sub>5-27</sub>	<	0,25 %/K
		typ.	5 V

**Demodulator part**

Input burst signal amplitude (peak-to-peak value) between pins 21 and 22; note 6	$V_{21-22(p-p)}$	typ.	100 mV
Input impedance between pins 21 and 22	$ Z_{21-22} $	typ.	2 k $\Omega$
Ratio of demodulated signals for equal input signals at pins 21 and 22 (B-Y)/(R-Y)	$\frac{V_{16-27}}{V_{12-27}}$	typ.	1,78 $\pm$ 10%
(G-Y)/(R-Y); no (B-Y) signal	$\frac{V_{14-27}}{V_{12-27}}$	typ.	-0,51 $\pm$ 10%
(G-Y)/(B-Y); no (R-Y) signal	$\frac{V_{14-27}}{V_{16-27}}$	typ.	-0,19 $\pm$ 25%
Frequency response between 0 and 1 MHz			-3 dB
Cross talk between colour demodulated signals		>	40 dB
Phase difference between (R-Y) signal and (R-Y) reference signal		<	5 $^{\circ}$
Phase difference between (R-Y) and (B-Y) reference signals		typ.	90 $^{\circ}$ 85 to 95 $^{\circ}$

**R.G.B. matrix and amplifiers**

Output voltage (peak-to-peak value) at nominal luminance/contrast (black to white); note 3	$V_{12,14,16-27(p-p)}$	typ.	5,4 V 4,5 to 6,3 V
Output voltage (peak-to-peak value) of the RED channel at nominal contrast/saturation and no luminance signal at the input, (R-Y) signal	$V_{12-27(p-p)}$	typ.	5,25 V 3,7 to 6,7 V
Maximum peak white level; note 7		typ.	9,3 V 9,0 to 9,6 V
Maximum output current	$I_{12,14,16}$	<	15 mA
Black level at the output for a brightness control voltage of 2 V	$V_{12,14,16-27}$	typ.	2,6 V
Difference in black level between the three channels at an output level of 3 V; note 8	$\Delta V$	<	200 mV
Black level shift with vision contents		<	40 mV
Brightness control voltage range	see Fig. 5		
Input current brightness control	$I_{11}$	<	50 $\mu$ A
Variation of black level with temperature	$\Delta V$	typ. <	0,35 mV/K 1,0 mV/K
Variation of black level with contrast control	$\Delta V$	typ. <	10 mV 200 mV
Relative spread between the R, G and B output signals		<	10 %
Relative black-level variation between the three channels during variation of contrast and supply voltage		typ. <	0 mV 20 mV

**CHARACTERISTICS** (continued)**RGB matrix and amplifier** (continued)

Differential black-level drift over a temperature range of 40 °C		typ. 0 mV < 20 mV
Blanking level at the RGB outputs		typ. 2,1 V 1,9 to 2,3 V
Difference in blanking level of the three channels		typ. 0 mV
Differential blanking level drift over a temperature range of 40 °C		typ. 0 mV
Tracking of output black level with supply voltage	$\frac{\Delta V_{bl}}{V_{bl}} \times \frac{V_P}{\Delta V_P}$	typ. 1,1
Signal-to-noise ratio of output signals; note 11	S/N	> 62 dB
Residual 4,4 MHz signal at RGB outputs (peak-to-peak value)		typ. 40 mV < 150 mV
Residual 8,8 MHz signal and higher harmonics at the RGB outputs (peak-to-peak value)		typ. 75 mV < 150 mV
Output impedance of RGB outputs	$ Z_{12,14,16-27} $	typ. 50 Ω
Frequency response of total luminance and RGB amplifier circuits for f = 0 to 5 MHz		< -3 dB
<b>Signal insertion</b> (pins 13,15 and 17)		
Input signals (peak-to-peak value) for an RGB output voltage of 5 V peak-to-peak	$V_{13,15,17-27(p-p)}$	typ. 1 V 0,85 to 1,1 V
Difference between the black levels of the RGB signals and the inserted signals at the output; note 9	$\Delta V$	< 260 mV
Output rise time	$t_r$	typ. 40 ns < 80 ns
Differential delay time for the three channels	$t_d$	typ. 0 ns < 40 ns
Input current	$I_{13,15,17}$	< 10 μA
<b>Data blanking</b> (pin 9)		
Input voltage for no data insertion	$V_{9-27}$	< 0,4 V
Input voltage for data insertion	$V_{9-27}$	> 0,9 V
Maximum input voltage	$V_{9-27}$	< 3 V
Delay of data blanking	$t_d$	< 20 ns
Input current	$I_9$	< 35 μA
Input impedance	$ Z_{9-27} $	typ. 10 kΩ
Suppression of the internal RGB signals when $V_{9-27} > 0,9$ V		> 46 dB

**Sandcastle input (pin 8)**

Level at which the RGB blanking is activated	$V_{8-27}$	typ. 1,5 V 1 to 2 V
Level at which burst gating and clamping pulse are separated	$V_{8-27}$	typ. 7,0 V 6,5 to 7,5 V
Delay between black level clamping and burst gating pulse	$t_d$	typ. 0,4 $\mu$ s
Input current for:		
$V_{8-27} = 0$ to 1 V	$-I_g$	< 1 mA
$V_{8-27} = 1$ to 8,5 V	$I_g$	typ. 20 $\mu$ A
$V_{8-27} = 8,5$ to 12 V	$I_g$	< 2 mA

**Notes to the characteristics**

- Signal with the negative-going sync; amplitude includes sync pulse amplitude.
- Indicated is a signal for a colour bar with 75% saturation, so chrominance to burst ratio is 2,2 : 1.
- Nominal contrast is specified as the maximum contrast  $-3$  dB and nominal saturation as the maximum saturation  $-6$  dB.
- All frequency variations are referred to the 4,4 MHz carrier frequency.
- For  $\pm 400$  Hz deviation of the oscillator frequency.
- These signal amplitudes are determined by the a.c.c. circuit of the reference part.
- When this level is exceeded, the amplitude of the output signal is reduced via a discharge of the capacitor at pin 7 (contrast control). The start of the peak white limiting action has a delay of one line period.
- The variation of the black level depends directly on the gain of each channel during brightness control in the three channels. As a consequence, the black levels at the outputs (for output levels above or below 3 V) can have a difference which exceeds 200 mV. Because the amplitude and the black level change with brightness control have a direct relationship, no discolouring can occur, caused by adjustment of contrast and brightness.
- This difference occurs when the source impedance of the data signal inputs is  $150 \Omega$  and the black level clamp pulse duration is 4  $\mu$ s (sandcastle pulse). A lower difference is obtained when the impedance is lower.
- Cross-coupling is measured under the following condition. Input signals nominal, contrast and saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
- The signal-to-noise ratio is specified as peak-to-peak signal with respect to r.m.s. noise.

APPLICATION INFORMATION

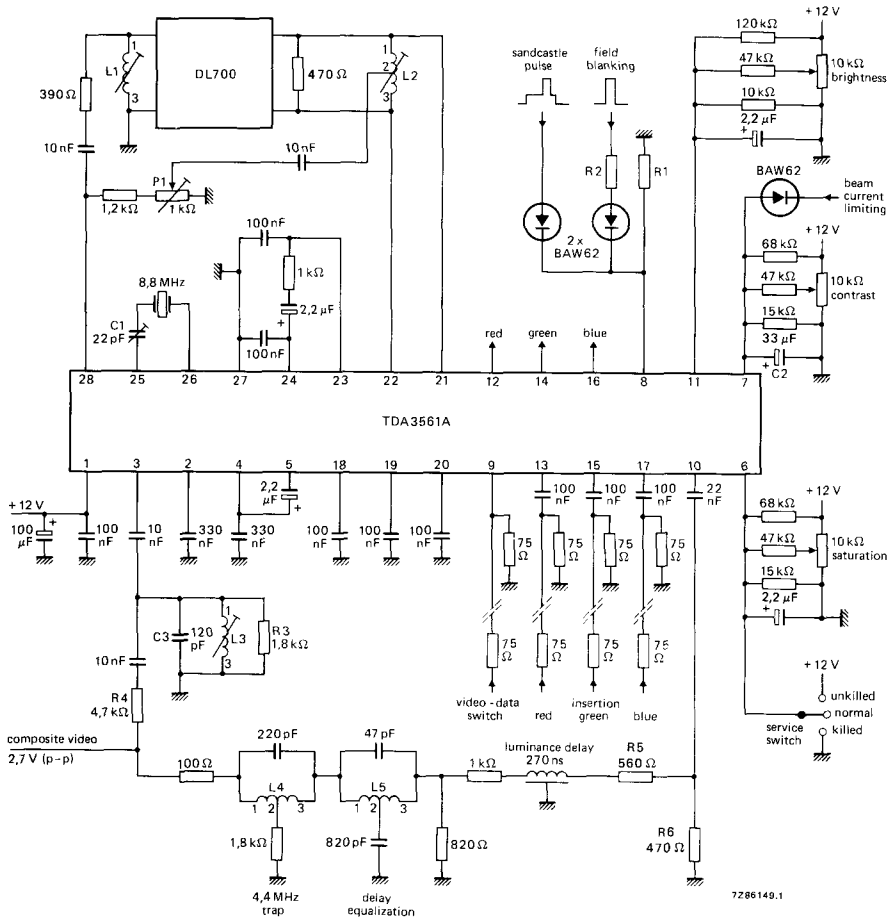

Fig. 6 Application circuit.

Adjustments (see Fig. 6)

- C1 8,8 MHz oscillator
- L1 phase delay line
- L2 nominal value
- L3 4,4 MHz chrominance input filter
- L4 4,4 MHz trap in luminance signal line
- L5 delay equalization
- P1 amplitude of direct chroma signal
- R1 } field blanking  $\frac{R1}{R1 + R2} \times$  field blanking amplitude 2,0 V to 6,5 V.
- R2 }

- = 10,7  $\mu$ H
- = 10,7  $\mu$ H
- = 10,7  $\mu$ H = L1
- = 5,6  $\mu$ H
- = 66,1  $\mu$ H

For a video input voltage of 1 V peak-to-peak: R3 can be omitted; R4 = 1 k $\Omega$ ; R5 must be short-circuited; R6 = 1 k $\Omega$ .

## APPLICATION INFORMATION

The function is described against the corresponding pin number.

### 1. + 12 V power supply

The circuit gives good operation in a supply voltage range between 8 and 13,2 V provided that the supply voltage for the controls is equal to the supply voltage for the TDA3561A. All signal and control levels have a linear dependency on the supply voltage. The current taken by the device at 12 V is typically 85 mA. It is linearly dependent on the supply voltage.

### 2. Control voltage for identification

This pin requires a detection capacitor of about 330 nF for correct operation. The voltages available under various signal conditions are given in the specification.

### 3. Chrominance input

The chroma signal must be a.c.-coupled to the input. Its amplitude must be between 55 mV and 1100 mV peak-to-peak (25 mV to 500 mV peak-to-peak burst signal). All figures for the chroma signals are based on a colour bar signal with 75% saturation, that is the burst-to-chroma ratio of the input signal is 1 : 2,25.

### 4. Reference voltage A.C.C. detector

This pin must be decoupled by a capacitor of about 330 nF. The voltage at this pin is 4,9 V.

### 5. Control voltage A.C.C.

The A.C.C. is obtained by synchronous detection of the burst signal followed by a peak detector. A good noise immunity is obtained in this way and an increase of the colour for weak input signals is prevented. The recommended capacitor value at this pin is 2,2  $\mu$ F.

### 6. Saturation control

The saturation control range is in excess of 50 dB. The control voltage range is 2 to 4 V. Saturation control is a linear function of the control voltage.

When the colour killer is active, the saturation control voltage is reduced to a low level if the resistance of the external saturation control network is sufficiently high. Then the chroma amplifier supplies no signal to the demodulator. Colour switch-on can be delayed by proper choice of the time constant for the saturation control setting circuit.

When the saturation control pin is connected to the power supply the colour killer circuit is overruled so that the colour signal is visible on the screen. In this way it is possible to adjust the oscillator frequency without using a frequency counter (see also pins 25 and 26).

### 7. Contrast control

The contrast control range is 20 dB for a control voltage change from + 2 to + 4 V. Contrast control is a linear function of the control voltage. The output signal is suppressed when the control voltage is 1 V or less. If one or more output signals surpasses the level of 9 V the peak white limiter circuit becomes active and reduces the output signals via the contrast control by discharging C2 via an internal current sink.

### 8. Sandcastle and field blanking input

The output signals are blanked if the amplitude of the input pulse is between 2 and 6,5 V. The burst gate and clamping circuits are activated if the input pulse exceeds a level of 7,5 V.

The higher part of the sandcastle pulse should start just after the sync pulse to prevent clamping of video signal on the sync pulse. The width should be about 4  $\mu$ s for proper A.C.C. operation.

### 9. Video-data switching

The insertion circuit is activated by means of this input by an input pulse between 1 V and 2 V. In that condition, the internal RGB signals are switched off and the inserted signals are supplied to the output amplifiers. If only normal operation is wanted this pin should be connected to the negative supply. The switching times are very short (< 20 ns) to avoid coloured edges of the inserted signals on the screen.

### 10. Luminance signal input

The input signal should have a peak-to-peak amplitude of 0,45 V (peak white to sync) to obtain a black-white output signal of 5 V at nominal contrast. It must be a.c.-coupled to the input by a capacitor of about 22 nF. The signal is clamped at the input to an internal reference voltage. A 1 k $\Omega$  luminance delay line can be applied because the luminance input impedance is made very high. Consequently the charging and discharging currents of the coupling capacitor are very small and do not influence the signal level at the input noticeably. Additionally the coupling capacitor value may be small.

### 11. Brightness control

The black level of the RGB outputs can be set by the voltage on this pin (see Fig. 5). The black level can be set higher than 4 V however the available output signal amplitude is reduced (see pin 7). Brightness control also operates on the black level of the inserted signals.

### 12, 14, 16. RGB outputs

The output circuits for red, green and blue are identical. Output signals are 5,25 V (R, G and B) at nominal input signals and control settings. The black levels of the three outputs have the same value. The blanking level at the outputs is 2,1 V. The peak white level is limited to 9,3 V. When this level exceeded the output signal amplitude is reduced via the contrast control (see pin 7).

### 13, 15, 17. Inputs for external RGB signals

The external signals must be a.c.-coupled to the inputs via a coupling capacitor of about 100 nF. Source impedance should not exceed 150  $\Omega$ . The input signal required for a 5 V peak-to-peak output signal is 1 V peak -to-peak. At the RGB outputs the black level of the inserted signal is identical to that of normal RGB signals. When these inputs are not used the coupling capacitors have to be connected to the negative supply.

### 18, 19, 20. Black level clamp capacitors

The black level clamp capacitors for the three channels are connected to these pins. The value of each capacitor should be about 100 nF.

### 21, 22. Inputs (B-Y) and (R-Y) demodulators

The input signal is automatically fixed to the required level by means of the burst phase detector and A.C.C. generator which are connected to pin 21 and pin 22. As the burst (applied differentially to those pins) is kept constant by the A.C.C., the colour difference signals automatically have the correct value.

**APPLICATION INFORMATION** (continued)**23, 24. Burst phase detector outputs**

At these pins the output of the burst phase detector is filtered and controls the reference oscillator. An adequate catching range is obtained with the time constants given in the application circuit (see Fig. 6).

**25, 26. Reference oscillator**

The frequency of the oscillator is adjusted by the variable capacitor C1. For frequency adjustment interconnect pin 21 and pin 22. The frequency can be measured by connecting a suitable frequency counter to pin 25.

**28. Output of the chroma amplifier**

Both burst and chroma signals are available at the output. The burst-to-chroma ratio at the output is identical to that at the input for nominal control settings. The burst signal is not affected by the controls. The amplitude of the input signal to the demodulator is kept constant by the A.C.C. Therefore the output signal at pin 28 will depend on the signal loss in the delay line.

TDA3565

## PAL DECODER

### GENERAL DESCRIPTION

The TDA3565 PAL decoder contains all the functions required for PAL signal decoding and colour matrixing and is contained within an 18-pin package. The oscillator, a.c.c. detector and burst phase detector each have single-pin outputs and the coupling capacitor for the luminance input at pin 8 doubles as a storage capacitor for the black level clamping circuit. Black level clamping of the three colour channels is performed using feedback proportional to the red channel black level. This feedback (variable with the brightness control) controls the input level of the luminance amplifier and therefore the clamping levels of all three colour signal outputs.

### QUICK REFERENCE DATA

Supply voltage	$V_p = V_{1-17}$	typ.	12 V
Supply current	$I_p = I_1$	typ.	85 mA
Luminance input signal (peak-to-peak value)	$V_{8-17(p-p)}$	typ.	0,45 V
Chrominance input signal (peak-to-peak value)	$V_{3-17(p-p)}$	typ.	550 mV
RGB output signal amplitudes (peak-to-peak value) at nominal luminance and contrast	$V_{10,11,12-17(p-p)}$	typ.	5 V
Contrast control range			-17 to +3 dB
Saturation control range		>	50 dB
A.C.C. control range		>	30 dB
Level at which RGB blanking is activated	$V_{7-17}$	typ.	1,5 V
Level at which burst gate/clamping pulse are separated	$V_{7-17}$	typ.	7 V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 1)	$V_P = V_{1-17}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,7 W
Operating ambient temperature range	$T_{amb}$		-25 to +65 °C
Storage temperature range	$T_{stg}$		-25 to +150 °C

**THERMAL RESISTANCE**

Input current at:					
V7.17 = 0 to 1 V	I7	—	—	-1	mA
V7.17 = 1 to 8,5 V	I7	—	20	40	$\mu$ A
V7.17 = 8,5 to 12 V	I7	—	—	2	mA

**Notes to the characteristics**

1. Signal with negative-going sync pulse, amplitude includes sync pulse amplitude.
2. The signal indicated is for a colour bar with 75% saturation, so the chroma burst ratio of 2,2 : 1.
3. Nominal contrast is defined as (maximum contrast -3 dB) and nominal saturation is (maximum saturation -12 dB).
4. Cross coupling is measured under the following condition; input signals nominal and contrast/saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal signal at that output.
5. The signal-to-noise ratio is specified as peak-to-peak signal with respect to r.m.s. noise.
6. These signal amplitudes are determined by the a.c.c. circuit of the reference part.
7. When this level is exceeded the amplitude of the output signal is reduced via a discharge of the capacitor at pin 6 (contrast control). The discharge current is 5,5 mA.

## PAL/NTSC DECODER

## GENERAL DESCRIPTION

The TDA3566 is a monolithic integrated decoder for the PAL and/or NTSC colour television standards. It combines all functions required for the identification and demodulation of PAL/NTSC signals. Furthermore it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 4 V peak-to-peak (picture information) enabling direct drive of the discrete output stages. The circuit also contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. Teletext/broadcast antiope), channel number display, etc.

## Features

- A black-current stabilizer which controls the black-currents of the three electron-guns to a level low enough to omit the black-level adjustment
- Contrast control of inserted RGB signals
- No black-level disturbance when non-synchronized external RGB signals are available on the inputs
- NTSC capability with hue control

## QUICK REFERENCE DATA

## PACKAGE OUTLINE

28-lead DIL; plastic, with internal heat spreader (SOT117).

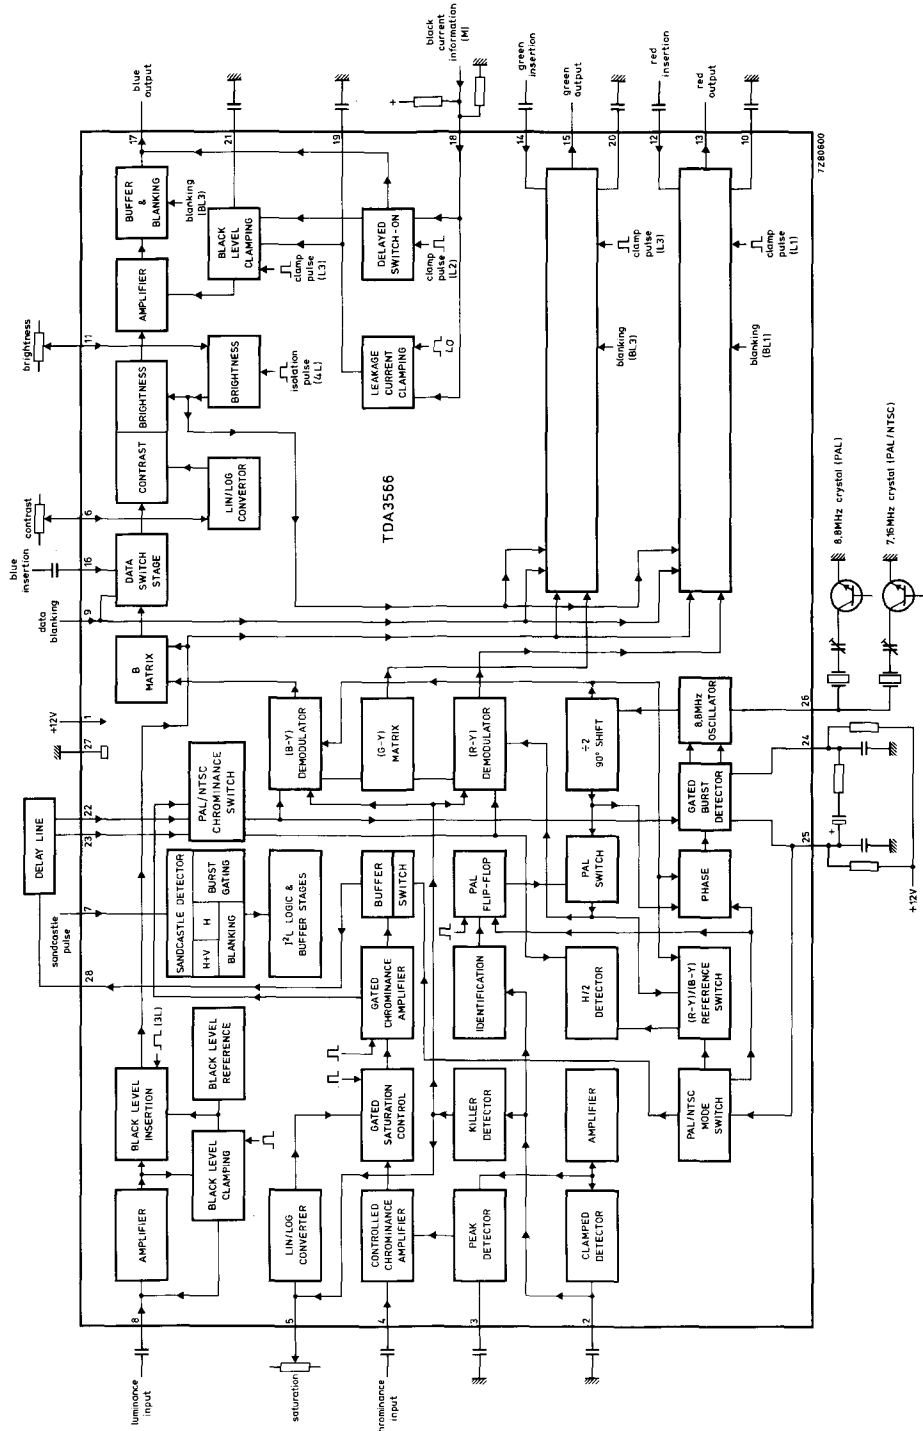

Fig. 1 Block diagram; for explanation of pulse mnemonics see Fig. 6.

## FUNCTIONAL DESCRIPTION

The TDA3566 is a further development of the TDA3562A. It has the same pinning and almost the same application. The differences between the TDA3562A and the TDA3566 are as follows:

- The NTSC-application has largely been simplified. In the case of NTSC the chroma signal is now internally coupled to the demodulators, ACC and phase detectors. The chroma output signal (pin 28) is suppressed in this case. It follows that the external switches and filters which are needed for the TDA3562A are not needed for the TDA3566.

Furthermore there is no difference between the amplitude of the colour output signals in the PAL or NTSC mode. The PAL/NTSC-switch and the hue control of the TDA3566 and the TDA3562A are identical.

- The switch-on and the switch-off behaviour of the TDA3566 has been improved. This has been obtained by suppressing the output signals during the switch-on and switch-off periods.
- The clamp capacitors connected to the pins 10, 20 and 21 can be reduced to 100 nF for the TDA3566. The clamp capacitors also receive a pre-bias voltage to avoid coloured background during switch-on.
- The crystal oscillator circuit has been changed to prevent parasitic oscillations on the third overtone of the crystal. This has the consequence that optimal tuning capacitance must be reduced to 10 pF.

### Luminance amplifier

The luminance amplifier is voltage driven and requires an input signal of 450 mV peak-to-peak (positive video). The luminance delay line must be connected between the i.f. amplifier and the decoder. The input signal is a.c. coupled to the input (pin 8). After amplification, the black level at the output of the preamplifier is clamped to a fixed d.c. level by the black level clamping circuit. During three line periods after vertical blanking, the luminance signal is blanked out and the black level reference voltage is inserted by a switching circuit. This black level reference voltage is controlled via pin 11 (brightness). At the same time the RGB signals are clamped. Noise and residual signals have no influence during clamping thus simple internal clamping circuitry is used.

### Chrominance amplifiers

The chrominance amplifier has an asymmetrical input. The input signal must be a.c. coupled (pin 4) and have a minimum amplitude of 40 mV peak-to-peak. The gain control stage has a control range in excess of 30 dB, the maximum input signal must not exceed 1,1 V peak-to-peak, otherwise clipping of the input signal will occur. Form the gain control stage the chrominance signal is fed to the saturation control stage. Saturation is linear controlled via pin 5. The control voltage range is 2 to 4 V, the input impedance is high and the saturation control range is in excess of 50 dB. The burst signal is not affected by saturation control. The signal is then fed to a gated amplifier which has a 12 dB higher gain during the chrominance signal. As a result the signal at the output (pin 28) has a burst to chrominance ratio which is 6 dB lower than that of the input signal when the saturation control is set at -6 dB. The chrominance output signal is fed to the delay line and, after matrixing, is applied to the demodulator input pins (pins 22 and 23). These signals are fed to the burst phase detector. In the case of NTSC the chroma signal is internally coupled to the demodulators, ACC and phase detector.

**FUNCTIONAL DESCRIPTION** (continued)**Oscillator and identification circuit**

The burst phase detector is gated with the narrow part of the sandcastle pulse (pin 7). In the detector the (R-Y) and (B-Y) signals are added to provide the composite burst signal again. This composite signal is compared with the oscillator signal divided-by-2 ((R-Y) reference signal). The control voltage is available at pins 24 and 25, and is also applied to the 8,8 MHz oscillator. The 4,4 MHz signal is obtained via the divide-by-2 circuit, which generates both the (B-Y) and (R-Y) reference signals and provides a 90° phase shift between them.

The flip-flop is driven by pulses obtained from the sandcastle detector. For the identification of the phase at PAL mode, the (R-Y) reference signal coming from the PAL switch, is compared to the vertical signal (R-Y) of the PAL delay line. This is carried out in the H/2 detector, which is gated during burst. When the phase is incorrect, the flip-flop gets a reset from the identification circuit. When the phase is correct, the output voltage of the H/2 detector is directly related to the burst amplitude so that this voltage can be used for the a.c.c. To avoid 'blooming-up' of the picture under weak input signal conditions the a.c.c. voltage is generated by peak detection of the H/2 detector output signal.

The killer and identification circuits get their information from a gated output signal of the H/2 detector. Killing is obtained via the saturation control stage and the demodulators to obtain good suppression. The time constant of the saturation control (pin 5) provides a delayed switch-on after killing.

Adjustment of the oscillator is achieved by variation of the burst phase detector load resistance between pins 24 and 25 (see Fig. 7). With this application the trimmer capacitor in series with the 8,8 MHz crystal (pin 26) can be replaced by a fixed value capacitor to compensate for unbalance of the phase detector.

**Demodulator**

The (R-Y) and (B-Y) demodulators are driven by the colour difference signals from the delay-line matrix circuit and the reference signals from the 8,8 MHz divider circuit. The (R-Y) reference signal is fed via the PAL-switch. The output signals are fed to the R and B matrix circuits and to the (G-Y) matrix to provide the (G-Y) signal which is applied to the G-matrix. The demodulation circuits are killed and blanked by by-passing the input signals.

**NTSC mode**

The NTSC mode is switched on when the voltage at the burst phase detector outputs (pins 24 and 25) is adjusted below 9 V. To ensure reliable application the phase detector load resistors are external. When the TDA3566 is used only for PAL these two 33 kΩ resistors must be connected to + 12 V (see Fig. 7). For PAL/NTSC application the value of each resistor must be reduced to 10 kΩ and connected to the slider of a potentiometer (see Fig. 8). The switching transistor brings the voltage at pins 24 and 25 below 9 V which switches the circuit to the NTSC mode. The position of the PAL flip-flop ensures that the correct phase of the (R-Y) reference signal is supplied to the (R-Y) demodulator. The drive to the H/2 detector is now provided by the (B-Y) reference signal. (In the PAL mode it is driven by the (R-Y) reference signal.)

Hue control is realized by changing the phase of the reference drive to the burst phase detector. This is achieved by varying the voltage at pins 24 and 25 between 7,5 V and 8,5 V, nominal position 8,0 V. The hue control characteristic is shown in Fig. 5.

### RGB matrix and amplifiers

The three matrix and amplifier circuits are identical and only one circuit will be described.

The luminance and the colour difference signals are added in the matrix circuit to obtain the colour signal, which is then fed to the contrast control stage. The contrast control voltage is supplied to pin 6 (high-input impedance). The control range is +3 dB to -17 dB nominal. The relationship between the control voltage and the gain is linear (see Fig. 2).

During the 3-line period after blanking a pulse is inserted at the output of the contrast control stage. The amplitude of this pulse is varied by a control voltage at pin 11. This applies a variable offset to the normal black level, thus providing brightness control. The brightness control range is 1 V to 3 V.

While this offset level is present, the 'black-current' input impedance (pin 18) is high and the internal clamp circuit is activated. The clamp circuit then compares the reference voltage at pin 19 with the voltage developed across the external resistor network  $R_A$  and  $R_B$  (pin 18) which is provided by picture tube beam current. The output of the comparator is stored in capacitors connected from pins 10, 20 and 21 to ground which controls the black level at the output. The reference voltage is composed by the resistor divider network and the leakage current of the picture tube into this bleeder. During vertical blanking, this voltage is stored in the capacitor connected to pin 19, which ensures that the leakage current of the CRT does not influence the black current measurement.

The RGB output signals can never exceed a level of 10 V. When the signal tends to exceed this level the output signal is clipped. The black level at the outputs (pins 13, 15 and 17) will be about 3 V. This level depends on the spread of the guns of the picture tube. If a beam current stabilizer is not used it is possible to stabilize the black levels at the outputs, which in this application must be connected to the black current measuring input (pin 18) via a resistor network.

### Data insertion

Each colour amplifier has a separate input for data insertion. A 1 V peak-to-peak input signal provides a 4 V peak-to-peak output signal. To avoid the 'black-level' of the inserted signal differing from the black level of the normal video signal, the data is clamped to the black level of the luminance signal. Therefore a.c. coupling is required for the data inputs.

To avoid a disturbance of the blanking level due to the clamping circuit, the source impedance of the driver circuit must not exceed 150  $\Omega$ .

The data insertion circuit is activated by the data blanking input (pin 9). When the voltage at this pin exceeds a level of 0,9 V, the RGB matrix circuits are switched off and the data amplifiers are switched on. To avoid coloured edges, the data blanking switching time is short.

The amplitude of the data output signals is controlled by the contrast control at pin 6. The black level is equal to the video black level and can be varied between 2 and 4 V (nominal condition) by the brightness control voltage at pin 11.

Non-synchronized data signals do not disturb the black level of the internal signals.

### Blanking of RGB and data signals

Both the RGB and data signals can be blanked via the sandcastle input (pin 7). A slicing level of 1,5 V is used for this blanking function, so that the wide part of the sandcastle pulse is separated from the remainder of the pulse. During blanking a level of +1 V is available at the output.

To prevent parasitic oscillations on the third overtone of the crystal the optimal tuning capacitance should be 10 pF.

**RATINGS**

Limiting values in accordance with Absolute Maximum System (IEC 134)

DEVELOPMENT DATA

**Notes to the characteristics**

1. Signal with the negative-going sync; amplitude includes sync amplitude.
2. Indicated is a signal for a colour bar with 75% saturation; chrominance to burst ratio is 2,2 : 1.
3. Nominal contrast is specified as the maximum contrast  $-5$  dB and nominal saturation as the maximum saturation  $-6$  dB.
4. Cross coupling is measured under the following condition: input signal nominal, contrast and saturation such that nominal output signals are obtained. The signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
5. The signal-to-noise ratio is defined as peak-to-peak signal with respect to r.m.s. noise.
6. All frequency variations are referred to 4,4 MHz carrier frequency.
7. These signal amplitudes are determined by the a.c.c. circuit of the reference part.
8. The demodulators are driven by a chrominance signal of equal amplitude for the (R-Y) and the (B-Y) components. The phase of the (R-Y) chrominance signal equals the phase of the (R-Y) reference signal. This also applies to the (B-Y) signals.
9. This value depends on the gain setting of the RGB output amplifiers and the drift of the picture tube guns. Higher black level values are possible (up to 5 V) but in that application the amplitude of the output signal is reduced.
10. The variation of the black-level during brightness control in the three different channels is directly dependent on the gain of each channel. Discolouration during adjustments of contrast and brightness does not occur because amplitude and the black-level change with brightness control are directly related.
11. This difference occurs when the source impedance of the data signals is  $150\ \Omega$  and the black level clamp pulse width is  $4\ \mu\text{s}$  (sandcastle pulse). For a lower impedance the difference will be lower.
12. The voltage at pins 24 and 25 can be changed by connecting the load resistors ( $10\ \text{k}\Omega$  in this application) to the slider bar of the hue control potentiometer (see Fig. 8). When the transistor is switched on, the voltage at pins 24 and 25 is reduced below 9 V, and the circuit is switched to NTSC mode. The width of the burst gate is assumed to be  $4\ \mu\text{s}$  typical.

TDA3567

## NTSC DECODER

### GENERAL DESCRIPTION

The TDA3567 is a monolithic integrated decoder for the NTSC colour television standards. It combines all functions required for the demodulation of NTSC signals. Further more it contains a luminance amplifier, an RGB-matrix and amplifier. These amplifiers supply output signals up to 5 V peak-to-peak (picture information) enabling direct drive of the discrete output stages.

### PACKAGE OUTLINE

18-lead DIL; plastic, with internal heatspreader (SOT102).

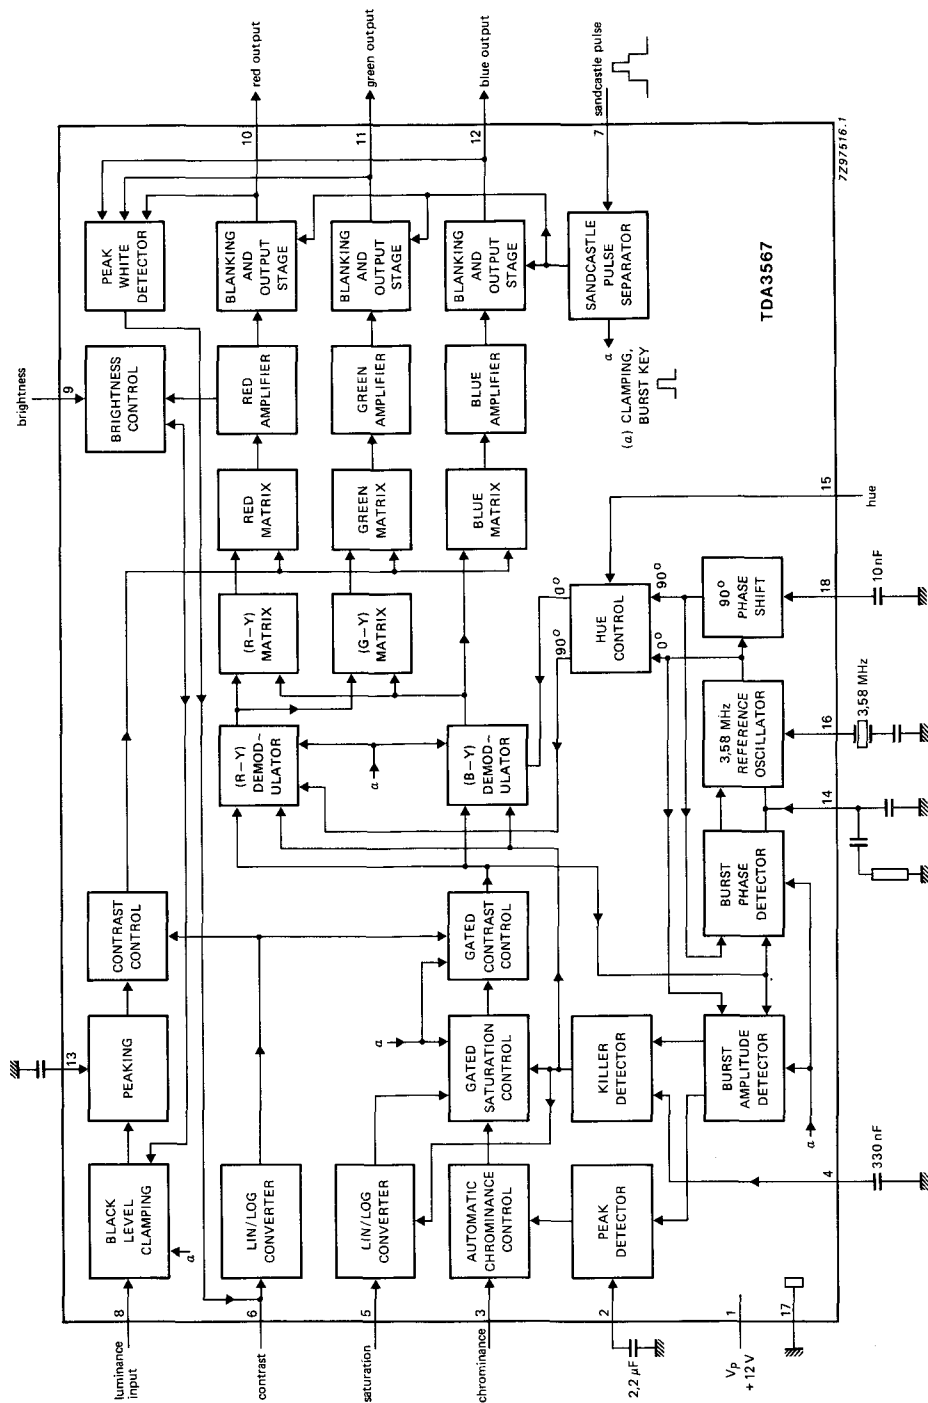

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

### Luminance amplifier

The luminance amplifier is voltage driven and requires an input signal of 450 mV peak-to-peak\*. The luminance delay line must be connected between the i.f. amplifier and the decoder. The input signal must be a.c. coupled to the input pin 8.

The black level clamp circuit of the RGB amplifiers uses the coupling capacitor as a storage capacitor. After clamping the signal is fed to a peaking stage. The RC network connected to pin 13 is used to define the amount of overshoot.

The peaking stage is followed by a contrast control stage. The control voltage has to be supplied to pin 6. The control voltage range is nominally  $-17$  to  $+3$  dB. The linear curve of the contrast control voltage is shown in Fig. 2.

### Chrominance amplifier

The chrominance amplifier has an asymmetrical input. The input signal at pin 3 must be a.c. coupled, and must have an amplitude of 550 mV peak-to-peak. The gain control stage has a control range in excess of 30 dB, the maximum input signal should not exceed 1,1 V peak-to-peak, otherwise clipping of the input signal will occur. From the gain control stage the chrominance signal is fed to the saturation and contrast control stages. Chrominance and luminance control stages are directly coupled to obtain good tracking. The saturation is linearly controlled via pin 5. The control voltage range is 2 V to 4 V. The impedance is high and the saturation control range is in excess of 50 dB. The burst signal is not affected by contrast or saturation control. After the amplification and control stages the chrominance signal is internally fed to the (R-Y) and (B-Y) demodulators, burst phase and a.c.c. detectors.

### Oscillator and a.c.c. circuit

The 3,58 MHz reference oscillator operates at the subcarrier frequency. The crystal must be connected between pin 16 and ground. The oscillator does not require adjustment due to the small spreads of the IC. The free running frequency of the oscillator can be checked by connecting the saturation control (pin 5) to the positive supply line. Then the loop is opened, so that the frequency can be measured. The oscillator has an internal gain limiting stage which controls the gain to unity, so that internal signals are sinusoidal. This prevents the generation of higher harmonics of the subcarrier signals. The burst signal is compared to a  $0^\circ$  reference signal by the burst amplitude detector and is then amplified and fed to a peak detector for a.c.c. and to a sample and hold circuit which drives the colour killer circuit. The reference signal for the burst phase detector is provided by the  $90^\circ$  phase shifted signal. An RC network is used to obtain the required catching range and noise immunity for the output voltage of the burst phase detector.

The hue control is obtained by mixing oscillator signals with a phase of  $0^\circ$  and  $90^\circ$  before they are fed to the (R-Y) and (B-Y) demodulators. The  $90^\circ$  phase shifted signal is provided by a miller integrator (biased by pin 18). As the hue control is independent of the PLL, the control will react without time delay on the control voltage changes.

\* Signal with negative going sync; amplitude includes sync pulse amplitude.

**FUNCTIONAL DESCRIPTION** (continued)**Demodulator circuits**

The demodulators are driven by the amplified and controlled chrominance signals, the reference signals are obtained from the hue control circuit. In nominal hue control position the phase angle of (R-Y) reference signal is  $0^\circ$ , the phase angle of the (B-Y) reference signal is  $90^\circ$ .

For flesh tone corrections the demodulated (R-Y) signal is matrixed with the demodulated (B-Y) signal according to the following equations:

$$(R-Y)_{\text{matrixed}} = 1,61 (R-Y)_{\text{IN}} - 0,42 (B-Y)_{\text{IN}}$$

$$(G-Y)_{\text{matrixed}} = 0,43 (R-Y)_{\text{IN}} - 0,11 (B-Y)_{\text{IN}}$$

$$(B-Y)_{\text{matrixed}} = (B-Y)_{\text{IN}}$$

In these equations  $(R-Y)_{\text{IN}}$  and  $(B-Y)_{\text{IN}}$  indicate the colour difference signal amplitudes, when the chrominance signal is demodulated with a phase difference between the R-Y and B-Y demodulator of  $90^\circ$  and a gain ratio  $B-Y/R-Y = 1,78$ .

**RGB matrix circuit and amplifiers**

The three matrix and amplifier circuits are identical. The luminance signal and the colour difference signals are added in the matrix circuit to obtain the colour signal.

Output signals are 5 V (peak-to-peak) (black-white) for the following nominal input signals and control settings.

- Luminance 450 mV (peak-to-peak)
- Chrominance 550 mV (peak-to-peak) (burst-to-chrominance ratio of the input 1 : 2.2)
- Contrast -3 dB (maximum)
- Saturation -10 dB (maximum)

The maximum available output voltage is approximately 7 V (peak-to-peak). The black level of the red channel is compared with a variable external reference level (pin 9), which provides the brightness control. The control loop is closed via the luminance input.

The luminance input is varied to control the black level control, therefore the green and blue outputs will follow any variation of the red output. The output of the black control can be varied between 2 V to 4 V. The corresponding brightness control voltage is shown in Fig. 4.

If the output signal surpasses the level of 9 V the peak-white limiter circuit becomes active and reduces the output signal via the contrast control.

**Blanking of RGB signals**

A slicing level of about 1,5 V is used for this blanking function, so that the wide part of the sandcastle pulse is separated from the rest of the pulse. During blanking a level of + 2 V is available at the output.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 1)	$V_p = V_{1-17}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,7 W
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		-25 to +65 °C

**THERMAL RESISTANCE**

**Noted to the characteristics**

- Signal with negative going sync; amplitude includes sync pulse amplitude.
- Indicated is a signal for colour bar with 75% saturation, so the chrominance to burst ratio is 2,2 : 1.
- Nominal contrast is specified as maximum contrast —3 dB and nominal saturation as maximum saturation —10 dB.
- Cross coupling is measured under the following condition:
  - input signals nominal;
  - contrast and saturation such that nominal output signals are obtained;
  - the signals at the output at which no signal should be available must be compared with the nominal output signal at that output.
- The signal-to-noise ratio is specified as peak-to-peak signal with respect to RMS noise.
- When this level is exceeded the amplifier of the output signal is reduced via a discharge of the capacitor on pin 7 (contrast control). Discharge current is 5,5 mA.
- These matrixed values are found by measuring the ratio of the various output signals. The values are derived from the matrix equations given in the section 'FUNCTIONAL DESCRIPTION'.

TDA3569

## NTSC DECODER WITH FAST RGB BLANKING

### GENERAL DESCRIPTION

The TDA3569 NTSC decoder combines luminance amplifier, RGB matrix and RGB amplifiers to provide NTSC demodulation and direct drive of discrete output stages. A facility for fast blanking of the RGB outputs is included.

### Features

- Automatic chrominance levelling (avoids saturation at chrominance input)
- Peaking circuit with d.c. control
- Fast RGB output blanking

### QUICK REFERENCE DATA

### PACKAGE OUTLINE

20-lead DIL; plastic with internal heat-spreader (SOT146EE7).

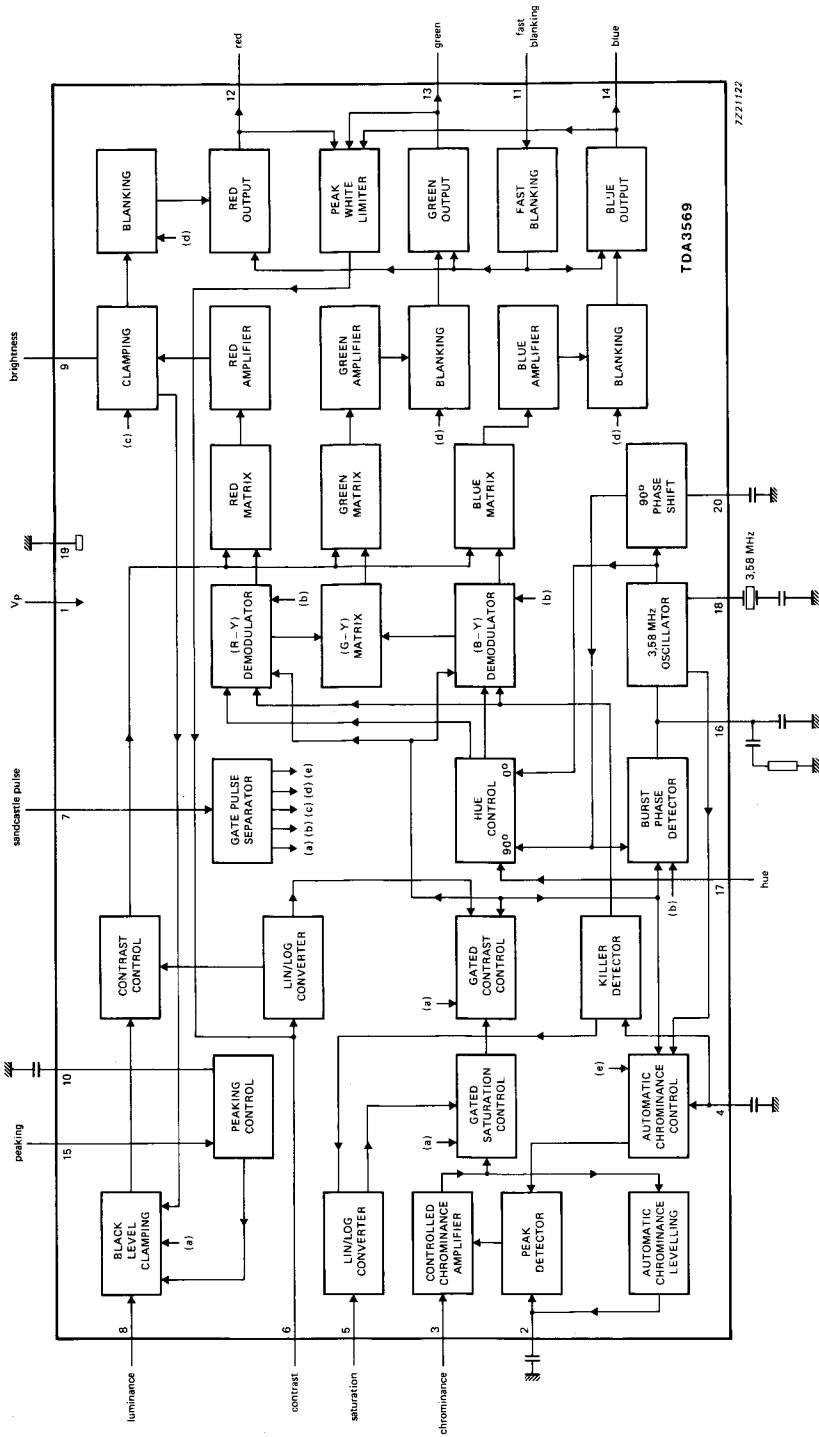

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

### Luminance amplifier

The luminance amplifier is voltage driven and requires a positive video input signal of 450 mV peak-to-peak, a.c. coupled to pin 8. The coupling capacitor provides storage for the black level clamping circuit. After clamping the signal is fed to a peaking circuit in which the amount of overshoot is controlled from the voltage on pin 15.

Then next stage controls luminance signal contrast. Adjusted by the voltage on pin 6, the contrast control range is nominally  $-17$  to  $+3$  dB. The curve is linear as shown in Fig. 2.

### Chrominance amplifier

The chrominance amplifier has an asymmetrical input and requires a.c. coupling to pin 3. The minimum peak-to-peak signal amplitude at the input is 55 mV (colour bar signal with 75% saturation; burst signal is 25 mV (peak-to-peak)). The gain control has a range greater than 30 dB but to avoid clipping, the input signal should not exceed 1,1 V (peak-to-peak).

After gain control, the chrominance signal is fed to an automatic chrominance levelling (ACL) circuit which avoids over-saturation when the incoming chrominance/burst ratio exceeds 2,2 : 1. The ACL circuit controls the chrominance amplitude via the automatic chrominance control (ACC) circuit.

The controlled chrominance signal is then fed to the saturation and contrast control stages. The chrominance and luminance contrast stages are directly coupled to ensure good tracking. Saturation is controlled via pin 5. This has a high impedance and a control range of 2 to 4 V, giving a linear saturation control greater than 50 dB. The burst signal is not affected by contrast or saturation controls.

After the amplification and control stages the chrominance signal is fed to the (R-Y) and (B-Y) demodulators, the burst phase detector and the ACC detector.

### Oscillator and ACC circuit

The 3,58 MHz reference oscillator operates at the subcarrier frequency. The crystal is connected between pin 18 and ground. The oscillator does not require adjustment due to the small spreads of the IC. To check the free running frequency of the oscillator the loop is opened by connecting the saturation control (pin 5) to the positive supply line. The oscillator has an internal gain-limiting stage which holds the gain at unity. This ensures internal signals remain sinusoidal thus preventing higher harmonics of subcarrier signals and allowing hue control to be obtained by mixing two signals with phases of  $0^\circ$  and  $90^\circ$ . The  $90^\circ$  phase shift is obtained via a Miller integrator and the bias capacitor for this is connected at pin 20.

The ACC detector compares the burst signal with the  $0^\circ$  reference signal. After detection, the ACC signal is fed via a peak detector to control the chrominance amplifier and to a sample-and-hold circuit to drive the colour killer circuit.

The reference signal for the burst phase detector is provided by the  $90^\circ$  phase-shifted signal. An RC network is used to obtain the required catching range and noise immunity for the output voltage of the burst phase detector.

The hue control is obtained by mixing the  $0^\circ$  and  $90^\circ$  oscillator signals before they are fed to the (R-Y) and (B-Y) demodulators. This means that the hue control reacts to control voltage changes without delay as it is not dependent on the PLL.

**FUNCTIONAL DESCRIPTION** (continued)**Demodulator circuits**

The demodulators are driven by the amplified and controlled chrominance signals, the reference signals being from the hue control circuit. With nominal hue control, the phase angle of the (R-Y) reference signal is  $0^\circ$  and that for the (B-Y) reference signal is  $90^\circ$ .

For flesh tone correction the demodulated (R-Y) signal is matrixed with the demodulated (B-Y) signal according to the following equations:

$$(R-Y)_{\text{matrixed}} = 1,61 (R-Y)_{\text{IN}} - 0,42 (B-Y)_{\text{IN}}$$

$$(G-Y)_{\text{matrixed}} = -0,43 (R-Y)_{\text{IN}} - 0,11 (B-Y)_{\text{IN}}$$

$$(B-Y)_{\text{matrixed}} = (B-Y)_{\text{IN}}$$

In these equations  $(R-Y)_{\text{IN}}$  and  $(B-Y)_{\text{IN}}$  indicate the colour difference signal amplitudes when the chrominance signal is demodulated with a phase difference of  $90^\circ$  between the R-Y and B-Y demodulators and gain ratio B-Y/R-Y = 1,78 : 1.

**RGB matrix and amplifier circuits**

The three matrix and amplifier circuits are identical. The luminance signal and the colour difference signals are added in the matrix circuit to obtain the colour signal.

Output signals are 5 V (peak-to-peak) (black-white) for the following nominal input signals and control settings.

- Luminance 450 mV (peak-to-peak)
- Chrominance 550 mV (peak-to-peak) (burst/chrominance ratio of the input = 1 : 2,2)
- Contrast -3 dB (maximum)
- Saturation -10 dB (maximum)

The maximum available output voltage is approximately 7 V (peak-to-peak).

The black level of the red channel is compared with a variable external reference level (pin 9) which provides the brightness control. The control loop is closed via the luminance input.

The luminance input is varied to control the black level, therefore the green and blue outputs follow any variation of the red output. The output of the black level control can be varied between 2 V and 4 V. The corresponding brightness control voltage is shown in Fig. 4.

If the output signal approaches the level of 9 V the peak-white limiter circuit becomes active and reduces the output signal via the contrast control.

**Blanking of RGB signals**

A slicing level of about 1,5 V is used for this blanking function, so that the wide part of the sandcastle pulse is separated from the rest of the pulse. During blanking a level of +2 V is available at the output.

The circuit also has a fast blanking input (pin 11) which blanks the RGB outputs within 50 ns.

## SECAM PROCESSOR CIRCUIT

### GENERAL DESCRIPTION

The TDA3590A processor circuit converts SECAM signals into sequential phase-modulated (quasi-PAL) signals. It combines all the functions of the TDA3590, TDA3591 and TDA3591A to provide a complete SECAM processor system. The circuit is intended for use in conjunction with TDA3560, TDA3561, TDA3561A, TDA3562A or TDA3566 to provide SECAM/PAL/NTSC/black-and-white processor combinations.

### Features

- Limiter/amplifier for chrominance signal
- SECAM demodulator
- Clamp circuits and de-emphasis for colour difference signals
- Modulator to convert colour difference signals into sequential, phase-modulated signals
- Identification circuit for horizontal, vertical or combined horizontal and vertical SECAM identification
- Divider circuit to provide 4,4 MHz carrier from 8,8 MHz signals generated in TDA3560/61/61A/62A/66
- Sandcastle pulse detector
- SECAM switch and PAL matrix
- Video amplifier
- Pin compatibility with TDA3590, TDA3591 and TDA3591A when application requires SECAM ident priority (does not apply with PAL ident priority)

### QUICK REFERENCE DATA

Supply voltage	$V_P = V_{17-2}$	typ.	12 V

Input signal SECAM (peak-to-peak value)	$V_{4-2(p-p)}$	typ.	100 mV
Output signal PAL (peak-to-peak value) at $V_{16(p-p)} = 1,2$ V	$V_{8-2(p-p)}$	typ.	900 mV
Output signal SECAM (peak-to-peak value)	$V_{8-2(p-p)}$	typ.	500 mV
<b>Identification</b>			
Input voltage range for horizontal identification (pin 5)	$V_{5-2}$		0 to 8 V
Input voltage range for vertical identification (pin 5)	$V_{5-2}$		10,5 to 12,0 V
Voltage at pin 6 for PAL	$V_{6-2}$	typ.	10,2 V
Voltage at pin 6 for SECAM	$V_{6-2}$	typ.	7,0 V
<b>Sandcastle pulse detector</b>			
Vertical blanking level	$V_{19-2}$	typ.	1,5 V
Horizontal blanking level	$V_{19-2}$	typ.	3,5 V
Burst gating level	$V_{19-2}$	typ.	7,2 V
<b>Luminance amplifier</b>			
Luminance input signal (peak-to-peak value)	$V_{16-2(p-p)}$	typ.	1,2 V
Luminance output signal (peak-to-peak value)	$V_{15-2(p-p)}$	typ.	3,0 V
<b>PAL matrix and SECAM switch</b>			
Burst signal amplitude (peak-to-peak value)	$V_{11; 12-2(p-p)}$	typ.	60 mV
Amplification for PAL		typ.	0,5 dB
Amplification for SECAM		typ.	6 dB

### PACKAGE OUTLINE

24-lead DIL; plastic (with internal heat spreader) (SOT101B).

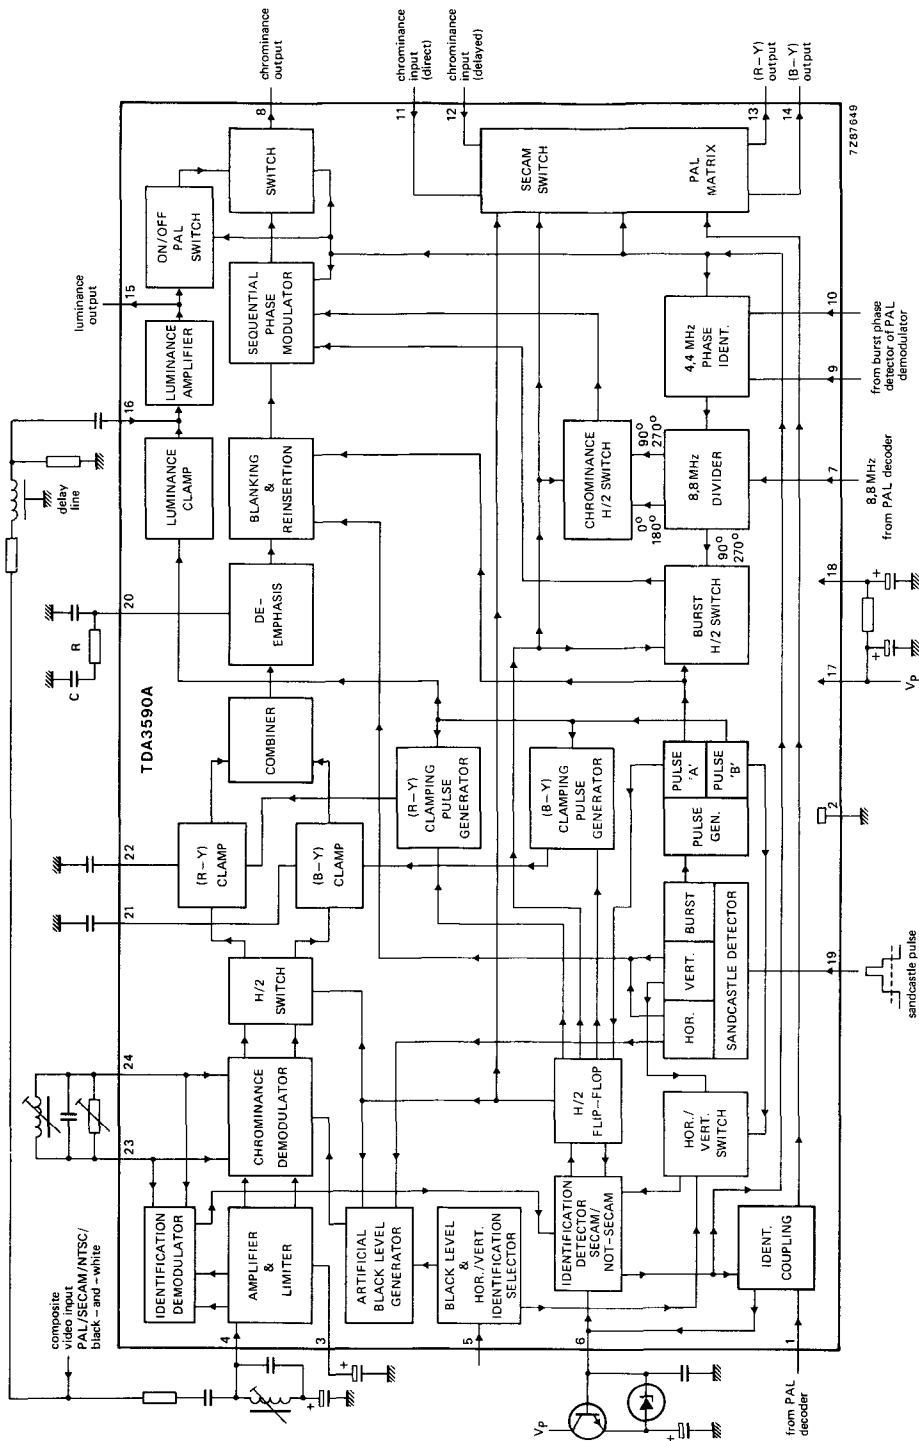

Fig. 1 Block diagram.

**PINNING**

1. Identification coupling input for PAL/not-PAL identification using half the saturation voltage of the PAL decoder.
2. Ground.
3. Limiter feedback.
4. SECAM video input.
5. Identification selection input using a d.c. level to preset the identification mode of horizontal/vertical detection + black level clamping/insertion.
6. Storage circuit input to SECAM/not-SECAM identification detector.
7. Divider circuit input of 8,8 MHz from the PAL decoder.
8. Chrominance signal output comprising PAL or processed SECAM (quasi-PAL).
9. Carrier signal phase identification input from the burst phase detector of the PAL decoder.
10. As for pin 9.
11. Direct chrominance input to SECAM switch/PAL matrix.
12. Delayed chrominance input to SECAM switch/PAL matrix.
13. Colour difference output (R-Y).
14. Colour difference output (B-Y).
15. Luminance output.
16. Luminance/PAL input.
17. Positive supply voltage ( $V_p$ ).
18. Decoupled positive supply voltage.
19. Three-level sandcastle pulse input.
20. De-emphasis circuit connection.
21. Storage capacitor connection for (B-Y) clamp.
22. Storage capacitor connection for (R-Y) clamp.
23. Connection for reference tuned circuit for SECAM chrominance and identification demodulators.
24. As for pin 23.

**FUNCTIONAL DESCRIPTION****Demodulation**

The chrominance and identification demodulators of the TDA3590A both share the same reference tuned circuit (pins 23 and 24). The identification circuit automatically detects whether the incoming signal is SECAM or not-SECAM.

When the incoming signals are not-SECAM (PAL/NTSC/black-and-white) they are diverted via pin 16 to the chrominance output at pin 8 and no signal demodulation takes place. The delay line connected to pin 16 delays the signals to equalize the delay of the SECAM processor circuitry. When SECAM signals are received the PAL signal path is switched off.

Incoming SECAM signals are applied to pin 4 via an external bell filter. The signals are amplified, limited and then demodulated. The limiters give optimum i.f. interference suppression. Only one demodulator is necessary as the colour difference signals are available sequentially. After demodulation the colour difference signals are separated by an H/2 switch and then applied to (R-Y) and (B-Y) clamp circuits where the black levels are clamped to the same d.c. level. The optimum black level can be obtained at the end of the horizontal burst, so the timing of the (R-Y) and (B-Y) clamp is determined by the last 1,45  $\mu$ s of the burst gate pulse.

The two colour difference signals are combined again after clamping and then applied to the modulator via de-emphasis, blanking and reinsertion circuits.

The ratio of (R-Y) to (B-Y) at the de-emphasis output (pin 20) is 1,78. The external de-emphasis components of  $R = 1 \text{ k}\Omega$  and  $C = 470 \text{ pF}$  give a spread at the internal de-emphasis network  $< 20\%$ .

## FUNCTIONAL DESCRIPTION (continued)

If artificial black level reinsertion is required the burst gating pulse (Fig. 2) is used to time black level clamping. Artificial black levels are inserted during the horizontal blanking period when  $V_{5-2} > 2 \text{ V}$ . The clamp circuits then react to the artificial levels instead of the demodulated burst signals (this is necessary when no horizontal burst signals are available). The inserted signals may not be identical to the demodulated signals because of circuitry spread but this can be corrected by detuning the demodulator reference tuned circuit.

### Modulation

A burst signal is reinserted into the combined SECAM signal at the input to the sequential phase modulator. The nominal duration of this burst is  $2,85 \mu\text{s}$  which approximates to the duration of the PAL burst and, in combination with the horizontal blanking pulse (used as keying pulse in the SECAM switch), minimizes interference in the a.c.c. loop of the TDA3560/61/62.

At the input to the modulator the (R-Y) and (B-Y) signals have a positive phase position for magenta colour. The modulation carriers for the (R-Y) and (B-Y) signals are  $90^\circ$  out of phase; the burst is modulated in the + (R-Y) direction and is only present during an (R-Y) line, the modulated (R-Y) component has the same phase position as the (R-Y) burst for magenta colour.

The chrominance output from pin 8, in the SECAM mode, is a quasi-PAL signal with alternate line, sequential modulation. Odd and even harmonics of the 4,4 MHz carrier introduced by the modulator are suppressed by internal filters. A correction is made to the burst-chrominance ratio of the quasi-PAL signals for equal saturation of PAL and SECAM signals.

### Identification

Identification of the SECAM signal is performed using the fact that only SECAM has a line-to-line difference in demodulated voltage level. This is detected during the last  $1,5 \mu\text{s}$  of the burst gate pulse. A flip-flop, which is switched by the leading edge of the sandcastle time blanking pulse, provides the reference input to the identification detector. Here the phase of the flip-flop is compared with that of the changing voltage levels from the demodulator. The SECAM identification circuits operate when selected by the voltage on pin 5; this may be horizontal, vertical or combined horizontal and vertical identification, depending on the switching arrangements of pin 5. An internal voltage divider presets pin 5 to 6V to give automatic selection of horizontal identification plus black level re-insertion. Vertical identification is selected by taking the voltage on pin 5 above 10,5 V, then the system compares the demodulator output voltage only during line scanning of the vertical blanking.

Information obtained from the identification detector is also used for colour killing and, if required, for switching to PAL.

### Luminance amplification

The luminance amplifier input at pin 16 can be up to 1,2 V (peak-to-peak value) which equates to a peak-to-peak voltage of 2,7 V  $-7 \text{ dB}$ . The amplifier gain is typically 8 dB. The luminance clamping circuit is activated during the SECAM identification timing (see Fig. 2).

### Sandcastle pulse detection

The sandcastle pulse detector requires a three-level sandcastle pulse to provide horizontal blanking, vertical blanking and burst gate pulses. The detected burst gate pulse triggers a pulse generator which produces two timing pulses, pulse 'A' and pulse 'B' (see Fig. 2). Pulse 'A' is used to time the PAL burst modulator. Pulse 'B' provides the timing of the (R-Y) clamp (present only during a red line); the (B-Y) clamp (present only during a blue line); the luminance clamp (present every line); and the SECAM horizontal identification circuit.

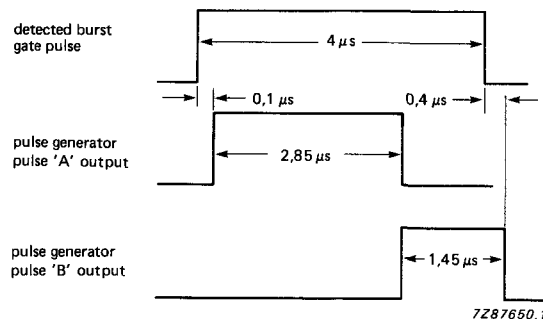

Fig. 2 Burst gate timing pulse generation.

### PAL matrix and SECAM switch

The PAL matrix and SECAM switch is included in the TDA3590A to facilitate handling of the two chrominance signal types, PAL and SECAM. For PAL, the direct chrominance signal and the chrominance signal delayed by the PAL delay line are used by the PAL matrix to separate the two colour difference signals. Phase accuracy is not critical for this operation as the colour difference signals are not mixed. For SECAM, the quasi-PAL sequential colour difference signals are separated by switching. The gain of the switching circuit is two times that for normal PAL reception to maintain signal balance between the two systems. The (B-Y) output from the SECAM switch is a signal with no burst; the (R-Y) output has a burst modulated in the + (R-Y) direction during the + (R-Y) line. There is minimal crosstalk between the colour difference signals in the SECAM switch.

### Carrier generation

The carrier for the sequential phase modulator is obtained using the 8,8 MHz input from the PAL decoder. This input is divided by two to provide two 4,4 MHz signals with a phase relationship of 90°. Correct phasing between the 4,4 MHz and the PAL decoder is ensured by the 4,4 MHz phase identifier circuit which resets the divider if the phasing is wrong (see Figs 3 and 4 for inter-connections). The inputs/outputs to the phase identifier have internal current sources in the case of SECAM.

### Coupling of identification systems

Coupling of system identification between TDA3590A and a PAL decoder is performed using the functions of pins 1 and 6. The voltage level at pin 1 is controlled by the PAL/not-PAL detection of the PAL decoder; the voltage level at pin 6 is a function of SECAM/not-SECAM detection of the TDA3590A modified by the action of pin 6 external circuit.

The circuit action is as follows and is summarized in Table 1.

Channel switching	During channel switching pin 6 is taken rapidly to a high voltage ( $\pm 10,2$ V) by the external circuit. This corresponds to the not-SECAM mode of the TDA3590A.
PAL	The high voltage level at pin 6 caused by channel switching is maintained by the TDA3590A when it recognizes the signal as not-SECAM. An internal current source keeps pin 6 voltage high, locking the TDA3590A in the not-SECAM mode. This condition is maintained even if reflected PAL signals are present. The PAL decoder recognizes the signal as PAL and takes pin 1 of TDA3590A to a voltage of between 0,5 and 2,6 V, depending on the setting of the saturation voltage. The system is thus locked in the PAL mode.

**FUNCTIONAL DESCRIPTION** (continued)

**SECAM** The initial high voltage level ( $\pm 10,2$  V) at pin 6 caused by channel switching sets the TDA3590A in the not-SECAM mode and during this time the PAL decoder detects a not-PAL signal. This causes a voltage at pin 1 of  $< 0,4$  V which prevents the internal current source of TDA3590A maintaining the high voltage level of pin 6 which, in turn, allows the TDA3590A to detect SECAM. The initiation of SECAM detection is delayed by the action of pin 6 external circuit and commences when pin 6 approaches 9,1 V. The SECAM signals are converted by TDA3590A to quasi-PAL signals at pin 8 which are detected by the PAL decoder as PAL signals. The resulting modes of operation are SECAM for the TDA3590A and PAL for the PAL decoder, together giving a system operation in the SECAM mode.

**Black-and-white** The TDA3590A is initially set in the not-SECAM mode as previously described. The PAL decoder detects not-PAL and the TDA3590A detects not-SECAM which results in a system operation in the colour-killing mode.

**Table 1** System operating modes

TDA3590A mode	PAL decoder mode	system operating mode
SECAM	PAL	SECAM
SECAM	not-PAL	condition not used
not-SECAM	PAL	PAL
not-SECAM	not-PAL	black-and-white

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 17)	$V_P = V_{17-2}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,88 W
Operating ambient temperature range	$T_{amb}$		-25 to + 65 °C
Storage temperature range	$T_{stg}$		-25 to + 150 °C

## CHARACTERISTICS

$V_P = V_{17-2} = 12 \text{ V}$ ;  $T_{\text{amb}} = 25 \text{ }^\circ\text{C}$ ; unless otherwise specified. The parameter values are valid only when the reference tuned circuit has been aligned as detailed in note 1.

parameter	symbol	min.	typ.	max.	unit
<b>Supplies</b>					
Supply voltage range (pin 17)	$V_{17-2}$	10,8	12,0	13,2	V

upper voltage level	$V_{1-2}$	> 2,6	—	$V_p$	V

**Notes to the characteristics**

1. The parameter values given in the characteristics are valid only when the following alignment procedure is performed:
  - a. Supply a SECAM signal input to pin 4 at 100 mV (peak-to-peak value) without deviation during a red and blue line (SECAM black colour information).
  - b. Align the reference tuned circuit so that the output signal from pin 8 to the PAL decoder is minimum during scan (PAL black colour information).
2. When an artificial black level is inserted after demodulation the resulting black level deviation depends on the adjustment of the demodulator tuned circuit. It is therefore possible to obtain a value of 0%.
3. (B-Y) linearity is defined by  $V_{\text{out(yellow)}}/V_{\text{out(blue)}}$  where  $f_{\text{yellow}} = (\text{typ.}) 4,02 \text{ MHz}$ ;  $f_{\text{blue}} = (\text{typ.}) 4,48 \text{ MHz}$ ;  $V_{5-2} = 2,0 \text{ V}$ .
4. (R-Y) linearity is defined by  $V_{\text{out(cyan)}}/V_{\text{out(red)}}$  where  $f_{\text{cyan}} = (\text{typ.}) 4,68 \text{ MHz}$ ;  $f_{\text{red}} = (\text{typ.}) 4,12 \text{ MHz}$ ;  $V_{5-2} = 2,0 \text{ V}$ .
5. When the input signal to the limiter (pin 4) changes from 300 to 15 mV (peak-to-peak value) the zero point of the chrominance demodulator shifts by a typical value of 5 kHz.
6. The phase delay between the oscillator output of TDA3560/61/61A/62A/66 and the input to TDA3590A pin 7 must be adjusted for minimum burst amplitude at pin 28 of the PAL decoder.

**APPLICATION INFORMATION**

The pin-to-pin functions of the application shown in Fig. 3 are described against the corresponding pin numbers.

**Pin 4. Chrominance input**

Typical input signal values (peak-to-peak) are: SECAM 100 mV; PAL 0,55 V. The input signal, which should be free from any sound modulation, is applied single-ended to pin 4 via a filter which has the bell-shaped bandpass required for SECAM signals.

**Pin 5. Horizontal/vertical identification**

Selection of horizontal or vertical identification depends on the external voltage applied to pin 5. When the d.c. level on pin 5 changes with time (pulse information) a combination of horizontal and vertical identification is possible.

*Horizontal identification*

When the voltage at pin 5 is  $< 0,5 \text{ V}$  horizontal identification and black level clamping occur. The clamping is during the back porch of the colour difference signals. If artificial black level insertion is required the voltage at pin 5 should be between 2 and 8 V.

*Vertical identification*

When the voltage on pin 5 is  $> 10,5 \text{ V}$  vertical identification occurs (identification on 9 lines in the vertical blanking period). In this mode the black level is artificially inserted after demodulation.

**Pin 6. System identification**

During PAL reception the typical voltage at pin 6 is 10,2 V. This causes the luminance stage to be connected internally to the chrominance output at pin 8 and also activates the PAL matrix for normal PAL signals. During SECAM reception the typical voltage at pin 6 is 7 V. This changes the internal connection of the output from the luminance stage to the sequential phase modulator and enables the SECAM switch. Noisy SECAM signals cause the voltage at pin 6 to increase, colour killing occurs at 9,8 V and colour is reinstated at 9,1 V.

**Pin 7. Carrier generation**

An 8,8 MHz signal from the PAL decoder is applied via pin 7 to the divider circuit in the TDA3590A. From this two 4,4 MHz signals are obtained with a phase shift of  $90^\circ$  with respect to each other. These signals are applied to the modulator via an H/2 switch. The delay of the 8,8 MHz input must be adjusted for minimum burst amplitude of the chrominance signal at pin 28 of the PAL decoder. With this condition the burst generated by the TDA3590A is in phase with the (R-Y) reference signal for the PAL decoder demodulator (the a.c.c. of the PAL decoder operates in the + (R-Y) direction).

**Pin 8. Chrominance output**

During PAL reception this output is connected internally to the luminance stage and a composite PAL video signal is present at pin 8. During SECAM reception the sequential phase modulator is connected to this output to give a quasi-PAL signal from pin 8. Typical peak-to-peak amplitudes of the signal from pin 8 are 900 mV for PAL (with peak-to-peak input at pin 16 of 1,2 V) and 500 mV for SECAM. The output signals are applied via a chrominance bandpass filter to the chrominance a.c.c. amplifier input of the PAL decoder.

**Pins 9 and 10. Divider resetting**

The output of the PAL decoder burst phase detector is connected to pins 9 and 10 of TDA3590A. During SECAM reception this signal carries differential a.c. current information about the phase relationship of the 4,4 MHz dividers of both ICs. The TDA3590A generates a minimum relative voltage between pins 9 and 10 at an absolute voltage level of 10,5 V. This overrules the PAL decoder oscillator control function causing the oscillator to run at  $2 \times 4,43$  MHz.

**Pins 11, 12, 13 and 14. SECAM switch and PAL matrix**

The PAL matrix circuit is enabled by system identification of PAL reception. The signal inputs to the matrix are the (direct) a.c.c. composite video output from the PAL decoder via an attenuator to pin 11 and a delayed version of the same signal via a glass delay line to pin 12. Active matrixing takes place in the IC and the separated (R-Y) and (B-Y) signals are available at pins 13 and 14 respectively.

The SECAM switch circuit is selected by system identification of SECAM reception. The inputs to the SECAM switch are the sequentially modulated quasi-PAL signals, direct and delayed, to pins 11 and 12 respectively. The SECAM switch separates the (R-Y) and (B-Y) signals which are then available at pins 13 and 14 respectively.

**Pins 15 and 16. Luminance signals**

The maximum peak-to-peak amplitude of the input to pin 16 should be 1,7 V. The relatively high input impedance of the luminance amplifier allows a 22 nF coupling capacitor to be used. The luminance amplifier has internal input clamping and a gain of 8 dB. The output is available at pin 15.

During SECAM reception the luminance signal is delayed approximately 470 ns by an external delay line to equalize the SECAM processing delay. The luminance and chrominance outputs are then correctly timed.

During PAL reception the PAL composite video signal passes through the external delay line and, after amplification, is available at pins 15 and 8.

**APPLICATION INFORMATION** (continued)**Pins 17 and 18. Supply voltage (+ 12 V)**

Correct operation is ensured within the supply voltage range of 10,8 to 13,2 V. The typical power dissipation of the IC at 12 V is 1,2 W.

Pins 17 and 18 are separated by an external RC filter. Pin 18 supplies all the output stages and the biasing for several current sinks in the IC. Separation of the supply voltages minimizes crosstalk between the various parts of the IC. The capacitor at pin 18 must be small ( $\approx 1 \mu\text{F}$ ) to avoid the possibility of internal damage to the IC by discharge current should pin 17 be short-circuited to ground.

**Pin 19. Sandcastle pulse**

The required three-level sandcastle pulse may be coupled directly to the sandcastle pulse detector input at pin 19. The horizontal blanking, vertical blanking and burst gate pulses are separated by the IC.

**Pin 20. De-emphasis**

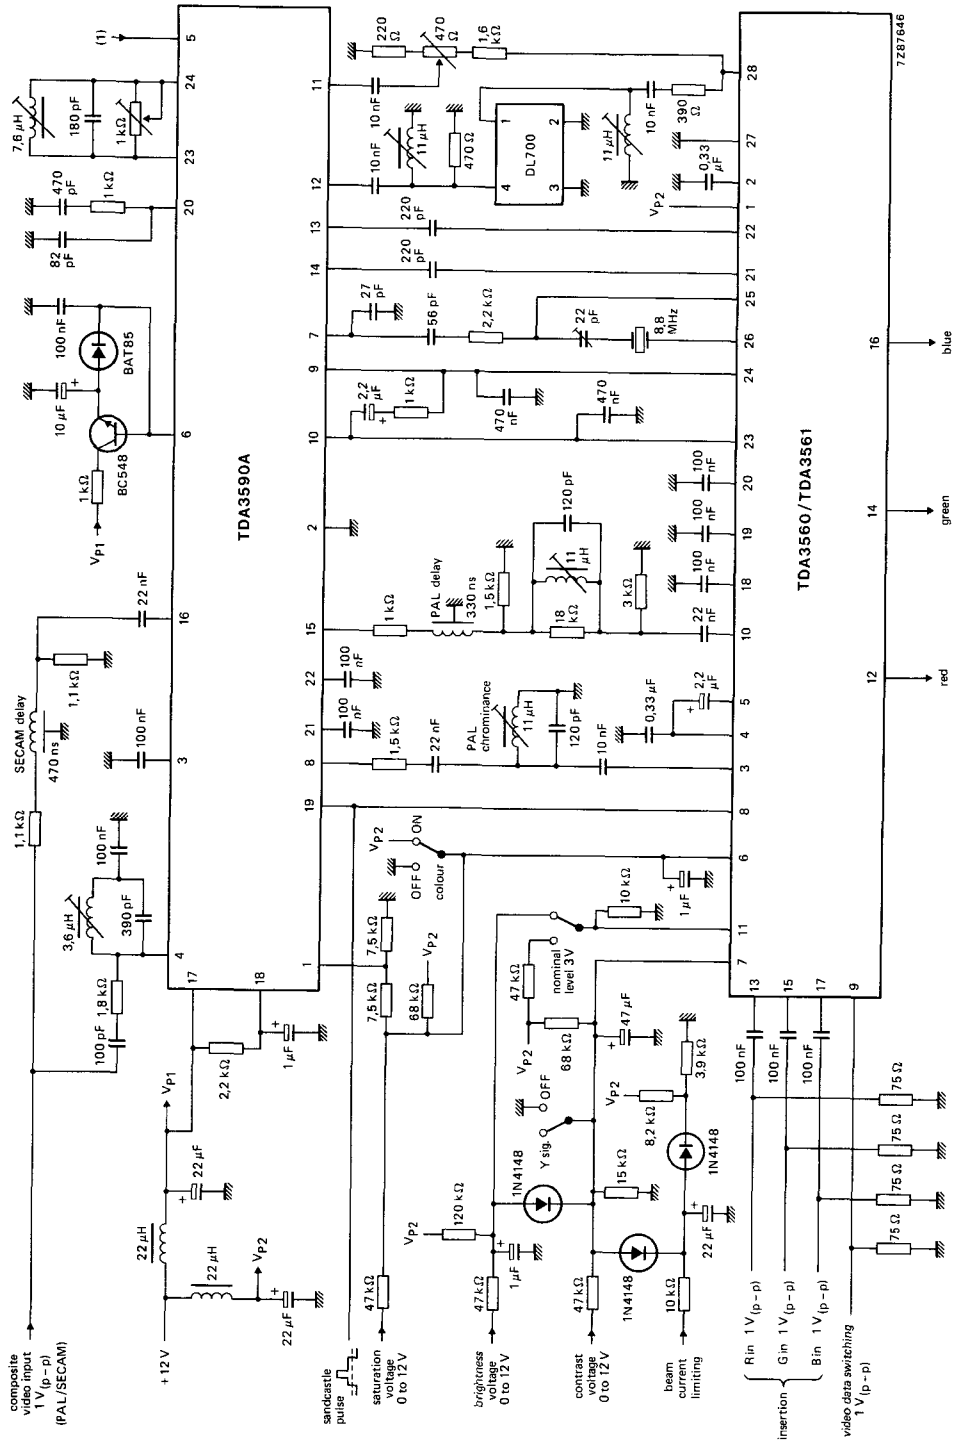

De-emphasis is performed at this pin with a 1 k $\Omega$  resistor and a 470 pF capacitor. Additional filtering of the 8,8 MHz signal using an 82 pF coupling capacitor prevents moiré patterns appearing on the screen.

**Pins 21 and 22. Clamping of (R-Y) and (B-Y) signals**

Clamping of the colour difference signals is performed after they have been separated. The normal value for the clamping storage capacitors is 100 nF but this may be increased to 470 nF if required.

**Pins 23 and 24. Demodulator reference tuned circuit**

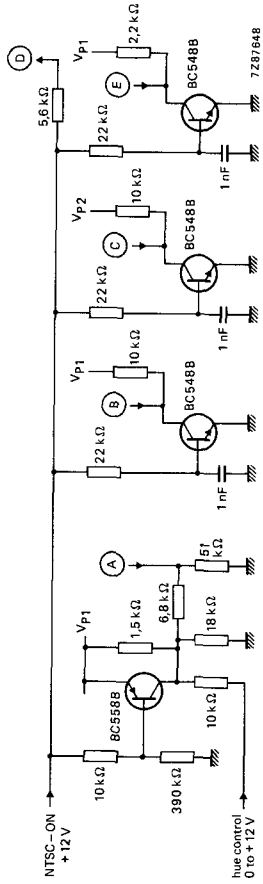

The SECAM signal is applied to the demodulator via a bell filter and a limiter amplifier. Only one chrominance demodulator is used because of the sequential nature of the signal. The reference signal from the tuned circuit is applied to pins 23 and 24. Tuning and damping adjustments of the reference tuned circuit should be performed at  $V_{5-2} > 2 \text{ V}$  (SECAM video (R-Y) (B-Y) information switched off). Adjustments should be such that minimum modulator voltage appears at pin 8, then any deviations between the black levels (when clamping on the back porch and when an artificial black level is filled in) can be made minimum.

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA3592A

## SECAM-PAL TRANSCODER

### GENERAL DESCRIPTION

The TDA3592A transcoder circuit converts SECAM input signals into true PAL signals, and can be used in combination with all types of PAL decoder.

### Features

- Limiter input for chrominance signal
- SECAM demodulator
- Clamp circuits and de-emphasis for colour difference signals
- Modulator to provide true PAL signals
- 4,43 MHz oscillator
- Sandcastle pulse detector
- Identification circuit for horizontal and vertical SECAM identification
- Can be used with all types of PAL decoder
- Power-saving feature operates when supply voltage falls to (typ.) 5 V: SECAM processing shuts down but SECAM signal path remains active

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 17)		$V_p$	9,0	12,0	13,2	V
Supply current (pin 17)	$V_p = 12\text{ V}$	$I_p$	65	90	115	mA
Supply current (pin 17 and 18) (SECAM only)	$V_p = 5\text{ V}$	$I_p$	16	20	24	mA

### PACKAGE OUTLINE

24-lead DIL; plastic with heat spreader (SOT101B).

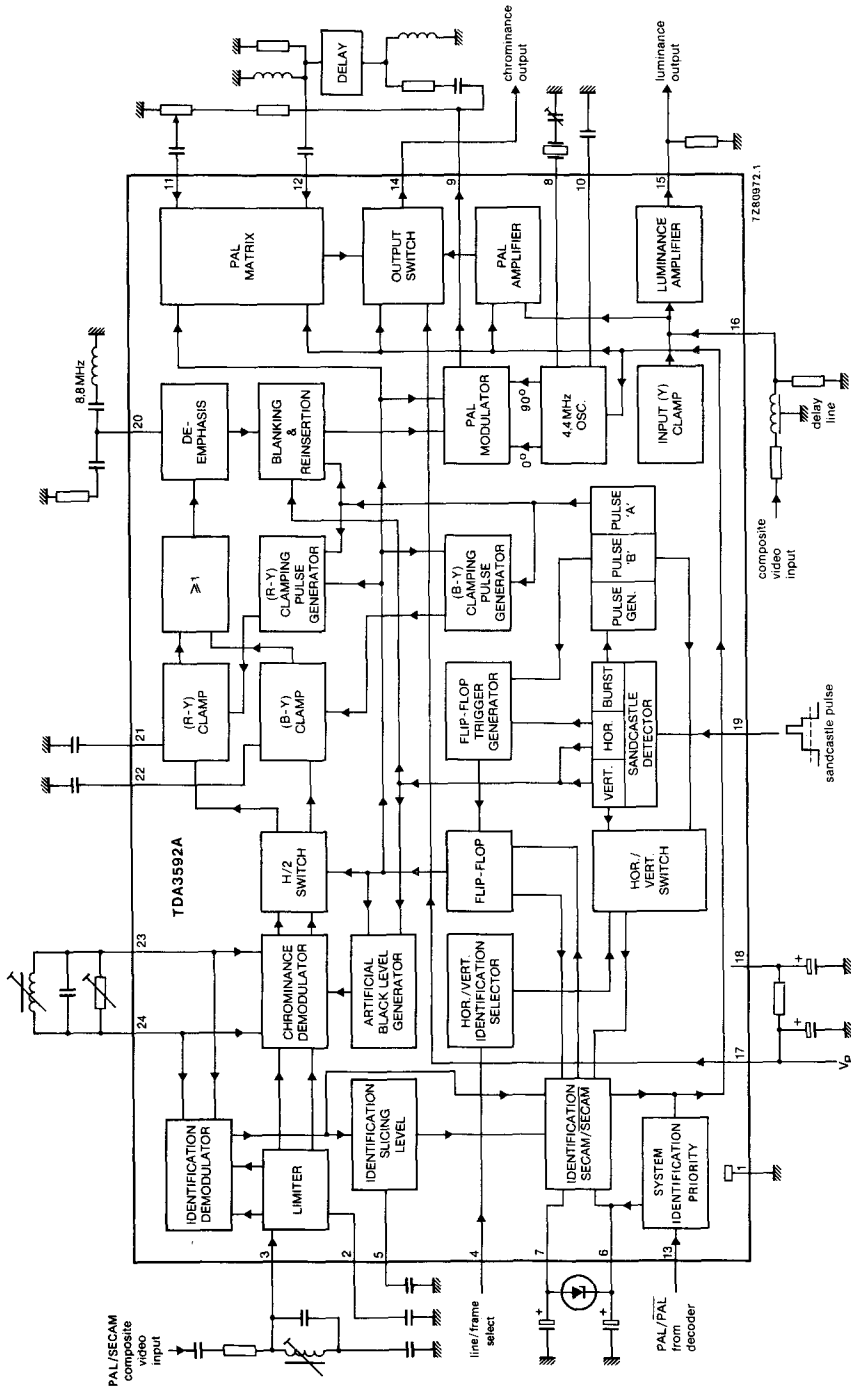

Fig. 1 Block diagram.

**PINNING**

1. Ground.
2. Limiter feedback.
3. Limiter input: chrominance input SECAM; identification input  $\overline{\text{SECAM/SECAM}}$ .
4. Identification selection input using a DC level to preset the identification mode.  
At  $V_4 < 2,9 \text{ V}$  the TDA3592A is preset for frame identification.  
At  $V_4 > 4,1 \text{ V}$  the TDA3592A is preset for line identification.
5. Storage capacitor input for floating level identification.
6. Storage capacitor input to  $\overline{\text{SECAM/SECAM}}$  identification circuit.
7. Double time-constant input to  $\overline{\text{SECAM/SECAM}}$  identification circuit.
8. 4,43 MHz oscillator.
9. Sequentially modulated output.
10. Decoupling capacitor for miller integrator feedback circuit.
11. Direct input chrominance signal.
12. Delayed input chrominance signal.
13. PAL/ $\overline{\text{PAL}}$  input signal from PAL decoder.
14. Chrominance output signal.
15. Luminance output signal.
16. Luminance/ $\overline{\text{SECAM}}$  input signal.
17. Positive supply voltage ( $V_p$ ).
18. Decoupled positive supply voltage.
19. Three-level sandcastle pulse input.
20. De-emphasis circuit connection:  $R = 560 \Omega$ ;  $C = 1 \text{ nF}$ .
21. Storage capacitor connection for (R-Y) clamp.
22. Storage capacitor connection for (B-Y) clamp.
23. Demodulator reference tuned circuit: nominal frequency = 4,33 MHz; nominal  $Q_L = 2,45$ .
24. As for pin 23.

## FUNCTIONAL DESCRIPTION

### Demodulation

The chrominance and identification demodulators of the TDA3592A both share the same reference tuned circuit (pins 23 and 24). The identification circuit automatically detects whether the incoming signal is SECAM or SECAM (NTSC, PAL or black-and-white).

When the incoming signals are PAL they are diverted via pin 16 to the chrominance output at pin 14 and no signal demodulation takes place. The delay line connected to pin 16 delays the signals to equalize the delay of the SECAM-PAL transcoding process. When SECAM signals are received, the PAL signal path is switched off.

Incoming SECAM signals are applied to pin 3 via an external bell filter. The signals are amplified, limited and then demodulated. Only one demodulator is necessary as the colour difference signals are available sequentially. After demodulation the colour difference signals are separated by an H/2 switch and then applied to (R-Y) and (B-Y) clamp circuits where the black levels are clamped to the same DC level. With all conditions at pin 4, artificial black levels are inserted during the horizontal blanking periods. This is done because of the possibility of horizontal burst signals not being available. The artificial levels may not be identical to the detected black level due to circuit spread but this can be corrected by detuning the reference tuned circuit.

The two colour difference signals are combined again after clamping and then applied to the modulator via de-emphasis, blanking and reinsertion circuits. The ratio of (R-Y) to (B-Y) at the de-emphasis output (pin 20) is 1,78.

### Modulation

A burst signal is reinserted into the combined SECAM signal at the input to the PAL modulator. At this input the phase relationship for magenta colour is  $+(R-Y)$  and  $-(B-Y)$ . The modulation carriers for the (R-Y) and (B-Y) signals are  $90^\circ$  out of phase; for a magenta colour the modulated (R-Y) component has the same phase position as the (R-Y) burst. The (B-Y) burst is modulated  $180^\circ$  out of phase with respect to the (B-Y) component of a magenta-coloured input signal.

### Identification SECAM/SECAM

Identification of the SECAM signal is performed using the fact that only SECAM signals have a line-to-line difference in voltage level. The identification circuit compares the phase of the demodulated voltage difference waveform with the phase of the flip-flop output. If the phase relationship is not correct, the flip-flop is reset by an extra pulse from the flip-flop trigger generator. For horizontal identification the phase comparison is performed during the period of pulse 'B' (see Fig. 2). When vertical identification is selected, the comparison is performed only during the horizontal scan of the vertical blanking. The SECAM identification circuits operate when selected by the voltage on pin 4; this may be horizontal, vertical or combined horizontal and vertical identification, depending on the switching arrangements of pin 4.

These are as follows:

- Horizontal identification preset when  $V_{4.1} < 2,9 \text{ V}$ ;
- Vertical identification preset when  $V_{4.1} > 4,1 \text{ V}$ ;
- Horizontal/vertical combination when sandcastle pulse is present on pin 4.

Information obtained from the identification detector is also used for colour killing and, if required, for switching to PAL.

### Sandcastle pulse detection

The sandcastle pulse detector requires a three-level sandcastle pulse to provide horizontal blanking, vertical blanking and burst gate pulses. The detector burst gate pulse triggers a pulse generator which produces two timing pulses, pulse 'A' and pulse 'B' (see Fig. 2). Pulse 'A' is used to time the PAL modulator burst and to sample the (R-Y) and (B-Y) clamping pulse generators. A (R-Y) clamping pulse is generated only during a red line and a (B-Y) clamping pulse only during a blue line. Pulse 'B' times the SECAM horizontal identification.

Fig. 2 Burst gate timing pulse generation.

### Carrier generation

The carrier signal for the PAL modulator is obtained from a 4,43 MHz oscillator. An internal Miller integrator operates in conjunction with the decoupling capacitor at pin 10 to provide the required  $90^\circ$  phase shift.

### PAL matrix

The signal output from the PAL modulator at pin 9 is sequentially modulated with (R-Y) burst phased in the  $+(R-Y)$  direction, and (B-Y) burst phased in the  $-(B-Y)$  direction. This PAL signal is applied directly to pin 11 and via a  $64 \mu\text{s}$  delay to pin 12. A true PAL signal is constructed in the PAL matrix by means of an additional/subtraction process (in a correct H/2 sequence) using the delayed and undelayed inputs.

**FUNCTIONAL DESCRIPTION** (continued)**Coupling of identification systems**

Coupling of a TDA3592A and a PAL decoder can be performed to obtain an optimum identification system. The system operates using the functions of pins 13, 6 and 7: the voltage level at pin 13 is controlled by the PAL/ $\overline{\text{PAL}}$  detection of the PAL decoder; and the voltage level at pins 6 and 7 are functions of SECAM/ $\overline{\text{SECAM}}$  detection in the TDA3592A.

The circuit action is as follows and is summarized in Table 1.

Channel switching	During channel switching pin 6 is taken rapidly to a high voltage ( $\pm 10,2$ V), this corresponds to the SECAM mode of the TDA3592A.
PAL	The high voltage level at pin 6 caused by channel switching is maintained by the TDA3592A when it recognizes the signal as $\overline{\text{SECAM}}$ (this condition is maintained even if reflected PAL signals are present). The PAL decoder recognizes the signal as PAL and takes pin 13 of TDA3592A to a voltage greater than 1,7 V. The TDA3592A is now held in the $\overline{\text{SECAM}}$ condition by an internal current source at pin 6.
SECAM	The initial high voltage level (+ 10,2 V) at pin 6 caused by channel switching sets the TDA3592A in the SECAM mode and during this time the PAL decoder detects a PAL signal. This causes a voltage at pin 13 of $< 1,1$ V which prevents the internal current source of TDA3592A maintaining the high voltage level of pin 6 which, in turn, allows the TDA3592A to detect SECAM. The initiation of SECAM detection is delayed by the action of the external circuit at pins 6 and 7 and commences as pin 6 approaches 7,0 V. The SECAM signals are converted by TDA3592A to PAL signals at pin 14, which results in the PAL decoder switching to the PAL mode (the TDA3592A remains in the SECAM mode).
Black-and-white	The TDA3592A is initially set in the $\overline{\text{SECAM}}$ mode as previously described. The PAL decoder detects PAL and the TDA3592A detects $\overline{\text{SECAM}}$ which results in a system operation in the colour-killing mode.

**Table 1** System operating modes

TDA3592A	PAL decoder mode	System operating mode
SECAM	PAL	SECAM
$\overline{\text{SECAM}}$	$\overline{\text{PAL}}$	condition not used
$\overline{\text{SECAM}}$	PAL	PAL
$\overline{\text{SECAM}}$	$\overline{\text{PAL}}$	black-and-white

**System priorities**

When TDA3592A pin 13 is connected to the PAL/ $\overline{\text{PAL}}$  output of a PAL decoder, the system will give PAL priority in signal identification. Connecting TDA3592A pin 13 to ground will give SECAM priority.

**Luminance and chrominance signal paths**

The signal input at pin 16 is clamped by a circuit which detects the top of the luminance signal sync pulse. This clamp, the luminance signal path to pin 15 and the  $\overline{\text{SECAM}}$  signal path to pin 14 remain active when the supply voltage falls to (typ.) 5 V. At this level of supply voltage the SECAM processing circuits are switched off, giving a reduction in total power dissipation.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	max.	unit
Supply voltage (pin 17)	V <sub>p</sub>	—	13,2	V
Total power dissipation	P <sub>tot</sub>	—	1,78	W
Operating ambient temperature range	T <sub>amb</sub>	-25	+70	°C
Storage temperature range	T <sub>stg</sub>	-25	+150	°C

## CHARACTERISTICS

V<sub>p</sub> = V<sub>17-1</sub> = 12 V; T<sub>amb</sub> = 25 °C; unless otherwise specified.

The parameter values are valid only when the reference tuned circuit has been aligned as detailed in note 1. All voltages are reference to ground pin 1.

Frequency response at $-3 \text{ dB}$ (pin 16 to 14)		f	6	—	—	MHz

**Notes to the characteristics**

1. The parameter values given in the characteristics are valid only when the following alignment procedure is performed:
  - a. Supply a SECAM signal input to pin 3 at 100 mV (peak-to-peak value) without deviation during a red and blue line (SECAM black colour information).
  - b. Align the reference tuned circuit so that the output signal from pin 14 to the PAL decoder is minimum during scan (PAL black colour information).
2. When the input signal to the limiter (pin 3) changes from 300 to 15 mV (peak-to-peak value) the zero point of the chrominance demodulator shifts by a typical value of 5 kHz;  $f = 4,33$  MHz (typ.).
3. (B-Y) linearity is defined by  $V_{out(yellow)}/V_{out(blue)}$  where  $f_{yellow} =$  (typ.) 4,02 MHz;  $f_{blue} =$  (typ.) 4,48 MHz.
4. (R-Y) linearity is defined by  $V_{out(cyan)}/V_{out(red)}$  where  $f_{cyan} =$  (typ.) 4,68 MHz;  $f_{red} =$  (typ.) 4,12 MHz.

5. The parameter value is equated by:  $\frac{(B-D)/F - (A-C)/E}{Y - X} \times \frac{\Delta f \text{ (kHz)}}{^{\circ}C}$

$$E = \frac{E1 - E2}{2} \quad F = \frac{F1 - F2}{2}$$

Where

- A = demodulated black level at temperature X
- B = demodulated black level at temperature Y
- C = artificial black level at temperature X
- D = artificial black level at temperature Y
- E1 = demodulated output signal at temperature X ( $f_o - \Delta f$ )
- E2 = demodulated output signal at temperature X ( $f_o + \Delta f$ )
- F1 = demodulated output signal at temperature Y ( $f_o - \Delta f$ )
- F2 = demodulated output signal at temperature Y ( $f_o + \Delta f$ )

for B-Y:  $f_o = f_{ob} = 4,25$  MHz ( $\Delta f = 230$  kHz)  
 for R-Y:  $f_o = f_{or} = 4,40625$  MHz ( $\Delta f = 280$  kHz)

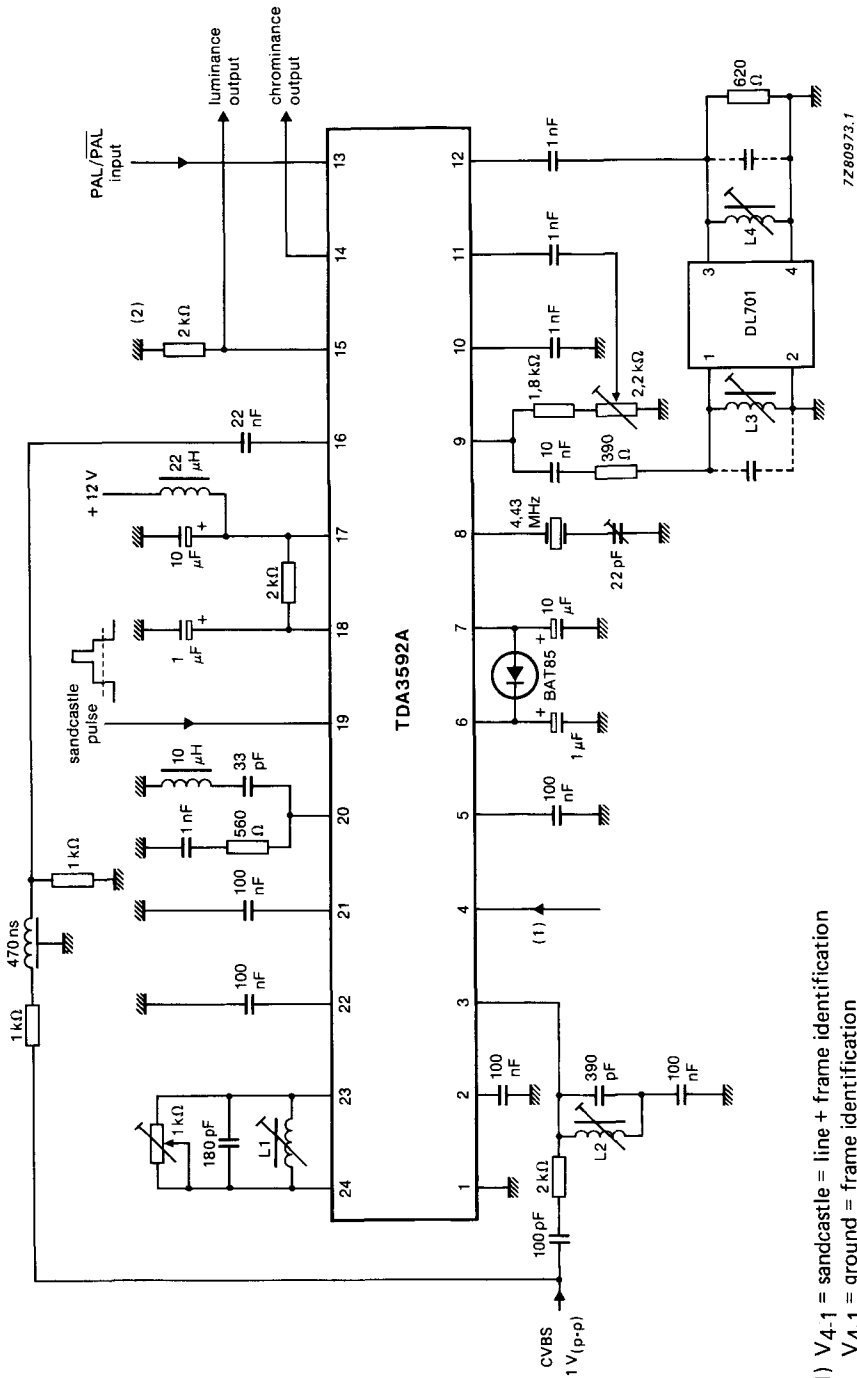

6. During stable signal conditions  $V_7$  is always at  $V_F$  (BAT85) below  $V_6$ .
7. The burst gate pulse width  $> 3,45 \mu s$ .
8. The specification figures are only valid when the reference tuned circuit is aligned as indicated in note 1.
9. Ensure that the 4,433 MHz carrier is in the correct phase; black level shift at temperature X = A and at Y = B.  
 Output signal ( $\Delta f = 230$  kHz for B-Y;  $\Delta f = 280$  kHz for R-Y) at temperature X = E and at Y = F.

The parameter is equated by:  $\frac{(B/(F-B) - A/(E-A))}{Y - X} \times 230; 280 \text{ kHz}$

10. Chrominance definition – burst ratio at SECAM condition (pin 9).

The parameter is equated by:  $\frac{V_{out(p-p) \text{ Red (R-Y)}}}{V_{burst(p-p) \text{ (R-Y)}}$

APPLICATION INFORMATION

- (1) V<sub>4-1</sub> = sandcastle = line + frame identification
- V<sub>4-1</sub> = ground = frame identification
- V<sub>4-1</sub> = V<sub>p</sub> = line identification
- (2) minimum load resistance at pin 15 = 2 kΩ

Fig. 3 Application circuit.

## VERTICAL DEFLECTION AND GUARD CIRCUIT (90°)

### GENERAL DESCRIPTION

The TDA3653B/C is a vertical deflection output circuit for drive of various deflection systems with currents up to 1.5 A peak-to-peak.

### Features

- Driver
- Output stage
- Thermal protection and output stage protection
- Flyback generator
- Voltage stabilizer
- Guard circuit

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
<b>Supply (note 1)</b>					
Supply voltage range					
pin 9	$V_P = V_{9-4}$	10	—	40	V
pin 6	$V_{6-4}$	—	—	60	V
<b>Output (pin 5)</b>					
Peak output voltage during flyback	$V_{5-4M}$	—	—	60	V
Output current	$I_5(p-p)$	—	1.2	1.5	A
Operating junction temperature range	$T_j$	-25	—	+ 150	°C
Thermal resistance junction to mounting base					
(SOT110B)	$R_{th\ j-mb}$	—	10	—	K/W
(SOT131)	$R_{th\ j-mb}$	—	3.5	—	K/W

### Note to the quick reference data

1. The maximum supply voltage should be chosen such that during flyback the voltage at pin 5 does not exceed 60 V.

### PACKAGE OUTLINES

TDA3653B: 9-lead SIL; plastic (SOT110B).

TDA3653C: 9-lead SIL; plastic power (SOT131).

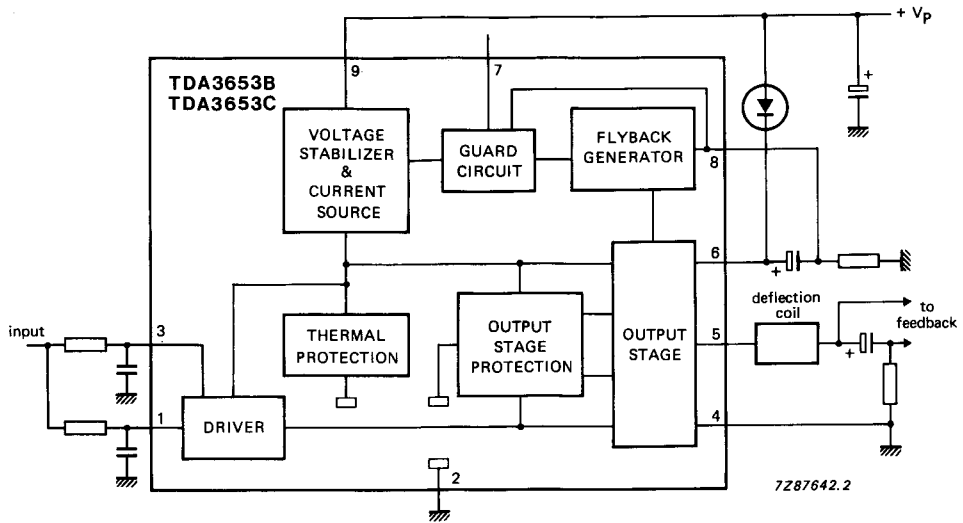

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

### Output stage and protection circuit

Pin 5 is the output pin. The supply for the output stage is fed to pin 6 and the output stage ground is connected to pin 4. The output transistors of the class-B output stage can each deliver 0.75 A maximum. The maximum voltage for pin 5 and 6 is 60 V.

The output power transistors are protected such that their operation remains within the SOAR area. This is achieved by the co-operation of the thermal protection circuit, the current-voltage detector, the short-circuit protection and the special measures in the internal circuit layout.

### Driver and switching circuit

Pin 1 is the input for the driver of the output stage. The signal at pin 1 is also applied via external resistors to pin 3 which is the input of a switching circuit. When the flyback starts, this switching circuit rapidly turns off the lower output stage and so limits the turn-off dissipation. It also allows a quick start of the flyback generator.

External connection of pin 1 to pin 3 allows for applications in which the pins are driven separately.

### Flyback generator

During scan the capacitor connected between pins 6 and 8 is charged to a level which is dependent on the value of the resistor at pin 8 (see Fig.1).

When the flyback starts and the voltage at the output pin (pin 5) exceeds the supply voltage, the flyback generator is activated.

The supply voltage is then connected in series, via pin 8, with the voltage across the capacitor during the flyback period.

This implies that during scan the supply voltage can be reduced to the required scan voltage plus saturation voltage of the output transistors.

The amplitude of the flyback voltage can be chosen by changing the value of the external resistor at pin 8.

It should be noted that the application is chosen such that the lowest voltage at pin 8 is  $> 2.5$  V, during normal operation.

### Guard circuit

When there is no deflection current and the flyback generator is not activated, the voltage at pin 8 reduces to less than 1.8 V. The guard circuit will then produce a DC voltage at pin 7, which can be used to blank the picture tube and thus prevent screen damage.

### Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply of 6 V to drive the output stage, which prevents the drive current of the output stage being affected by supply voltage variations.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134); pins 4 and 2 externally connected to ground.

paramater	symbol	min.	max.	unit
Supply voltage (pin 9)	$V_P = V_{9-4}$	—	40	V

Frequency response (–3 dB)	note 7	$f$	—	40	—	kHz

**Notes to the characteristics**

1. The maximum supply voltage should be chosen such that during flyback the voltage at pin 5 does not exceed 60 V.
2. When  $V_{5-4} = 13\text{ V}$  and no load at pin 5.
3. Duty factor maximum 3.3%.
4. Guard circuit is active.
5. During normal operation the voltage  $V_{8-2}$  may not be lower than 2.5 V.
6.  $R_{load} = 8\ \Omega$ ;  $I_{load(rms)} = 125\text{ mA}$ .
7. With 220 pF between pins 1 and 5.

APPLICATION INFORMATION

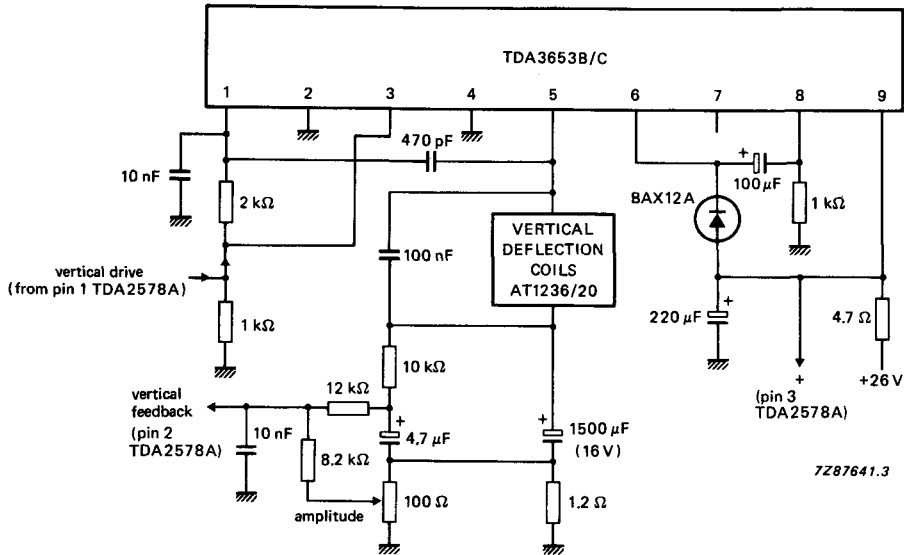

Fig. 4 Typical application circuit diagram of the TDA3653B/C (vertical output), when used in combination with the TDA2578A (see Fig. 5).

Note to deflection coils AT1236/20: L = 29 mH, R = 13.6 Ω; deflection current without overscan is 0.82 A peak-to-peak and EHT voltage is 25 kV.

APPLICATION INFORMATION (continued)

## VERTICAL DEFLECTION AND GUARD CIRCUIT (110°)

### GENERAL DESCRIPTION

The TDA3654 is a full performance vertical deflection output circuit for direct drive of the deflection coils and can be used for a wide range of 90° and 110° deflection systems.

A guard circuit is provided which blanks the picture tube screen in the absence of deflection current.

### Features

- Direct drive to the deflection coils
- 90° and 110° deflection system
- *Internal blanking guard circuit*
- Internal voltage stabilizer

### QUICK REFERENCE DATA

Output voltage	V <sub>5-2</sub>	max.	60 V
Output current (peak-to-peak)	I <sub>5(p-p)</sub>	max.	3 A
Supply voltage	V <sub>9-2</sub>	max.	40 V
Guard circuit output voltage	V <sub>7-2</sub>	max.	5,6 V
Operating ambient temperature range	T <sub>amb</sub>		-25 to +60 °C
Storage temperature	T <sub>stg</sub>		-65 to +150 °C

### THERMAL RESISTANCE

From junction to mounting base	R <sub>th j-mb</sub>	3,5 to 4 K/W
--------------------------------	----------------------	--------------

### PACKAGE OUTLINES

TDA3654 : 9-lead SIL; plastic power (SOT131).

TDA3654Q : 9-lead SIL bent to DIL; plastic power (SOT157).

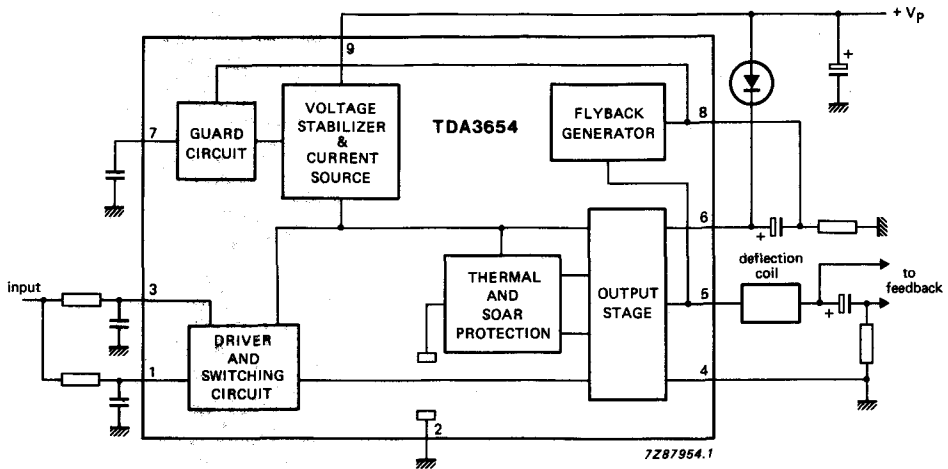

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

### Output stage and protection circuits

The output stage consists of two Darlington configurations in class B arrangement.

Each output transistor can deliver 1,5 A maximum and the  $V_{CE0}$  is 60 V.

Protection of the output stage is such that the operation of the transistors remains well within the SOAR area in all circumstances at the output pin, (pin 5). This is obtained by the cooperation of the thermal protection circuit, the current-voltage detector and the short circuit protection.

Special measures in the internal circuit layout give the output transistors extra solidity, this is illustrated in Fig. 5 where typical SOAR curves of the lower output transistor are given. The same curves also apply for the upper output device. The supply for the output stage is fed to pin 6 and the output stage ground is connected to pin 4.

### Driver and switching circuit

Pin 1 is the input for the driver of the output stage. The signal at pin 1 is also applied to pin 3 which is the input of a switching circuit (pin 1 and 3 are connected via external resistors).

This switching circuit rapidly turns off the lower output stage when the flyback starts and it, therefore, allows a quick start of the flyback generator. The maximum required input signal for the maximum output current peak-to-peak value of 3 A is only 3 V, the sum of the currents in pins 1 and 3 is then maximum 1 mA.

### Flyback generator

During scan, the capacitor between pins 6 and 8 is charged to a level which is dependent on the value of the resistor at pin 8 (see Fig. 1).

When the flyback starts and the voltage at the output pin (pin 5) exceeds the supply voltage, the flyback generator is activated.

The supply voltage is then connected in series, via pin 8, with the voltage across the capacitor during the flyback period.

This implies that during scan the supply voltage can be reduced to the required scan voltage plus saturation voltage of the output transistors.

The amplitude of the flyback voltage can be chosen by changing the value of the external resistor at pin 8.

It should be noted that the application is chosen such that the lowest voltage at pin 8 is  $> 1,5$  V, during normal operation.

### Guard circuit

When there is no deflection current, for any reason, the voltage at pin 8 becomes less than 1 V, the guard circuit will produce a d.c. voltage at pin 7. This voltage can be used to blank the picture tube, so that the screen will not burn in.

### Voltage stabilizer

The internal voltage stabilizer provides a stabilized supply of 6 V to drive the output stage, so the drive current is not affected by supply voltage variations.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134).  
Pins 2 and 4 are externally connected to ground.

**Voltages**

Output voltage	$V_{5-4}$	0 to 60	V
Supply voltage	$V_{9-4}$	0 to 40	V
Supply voltage output stage	$V_{6-4}$	0 to 60	V
Input voltage	$V_{1-2}$	0 to $V_{9-4}$	V
Input voltage switching circuit	$V_{3-2}$	0 to $V_{9-4}$	V
External voltage at pin 7	$V_{7-2}$	0 to 5,6	V

**Currents**

Repetitive peak output current	$\pm I_{5RM}$	max.	1,5 A
Non-repetitive peak output current (note 1)	$\pm I_{5SM}$	max.	3 A
Repetitive peak output current of flyback generator	$I_{8RM}$	max.	+ 1,5 A - 1,6 A
Non-repetitive peak output current of flyback generator (note 1)	$\pm I_{8SM}$	max.	3 A

**Temperatures**

Storage temperature range	$T_{stg}$	-65 to + 150	°C
Operating ambient temperature range (see Fig. 3)	$T_{amb}$	-25 to + 60	°C
Operating junction temperature range	$T_j$	-25 to + 150	°C

## CHARACTERISTICS

$T_{amb} = 25\text{ }^{\circ}\text{C}$ , supply voltage ( $V_{9-4}$ ) = 26 V; unless otherwise stated; pin 1 externally connected to pin 3.  
Pins 2 and 4 externally connected to ground.

## SECAM IDENTIFICATION CIRCUIT

### GENERAL DESCRIPTION

The TDA3724 is a monolithic integrated circuit for SECAM identification in PAL/SECAM (B,G) video tape recorders.

### QUICK REFERENCE DATA

Supply voltage (pin 10)	$V_P = V_{10-8}$	typ.	10 V
Supply current (pin 10)	$I_P = I_{10}$	typ.	16 mA
Identification inputs	$V_{3-8}$ (p-p)	min.	0,22 V
Identification inputs	$V_{4-8}$ (p-p)	min.	0,22 V
Identification output current	$I_1$	min.	3 mA

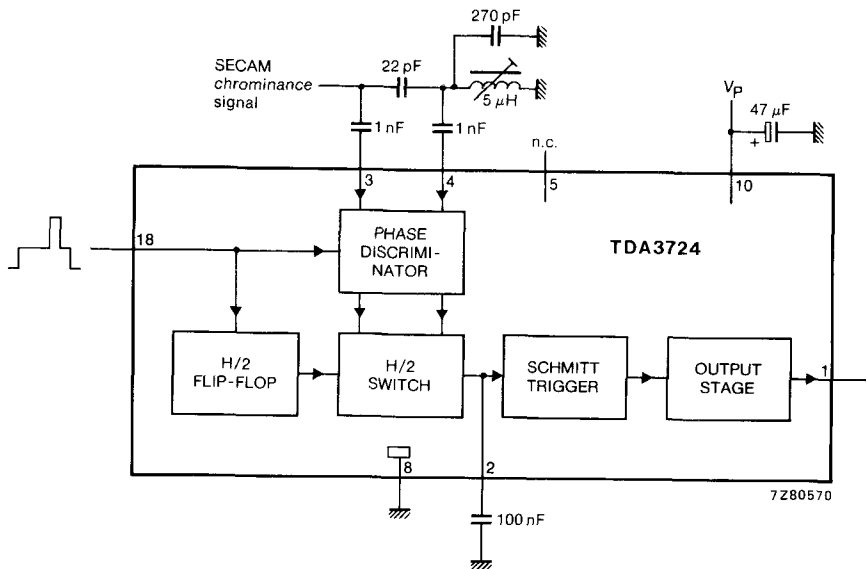

Fig. 1 Block diagram.

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	$V_P = V_{10-8}$	max.	13,2 V
Voltage range at pins 3,4,18	$V_{n-8}$		0 to $V_P$ V
Voltage range at pin 2	$V_{2-8}$		$\frac{1}{2}V_P$ to $V_P$ V
Current at pin 1	$-I_1$		5 mA
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to 70 °C

**CHARACTERISTICS**

$V_P = 10$  V;  $T_{amb} = 25$  °C; measured in Fig. 1; unless otherwise specified.

parameter	symbol	min.	typ.	max.	unit
Supply at pin 10					
Supply voltage	$V_P = V_{10-8}$	9,6	10	13,2	V
Supply current at $V_P = 10$ V	$I_{10}$	—	16	21	mA
Supply current at $V_P = 13,2$ V	$I_{10}$	—	—	28	mA
Output voltage at pin 1 (open collector of pnp transistor) at SECAM mode	$V_{1-8}$	9,3	—	—	V
Output current pin 1 at SECAM mode	$-I_1$	3	—	—	mA
Output current pin 1 at NOT SECAM mode	$-I_1$	—	—	10	$\mu$ A
Charge capacitor for ident. integration	$C_{2-8}$	100	—	2000	nF
Identification inputs pin 3,4					
input voltage	$V_{3, 4-8}$ (p-p)	0,22	—	1,0	V
input resistance	$R_{3, 4-8}$	14	—	22	k $\Omega$
Sandcastle input pin 18					
input voltage for active discriminating stage	$V_{18-8}$	6,0	—	$V_P$	V

## SECAM (L) CHROMINANCE PROCESSOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3725 is a monolithic integrated circuit for chrominance processing in SECAM (L) video recorders.

### Features

- SECAM identification with output stage of SECAM/NOT SECAM identification
- Input to force recording or playback mode
- A.G.C. amplifier and soft limiting amplifier for SECAM chrominance inputs
- Divide by 4 of the chrominance frequencies for recording mode
- Rectifier and multiplier to generate 4 times SECAM chrominance frequencies at playback mode with external filtering
- Output for monitoring

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 10)	$V_p = V_{10-8}$	—	10	—	V
Supply current (pin 10)	$I_p = I_{13}$	—	38	—	mA
Chroma input signal (record)	$V_{11-8(p-p)}$	25	—	—	mV
Chroma input signal (playback)	$V_{9-8(p-p)}$	25	—	—	mV

Output voltage pin 1 (open collector of pnp transistor) in SECAM mode	$V_{1-8}$	9,3	—	—	V
Output current pin 1 in SECAM mode	$-I_1$	3	—	—	mA
Output current pin 1 in NOT SECAM mode	$-I_1$	—	—	1	$\mu\text{A}$
Charge capacitor for ident integration	$C_{2-8}$	100	—	1000	nF
Threshold colour forced on	$V_{2-8}$	8	—	$V_p$	V
Threshold killer forced on	$V_{2-8}$	5,8	—	6,2	V
Identification input voltage pin 3	$V_{3-8(p-p)}$	0,22	—	1	V
Identification input voltage pin 4	$V_{4-8(p-p)}$	0,22	—	1	V
Input resistance pins 3,4	$R_{3,4-8}$	14	18	22	k $\Omega$
Sandcastle input pin 18					
Input voltage for inactive discriminating stage	$V_{18-8}$	0	—	4,8	V
Input voltage for active discriminating stage	$V_{18-8}$	6	—	$V_p$	V

## FREQUENCY DEMODULATOR AND DROP OUT COMPENSATOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3730 is a monolithic integrated circuit for luminance processing in the playback path of video recorders. The device incorporates two signal channels, one for the main signal and one for the drop out signal.

### Features

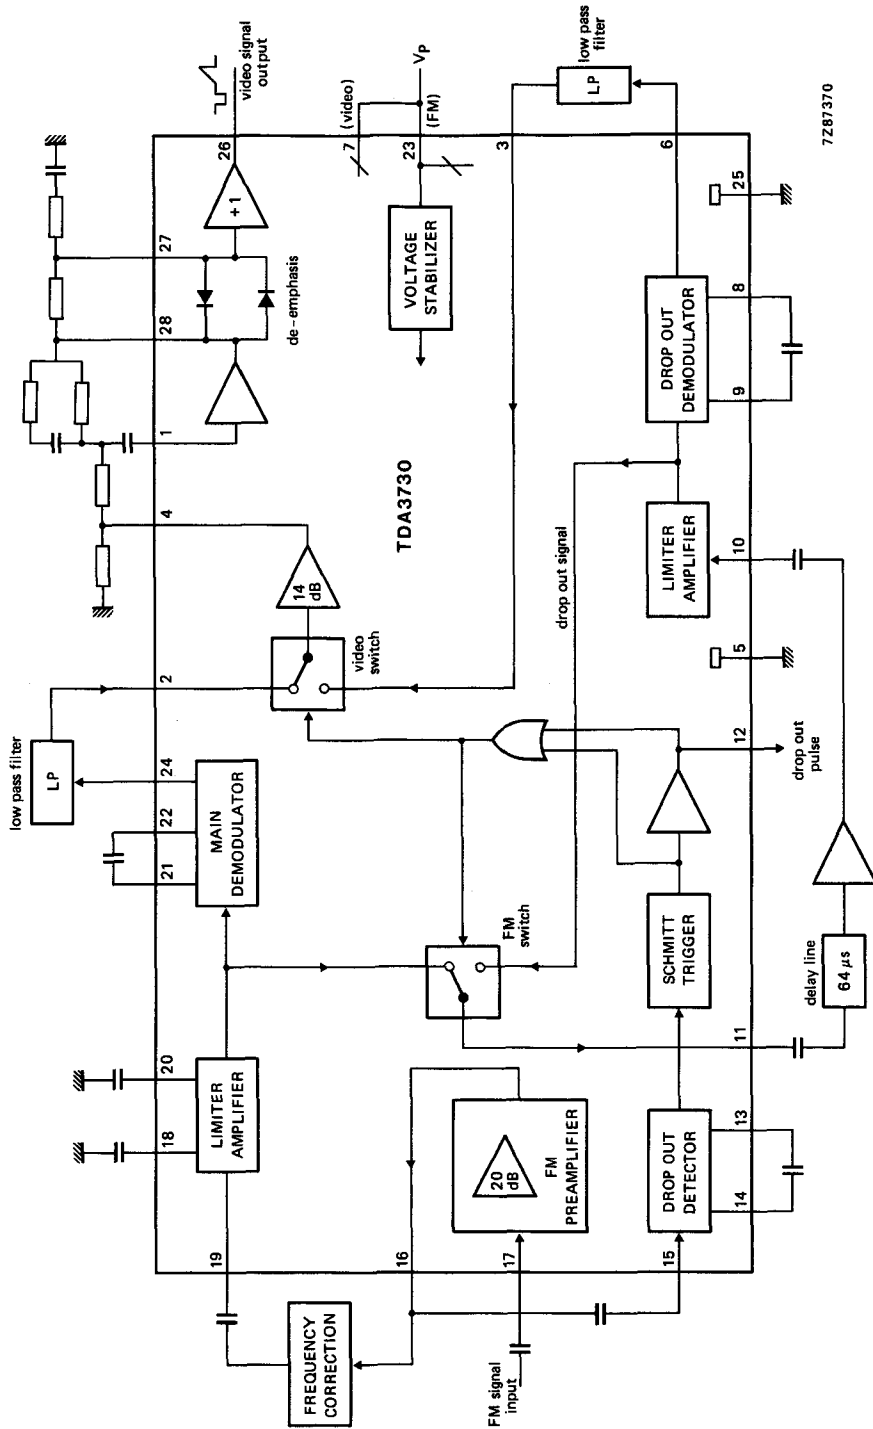

- FM preamplifier
- Limiter in main and drop out channel
- Demodulator in main and drop out channel
- Drop out detector with Schmitt-trigger
- Electronic switches for FM and video signal controlled by drop out detector
- Linear and dynamic video de-emphasis
- D.C. reference stabilizer

### QUICK REFERENCE DATA

Supply voltage (pin 7 and pin 23)	$V_P = V_{7, 23-5, 25}$	typ.	10 V
Supply current (pin 7 + pin 23)	$I_P = I_7 + I_{23}$	typ.	40 mA
FM input signal (pin 17) (peak-to-peak value)	$V_{17-25(p-p)}$	typ.	100 mV
Video output signal (pin 26) (peak-to-peak value)	$V_{26-5(p-p)}$	typ.	2 V

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

7287370

TDA3740

## VIDEO PROCESSOR AND FREQUENCY MODULATOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3740 is a monolithic integrated circuit for video signal processing and frequency modulation in video recorders.

### Features

- Video controlled amplifier with clamping stage
- Fast and slow white amplitude detector
- Sync amplitude detector
- Black and white clip
- Insertion of sync and composite video signals
- Adder stage for composite video and chrominance signals
- Two-stage amplification for the composite video signal with dynamic (adjustable) and linear pre-emphasis
- White clip with external determination of clipping level
- Voltage controlled oscillator (frequency modulator)
- Blanking stage for the voltage controlled oscillator and limiter amplifier
- Reference voltage source

### QUICK REFERENCE DATA

---

Supply voltage (pin 18, 28)	$V_p = V_{18, 28-27}$	typ.	10 V
Supply current (pin 18, 28) (record mode)	$I_p = I_{18, 28}$	typ.	58 mA
Supply current (pin 18) (playback mode)	$I_p = I_{18}$	typ.	28 mA
Composite video input signal (peak-to-peak value)	$V_{3-27(p-p)}$	typ.	350 mV
Composite colour video output signal (peak-to-peak value)	$V_{7-27(p-p)}$	typ.	2 V
Chrominance input signal (peak-to-peak value)	$V_{9-27(p-p)}$	typ.	240 mV
Output current (pin 22, 23)	$I_{22, 23}$	typ.	8,5 mA

---

D.C. level of top sync	V7-27	2,4	2,7	3,0	V
Sync amplitude at CVBS output pin 7	V7-27(p-p)	570	600	630	mV
Gain (f = 4,43 MHz)	G7-9	7	8	9	dB
Output resistance	R7-27	—	—	30	$\Omega$
Frequency response (0 to 5 MHz)	$\alpha$ 7-9	-0,5	—	+0,5	dB
<b>Dynamic and linear pre-emphasis; white limiter</b>					
Input resistance pin 11	R11-27	15	—	—	k $\Omega$
Output resistance (emitter follower with internal current source)	R12-27	—	—	30	$\Omega$
Gain-bandwidth product dynamic (V <sub>24-27</sub> = V <sub>p</sub> )		24	36	—	MHz
linear		30	—	—	MHz

parameter	symbol	min.	typ.	max.	unit
Range of dynamic pre-emphasis (fixed by external resistors at pin 10)	V10-27	0	—	2,5	V
Gain adjustment range at 1 MHz and V7-27 = 632 mV	G12-7	1,5	—	8	dB
Output resistance (emitter follower with internal current source)	R14-27	—	—	30	$\Omega$
White clip level deviation relative to V16-27 = 1,5 V	V16-15	75	—	125	mV
Range of clipping determination (note 2)	V16-27	1	—	3	V
<b>Frequency modulator</b>					
D.C. level at pin 21 (note 3)	V21-27	1,8	1,9	2,0	V
FM output voltage (note 3) R21-27 = 1,5 k $\Omega$ , R22, 23-18 = 470 $\Omega$	V22, 23-27	—	660	—	mV
Slope between 3 MHz and 6 MHz	$\frac{\Delta f_{22,23}}$	—	10,5	—	KHz
	$\Delta I_{17}$	—	—	—	$\mu A$
Linearity between 3 MHz and 6 MHz	m	95	—	—	%
Suppression of the 2nd harmonic referred to the 1st harmonic 3,8 MHz (balanced)	$\alpha_{harm}$	40	46	—	dB
Frequency drift dependent on: drift of supply voltage (V <sub>p</sub> = 9 – 13,2 V)	$\frac{\Delta f_{22,23}}{\Delta V_p}$	—	5	10	$\frac{KHz}{V}$
drift of ambient temperature (T <sub>amb</sub> = 0 – 70 °C) at 3,8 MHz	$\Delta f_{22,23}$	–85	—	+85	kHz
	$\Delta f_{22,23}$	–85	—	+85	kHz
Drift of frequency span dependent on temperature drift (T <sub>amb</sub> = 0 – 70 °C)	$\Delta f$	–70	—	+70	kHz
Input voltage to switch FM off	V24-27	—	—	2	V
Input voltage to switch FM on	V24-27	3	—	—	V
Input resistance	R24-27	10	—	—	k $\Omega$

parameter	symbol	min.	typ.	max.	unit
<b>Reference voltage source (pin 25)</b>					
Output voltage	$V_{25-27}$	–	5,5	–	V
Output current (additional to application)	$I_{25}$	–3	–	+5	mA
Output voltage drift dependent on drift of supply voltage ( $V_p = 9 - 13,2$ V)	$\frac{\Delta V_{25-27}}{\Delta V_p}$	–10	–	+10	$\frac{mV}{V}$
drift of ambient temperature ( $T_{amb} = 0 - 70$ °C)	$\Delta V_{25-27}$	–90	–	+90	mV

**Notes**

1. Duration of clamping pulse is determined by  $C_{4-27}$  as follows:  $t_d (\mu s) = 1,364 \cdot C_{4-27} (nF)$ .
2. White clipping level is fixed by the external resistors at pin 16, e.g.  $R_{16-25} = 3,3 k\Omega$  and  $R_{16-27} = 2 k\Omega$  results in 160% clipping level.
3. FM output amplitude at pins 22 and 23 is determined by the external fixed resistors  $R_{21-27}$ ,  $R_{22-18}$  and  $R_{23-18}$ .

## PAL/NTSC/SECAM SYNCHRONIZATION PROCESSOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3755 is a monolithic integrated circuit for PAL/NTSC SECAM synchronization processing in VHS video recorders.

### Features

- Adaptive sync separator
- Internal vertical sync pulse integrator
- Composite sync and vertical pulse output
- Current controlled oscillator (CCO) with 320/321 times horizontal frequency
- Horizontal phase detector with current output
- Video identification and mute circuit
- Burst gating pulse output (externally adjustable phase relationship)
- Test-picture output
- Subcarrier frequency output switched in phase in accordance with VHS standard
- Fast phase correction of subcarrier frequency
- Selection input to force PAL or NTSC function
- Still picture input

### QUICK REFERENCE DATA

Supply voltage (pin 13)	$V_p = V_{13-15}$	typ.	10 V
Supply current (pin 13)	$I_p = I_{13}$	typ.	24 mA
<b>Sync separator</b>			
Sync pulse input voltage (peak-to-peak value)	$V_{3-15(p-p)}$	typ.	300 mV
Sync pulse output voltage (peak-to-peak value)	$V_{1-15(p-p)}$	min.	7,3 V
<b>Vertical sync pulse</b>			
Output voltage (peak-to-peak value)	$V_{18-15(p-p)}$	min.	2,7 V
<b>Phase detector</b>			
Catching range	$\Delta f$	min.	$\pm 3,0 \%$
<b>Oscillator</b>			
Oscillator frequency			
PAL	$f_{osc}$	typ.	5,02 MHz
NTSC	$f_{osc}$	typ.	5,04 MHz
Output frequency			
PAL	$f_o$	typ.	627 kHz
NTSC	$f_o$	typ.	629 kHz
Output sinewave (peak-to-peak value)	$V_{8-15(p-p)}$	typ.	3 V

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

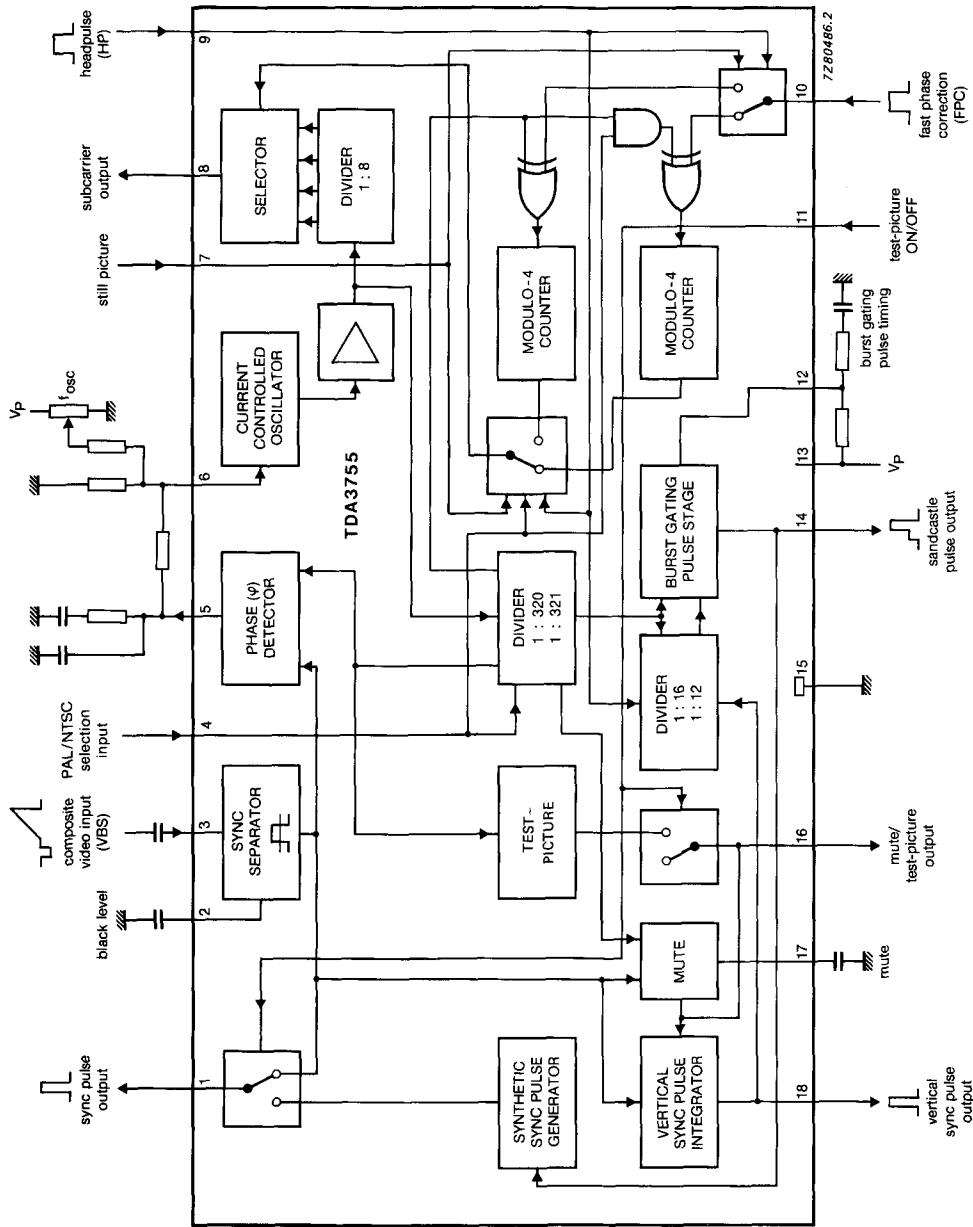

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 13)	$V_P = V_{13-15}$	max.	13,2 V
Voltage range at pins 2, 3, 4, 7, 9, 10, 11, 17 to pin 15 (ground)	$V_{n-15}$		0 to $V_P$ V
Voltage range at pin 12	$V_{12-15}$	min.	0 V
Voltage range at pin 6	$V_{6-15}$	max.	8 V
Currents			
at pins 1, 5, 8, 14, 16, 18	$\pm I_n$	max.	5 mA
at pin 6	$-I_6$	max.	1 mA
at pin 12	$I_{12}$	max.	2 mA
Total power dissipation	$P_{tot}$	max.	1 W
Storage temperature range	$T_{stg}$		-25 to + 150 °C
Operating ambient temperature range	$T_{amb}$		0 to + 70 °C

## CHARACTERISTICS

$V_p = 10\text{ V}$ ;  $T_{amb} = 25\text{ }^\circ\text{C}$ ; measured in Fig. 4; unless otherwise specified

<b>Test picture/mute/synthetic sync pulse</b>					
Minimum voltage at pin 11 for test picture mode active (note 4)	V <sub>11-15</sub>	4,8	—	—	V
Maximum voltage at pin 11 for test picture mode inactive	V <sub>11-15</sub>	—	—	3,8	V
Output voltage at pin 16					
at test picture "black" or at mute	V <sub>16-15</sub>	—	2,75	—	V
at test picture "white"	V <sub>16-15</sub>	—	4,50	—	V
at "in sync condition"	V <sub>16-15</sub>	—	—	0,5	V
Input current (pin 11)	-I <sub>11</sub>	—	—	25	μA
<b>Oscillator/phase detector</b>					
Oscillator frequency (note 5)					
PAL	f <sub>osc</sub>	—	5,02	—	MHz
NTSC	f <sub>osc</sub>	—	5,04	—	MHz
Oscillator conversion gain	k <sub>o</sub>	—	16,13	—	MHz/mA
D.C. control voltage	V <sub>6-15</sub>	—	2,1	—	V
Input current for f = 5,016 MHz	-I <sub>16</sub>	—	310	—	μA
Holding range (note 6)	Δf	± 3,2	—	—	%
Catching range (note 6)	Δf	± 3,0	—	—	%
Control loop gain	k <sub>v</sub>	—	380 x 10 <sup>3</sup>	—	s <sup>-1</sup>
Output of lower subcarrier (note 7) (peak-to-peak value)	V <sub>8-15(p-p)</sub>	—	3	—	V
Output current	I <sub>8</sub>	—	—	2	mA
D.C. output voltage	V <sub>8-15</sub>	—	3,1	—	V
2nd harmonic suppression without switching	α <sub>2nd</sub>	20	—	—	dB
Switching position prior to centre of sync pulse (pin 3)	t <sub>s</sub>	—	2	—	μs
Output peak current of phase detector during sync pulse	± I <sub>5</sub>	—	3,78	—	mA
Output voltage range (note 8)	V <sub>5-15</sub>	1,4	—	2,8	V

## CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
<b>Sandcastle pulse (pin 14; note 9)</b>					
Output voltage HIGH (note 10) at $-I_{14} = 1$ mA	V <sub>14-15</sub>	7,8	—	—	V
Output voltage INTERMEDIATE at $-I_{14} = 1$ mA	V <sub>14-15</sub>	2,3	3,0	3,7	V
Output voltage LOW at $I_{14} = 1$ mA	V <sub>14-15</sub>	—	—	0,5	V
Lower part is starting prior to the centre of sync pulse at pin 3 and ending with the upper part	t <sub>14-3</sub>	—	2,6	—	μs
<b>Fast phase correction/head pulse</b>					
Threshold voltage for fast phase correction (note 11)	V <sub>10-15</sub>	—	7,2	—	V
Input current	-I <sub>10</sub>	—	—	20	μA
Threshold voltage of head pulse input	V <sub>9-15</sub>	—	1,4	—	V
Input current	-I <sub>9</sub>	—	—	20	μA
D.C. input voltage	V <sub>7-15</sub>	—	5,6	—	V
Input resistance	R <sub>7-15</sub>	3	—	—	kΩ
<b>Subcarrier phase switching (note 12)</b>					
Phase switching of subcarrier phase in accordance with head pulse if	V <sub>7-15</sub>	—	5,6*	—	V
LOW state of still picture input	V <sub>7-15</sub>	—	—	0,5	V
Continuous phase switching regardless of head pulse if	V <sub>7-15</sub>	—	V <sub>p</sub>	—	V

\* Or not connected.

## Notes to characteristics

1. The sync separator input signal is shown in Fig. 2.

Fig. 2 Colour composite video input signal at pin 3.

2. The black level and the top sync level are detected internally and stored in capacitors at pin 2 and pin 3 respectively.
3. The vertical sync pulse output is disabled by mute.
4. In test picture mode the synthetic sync pulse is fed to output pin 1 and the vertical pulse consists of an uninterrupted block pulse of  $192 \mu\text{s}$  triggering at every transition of head pulse (HP) at pin 9. The timing of test picture and synthetic sync pulse is shown in Fig. 3.

Where: The value of  $t_1$  is dependent upon adjustment of the burst gating pulse delay.  
Time  $t_2$  is the burst gating pulse duration.

Fig. 3 Timing of test picture and synthetic sync pulse.

5. Oscillator adjustment during test picture mode made only, at  $V_{11-15} > 4,8 \text{ V}$ ,  $V_{7-15} = 0 \text{ V}$  and  $V_{4-15} > 2 \text{ V}$  or open circuit; measurement is  $f_{\text{osc}}/8$  at output pin 8.
6. The holding range and catching range are both determined by the resistor connected between pin 5 and pin 6.
7. The phase of the lower subcarrier is switched in accordance with the VHS standard. PNP emitter follower, internal resistive load of  $10 \text{ k}\Omega$  (typ.) to  $V_P$ .
8. The output voltage at pin 5 is disabled during test picture mode.

**Notes to characteristics (continued)**

9. The burst gating pulse is superimposed on an uninterrupted horizontal pulse. It is suppressed 16 times starting with every transition of the head pulse at pin 9. If a vertical pulse is detected during that time the burst gating pulses are additionally suppressed until line 12 and line 324 respectively. In any event the number of suppressed burst gating pulses is even.
10. The timing of the upper part of the sandcastle pulse is determined by the components connected to pin 12 (Fig. 4) and is independent of supply voltage variations.
11. The fast phase correction pulses have to be in the burst gating reference pulse. For any HIGH to LOW transitions of the correction pulse the phase is corrected by  $-90^\circ$  if the head pulse input is LOW and by  $+90^\circ$  if the head pulse input is HIGH.
12. Subcarrier phase switching is detailed in Table 1.  
Subcarrier is  $40,000 \times f_H$  for NTSC state and  $40,125 \times f_H$  for PAL state.

**Table 1** Subcarrier phase switching

still picture input	PAL		NTSC	
	HP = HIGH	HP = LOW	HP = HIGH	HP = LOW
HIGH	$-90^\circ$	$-90^\circ$	$-90^\circ$	$-90^\circ$
not connected	$0^\circ$	$-90^\circ$	$+90^\circ$	$-90^\circ$
LOW	$0^\circ$	$0^\circ$	$+90^\circ$	$+90^\circ$

APPLICATION INFORMATION

## PAL CHROMINANCE SIGNAL PROCESSOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3760 is a monolithic integrated circuit for chrominance signal processing in video recorders.

#### Features

- Automatic gain controlled pre-amplifier with record/playback selection
- Signal mixer with balancing stage
- Output stage for the 627 kHz chrominance signal, with facility for being disabled by colour killer and record/playback mode switch
- Amplitude detector with automatic gain control for the preamplifier
- 4,43 MHz voltage controlled oscillator (VCO) for recording and playback
- 4,43 MHz fixed oscillator for playback
- Phase detector controlled synchronization of the VCO
- Subcarrier mixer
- H/2 demodulator for the production of PAL identification and colour killing signals
- Flip-flop for PAL identification
- Sandcastle pulse processing
- Colour killing stage with hysteresis
- Internal record/playback selection
- Second phase detector for fast phase correction of sub-carrier

### QUICK REFERENCE DATA

Supply voltage (pin 9)	$V_P = V_{9-15}$	typ.	10 V
Supply current (pin 9)	$I_P = I_9$	typ.	45 mA
<b>Inputs</b>			
Chrominance signal			
4,43 MHz for record (peak-to-peak value)	$V_{2-15(p-p)}$	typ.	200 mV
627 kHz for playback (peak-to-peak value)	$V_{1-15(p-p)}$	typ.	200 mV
<b>Outputs</b>			
Chrominance signal			
4,43 MHz (peak-to-peak value)	$V_{24-15(p-p)}$	typ.	490 mV
627 kHz (peak-to-peak value)	$V_{26-15(p-p)}$	typ.	2 V

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

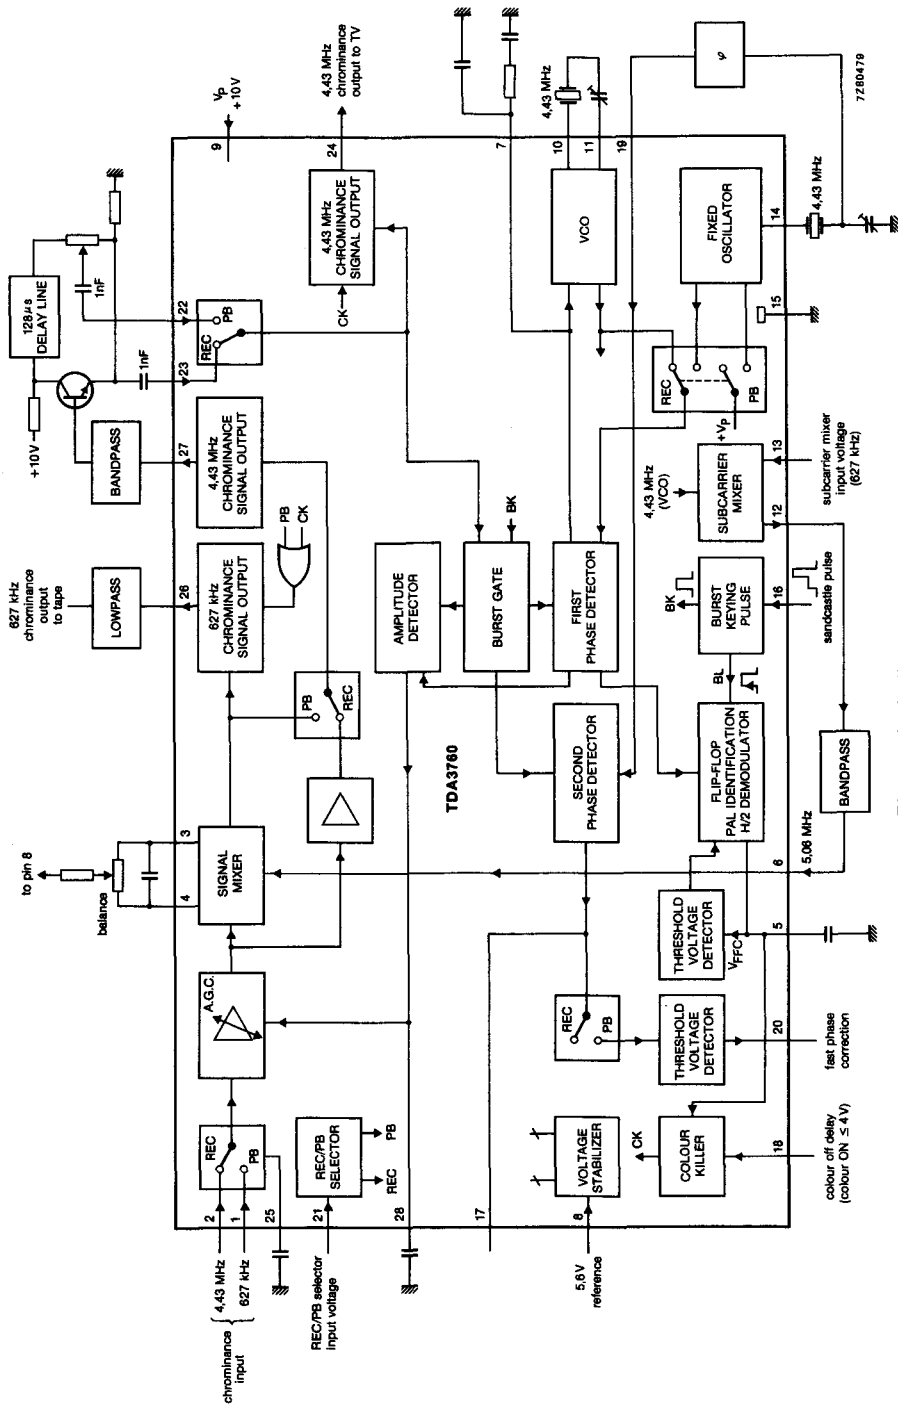

Fig. 1 Block diagram.

- BK = burst key pulse
- BL = blanking pulse
- FFC = flip-flop correction
- FPC = fast phase correction
- REC = record
- PB = playback
- CK = colour killer

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 9)	$V_P = V_{9-15}$	max.	13,2 V
Voltage range at pins 1, 2, 5, 7, 8, 9, 16, 17, 18, 19, 20, 21, 22, 23 to pin 15 (ground)	$V_{n-15}$		0 to $V_P$ V
Voltage ranges at pins 3, 4, 28*	$V_{3, 4, 28-15}$		3 to 6 V
at pin 6, 25*	$V_{6, 25-15}$		0 to 5 V
at pin 10*	$V_{10-15}$		1,5 to 4 V
at pin 13*	$V_{13-15}$		0 to 3 V
at pin 14*	$V_{14-15}$		0 to 8 V
Voltages at pin 12	$V_{12-15}$	max.	$V_P$ V
at pin 24	$V_{24-15}$	max.	7 V
Currents at pins 11, 18	$-I_{11, 18}$	max.	2 mA
at pins 12, 26, 27	$-I_{12, 26, 27}$	max.	5 mA
at pin 24	$-I_{24}$	max.	3 mA
Total power dissipation	$P_{tot}$	max.	1,4 W
Storage temperature range	$T_{stg}$		-25 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to +70 °C

\* Measured with  $V_{8-15} = 5,6$  V

## CHARACTERISTICS

$V_P = V_{9-15} = 10\text{ V}$ ;  $V_{8-15} = 5,6\text{ V}$ ;  $T_{amb} = 25\text{ }^\circ\text{C}$ ; burst key duration  $4\text{ }\mu\text{s}$ ; unless otherwise specified

## NTSC CHROMINANCE SIGNAL PROCESSOR FOR VIDEO RECORDERS

### GENERAL DESCRIPTION

The TDA3765 is a monolithic integrated circuit for chrominance signal processing in video recorders.

### Features

- Automatic gain controlled pre-amplifier with record/playback selection
- Signal mixer with balancing stage
- Output stage for the 629 kHz chrominance signal, with facility for being disabled by colour killer and record/playback mode switch
- Amplitude detector with automatic gain control for the preamplifier
- 3,58 MHz voltage controlled oscillator (VCO) for recording and playback
- 3,58 MHz fixed oscillator for playback
- Phase detector controlled synchronization of the VCO
- Subcarrier mixer
- Sandcastle pulse processing
- Colour killing stage with hysteresis
- Internal record/playback selection
- Second phase detector for fast phase correction of sub-carrier

### QUICK REFERENCE DATA

Supply voltage (pin 9)	$V_P = V_{9-15}$	typ.	10 V
Supply current (pin 9)	$I_P = I_9$	typ.	45 mA

### Inputs

Chrominance signal			
3,58 MHz for record (peak-to-peak value)	$V_{2-15(p-p)}$	typ.	200 mV
629 kHz for playback (peak-to-peak value)	$V_{1-15(p-p)}$	typ.	200 mV

### Outputs

Chrominance signal			
3,58 MHz (peak-to-peak value)	$V_{24-15(p-p)}$	typ.	490 mV
629 kHz (peak-to-peak value)	$V_{26-15(p-p)}$	typ.	2 V

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 9)	$V_P = V_{9-15}$	max.	13,2 V

## BAND SELECTOR AND WINDOW DETECTOR

### GENERAL DESCRIPTION

The TDA3791 is a monolithic integrated circuit intended for application in search-tuning systems for video recorders. It is designed to select one out of four tuners, each representing a particular band. Band selection tuning is indicated by a variable voltage  $V_{AFC}$ .

### Features

- Voltage window detector
- Band switch selector
- 4 short-circuit protected band switches
- Muting circuit
- Delay circuit
- Short-circuit protection circuit
- Power-on reset

### QUICK REFERENCE DATA

Supply voltage (pin 8)	$V_P = V_{8-16}$	typ.	12 V
Supply current (pin 8)	$I_P = I_8$		
unloaded band switches ON		typ.	25 mA
all band switches OFF		typ.	12 mA
Power dissipation	$P_{tot}$	max.	1,8 W
Storage temperature range	$T_{stg}$		-65 to +150 °C
Operating ambient temperature range	$T_{amb}$		0 to 70 °C

### PACKAGE OUTLINE

16-lead DIL; plastic with internal heat spreader (SOT38).

$$(1) R = \frac{10 \text{ V}}{35 \text{ mA}} \quad (2) R = \frac{5 \text{ V}}{2 \text{ mA}}$$

Fig. 1 Block diagram.

**FUNCTIONAL DESCRIPTION****Voltage window detector** (see Table 1)

The voltage window is dependent upon two inputs;  $V_{WM}$  (pin 2) and  $1/2V_{WW}$  (pin 1), which represent the centre of the window and the (window width)/2 respectively.

The voltage window range is from  $V_{WM} - 1/2V_{WW}$  to  $V_{WM} + 1/2V_{WW}$ . A variable input voltage  $V_{AFC IN}$  (pin 15) is compared with these window edges.

**Table 1** Truth table; window detector

inputs	outputs	
$V_{AFC IN} = V_{15-16}; V_{WM} = V_{2-16}; V_{WW} = V_{1-16}$	$V_{12-16}$	$V_{13-16}$
$V_{AFC IN} < V_{WM} - 1/2V_{WW}$	HIGH	LOW
$V_{WM} - 1/2V_{WW} < V_{AFC IN} < V_{WM} + 1/2V_{WW}$	HIGH	HIGH
$V_{AFC IN} > V_{WM} + 1/2V_{WW}$	LOW	HIGH

Where:  $V_{12-16}$  = tuning too low (TTL);  $V_{13-16}$  = tuning too high (TTH).

During transitions of the outputs ( $V_{12-16}$  and  $V_{13-16}$ ), a hysteresis value of approximately 20 mV is applied at the window edges.

**Band-switch selector** (see Table 2)

Selection of the band switches is determined by the input voltage levels of MSB (pin 4) and LSB (pin 5).

- If MSB or LSB  $> 4$  V, the input is HIGH
- If MSB or LSB  $< 0,8$  V, the input is LOW.

The band switches are selected as confirmed by Table 2.

**Table 2** Truth table; band switch selector

MSB ( $V_{4-16}$ )	LSB ( $V_{5-16}$ )	switch	HIGH output
HIGH	HIGH	I	$V_{10-16}$
HIGH	LOW	II	$V_{9-16}$
LOW	HIGH	III	$V_{7-16}$
LOW	LOW	IV	$V_{6-16}$

**Short-circuit protected band switches**

A selected band switch has a minimum output voltage of  $V_p - 0,3$  V provided the current is not more than 35 mA ( $I_{10}, I_9, I_7, I_6$ ). If the output voltage at pins 10, 9, 7 or 6 is less than 9 V a short-circuit condition exists, and the output current will not be more than 80 mA. In this event the band switch is switched off, after an externally determined delay.

**Muting**

The muting circuit is active when a selected band switch is switched off. Both outputs TTL (pin 12) and TTH (pin 13) will then be LOW.

**FUNCTIONAL DESCRIPTION (continued)****Delay circuit**

After selection of a band switch, it will be in a conducting state. If after selection and a delay, the output voltage has not reached 9 V, the band is switched off. This delay is determined by an external capacitor on output SW<sub>DE</sub> (pin 3).

**Short-circuit protection**

The short-circuit protection of each switch is provided by a flip-flop. If the condition of a band switch  $V_O < 9\text{ V}$  is detected, its flip-flop will be set and the band switch is switched off.

In the event of an incidental short-circuit to a band switch output, the band switch can be reset by applying 0 V to the power-on reset input (pin 11) or 0 V to the switch delay output SW<sub>DE</sub> (pin 3).

**Power-on reset**

Before the voltage supply reaches 9,6 V, the short-circuit protection flip-flops are reset to enable the selection of a band switch.

The power-on reset circuit also supplies the voltage level for short-circuit detection.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 8)	$V_P = V_{8-16}$	max.	13,2 V

## STEREO/DUAL TV SOUND PROCESSING CIRCUITS

### GENERAL DESCRIPTION

The TDA3800G; GS are stereo/dual TV sound decoder circuits for processing an a.f. and a sound i.f. signal in TV and VCR equipment, using active filters in selective frequency processing.

In deviation of our standard terms and conditions of sale the supply of the TDA3800 (ABS) does not imply any patent indemnity whatsoever with respect to the stereo-tone patent rights of I.G.R. Germany.

### Features

- Signal processing of one a.f. signal and one i.f. signal
- 2nd i.f. limiter/amplifier and FM demodulator (5,742 MHz) for the second sound channel
- Pilot carrier processing with digital identification, hysteresis and short switching times
- De-matrixing of the signals for the two audio channels
- De-emphasis
- Two dual channel, independently controllable a.f. outputs
- Low-resistance a.f. outputs (short-circuit protected); can be used for headphone
- Standardized switched output for controlling external audio/video equipment
- Signal path control by an identification bit (also in audio/video mode)
- LED indication of selected mode (also in audio/video mode)
- Possibility to apply a.f. signals from external equipment via the de-emphasis inputs (audio/video mode)
- Mode selection of stereo/mono or sound I/sound II
  - TDA3800G dynamic selection with internal storage
  - TDA3800GS static selection

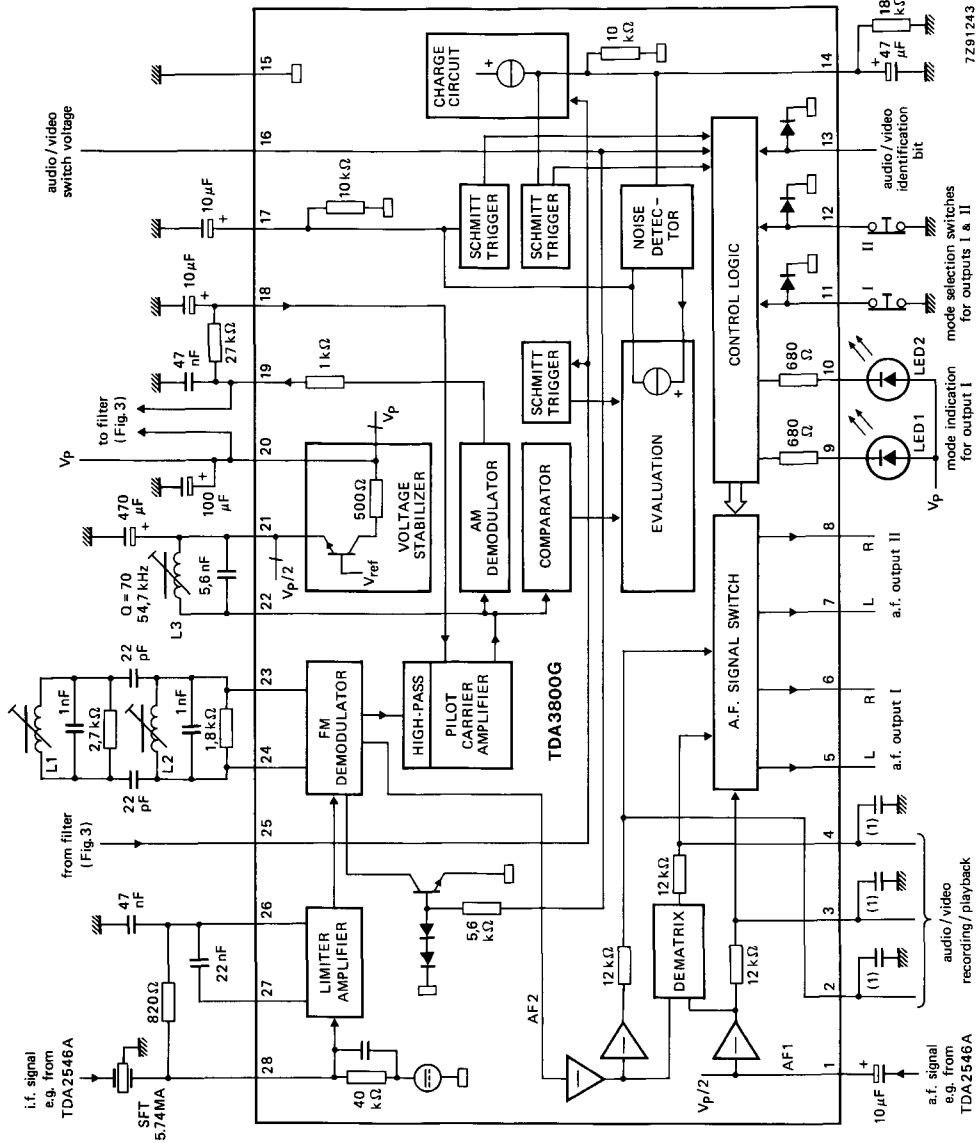

### QUICK REFERENCE DATA

Supply voltage (pin 20)	$V_P = V_{20-15}$	typ.	12 V
2nd sound i.f. input voltage for start of limiting (r.m.s. value)	$V_{i(rms)}$	typ.	50 $\mu$ V
Pilot carrier amplifier control range	$\Delta G_V$	min.	20 dB
A.F. input voltage (r.m.s. value)	$V_{i(rms)}$	typ.	1 V
A.F. demodulator output voltage (r.m.s. value)	$V_{o(rms)}$	typ.	0,6 V
LED output current	$I_{LED}$	typ.	15 mA
Signal-to-noise ratio of the a.f. signal switches	S/N	typ.	80 dB
Crosstalk in stereo mode	$\alpha_S$	min.	40 dB
Crosstalk in dual sound mode	$\alpha_{DS}$	min.	60 dB

### PACKAGE OUTLINES

Maximum d.c. output current short-circuit protected	± I <sub>21</sub>	—	0,5	—	mA

Notes to the characteristics (TDA3800G only)

1. Serial commands for stereo/mono or sound I/sound II selection are determined by the identification bit of the transmission.
2. The pushbuttons at pins 11 and 12 are assigned to the a.f. outputs I and II respectively.
3. When a transmitter changes its identification from dual sound to stereo and then back to dual sound again, the last selected dual sound signal is available automatically because of the internal storage of the choice. This is also applicable for mono/stereo selection.
4. Power-on reset: when applying the supply voltage, the stereo or the AF1 signal appears at both outputs I and II depending on the type of transmission.

Table 1 Mode indication possibilities

LED 1	LED 2	selected reception mode
OFF	OFF	mono at mono or stereo transmission
ON	ON	stereo at stereo transmission
OFF	ON	AF1 signal at dual sound transmission
ON	OFF	AF2 signal at dual sound transmission

## STEREO/DUAL TV SOUND DECODER CIRCUIT

### GENERAL DESCRIPTION

The TDA3803A is a stereo/dual TV sound decoder circuit with static switching for processing two AF signals in TV and VCR equipment. The LOW/HIGH static switching signals control the AF output selector. Two operational amplifiers perform bandpass filtering of the identification signals.

### Features

- Amplification of the two AF input signals by integrated operational amplifiers
- Low distortion stereo de-matrix
- All operational amplifiers offset compensated
- De-emphasis with operational amplifiers, preferably applied to the output terminals
- Two output ports each with two channels for headphones and loudspeakers
- Dual sound information at one port, each port individually switchable from sound I to sound II and sound II to sound I
- Mute function; while mute is active, it is possible to connect an external mono AF input signal to pin 10 appearing at pins 20 to 23.
- Identification without additional signals (horizontal etc.)

### QUICK REFERENCE DATA

Supply voltage (pin 13)	$V_P = V_{13-12}$	typ.	12 V
Supply current (pin 13)	$I_P = I_{13}$	typ.	28 mA
Pilot carrier amplifier gain control range	$\Delta G_V$	>	40 dB
AF input signals; at $G_V = 0$ dB (r.m.s. value)	$V_{i(rms)}$	=	1 V
LED output current	$I_{LED}$	typ.	12 mA
Weighted signal-to-noise ratio of the a.f. signal switches (CCIR468/2)	$(S+N)/N$	$\geq$	60 dB
Crosstalk in stereo mode	$\alpha_S$	>	40 dB
Crosstalk in dual sound mode	$\alpha_{DS}$	>	60 dB

Dual sound transmission: LED indication is valid for port I					

Table 1 Mode indication (note 1)

transmission mode	LED pin 15	LED pin 14
mono	OFF	OFF
stereo:		
stereo selection; $V_{19-12} \geq 2$ V	ON	ON
mono selection; $V_{19-12} \leq 0,8$ V	ON	ON
dual sound:		
sound I selection; $V_{17-12} \leq 0,8$ V	ON	OFF
sound II selection; $V_{17-12} \geq 2$ V	OFF	ON

## Notes to the characteristics

1. With mute (pin 18) ON both LEDs (pin 14 and 15) are switched OFF.
2. Pin 14 and 15 are also suitable as output switches to control TDA3810.  
At LED OFF and  $I_{14, 15} \leq 100 \mu\text{A}$ , then  $V_{14, 15-12} \leq 200$  mV.

TDA3806

## MULTIPLEX PLL STEREO DECODER

The TDA3806 is a phase-locked loop (PLL) stereo decoder for decoding the stereo multiplex signal. The decoding signal is generated by a phase-locked loop system. Second audio program (SAP) and adjacent channel interference (ACI) are suppressed by the internal circuitry. The decoder has a main signal and a sub-signal output. It is possible to apply a separate noise reduction system to the sub-signal. Main signal and noise reduced sub-signal have to be combined at an external matrix to both L and R.

### Features

- Adjustable gain by external resistors (separate for main and sub-signal)
- D.C. input for smooth mono-stereo takeover control (without influencing the pilot indicator)
- Pilot dependent mono-stereo switch
- Pilot indicator driver
- PLL oscillator switch-off facility
- Buffered oscillator frequency measuring facility
- Internal suppression of Second Audio Program (SAP) distortion (5th harmonic of pilot)
- Suppression of Adjacent Channel Interference (ACI) distortion (3rd harmonic of sub carrier)
- Electronic hum filtering

### QUICK REFERENCE DATA

TDA3808

## SECOND AUDIO PROGRAMME (SAP) SIGNAL PROCESSOR

### GENERAL DESCRIPTION

The circuit provides amplification, limiting, demodulation, indication and "no-signal" muting for processing the SAP facility of the multi-channel television sound system.

The main selectivity is done by a four pole bandpass filter in front of the integrated circuit.

### Features

- Selective amplifier
- Limiter
- Phase demodulator
- Level detector

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 4)	$V_p$	1,8	—	6,0	V
Supply current at $V_p = 4,5$ V	$I_p$	—	7	—	mA
Signal handling (e.m.f.)	$V_i$	—	200	—	mV
A.F. output voltage	$V_o$	—	160	—	mV

### PACKAGE OUTLINE

## SPATIAL, STEREO AND PSEUDO-STEREO SOUND CIRCUIT

The TDA3810 integrated circuit provides spatial, stereo and pseudo-stereo sound for radio and television equipment.

### Features

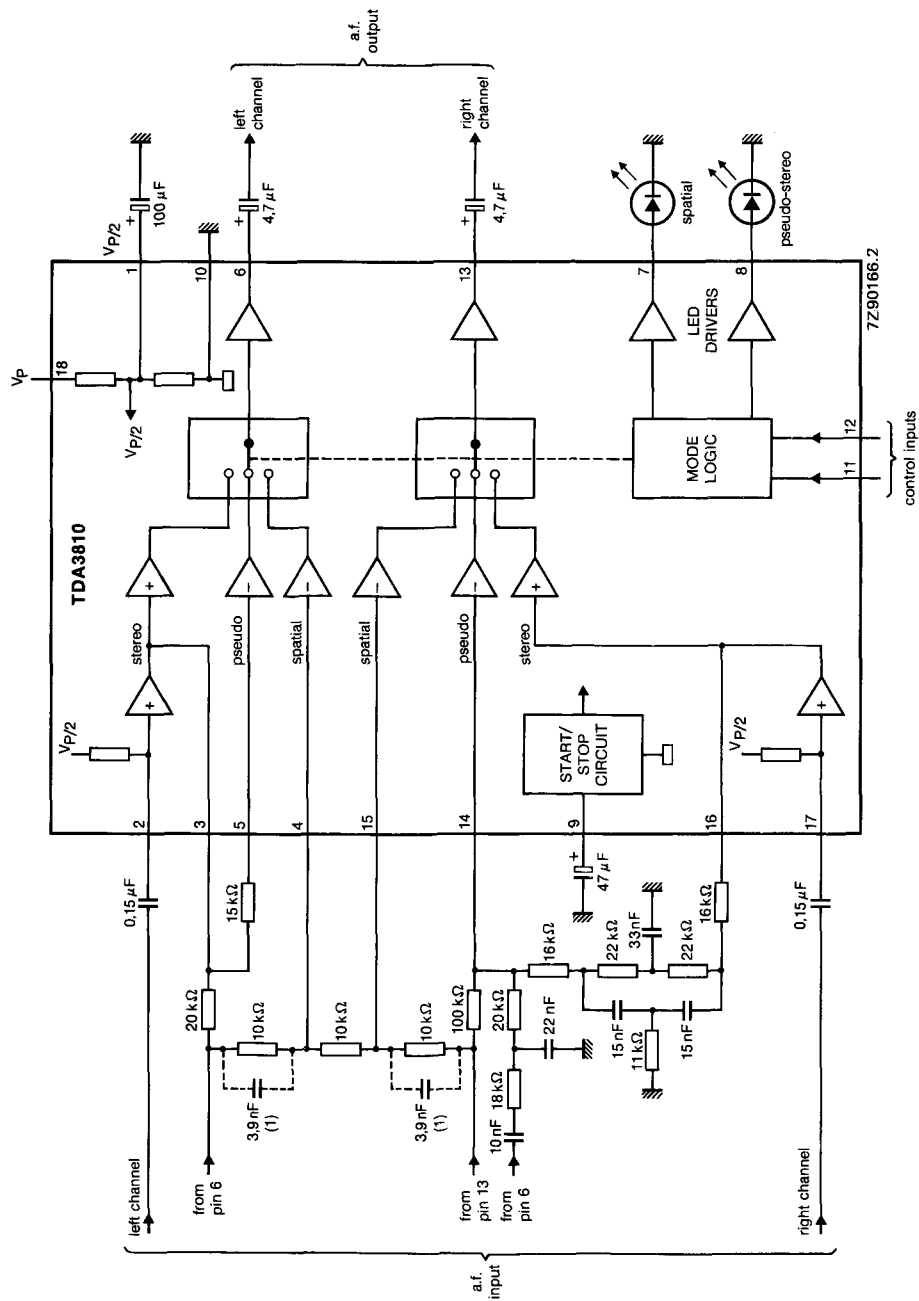

- Three switched functions: spatial (widened stereo image)  
stereo  
pseudo-stereo (artificial stereo from a mono source)
- Offset compensated operational amplifiers to reduce switch noise
- LED driver outputs to facilitate indication of selected operating mode
- Start/stop circuit to reduce switch noise and to prevent LED-flicker
- TTL-compatible control inputs

### QUICK REFERENCE DATA

Supply voltage (pin 18)	$V_p$	typ.	12 V
Supply current (LEDs off)	$I_p$	typ.	6 mA
Operating ambient temperature range	$T_{amb}$	0 to	+ 70 °C
Input signal (r.m.s. value)	$V_{i(rms)}$	<	2 V
Total harmonic distortion (stereo)	THD	typ.	0,1 %
Channel separation (stereo)	$\alpha$	typ.	70 dB
Gain (stereo)	$G_v$	typ.	0 dB

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

(1) Used in spatial mode for correction of high frequency only (optimal performance).

Fig. 1 Block diagram/test circuit showing external components; for control inputs to pins 11 and 12 see truth table.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 18)	$V_p$	max.	18 V

TDA3825

## SINGLE FM TV-SOUND DEMODULATOR CIRCUIT

### GENERAL DESCRIPTION

The TDA3825 is a single FM demodulator system with external AF input and mute.

### Features

- Supply voltage range from 4.5 V to 13.2 V
- AC coupled AF stage
- Multiple input AF operational amplifier with offset compensation
- External AF input
- High AF output voltage with low distortion
- AF gain of 0 dB without external components
- Frequency response can be determined by external components
- High ripple rejection
- Low switching noise between AF and mute

TDA3826

## SINGLE FM TV-SOUND DEMODULATOR CIRCUIT

### GENERAL DESCRIPTION

The TDA3826 is a single FM demodulator system with mute and 6 dB AF amplifier.

### Features

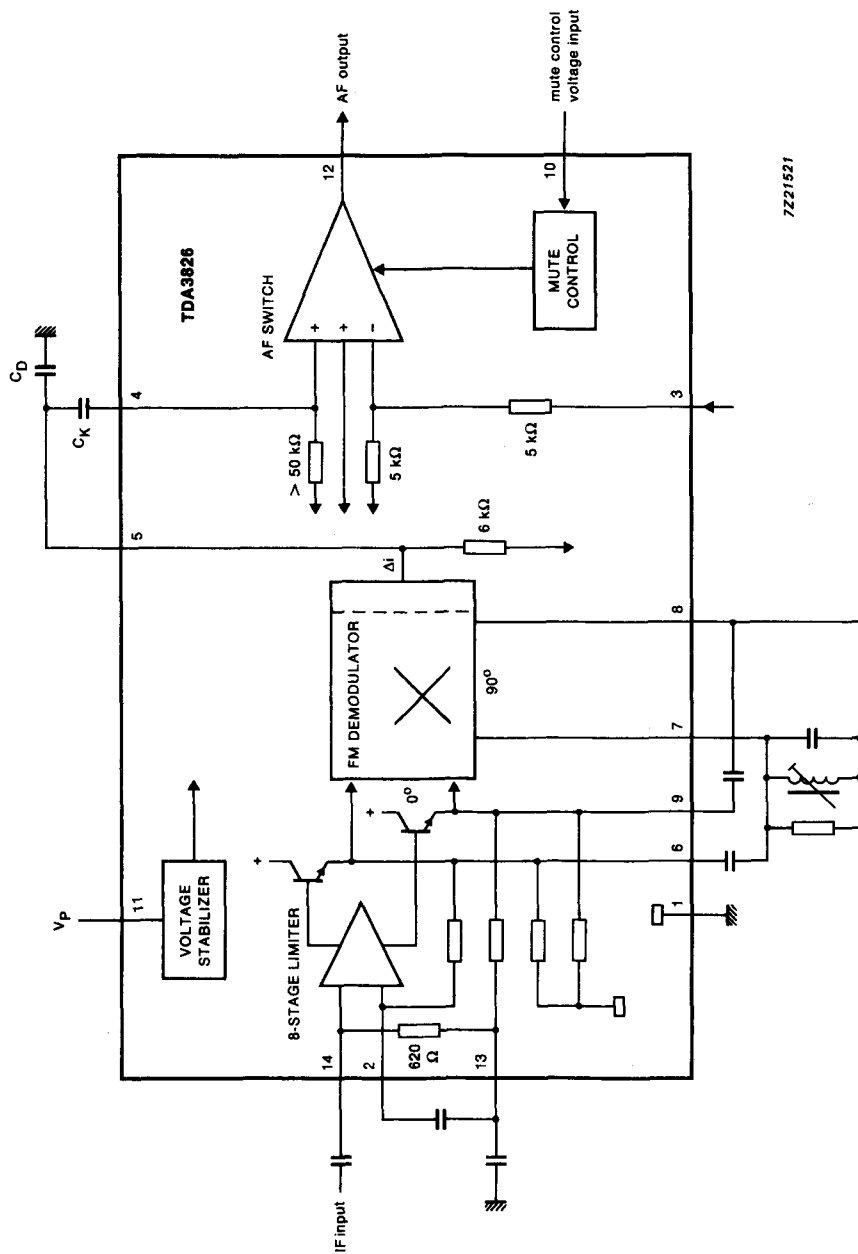

- Supply voltage range from 4.5 V to 13.2 V
- AC coupled AF stage
- AF operational amplifier output with offset compensated input stage
- High AF output voltage with low distortion
- High ripple rejection
- Low switching noise between AF and mute

TDA3845

## QUASI-SPLIT-SOUND CIRCUIT AND AM DEMODULATOR

The TDA3845 is a quasi-split-sound IF circuit which is designed to give high performance television FM/AM sound.

### Features

- Power supply from 5 V (200 mW) to 8 V source as well as an alternative 12 V source
- Gain controlled wideband IF amplifier (AC coupled with three stages)
- High precision internal 90° phase shifter for quadrature demodulator
- Amplitude detector for gain control which operates as a peak detector for FM sound and as a mean level detector for AM sound (switchable)
- Inphase wideband synchronous demodulator for AM detection
- Stabilizer circuit for ripple rejection and constant output signals
- ESD protection for all pins
- Suitable for all FM standards and L standard
- NICAM compatible

### QUICK REFERENCE DATA

<i>AM/AF signal</i>						
αRR = voltage ripple on V <sub>p</sub> /voltage ripple on output signal		αRR	30	40	—	dB
<i>FM phase noise</i>						
Δf <sub>rms</sub> intercarrier signal		Δf <sub>(rms)</sub>	—	10	20	Hz

**Notes to the characteristics**

- Start of gain control (LOW IF input signal) at −3 dB intercarrier signal reduction at pin 12, AGC mode set to FM or −3 dB AF signal reduction at pin 6, AGC mode set to AM.
- End of gain control (HIGH IF input signal) at +1 dB intercarrier signal expansion at pin 12, AGC mode set to FM or +1 dB AF signal expansion at pin 6, AGC mode set to AM.
- Picture carrier (38.9 MHz) to sound carriers (33.4 MHz/33.158 MHz) ratio: 13/20 dB.  
IF input signal (picture carrier at sync pulse); V<sub>1.16</sub> = 10 mV (RMS value), Transmitter mode: DSB.  
Reference for the (S + W)/W ratio (0 dB) corresponds to the sound modulation where f = 1 kHz and frequency deviation Δf = ± 50 kHz.  
With reduced frequency deviation Δf = ± 30 kHz and the (S + W)/W figures will decrease by 4.5 dB.
- If the device is used only for the B/G standard (no AM), the capacitor at pin 5 can be omitted (pin 5 has to be disconnected). In this instance the AGC will always operate as a peak-signal AGC and is independent of the voltage at pin 7.

**Notes to the characteristics (continued)**

The AM mode can also be used for the B/G standard, consequently standard switching is not required. However, the intercarrier level depends on the video modulation and the AF performance may decrease.

When the IC is operated from a 12 V power supply pin 7 can be connected to a 12 V logic level via a 2.2 k $\Omega$  series resistor.

5. LC reference circuit for the picture carrier (pins 8 and 9); 68 pF//0.247  $\mu$ H; in series with 27 pF: Q-loaded = 40 (Q<sub>o</sub> = 90); tuned to 38.9 MHz yields quadrature demodulation for the picture carrier which gives optimal video suppression at the intercarrier output (e.g. black-to-white jump of the video modulation).

The series capacitor provides a notch at the sound carrier frequency in order to produce more attenuation for the sound carrier in the PC reference channel. The ratio of parallel to series capacitance depends on the ratio of picture to sound carrier frequency which has to be adapted to other TV transmission standards, if required, in accordance with the formula:

$$C_S = C_P(F_{PC}/F_{SC})^2 - C_P$$

where:

C<sub>S</sub> = series capacitor

C<sub>P</sub> = parallel capacitor

F<sub>PC</sub> = picture carrier frequency

F<sub>SC</sub> = sound carrier frequency

The result is an improved 'intercarrier buzz' in the stereo system B/G, particularly with 250 kHz video modulation (up to 10 dB improvement in sound channel 2), or to suppress 350 kHz video modulated beat in the digitally modulated NICAM subcarrier.

In order to optimize the AF signal performance, fine tuning to the optimal S/W at the sound channel 2 may be achieved by a 250 kHz video modulated squarewave.

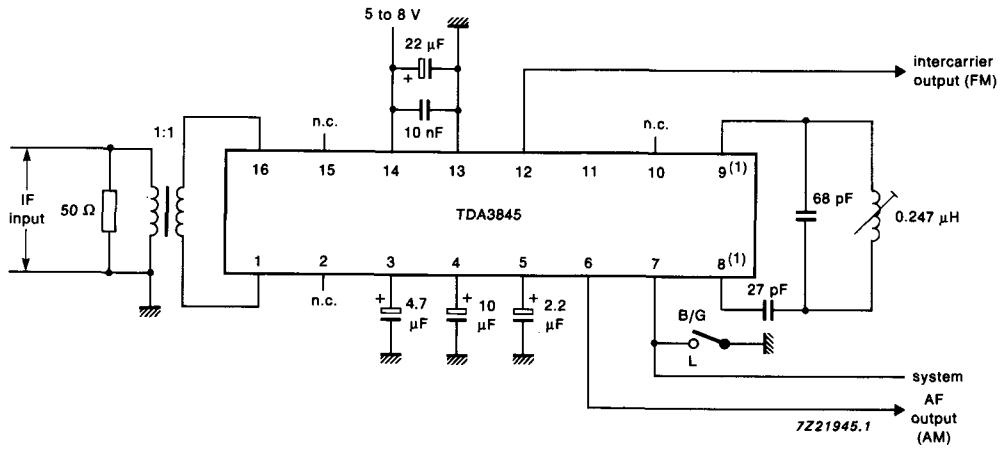

6. Residual video AM is defined as:

$$m = (A-B)/A$$

A = intercarrier level at sync pulse

B = intercarrier level at 100% white video modulation

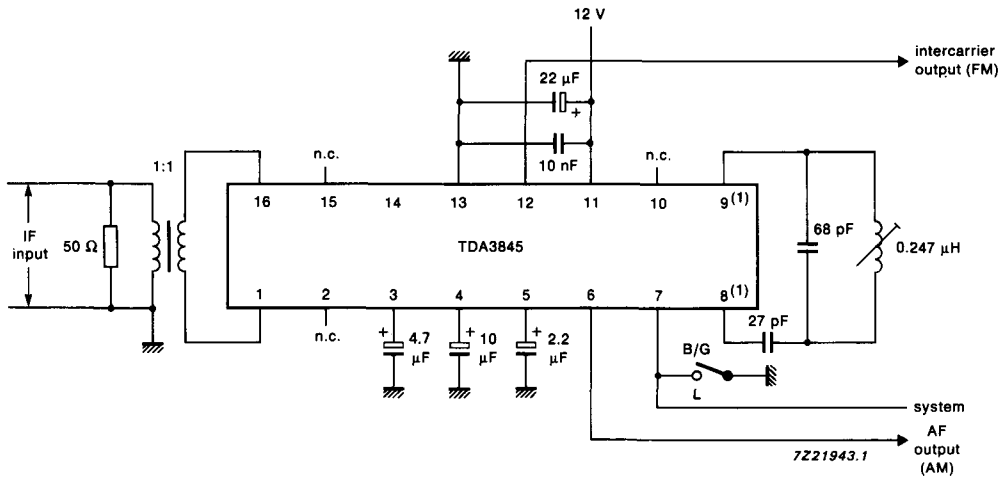

7. If higher AC output current is required an external resistor must be connected between the output pin and ground in order to increase the bias current of the emitter follower. The allowable maximum DC output current must not be exceeded.
8. For all S/N measurements the used vision IF modulator must conform to the following: Incidental phase modulation for black-to-white jump should be less than 0.5 degrees. Intercarrier performance, measured with the television demodulator AMF2 (intercarrier mode weighted S/N ratio) better than 60 dB for 6 kHz sinewave black-to-white video modulation. Weighted S/N ratio of the demodulated intercarrier signals in accordance with CCIR 468-2, measured with deemphasis of 50  $\mu$ s. The indicated (S+W)/W ratio X/Y concerns the sound channels 1 and 2 that means demodulated intercarrier signals of 5.5 and 5.74 MHz respectively.
9. Sound carrier frequency = 32.4 MHz modulated with f = 1 kHz and a modulation depth of 80%. IF input signal (sound carrier) V<sub>1.16</sub> = 10 mV (RMS value).
10. The capacitor at pin 4 can be omitted, however, the (S+W)/W figure for the AM sound (standard L) will be up to 8 dB worse in the IF voltage range 1 mV to 100 mV.
11. When the supply at V<sub>p2</sub> = 12 V the performance will be comparable with the performance when V<sub>p1</sub> = 5 to 8 V.  
The power supply pin that is not in use should be disconnected.
12. The maximum value is given as minimum 120 kHz and typical 700 kHz.

TDA4301

## VERTICAL DRIVER

### GENERAL DESCRIPTION

The TDA4301 is an integrated circuit which acts as an inverting buffer between the pulse pattern generator SAD1019 (LOCMOS technology) and the NXA1011 to NXA1041 frame-transfer sensors. The circuit consists of four drivers either for all vertical transfer clocks for image part (1A to 4A), or all vertical transfer clocks for storage part (1B to 4B) electrodes, and one driver for a transfer gate (TG) electrode.

TDA4301T

## VERTICAL DRIVER

### GENERAL DESCRIPTION

The TDA4301T is an integrated circuit which acts as an inverting buffer between the pulse pattern generator SAD1019 (LOCMOS technology) and the NXA1011 to NXA1041 frame transfer sensors. The circuit consists of four drivers either for all vertical transfer clocks for image part (1A to 4A), or all vertical transfer clocks for storage part (1B to 4B) electrodes, and one driver for a transfer gate (TG) electrode.

TDA4306

## MASTER GAIN

### GENERAL DESCRIPTION

The TDA4306 is an integrated circuit which controls the amplification of the four output signals (White, Yellow, Green and Cyan) from the frame transfer sensors (NXA1021 to NXA1041). The matching of the four channels is excellent over the whole control and temperature range. An on-chip white clipping circuit protects the white processor (TDA4303) from output signals that are too large. If white clipping occurs, a pulse is available to kill the colour information. Highlights will always be white, not coloured.

### Features

- Four variable gain amplifiers
- White clipping circuit
- Blanking switch
- 2.1 V reference voltage

### QUICK REFERENCE DATA

Input capacitance	$C_I$	—	—	5	pF
Delay between blanking input and one of the 4 amplifier outputs	$t_d$	—	40	100	ns

**Notes to the characteristics**

1. The maximum input voltage is permitted only if the input voltage minus the DC offset voltage = 2.1V. If the input voltage minus the DC offset voltage = 1.6 V, the maximum input voltage is 1 V(p-p).
2. Over the range 2 to x 8, after that each channel is adjusted to 0.  
This is possible only if the blanking pulse is switched off and the DC input voltage is equal to  $V_{ref}$ .

Fig.2 Gain as a function of  $V_{MG}$ .

## SMALL SIGNAL COMBINATION IC FOR MONOCHROME TV

### GENERAL DESCRIPTION

The TDA4500 combines all small signal functions (except the tuner) which are required for a monochrome television receiver.

For a complete monochrome television receiver only output stages are required to be added for horizontal and vertical deflection, video and sound. The TDA4500 can also be used in simple colour television receivers. In this application an external sandcastle pulse generator is required.

It incorporates the following functions:

- vertical sync separator/oscillator
- vertical output
- coincidence detector (sound mute)
- phase detector/frequency control
- a.g.c. detector
- sync separator
- horizontal oscillator
- synchronous demodulator
- vision i.f. amplifier
- tuner a.g.c.
- d.c. volume control
- a.f.c. detector
- video output
- sound demodulator
- audio output
- gate pulse generator
- sound limiter/feedback
- 90° phase shift
- overload detector
- horizontal output

### QUICK REFERENCE DATA

14.	decoupling	28.	mute/coincidence detector

**FUNCTIONAL DESCRIPTION (Fig. 1)**

A complete black-and-white receiver can be built around this circuit by adding only the output stages for horizontal and vertical deflection with the video and sound output stages. The TDA4500 can also be used in simple colour television receivers using an external circuit to generate the sandcastle.

The block diagram (Fig. 1) depicts the various functions which are described briefly below.

The sensitivity of the i.f. amplifier is  $70 \mu\text{V}$  for a peak-to-peak output voltage of 3 V (compare the TDA3541). This amplifier has a symmetrical input (pins 8 and 9) and is followed by a synchronous demodulator. The external tuned circuit is connected to pins 20 and 21. This circuit provides the information for the a.f.c. circuit, the  $90^\circ$  phase shift being supplied by internal RC-networks. An a.f.c. output with a voltage swing of about 9 V is obtained from pin 17 ( $V_{7-10} = 10,5 \text{ V}$ ).

The a.g.c. detector is gated to reduce sensitivity to external electrical noise and the a.g.c. time constant network is connected to pin 24. Gain control range of the i.f. amplifier is greater than 60 dB. Adjustments of the tuner take-over point is made at pin 4. When the voltage at pin 4 is approximately 3,5 V the direction of the tuner control voltage is positive-going. When the voltage at pin 4 is approximately 8 V the direction of the tuner control voltage is negative-going.

An output signal of 3 V (p-p) is obtained from the video amplifier (top sync level 1,5 V) with negative-going sync. Since the sound signal is derived from pin 16 (see Fig. 4) the video output is not blanked during the flyback period. As shown in the application circuit (Fig. 4) the band-pass filter for the sound must be connected between video output (pin 16) and sound i.f. input (pin 15). Sound information passes through a sound limiter network and a sound demodulator circuit with an external tuned circuit for this stage connected to pin 13. The demodulator is followed by a volume control stage with a control range of 80 dB and an output amplifier with an audio output signal of 170 mV (r.m.s.) for a  $\Delta f$  of 7,5 kHz and at maximum volume setting.

The slicing level of the sync separator is referred to the top sync and is determined by the values of external resistors, the recommended slicing level being 30%. Noise protection is provided for the sync separator stage. Separated sync pulses are supplied to the gated phase detector which compare the sync pulses with the sawtooth voltage obtained from the horizontal flyback pulse (pin 5). During catching the gating of the phase detector is switched off and the phase detector output current is increased.

The in-sync or out-of-sync condition is detected with the coincidence detector which is also used for transmitter identification. Sound output is suppressed when no input signal is available. Clamping the voltage on pin 28 to a level of 3,5 V sets the phase detector to a high output current, short time constant mode. This is appropriate for the reception of VCR signals.

Phase detector output voltage levels maintain the horizontal oscillator at its correct operating frequency. The push-pull output (pin 27) has a typical duty cycle of 40%.

Vertical sync pulses are obtained from an internal integrating network with the vertical sawtooth being generated in the vertical oscillator. This sawtooth voltage is compared with the feedback voltage from the deflection coil via pin 3. The comparator generates the drive voltage for the vertical deflection output stage.

The TDA4500 has four supply pins. Pin 7 and pin 10 are for the main positive supply and circuit ground respectively.

Critical circuits are grounded by pin 19. Pin 22 is the supply for the horizontal oscillator. A low current supply (5 mA minimum) can be used to start the oscillator from an external high voltage supply rail.

**RATINGS**

## Notes to characteristics

1. It is possible to start the horizontal oscillator by supplying a current of 5 mA which can be taken from the mains rectifier, to pin 22. The main supply (pin 7) can then be derived from the horizontal output stage.
2. I.F. input voltage (r.m.s.) – value at top sync level at which the video amplitude has dropped 0,5 dB compared with the amplitude at an input signal of 10 mV.
3. The input impedance has been chosen such that a SAW-filter can be applied. 800  $\Omega$  is an acceptable compromise between the requirements for triple transient suppression and power loss.
4. Measured with 0 dB = 150  $\mu$ V.
5. Measured at 10 mV(r.m.s.) top sync input signal.
6. With switched demodulator.
7. Signal with negative-going sync with top white being 10% of the top sync amplitude (Fig. 2).
8. This figure is valid for the complete video signal amplitude (peak-white to top sync).
9. Measured with an input signal ( $V_{g-g}$ ) of 10 mV(r.m.s.); the a.f.c. output (pin 7) loaded with 2 x 100 k $\Omega$  between the supply and ground. The Q factor of the reference tuned circuit is 50.
10. Voltage at pin 15 is the r.m.s. value.  $Q_L$  of the demodulator tuned circuit is 20. Audio frequency is 1 kHz and the carrier frequency is 5,5 MHz.
11. Measured with an input signal of 1 mV(r.m.s.)
12. The tuned demodulator circuit must give an output level equal to that given in the "mute" condition.
13. Volume can be controlled using a variable resistor connected to ground (nominal 5 k $\Omega$ ) or by means of a variable d.c. voltage. In this latter case the rather low impedance at pin 11 must be taken into account.

Fig. 2 Video output signal.

**Notes to characteristics (continued)**

14. The sync separator is noise gated. The slicing level is referred to top sync level and is independent of the video information. The value given is a percentage of the sync pulse amplitude. The slicing depends on the values of external resistors connected to pin 26.
15. Phase detector current increases by a factor of 7 during "catching" and when phase detector operates in the 'FAST' mode (pin 28). This ensures a high catching range and a higher dynamic loop gain.
16. Supply voltage variation in the range 8 to 12 V.
17. The negative-going edge of this pulse initiates the switch-off of the horizontal output transistor (simultaneous driver).
18. The circuit requires an integrated flyback pulse. The gate pulses for a.g.c. and the coincidence detector are obtained from the sawtooth.
19. The functions of in-sync/out-of-sync and transmitter identification have been combined on pin 28. For reception of VCR-signals the voltage on this pin must be fixed between 3 V and 4,5 V so that the time constant is fast and the sound is still available.

TDA4501

## SMALL SIGNAL COMBINATION IC FOR COLOUR TV

### GENERAL DESCRIPTION

The integration into a single package of all small-signal functions required for colour tv reception is achieved in the TDA4501. The only additional circuits needed to complete the receiver are a tuner, the deflection output stages and a colour decoder.

The IC includes a vision IF amplifier with synchronous demodulator and AFC circuit; an AGC detector with tuner output; an integral three-level sandcastle pulse generator; and fully synchronized vertical and horizontal drive outputs. A triggered vertical divider automatically adapts to 50 or 60 Hz working and eliminates the need for an external vertical frequency control.

Signal-strength dependent time-constant switches in the horizontal phase detector make external VCR switching unnecessary.

Sound signals are demodulated and amplified within the IC in a circuit which includes volume control and muting.

### Features

- Vision IF amplifier with synchronous demodulator
- AGC detector for negative modulation
- AGC output to tuner
- AFC circuit
- Video and audio preamplifiers
- Sound IF amplifier and demodulator
- Choice of sound volume control or horizontal oscillator starting function
- Horizontal synchronization circuit with two control loops
- Triggered divider system for vertical synchronization and sawtooth generation giving automatic amplitude adjustment for 50 or 60 Hz working
- Transmitter identification circuit with mute output
- Sandcastle pulse generator

**FUNCTIONAL DESCRIPTION****IF amplifier, demodulator and AFC**

The IF amplifier has a symmetrical input (pins 8 and 9), the input impedance of which is suitable for SAW-filtering to be used. The synchronous demodulator and the AFC circuit share an external reference tuned circuit (pins 20 and 21). An internal RC-network provides the necessary phase-shifting for AFC operation. The AFC circuit provides a control voltage output with a swing greater than 9 V from pin 18.

**AGC circuit**

Gating of the AGC detector is performed to reduce sensitivity of the IF amplifier to external electrical noise. The AGC time constant is provided by an RC-circuit connected to pin 19. Tuner AGC voltage is supplied from pin 5 and is suitable for tuners with p-n-p or n-p-n RF stages. The sense of the AGC (to increase in a positive or negative direction) and the point of tuner take-over are preset by the voltage level at pin 1.

**Video amplifier**

The signal through the video amplifier comprises video and sound information, therefore no gating of the video amplifier is performed during flyback periods.

**Sound circuit and horizontal oscillator starting function**

The input to the sound IF amplifier is obtained by a bandpass filter coupling from the video output (pin 17). The sound is demodulated and passed via a dual-function volume control stage to the audio output amplifier. The volume control function is obtained by connecting a variable resistor (10 k $\Omega$ ) between pin 11 and ground, or by supplying pin 11 with a variable voltage. Sound output is suppressed by an internal mute signal when no input signal is present.

The horizontal oscillator starting function is obtained by supplying pin 11 with a current of 6 mA during the switching-on period. The IC then uses this current to generate drive pulses for the horizontal deflection. For this application, the main supply voltage for the IC can be obtained from the horizontal deflection circuit.

**FUNCTIONAL DESCRIPTION (continued)****Vertical divider system**

A triggered divider system is used to synchronize the vertical drive waveforms, adjusting automatically to 50 or 60 Hz working. A large window (search window) is opened between counts of 488 and 722; when a separated vertical sync pulse occurs before count 576, the system works in the 60 Hz mode, otherwise 50 Hz working is chosen.

A narrow window is opened when 15 approved sync pulses have been detected. Divider ratio between 522 and 528 switches to 60 Hz mode; between 622 and 628 switches to 50 Hz mode.

The vertical blanking pulse is also generated via the divider system by adding the anti-topflutter pulse and the blanking pulse.

**Line phase detector**

The circuit has three operating conditions:

- a. Strong input signal and synchronized.
- b. Weak signal and synchronized.
- c. Non synchronized (weak and strong) signal.

The input signal condition is obtained from the AGC circuit.

**D.C. volume control/horizontal oscillator start**

The operation depends on the application. When during switch-on no current is supplied pin 11 will act as volume control. When a current of 6 mA is applied the volume control is set to maximum and the circuit will generate drive pulses for the horizontal deflection.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 7)	$V_P = V_{7-6}$	max.	13,2 V

TDA4502A

## SMALL SIGNAL COMBINATION FOR COLOUR TV

### GENERAL DESCRIPTION

The integration into a single package of all small signal functions required for colour TV reception is achieved in the TDA4502A. The only additional circuits required for colour TV reception are the deflection output stages, a sound detector and amplifier, and a colour decoder.

The IC includes a vision IF amplifier and video switching circuit, AFC circuit, AGC detector with tuner output, an integral three-level sandcastle pulse generator, fully synchronized vertical and horizontal drive outputs and a mute circuit with external availability. A triggered vertical divider automatically adapts to 50 or 60 Hz operating mode thereby eliminating the need for external vertical frequency control. The sound signal must be demodulated and amplified externally.

### Features

- Vision IF amplifier with synchronous demodulator
- AGC detector, suitable for negative modulation
- AGC output to tuner
- AFC circuit with ON/OFF switch
- Video preamplifier
- Video switch to select the internal, or an external, video signal
- Horizontal synchronization circuit with two control loops
- Vertical synchronization (divider system) and sawtooth generation with automatic amplitude adjustment for 50 and 60 Hz
- Transmitter identification (mute)
- Sandcastle pulse generator

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

### IF amplifier, synchronous demodulator and AFC

The IF amplifier (pins 8 and 9) has a symmetrical input, the impedance of which enables SAW-filtering to be used. The synchronous demodulator and the AFC circuit share an external reference tuned circuit (pins 20 and 21). An internal RC-network provides the necessary phase-shift for AFC operation. The AFC circuit provides a control voltage output with a voltage swing greater than 9 V at pin 18. In the internal and external mode the AFC can be switched OFF when pin 22 is connected to positive supply.

### AGC circuit

AGC gating is performed to reduce sensitivity of the IF amplifier to external noise. The AGC time constant is provided by an RC-circuit connected to pin 19. The tuner AGC voltage is supplied from pin 5. The point of tuner take-over is preset by the voltage level at pin 1.

### Video switch circuit

The IC has a video switch with two video inputs and one video output. One input is connected to the demodulated IF signal which is also fed to the video output pin of the peritelevision connector. The other input can be switched to an external signal which is applied to the video input of the peritelevision connector. The video output signal of the switch is fed to pin 25 of the IC, which is the synchronization part and, to the colour decoder. When the video switch is in the external mode, the synchronization circuit is switched to the external signal. The vision IF, AGC and AFC circuits will not be affected by the switching action and will, therefore, operate in the normal mode. Gating for the AGC detector is switched OFF when the switch is in the external mode. The first control loop is not switched to a low time constant when weak signals are received.

### Horizontal oscillator start function

The horizontal oscillator start function is achieved by applying a current of 8.5 mA to pin 11 during the switch-on period. This current can be taken from the mains rectifier. The main supply, pin 7, can then be obtained from the horizontal output stage. The load current of the driver has to be added to the start current.

### Horizontal synchronization

The positive video input signal is applied to pin 25. The horizontal synchronization has two control loops which have been introduced to generate a sandcastle pulse. By using the oscillator sawtooth, an accurate timing of the burst-key pulse can be made. Therefore, the phase of this sawtooth pulse must have a fixed relationship to the sync pulse.

### Horizontal phase detector

The circuit has two operating conditions:

(a) Synchronized

The first loop has a fixed time constant and a gated phase detector, this enables optimum performance for co-channel interference. The VCR mode is obtained by an additional load on pin 22.

(b) Non-synchronized

In this condition the time constant is the same as during the VCR mode.

### Vertical sync pulse

The vertical sync pulse integrator will not be disturbed when the vertical sync pulses have a width of 10  $\mu$ s and a separation of 22  $\mu$ s. This type of vertical sync pulse is generated by video tapes with anti-copy guard.

**Vertical divider system**

A synchronized divider system generates the vertical sawtooth waveforms at pin 2. The system uses an internal frequency doubler circuit to enable the horizontal oscillator to operate at its normal line frequency. One line period equals 2 clock pulses.

Using the divider system avoids the requirement for vertical frequency adjustment. The divider has a discriminator window for automatic switching from 50 Hz to 60 Hz mode. When the trigger pulse arrives before line 576 the 60 Hz mode is selected, if not, the 50 Hz mode is selected.

The divider system operates with two different reset windows to give maximum interference/disturbance protection. The windows are activated via an up/down counter.

The counter is increased by 1 each time the separated vertical sync pulse is within the narrow window. When the sync pulse is not within the narrow window the counter is decreased by 1.

The operation modes of the divider system are as follows:

**Mode A**

Large (search) window (divider ratio between 488 and 722)

This mode is valid for the following conditions:

- Divider is looking for a new transmitter
- Divider ratio found – not within the narrow window limits
- A non-standard composite video signal is detected – when a double or enlarged vertical sync pulse is detected after the internally generated anti-top-flutter pulse has ended. This means a vertical sync pulse width > 10 clock pulses (50 Hz); > 12 clock pulses (60 Hz). This mode is normally activated for video tape recorders operating in the feature trick mode
- Up/down counter value of the divider system, operating in the narrow window mode, drops below count 6

**Mode B**

Narrow window (divider ratio between 522 to 528 (60 Hz) or 622 to 628 (50 Hz))

The divider system switches over to this mode when the up/down counter has reached its maximum value of 15 approved vertical sync pulses. When the divider operates in this mode and, a vertical sync pulse is missing within the window, the divider is reset at the end of the window and the counter value is decreased by 1. At a counter value below 6 the divider system switches over to the large window mode.

The divider system also generates an anti-top-flutter pulse which inhibits the Phase 1 detector during the vertical sync pulse. The pulse width is dependent on the divider mode. In 'Mode A' the start is generated by resetting the divider. In 'Mode B' the anti-top-flutter pulse starts at the beginning of the first equalizing pulse. The anti-top-flutter pulse ends at count 10 for the 50 Hz mode and count 12 for the 60 Hz mode.

The vertical blanking pulse is also generated via the divider system. The start is initiated by resetting the divider while the blanking pulse width is at count 34, (17 lines), for the 60 Hz mode and at count 42, (21 lines), for the 50 Hz mode. The vertical blanking pulse, at the sandcastle output (pin 27), is generated by adding the anti-top-flutter pulse to the blanking pulse. When the divider operates in 'Mode B', the vertical blanking pulse starts at the beginning of the first equalizing pulse. The length of the vertical blanking in this condition is 21 lines in the 60 Hz mode and 25 lines in the 50 Hz mode.

## RATINGS

**Notes to the characteristics**

- The horizontal oscillator can be started when a current of 8.5 mA is applied to pin 11; this current can be taken from the mains rectifier. The main supply (pin 7) can then be derived from the horizontal output stage. The load current of the driver must be added to the start current (8.5 mA).
- On set AGC.
- Input impedance selected so that a SAW-filter can be applied.
- Measured with 0 dB = 150  $\mu\text{V}$ .
- Measured at 10 mV(rms) top sync input signal.
- Projected zero point with switched demodulator.
- Signal with negative going sync top white level 10% of the top sync amplitude.
- Measured in accordance with the test line given in Fig. 2.

The differential gain is expressed as a percentage of the difference in peak amplitudes between the largest and smallest value relative to the subcarrier amplitude at blanking level.

The differential phase is defined as the difference in degrees between the largest and smallest phase angle.

**Notes to the characteristics (continued)**

9. This figure is valid for the complete video signal amplitude (peak white to black) and measured with a 6.6 k $\Omega$  damping resistor connected between pins 20 and 21 (see Fig. 3).
10. The test set-up and input conditions are given in Fig. 4. The figures are measured at an input signal of 10 mV(rms).
11. Measured with a source impedance of 75  $\Omega$ , where:
- $$S/N = 20 \log \frac{V_o \text{ black-to-white}}{V_{n(\text{rms})} \text{ at } B = 5 \text{ MHz}}$$
12. The internal video and video switch inputs are applied to pin 15. By externally connecting the internal video signal to the video switch enables the sound trap to be connected between pins 15 and 17. When the video signal is applied internally to the switch then sound traps are required at two outputs. The switch is activated via a 100 k $\Omega$  resistor. When the resistor is connected to ground or left open-circuit the internal video signal is available at pin 14. When the resistor is connected to +V<sub>S</sub> the external video signal is available at pin 14. When the video switch is in the external mode the AFC can still be switched off when pin 22 is connected to the supply voltage.
13. The measured figures are obtained at an input signal of 10 mV(rms) and the AFC output loaded with 2 x 100 k $\Omega$  between the supply voltage and ground. The unloaded Q-factor of the reference tune circuit is 70. The AFC is switched off when pin 22 is connected to the supply voltage.
14. The minimum value is obtained by connecting a 1.8 k $\Omega$  series resistor between pins 14 and 25. The slicing level can be varied by changing the value of this resistor (a higher resistor value will result in a higher value of the minimum sync pulse amplitude). The slicing level is independent of the video information.
15. Frequency control is obtained by supplying a correction current to the oscillator RC network via a resistor between pins 23 and 24. The oscillator can be adjusted to the correct frequency using either of the following methods:
- Interrupt the resistor between pins 23 and 24.
  - Short-circuit the sync separator bias network (pin 25 to supply voltage).
- The device uses a long time constant for the first phase detector. The phase detector is gated to obtain optimal performance for co-channel interference. The VCR mode must be switched on via pin 22.
16. This figure is valid for an external load impedance of 82 k $\Omega$  connected between pin 28 and the shift-adjustment potentiometer.
17. The flyback input and sandcastle output are combined at pin 27. The flyback pulse is clamped to a level of 4.35 V. The minimum current required to drive the second control loop is 0.1 mA.
18. The functions in-sync/out-of-sync and transmitter identification are combined at pin 22. The 22 nF capacitor is charged during the sync pulse and discharged during the time difference between gating and sync pulse.
19. Because the vertical scan is synchronized via a divider system, no adjustment is required for the ramp generator. The divider system detects whether the incoming signal has a vertical frequency of 50 or 60 Hz and subsequently corrects the vertical amplitude.
20. To avoid screenburn, due to a collapse of the vertical deflection, a continuous blanking level is inserted in the sandcastle pulse when the feedback voltage from the vertical deflection is not within the specified limits.

## SMALL-SIGNAL COMBINATION IC FOR BLACK-AND-WHITE TV

### GENERAL DESCRIPTION

This IC contains all small-signal functions required for black-and-white tv reception. The only additional circuits needed to complete the receiver are a tuner and the deflection output stages.

The IC includes a vision i.f. amplifier with synchronous demodulator and a.f.c. circuit, an a.g.c. detector with tuner output and fully synchronized vertical and horizontal drive outputs.

Sound signals are demodulated and amplified within the IC in a circuit which includes volume control and internal muting.

The TDA4503 may also be adapted for simple colour tv reception by the use of an external, three-level sandcastle pulse generator.

### Features

- Vision i.f. amplifier with synchronous demodulator
- A.G.C. detector and amplifier with a.g.c. output to tuner
- A.F.C. circuit
- Video preamplifier
- Audio preamplifier
- Sound i.f. amplifier and demodulator
- D.C. volume control
- Horizontal synchronization circuit
- Transmitter identification and mute circuit
- Vertical synchronization circuit and sawtooth generator

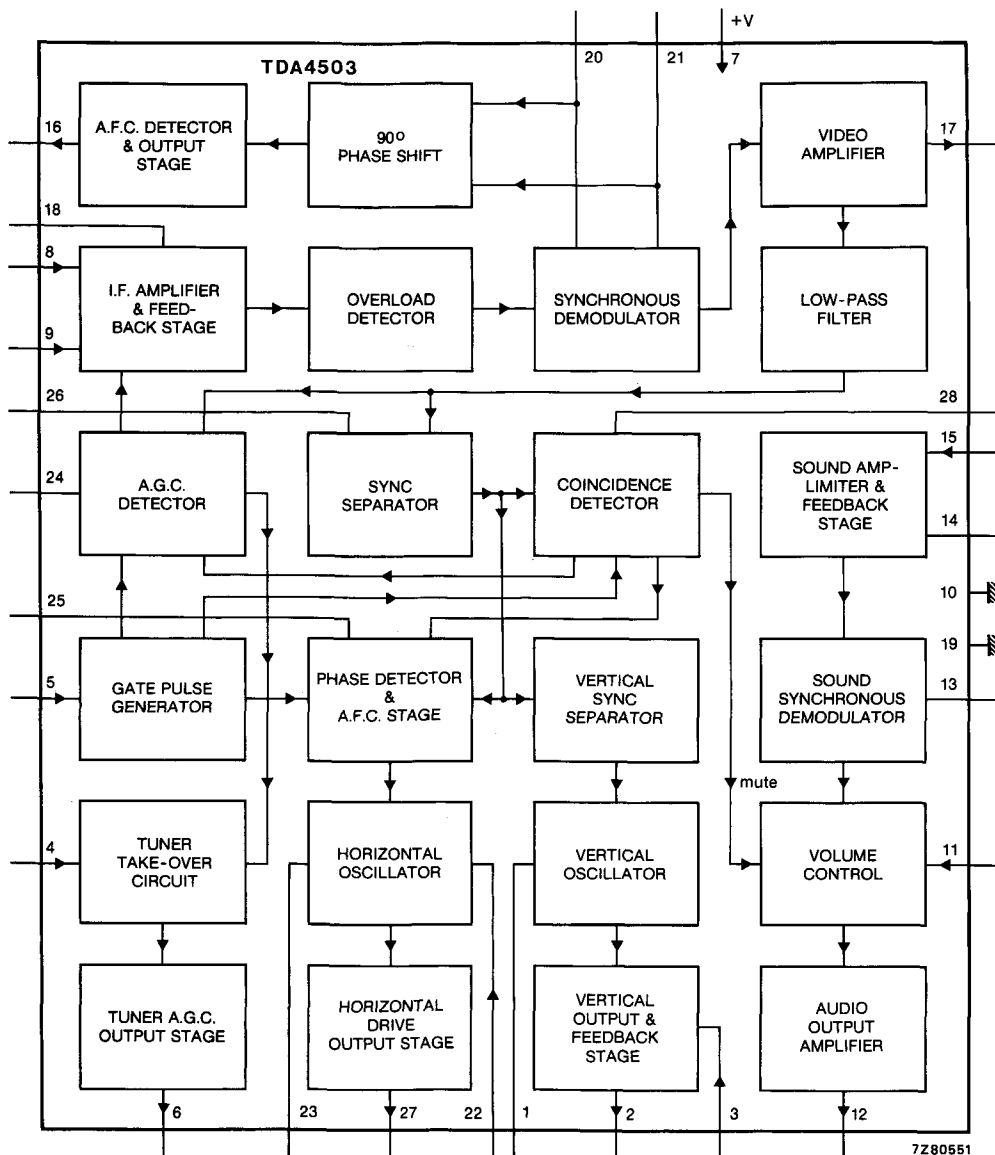

### QUICK REFERENCE DATA

**FUNCTIONAL DESCRIPTION****I.F. amplifier, demodulator and A.F.C.**

The i.f. amplifier operates with symmetrical inputs at pins 8 and 9 and has an input impedance suitable for SAW filter application. The amplifier sensitivity gives a peak-to-peak output voltage of 3 V for an r.m.s. input of 70  $\mu$ V. The demodulator and the a.f.c. circuit share an external reference tuned circuit (pins 20 and 21) and an internal RC-network provides the phase-shifting necessary for a.f.c. operation. The a.f.c. circuit provides a control voltage output with a (typical) swing of 9 V from pin 16 ( $V_p = 10,5$  V).

**A.G.C. circuit**

Gating of the a.g.c. detector is performed to reduce sensitivity of the i.f. amplifier to external electrical noise. The a.g.c. time constant is provided by an RC-network connected to pin 24. The typical gain control range of the i.f. amplifier is 60 dB. Tuner a.g.c. voltage is supplied from pin 6 and is suitable for tuners with pnp or npn RF stages. The sense of the AGC (to increase in a positive or negative direction) and the point of tuner take-over are preset by the voltage level at pin 4 ( $V_4 = 3,5$  V (typ) for positive a.g.c.;  $V_4 = 8$  V (typ) for negative a.g.c.).

**Video amplifier**

The video signal output from pin 17 has a peak-to-peak value of 3 V (top sync level = 1,5 V) and carries negative-going sync. In order to retain sound information at pin 17, the video signal is not blanked during flyback periods.

**Sound circuit**

The sound i.f. signal present at the video output (pin 17) is coupled to the sound circuit by a band-pass filter to pin 15. The sound circuit has an amplifier-limiter stage, a synchronous demodulator with reference tuned circuit at pin 13, a volume control stage and an output amplifier. The volume control has a range of approximately 80 dB and the audio output signal at maximum volume and with  $\Delta f = 7,5$  kHz is 320 mV (r.m.s. value). The sound output signal is suppressed when no input signal is detected.

**Synchronization circuits**

The sync separator slicing level is determined by an external resistor network at pin 26. The slicing level is referred to the top sync level and the recommended value for slicing is 30%. Internal protection from electrical noise is included.

A gated phase detector compares the phase of the separated sync pulses with a sawtooth waveform obtained from the flyback pulse at pin 5. In-sync and out-of-sync conditions are detected by the coincidence detector at pin 28 (this circuit also gives transmitter identification). During the out-of-sync condition, gating of the phase detector is switched off and the output current from the phase detector increases to give the detector a short time-constant and thus a fast response. This condition can be imposed by clamping the voltage at pin 28 to 3,5 V for the reception of VCR signals.

The horizontal oscillator frequency is controlled by the output voltage of the phase detector circuit. The horizontal drive output from pin 27 has a duty factor of 40%.

Vertical sync pulses are separated by an internal integrating network and are used to trigger the vertical oscillator. A comparator circuit compares the vertical sawtooth waveform, generated by the vertical oscillator, with feedback from the deflection coils and supplies the drive voltage for the output stage at pin 2.

**Power supplies**

The main supply is to pin 7 (positive supply) and pin 10 (ground). The horizontal oscillator is supplied from pin 22 to facilitate starting of the oscillator from a high-voltage rail. A special ground connection at pin 19 is used by critical voltage dividers in the feedback loops of the vision and sound i.f. circuits.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 7)	$V_p = V_{7-10}$	max.	13,2 V
Total power dissipation	$P_{tot}$	max.	1,7 W
Operating ambient temperature range	$T_{amb}$		-25 to + 65 °C
Storage temperature range	$T_{stg}$		-25 to +150 °C

**CHARACTERISTICS** $V_{7-10} = 10,5 \text{ V}$ ;  $V_{22-10} = 10,5 \text{ V}$ ;  $T_{amb} = 25 \text{ °C}$ ; unless otherwise specified

**Notes to the characteristics**

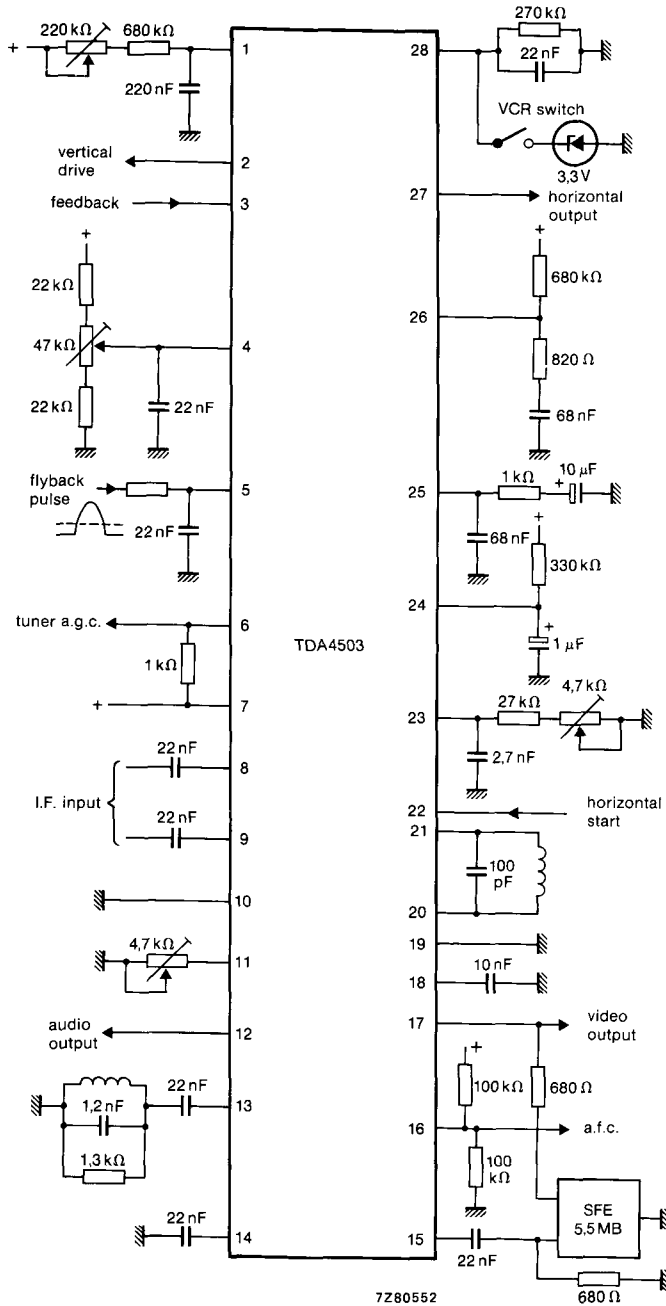

1. The horizontal oscillator can be started by supplying a current of 6 mA to pin 22. Taking this current from the mains rectifier allows the positive supply voltage to pin 7 to be derived from the horizontal output stage (the load current of pin 27 is additional to the 6 mA quoted).
2. At start of a.g.c.
3. Measured with 0 dB = 200  $\mu$ V.
4. Measured at 10 mV (rms) top sync output signal.
5. Signal with negative-going sync; top white = 10% of the top sync amplitude.
6. Measured with test line as shown in Fig. 4. The differential gain is expressed as a percentage of the difference in peak amplitudes between the largest and smallest values relative to the subcarrier amplitude at blanking level. The differential phase is defined as the difference in degrees between the largest and smallest phase angles.
7. Measured with a source impedance of 75  $\Omega$ .  

$$\text{Signal-to-noise ratio} = 20 \log \frac{V_O \text{ black-to-white}}{V_{i(\text{rms})} \text{ at } B = 5 \text{ MHz}}$$
8. Measured with a sawtooth-modulated input signal:  $m = 90\%$ ;  $V_{i(\text{rms})} = 10 \text{ mV}$ ;  

$$\text{Amplitude modulation} = \frac{V_O \text{ SC at top sync} - V_O \text{ SC at white}}{V_O \text{ SC at top sync} + V_O \text{ SC at white}} \times 100\%$$

(SC = sound carrier)
9. Starting point of tuner take-over for an npn tuner is when  $I_6 = 1,8 \text{ mA}$ , and for a pnp tuner is when  $I_6 = 0,2 \text{ mA}$ .
10. Measured at  $V_{8-9(\text{rms})} = 10 \text{ mV}$  and pin 16 loaded with  $2 \times 100 \text{ k}\Omega$  between  $V_7$  and ground. Reference tuned circuit Q-factor = 36.
11. Reference tuned circuit Q-factor = 16; audio frequency = 1 kHz; carrier frequency = 5,5 MHz.
12. The demodulator tuned circuit must be tuned for minimum distortion; output signal is measured at  $\Delta f = 7,5 \text{ kHz}$ ; other measurements are at  $\Delta f = 27,5 \text{ kHz}$ .
13. Volume control can be realized by a variable resistor (5 k $\Omega$ ) connected between pin 11 and ground, or by a variable voltage direct to pin 11 (the low value of input impedance to pin 11 must be taken into account).
14. The sync separator is noise-gated; the slicing level is referred to the top sync level and is independent of the video signal. The value stated is a percentage of the sync pulse amplitude, the level being dependent on external resistors connected to pin 26.
15. The phase detector current is increased by a factor of 7 during catching and when the phase detector is switched to 'fast' via pin 28, thus ensuring a wide catching range and a high dynamic loop gain.
16. The negative-going edge initiates switching-off of the line output transistor (simultaneous driver).
17. The circuit requires an integrated flyback pulse. Gate pulses for a.g.c. and coincidence detectors are obtained from the sawtooth waveform.
18. The functions of in-sync, out-of-sync and transmitter identification are combined on pin 28. For the reception of VCR signals,  $V_{28}$  must be fixed between 3 V and 4,5 V so that the time constant is fast and sound information is preserved.

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA4505

## SMALL SIGNAL COMBINATION IC FOR COLOUR TV

### GENERAL DESCRIPTION

The TDA4505 is a TV sub-system circuit, for colour television receivers. For a complete colour television receiver only a tuner, a colour decoder and output stages are required.

### Features

- Vision IF amplifier with synchronous demodulator
- Tuner AGC (negative going control voltage with increasing signal)
- AGC detector suited for negative modulation
- AFC circuit
- Video preamplifier
- Sound IF amplifier, demodulator and preamplifier
- DC volume control or separate supply for starting the oscillator
- Horizontal synchronization circuit with two control loops
- Vertical synchronization (divider system) and sawtooth generation with automatic amplitude adjustment for 50 or 60 Hz mode
- Transmitter identification (mute)
- Three level sandcastle pulse generation

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 7)	V <sub>7-6</sub>	9,5	12	13,2	V
Supply current (pin 7)	I <sub>7</sub>	—	135	—	mA
Supply current (pin 11)	I <sub>11</sub>	—	6	8,5	mA
Operating ambient temperature range	T <sub>amb</sub>	-25	—	+ 65	°C
Storage temperature range	T <sub>stg</sub>	-25	—	+ 150	°C
Total power dissipation	P <sub>tot</sub>	—	—	2,3	W

### PACKAGE OUTLINE

28-lead DIL; plastic (with internal heat spreader) (SOT117).

**FUNCTIONAL DESCRIPTION****IF amplifier, demodulator and AFC**

The IF amplifier has a symmetrical input (pins 8 and 9). The synchronous demodulator and the AFC circuit share an external reference tuned circuit (pins 20 and 21). An internal RC-network provides the necessary phase-shift for AFC operation. The AFC circuit is gated by an internally generated gating pulse. As a result the AFC output voltage contains no video information. The AFC circuit provides a control voltage output with a swing greater than 10 V at pin 18.

**AGC circuit**

Gating of the AGC detector is performed to reduce sensitivity of the IF amplifier to external electrical noise. The AGC time constant is provided by an RC-circuit connected to pin 19. The point of tuner take-over is preset by the voltage level at pin 1.

**Video amplifier**

The signal through the video amplifier comprises video and sound information.

**Sound circuit and horizontal oscillator starting function**

The input to the sound IF amplifier is obtained by a bandpass filter coupling from the video output (pin 17). The sound is demodulated and passed via a dual-function volume control stage to the audio output amplifier. The volume control function is obtained by connecting a variable resistor (4,7 k $\Omega$ ) between pin 11 and ground, or by supplying pin 11 with a variable voltage. Sound output is suppressed by an internal mute signal when no TV signal is identified.

**DC volume control/Horizontal oscillator start**

The circuit can be used with a DC volume control or with a starting possibility of the horizontal oscillator. The operation depends on the application. When during switch-on no current is supplied to pin 11 this pin will act as volume control. When a current of 6 mA is supplied to pin 11 the volume control is set to a fixed output signal and the IC will generate drive pulses for the horizontal deflection. The main supply of the IC can then be derived from the horizontal deflection.

**FUNCTIONAL DESCRIPTION** (continued)**Horizontal synchronization**

The video input signal (positive video) is connected to pin 25.

The horizontal synchronization has two control loops. This has been introduced to generate a sand-castle pulse. Using the oscillator sawtooth facilitates accurate timing of the burst key pulse. Therefore, the phase of this sawtooth must have a fixed relationship to the sync pulse, which is achieved by use of a second loop.

**Horizontal phase detector**

The circuit has the following operating conditions.

- (a) Strong input signal, synchronized or not synchronized.

(The input signal condition is obtained from the AGC-circuit, the in-sync./out-of-sync from the coincidence detector). In this condition the time constant is optimal for VCR-playback i.e.; fast time constant during the vertical retrace (to be able to correct head-errors of the VCR) and such a time constant during scan that fluctuations of the sync. are corrected. The phase detector is not gated.

- (b) Weak signal.

In this condition the time constant is doubled compared to condition (a). Also the phase detector is gated when the oscillator is synchronized. This ensures a stable display which is not disturbed by the noise in the video signal.

- (c) Not synchronized (weak signal).

In this condition the time constant during scan and vertical retrace are the same as during scan in condition (a).

**Vertical sync pulse**

The vertical sync pulse integrator will not be disturbed when the vertical sync pulses have a width of only  $10\ \mu\text{s}$  with a separation of  $22\ \mu\text{s}$ . This type of vertical sync pulses are generated by video tapes with anti-copy guard.

**Vertical divider system**

The TDA4505 embodies a synchronized divider system for generating the vertical sawtooth at pin 2. The divider system has an internal frequency doubling circuit, which allows the horizontal oscillator to operate at its normal line frequency. One line period equals 2 clock pulses.

Use of the divider system avoids the requirement for vertical frequency adjustment. The divider has a discriminator window for automatic switching from 60 Hz to 50 Hz mode. When the trigger pulse comes before line 576 the 60 Hz mode is selected, otherwise the 50 Hz mode is selected.

The divider system operates with 2 different divider reset windows for maximum interference/disturbance protection.

The windows are activated via an up/down counter.

The counter increases its counter value by 1 each time the separated vertical sync pulse is within the search window. When not within the search window this value is decreased by 1.

The operating modes of the divider system are as follows.

**Mode A**

Large (search) window (divider ratio between 488 and 722)

This mode is valid for the following conditions:

- Divider is looking for a new transmitter
- Divider ratio found — not within the narrow window limits
- Non-standard TV-signal condition detected while a double or enlarged vertical sync pulse is found after the internally generated anti-topflutter pulse has ended. This means a vertical sync pulse width > 8 clock pulses (50 Hz); > 10 clock pulses (60 Hz)  
Usually this mode is activated for video tape recorders operating in the feature trick mode
- Up/down counter value of the divider system operating in the narrow window mode drops below count 10

**Mode B**

Narrow window (divider ratio between 522 to 528; 60 Hz or 622 to 628; 50 Hz)

The divider system switches over to this mode when the up/down counter has reached its maximum value of 15 approved vertical sync pulses. When the divider operates in this mode and a vertical sync pulse is missing within the window, the divider is reset at the end of the window and the counter value is decreased by 1. At a counter value below 10 the divider system switches over the large window mode. The divider system also generates an anti-topflutter pulse which inhibits the Phase 1 detector during the vertical sync pulse. The pulse width is dependent on the divider mode. In Mode A the start is generated by reset of the divider. In Mode B the anti-topflutter pulse starts at the beginning of the first equalizing pulse.

The anti-topflutter pulse ends at count 10 for the 50 Hz mode and count 12 for the 60 Hz mode.

The vertical blanking pulse is also generated via the divider system. The start is by reset of the divider while the blanking pulse width is 34 (17 lines) for the 60 Hz mode and at count 42 (21 lines) for the 50 Hz mode. The vertical blanking pulse at the sandcastle output (pin 27) is generated by adding the anti-topflutter pulse to the blanking pulse. Thus the vertical blanking pulse starts at the beginning of the first equalizing pulse when the divider operates in Mode B. The length of the vertical blanking in this condition is 21 lines in the 60 Hz mode and 25 lines in the 50 Hz mode.

DEVELOPMENT DATA

**Application when external video signals require synchronization**

The input to the sync separator is externally available via pin 25. For normal application the video output signal at pin 17 is AC coupled to this input as shown in Fig. 10. It is possible to interrupt this connection and drive the sync separator from other sources such as:

- a teletext decoder in serial mode
- an external audio signal via a peritelevision connector

When a teletext decoder is applied the IF amplifier and synchronization circuit are operating in the same phase which allows various connections between the two parts (i.e. AGC gating) can remain active. When external signals are applied to the sync separator the connections between the two parts must be interrupted. This can be achieved by connecting pin 22 to ground, which results in the following conditions:

- AGC detector is not gated
- AFC circuit is active
- Mute circuit not active — sound channel remains switched on
- Phase detector 1 has an optimal time constant for external video sources

switching level HIGH		$\Delta_{4-6}$	—	+1,9	—	V

**Notes to the characteristics**

- Pin 11 has a double function. When during switch-on a current of 6 mA is supplied to this pin, which is used to start the horizontal oscillator. The main supply can then be obtained from the horizontal deflection stage. When no current is supplied to this pin it can be used as volume control. The indicated maximum value is the current at which all ICs will start. Higher currents are allowed, the excess current is bypassed to ground.
- Signal with negative going sync, top white 10% of the top sync amplitude.
- Measured according the test line shown in Fig. 3:
  - The differential gain is expressed as a percentage of the difference in peak amplitudes between the largest and smallest value relative to the subcarrier at blanking level.
  - The differential phase is defined as the difference in degrees between the largest and smallest phase angle.
- This figure is valid for the complete video signal amplitude (peak white-to-black); see Fig. 4.
- Signal-to-noise ratio =  $20 \log \frac{V_{\text{out black-to-white}}}{V_{n(\text{rms})}}$  at  $B = 5 \text{ MHz}$
- Tuner AGC; starting point tuner take-over at  $I = 0,2 \text{ mA}$ . Take-over to be adjusted with a potentiometer of  $47 \text{ k}\Omega$ . The voltage at pin 1 must not be reduced below 1 V.

**Notes to the characteristics (continued)**

7. The AFC control voltage is obtained by multiplying the IF output signal (which is also used to drive the synchronous demodulator) with a reference carrier. This reference carrier is obtained from the demodulator tuned circuit via a 90° phase shift network. The IF output signal has an asymmetrical frequency spectrum with respect to the carrier frequency. To avoid problems due to this asymmetrical signal the AFC circuit is gated by an internally generated gating pulse. As a result the detector is operative only during sync/black level at a constant carrier amplitude which contains no additional side bands. Thus the AFC output voltage contains no video information.

At very weak input signals the drive signal for the AFC circuit will have a high noise content. The noise input has an asymmetrical frequency spectrum which will cause an offset of the AFC output voltage. To avoid problems due to this effect the AFC is switched off when the AGC is controlled to maximum gain.

Values are measured with an input signal of 10 mV (rms) and the AFC output loaded with 2 x 470 kΩ between supply voltage and ground. The unloaded Q-factor of the reference tuned circuit is 70. The AFC is switched off when no signal is detected by the coincidence detector or when the voltage at pin 22 is between 1,2 V and 6,4 V. This can be realized by a resistor of 68 kΩ connected between pin 22 and ground.

- 8. The slicing level can be varied by changing the value of the resistance between pin 17 and pin 25. A higher resistance results in a larger value of the minimum sync pulse amplitude. The slicing level is independent of the video information.
- 9. Frequency control is obtained by supplying a correction current to the oscillator RC-network via a resistor, connected between the Phase 1 detector output and the oscillator network. The oscillator can be adjusted to the correct frequency by one of the two following methods:

(a) Interrupt R23-24.

(b) Short-circuit the sync separator bias network (pin 25 to power supply).

To avoid the necessity of a VCR switch, the time-constant of phase detector at strong input signal is sufficiently short to obtain a stable picture during VCR playback. During the vertical retrace period the time-constant is even shorter so that the head errors of the VCR are compensated at the beginning of the scan. During weak signal conditions (information derived from the AGC circuit) the time constant is increased to obtain a good noise immunity.

- 10. The horizontal flyback input and the sandcastle output have been combined on pin 27. The flyback pulse is clamped to a level of 4,9 V. The minimum current to drive the second control loop is 0,1 mA.
- 11. The functions in-sync/out-of-sync and transmitter identification have been combined on pin 22. The capacitor is charged during the sync pulse and discharged during the time difference between gating and sync pulse.
- 12. The vertical scan is synchronized by means of a divider system. Therefore no adjustment is required for the ramp generator. The divider detects whether the incoming signal has a vertical frequency of 50 or 60 Hz and corrects the vertical amplitude.
- 13. To avoid screenburn due to a collapse of the vertical deflection a continuous blanking level is inserted into the sandcastle pulse when the feedback voltage of the vertical deflection is not within the specified limits.

APPLICATION INFORMATION

DEVELOPMENT DATA

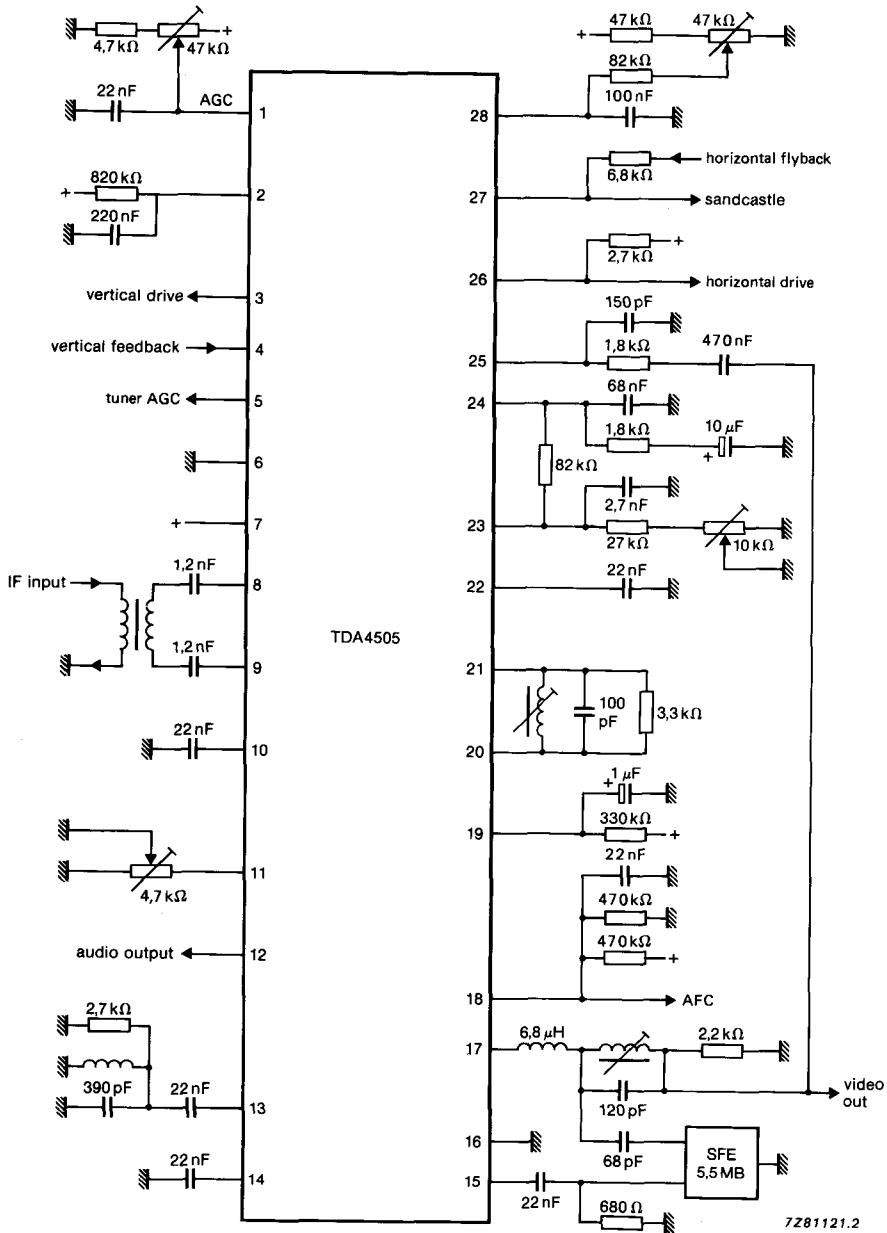

Fig. 10 Application diagram.

7Z81121.2

### PAL DECODER

The TDA4510 is a colour decoder for the PAL standard, which is pin sequent compatible with multi-standard decoder TDA4555 and also pin compatible with NTSC decoder TDA4570. It incorporates the following functions:

#### Chrominance part

- Gain controlled chrominance amplifier with operating point control stage
- Chrominance output stage for driving the 64  $\mu$ s delay line
- Blanking circuit for the colour burst signal
- Automatic chrominance control (ACC) with sampled rectifier during burst-key

#### Oscillator and control voltage part

- Reference oscillator for double subcarrier frequency
- Gated phase comparison
- Identification demodulator and automatic colour killer
- Sandcastle pulse detector
- Service switch

#### Demodulator part

- Two synchronous demodulators for the (B-Y) and (R-Y) signals
- PAL flip-flop and PAL switch
- Colour switching stages
- Separate colour switching output
- (B-Y) and (R-Y) signal output stages
- Internal filtering of residual carrier

#### QUICK REFERENCE DATA

Supply voltage	$V_p = V_{7-3}$	typ.	12 V
Supply current	$I_p = I_7$	typ.	50 mA
Chrominance input signal (peak-to-peak)	$V_{9-3(p-p)}$		10 to 400 mV
Chrominance output signal (peak-to-peak)	$V_{6-3(p-p)}$	typ.	1,6 V
Colour difference output signals (peak-to-peak values)			
-(R-Y) signal	$V_{1-3(p-p)}$	typ.	1,05 V $\pm$ 2 dB
-(B-Y) signal	$V_{2-3(p-p)}$	typ.	1,33 V $\pm$ 2 dB
Sandcastle pulse, required amplitude for burst gating level	$V_{15-3}$	typ.	7,7 V
horizontal pulse separation	$V_{15-3}$	typ.	4,5 V
vertical and horizontal pulse separation	$V_{15-3}$	typ.	2,5 V

#### PACKAGE OUTLINE

16-lead DIL; plastic (SOT38).

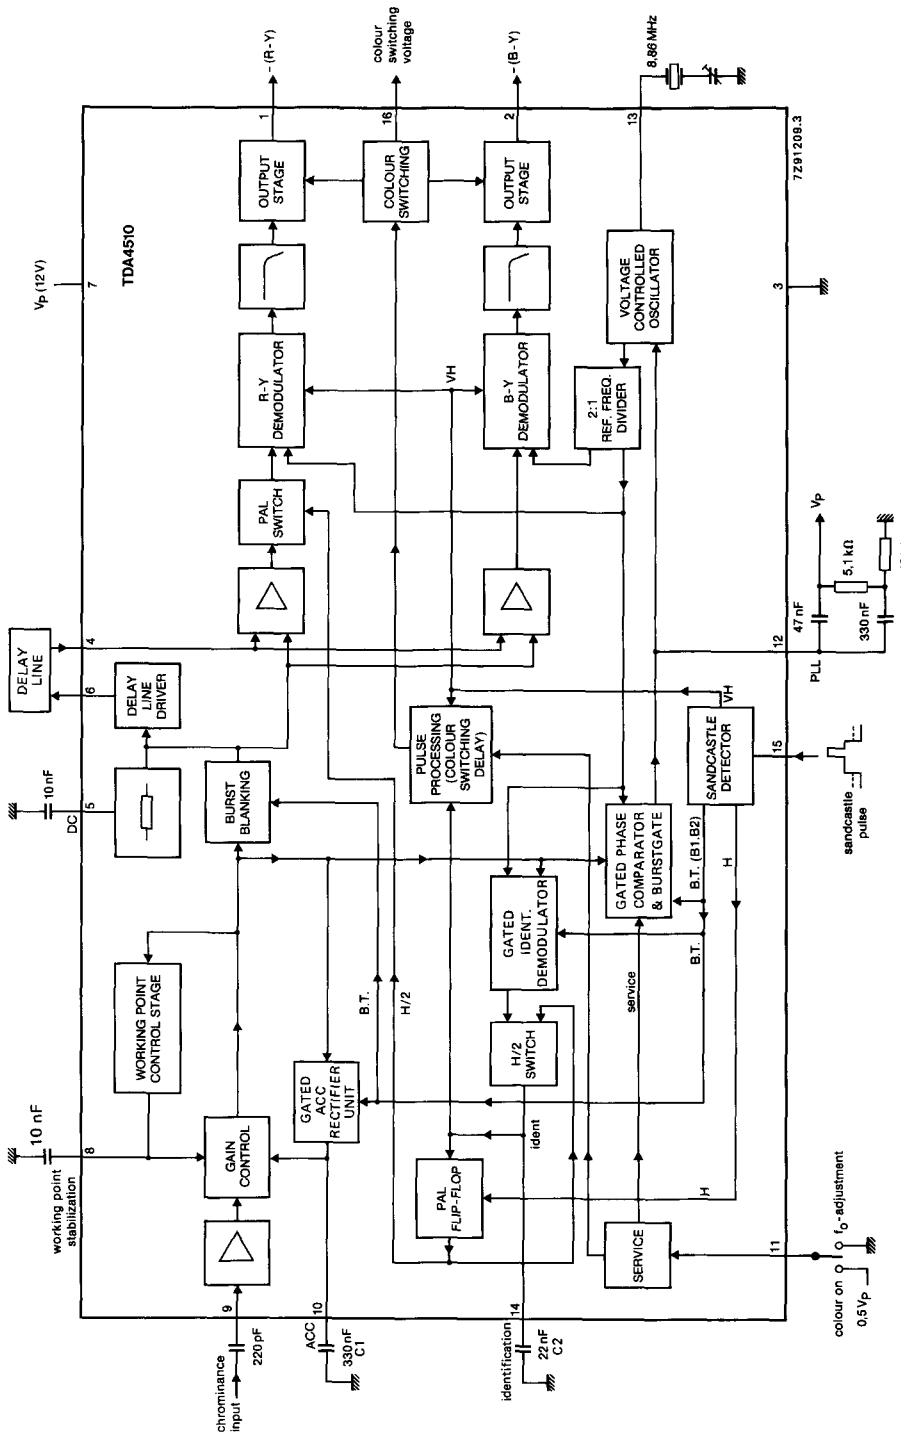

Fig. 1 Block diagram.

External capacitors in Fig. 1

C1 filter capacitor for control voltage (pin 10)

C2 filter capacitor for identification signal (pin 14)

**FUNCTIONAL DESCRIPTION****DIVIDER STAGES**

The divider stages provide  $-(R-Y)$  and  $-(B-Y)$  reference signals with the correct 90 degrees relation for the demodulators.

**PHASE COMPARATOR**

The phase comparator compares the  $-(R-Y)$  reference signal with the burst pulse and controls the frequency and phase of the reference oscillator.

**IDENTIFICATION DEMODULATOR**

The identification demodulator delivers a positive going identification signal for PAL-signals at pin 14, also used for the automatic colour-killer.

**SERVICE SWITCH**

The service switch has two functions. The first position ( $V_{14.3} < 1\text{ V}$ ) allows the adjustment of the reference oscillator. Therefore the colour is switched on and the burst for the oscillator PLL is switched off. The second position ( $V_{14.3} > 5\text{ V}$ ) switches the colour on and the output signals can be observed.

**SANDCASTLE PULSE DETECTOR**

Sandcastle pulse detector for burst-gate, line and blanking (horizontal and vertical) pulse detection. The vertical part of the sandcastle pulse is needed for the internal colour-on and colour-off delay.

**PULSE PROCESSING PART**

Pulse processing part which shall prevent a premature switching on of the colour. The colour-on delay, two or three field periods after identification of the PAL signal, is achieved by a counter. The colour is switched off immediately or at the latest one field period after disappearance of the identification voltage.

**RATINGS**

TDA4532

## SECAM DECODER

### GENERAL DESCRIPTION

The TDA4532 is a monolithic integrated colour decoder for SECAM television receivers. It is pin compatible with the multi-standard decoder TDA4555.

#### Features

##### Chrominance part

- Gain controlled amplifier with operating point control stage
- ACC (automatic chrominance control) with rectifier which is disabled during horizontal and vertical flyback
- Chrominance output stage for driving the 64  $\mu$ s glass delay line
- Limiter stages for direct and delayed chrominance signal
- SECAM permutator

##### Identification part

- Identification demodulator which is active during the horizontal identification signal and/or during part of the vertical flyback
- Identification mode switch (horizontal, vertical or combined horizontal and vertical)
- Service switch for forced colour on
- Sandcastle pulse for detection of burst gating pulse, horizontal blanking pulse, combined horizontal and vertical blanking pulse. The vertical part of the sandcastle pulse is required for the internal colour ON and colour OFF delay
- Pulse processor part which prevents premature switch-on of the colour. A counter provides colour ON delay of 2 or 3 vertical periods after identification of the SECAM signal. Colour is switched off immediately the identification voltage disappears, or 1 vertical period later

##### Demodulator part

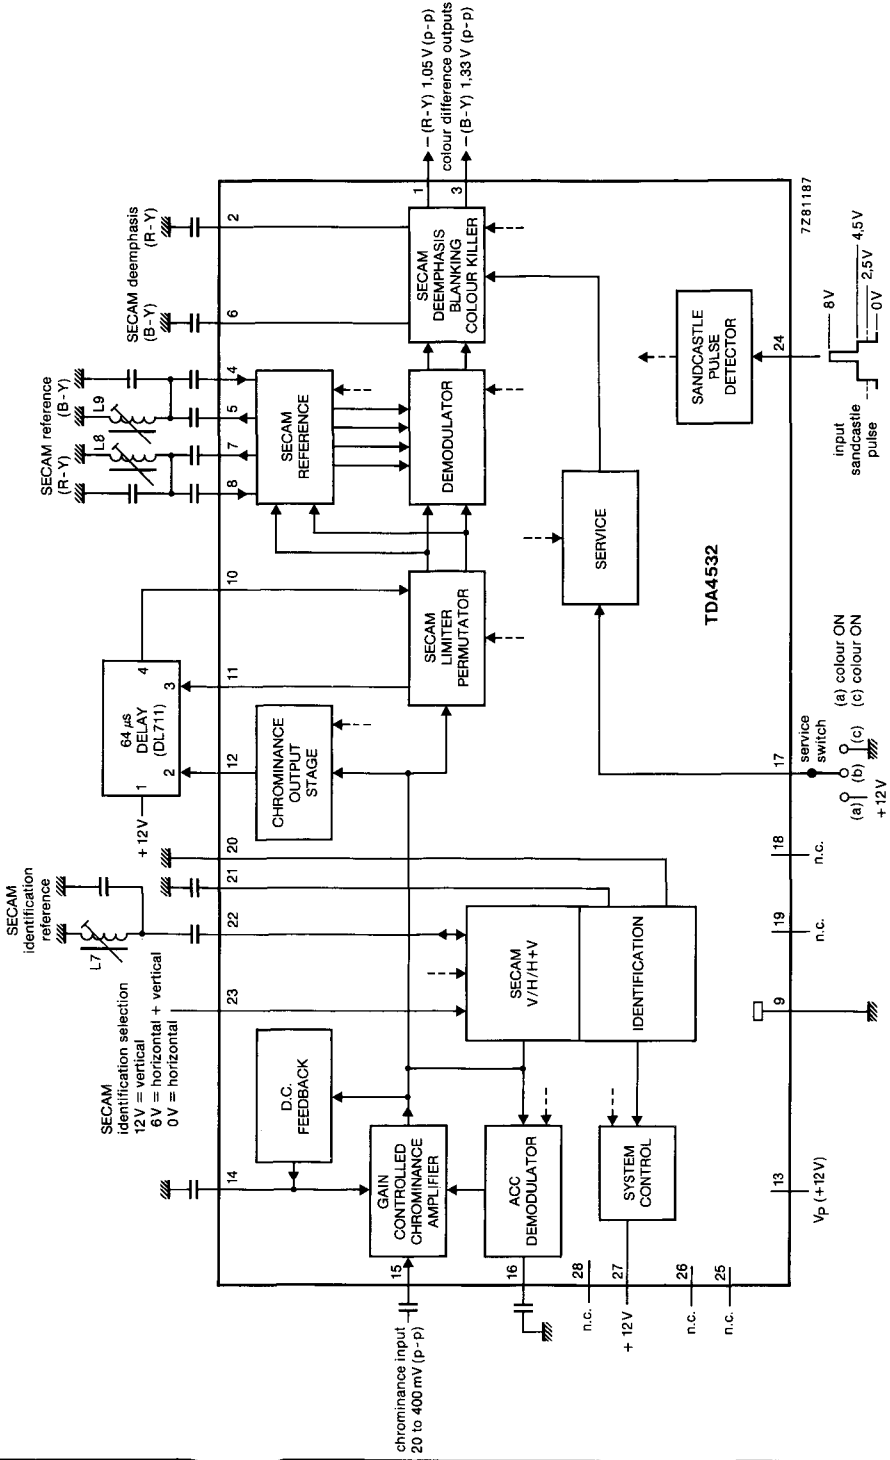

- Two quadrature demodulators with external reference tuned circuits
- Internal filtering of residual carrier in the demodulated colour difference signals
- De-emphasis circuit and colour switching stages in front of the output stages. The colour switching stages are controlled by the pulse processing part
- (B-Y) and (R-Y) colour difference output stages are low resistance n-p-n emitter followers

### QUICK REFERENCE DATA

Supply voltage (pin 13)	$V_p = V_{13-9}$	typ.	12 V
Supply current (pin 13)	$I_p = I_{13}$	typ.	60 mA
Chrominance input signal (peak-to-peak)	$V_{15-9(p-p)}$		20 to 400 mV
Chrominance output signal (peak-to-peak)	$V_{12-9(p-p)}$	typ.	1,6 V
Colour difference output signals (peak-to-peak values)			
-(R-Y)	$V_{1-9(p-p)}$	typ.	1,05 V
-(B-Y)	$V_{3-9(p-p)}$	typ.	1,33 V
Sandcastle pulse; required amplitude for			
vertical and horizontal pulse separation	$V_{24-9}$	typ.	2,5 V
horizontal pulse separation	$V_{24-9}$	typ.	4,5 V
burst gating	$V_{24-9}$	min.	7,7 V

### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

required pulse amplitude	V <sub>24-9</sub>	4,1	4,5	4,9	V
to separate burst gating pulse	V <sub>24-9</sub>	6,6	7,1	7,6	V
required pulse amplitude	V <sub>24-9</sub>	7,7	—	—	V
Input voltage during horizontal scanning	V <sub>24-9</sub>	—	—	1,1	V
Input current	-I <sub>24</sub>	—	—	100	μA

DEVELOPMENT DATA

**Notes to the characteristics**

1. The signal amplitude of the colour difference output signals  $-(R-Y)$  and  $-(B-Y)$  is dependent on the characteristics of the external tuned circuits at pins 7, 8 and 4, 5 respectively. Adjustment of the amplitude is achieved by varying the Q-factor of these tuned circuits. The resonant frequency must be adjusted such that the demodulated output frequency ( $f_D$ ) provides the same output level as the internally inserted reference voltage (achromatic value).
2. The sandcastle pulse is compared with three internal threshold levels, which are proportional to the supply voltage.

\*\* Or not connected.

## MULTISTANDARD DECODER

### GENERAL DESCRIPTION

The TDA4555 and TDA4556 are monolithic integrated multistandard colour decoders for the PAL, SECAM, NTSC 3,58 MHz and NTSC 4,43 MHz standards. The difference between the TDA4555 and the TDA4556 is the polarity of the colour difference output signals (B-Y) and (R-Y).

#### Features

##### Chrominance part

- Gain controlled chrominance amplifier for PAL, SECAM and NTSC
- ACC rectifier circuits (PAL/NTSC, SECAM)
- Burst blanking (PAL) in front of 64  $\mu$ s glass delay line
- Chrominance output stage for driving the 64  $\mu$ s glass delay line (PAL, SECAM)
- Limiter stages for direct and delayed SECAM signal
- SECAM permutator

##### Demodulator part

- Flyback blanking incorporated in the two synchronous demodulators (PAL, NTSC)
- PAL switch
- Internal PAL matrix
- Two quadrature demodulators with external reference tuned circuits (SECAM)
- Internal filtering of residual carrier
- De-emphasis (SECAM)
- Insertion of reference voltages as achromatic value (SECAM) in the (B-Y) and (R-Y) colour difference output stages (blanking)

##### Identification part

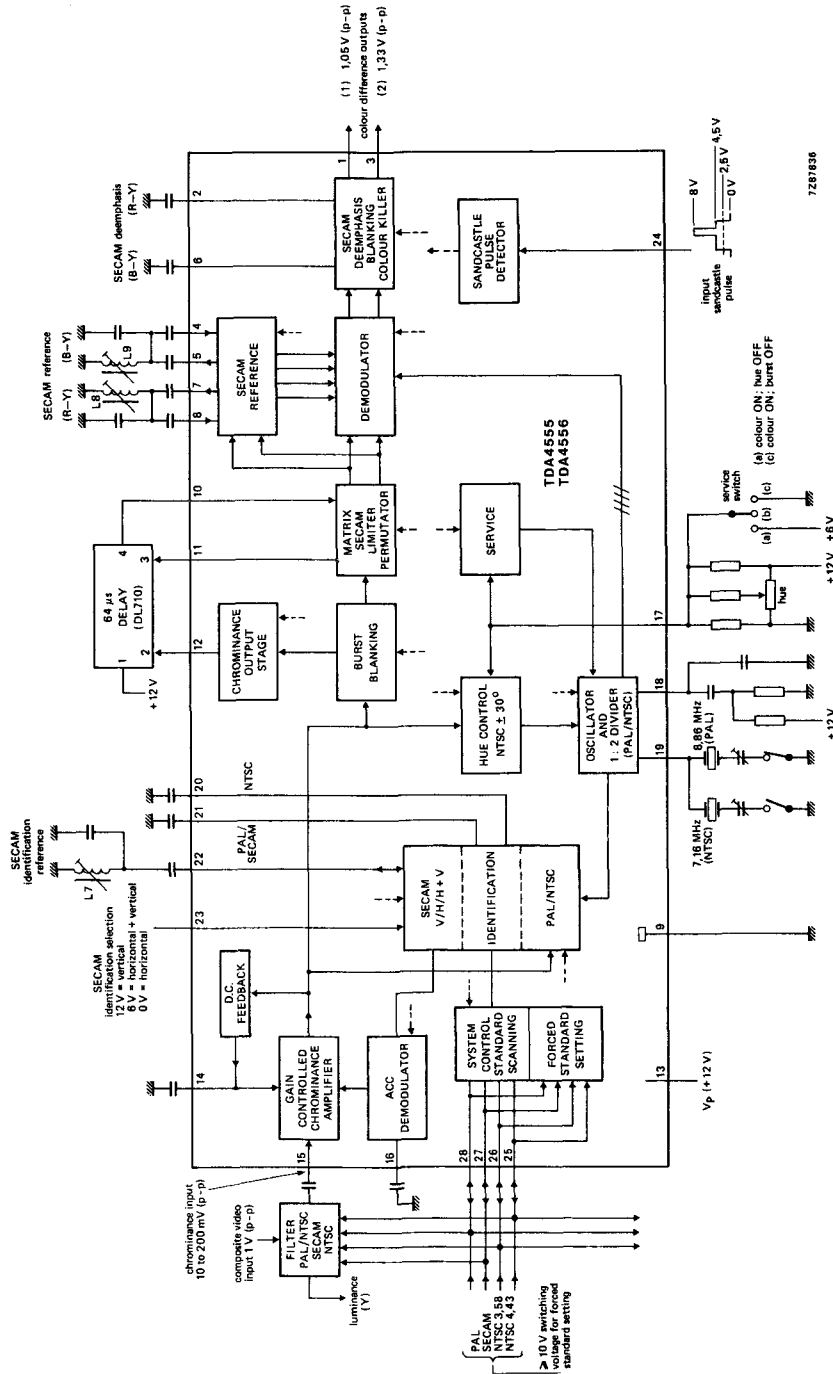

- Automatic standard recognition by sequential inquiry
- Delay for colour-on and scanning-on
- Reliable SECAM identification by PAL priority circuit
- Forced switch-on of a standard
- Four switching voltages for chrominance filters, traps and crystals
- Two identification circuits for PAL/SECAM (H/2) and NTSC
- PAL/SECAM flip-flop
- SECAM identification mode switch (horizontal, vertical or combined horizontal and vertical)
- Crystal oscillator with divider stages and PLL circuitry (PAL, NTSC) for double colour subcarrier frequency
- HUE control (NTSC)
- Service switch

**Notes to the characteristics**

1. The signal amplitude of the colour difference signals (R-Y) and (B-Y) is dependent on the characteristics of the external tuned circuits at pins 7, 8 and 4, 5 respectively. Adjustment of the amplitude is achieved by varying the Q-factor of these tuned circuits. The resonant frequency must be adjusted such that the demodulated output frequency ( $f_o$ ) provides the same output level as the internally inserted reference voltage (achromatic value).
2. The sandcastle pulse is compared with three internal threshold levels, which are proportional to the supply voltage.

### MULTISTANDARD DECODER

#### GENERAL DESCRIPTION

The TDA4557 is a monolithic integrated multistandard colour decoder for the PAL, SECAM, NTSC 3.58 MHz and NTSC 4.43 MHz standards.

#### Features

##### Chrominance part

- Gain controlled chrominance amplifier for PAL, SECAM and NTSC
- ACC rectifier circuits (PAL/NTSC, SECAM)
- Burst blanking (PAL) in front of 64  $\mu$ s glass delay line
- Chrominance output stage for driving the 64  $\mu$ s glass delay line (PAL, SECAM)
- Limiter stages for direct and delayed SECAM signal
- SECAM permutator

##### Demodulator part

- Flyback blanking incorporated in the demodulators (PAL, NTSC, SECAM)
- PAL switch
- Internal PAL matrix
- Two quadrature demodulators with external reference tuned circuits (SECAM)
- Internal filtering of residual carrier
- De-emphasis (SECAM)

##### Identification part

- Automatic standard recognition by sequential inquiry
- Delay for colour-on and scanning-on
- Reliable SECAM identification by PAL priority circuit and 50/60 Hz recognition
- Forced switch-on of a standard
- Four switching voltages for chrominance filters, traps and crystals
- Two identification circuits for PAL/SECAM (H/2) and NTSC
- PAL/SECAM flip-flop
- SECAM identification mode switch (horizontal, vertical or combined horizontal and vertical)
- Crystal oscillator with divider stages and PLL circuitry (PAL, NTSC) for double colour subcarrier frequency
- HUE control (NTSC)
- Service switch

Input voltage during horizontal scanning	V <sub>24-9</sub>	—	—	1.0	V
Input current	-I <sub>24</sub>	—	—	100	μA

**Notes to the characteristics**

1. The signal amplitude of the colour difference signals (R-Y) and B-Y) is dependent on the characteristics of the external tuned circuits at pins 7, 8 and 4, 5 respectively. Adjustment of the amplitude is achieved by varying the Q-factor of these tuned circuits. The resonant frequency must be adjusted such that the demodulated output frequency ( $f_D$ ) provides the same output level as the internally inserted reference voltage (achromatic value).
2. The sandcastle pulse is compared with three internal threshold levels, which are proportional to the supply voltage.

## COLOUR TRANSIENT IMPROVEMENT CIRCUIT

### GENERAL DESCRIPTION

The TDA4560 is a monolithic integrated circuit for colour transient improvement (CTI) and luminance delay line in gyrator technique in colour television receivers.

### Features

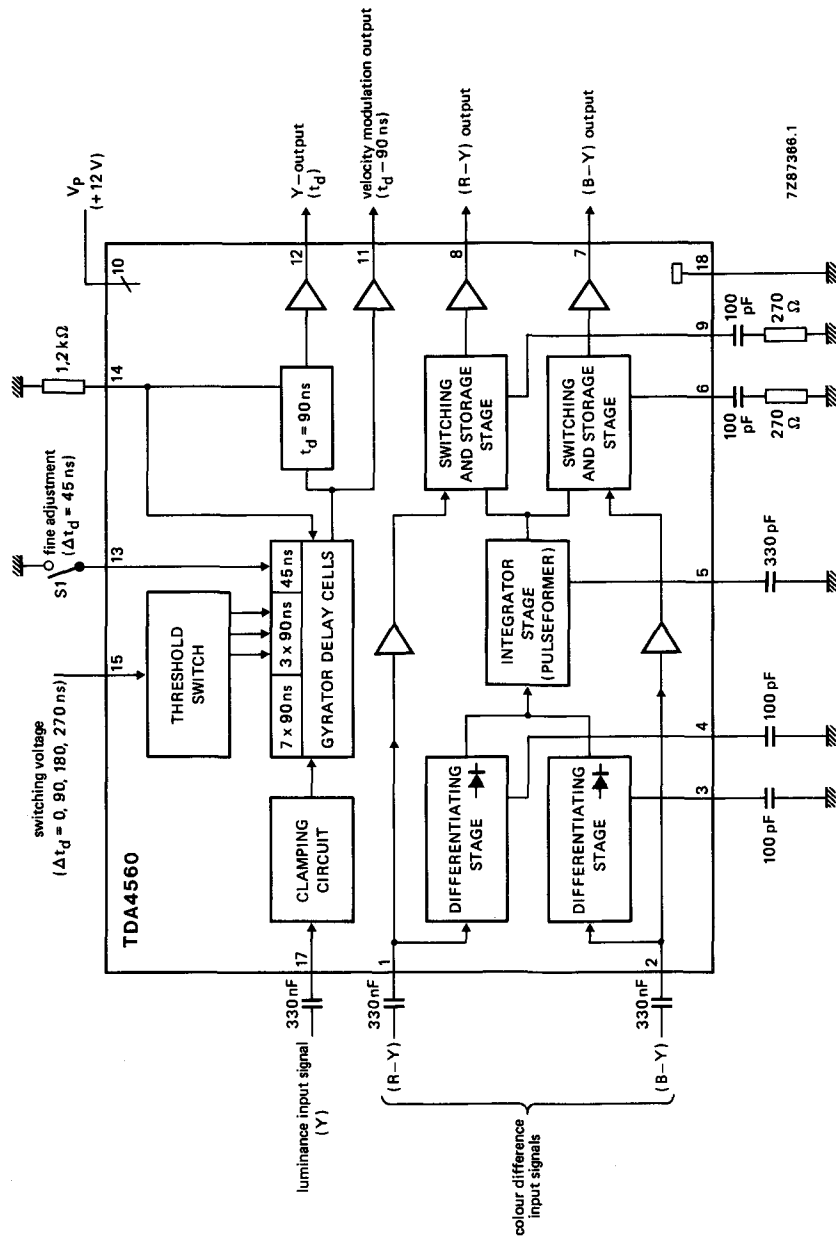

- Colour transient improvement for colour difference signals (R-Y) and (B-Y) with transient detecting-, storage- and switching stages resulting in high transients of colour difference output signals
- A luminance signal path (Y) which substitutes the conventional Y-delay coil with an integrated Y-delay line
- Switchable delay time from 720 ns to 1035 ns in steps of 45 ns
- Output for the option of velocity modulation

### QUICK REFERENCE DATA

Supply voltage (pin 10)	$V_P = V_{10-18}$	typ.	12 V
Supply current (pin 10)	$I_P = I_{10}$	typ.	35 mA
(R-Y) and (B-Y) attenuation	$\alpha_{cd}$	typ.	0 dB
(R-Y) and (B-Y) output transient time	$t_{tr}$	typ.	150 ns
Adjustable Y-delay time	$t_d$		720 to 1035 ns
Y-attenuation	$\alpha_Y$	typ.	7 dB

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

7287386.1

Fig. 1 Block diagram.

## FUNCTIONAL DESCRIPTION

The IC consists of two colour difference channels (B-Y) and (R-Y) and a luminance signal path (Y) as shown in Fig. 1.

### Colour difference channels

The (B-Y) and (R-Y) colour difference channels consist of a buffer amplifier at the input, a switching stage and an output amplifier. The switching stages, which are controlled by transient detecting stages (differentiators), switch to a value that has been stored at the beginning of the transients. The differentiating stages get their signal direct from the colour difference detecting signal (pins 1 and 2). Two parallel storage stages are incorporated in which the colour difference signals are stored during the transient time of the signal. After a time of about 600 ns they are switched immediately (transient time of 150 ns) to the outputs. The colour difference channels are not attenuated.

### Y-signal path

The Y-signal input (pin 17) is capacitively coupled to an input clamping circuit. Gyrator delay cells provide a maximum delay of 1035 ns including an additional delay of 45 ns via the fine adjustment switch (S1) at pin 13. Three delay cells are switched with two interstage switches dependent on the voltage at pin 15. Thus three switchable delay times of 90 ns, 180 ns or 270 ns less than the maximum delay time are available. A tuning compensation circuit ensures accuracy of delay time despite process tolerances. The Y-signal path has a 7 dB attenuation as a normal Y-delay coil and can replace this completely. The output is fed to pin 12 via a buffer amplifier. An additional output stage provides a signal of 90 ns less delay at pin 11 for the option of velocity modulation.

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC)

Supply voltage (pin 10)	$V_P = V_{10-18}$	max.	13,2 V
Voltage ranges to pin 18 (ground)			
at pins 1,2,12,15	$V_{n-18}$		0 to $V_P$ V

This data sheet contains advance information and specifications are subject to change without notice.

TDA4565

## COLOUR TRANSIENT IMPROVEMENT CIRCUIT

### GENERAL DESCRIPTION

The TDA4565 is a monolithic integrated circuit for colour transient improvement (CTI) and luminance delay line in gyrator technique in colour television receivers.

### Features

- Colour transient improvement for colour difference signals (R-Y) and (B-Y) with transient detecting-, storage- and switching stages resulting in high transients of colour difference output signals
- A luminance signal path (Y) which substitutes the conventional Y-delay coil with an integrated Y-delay line
- Switchable delay time from 730 ns to 1000 ns in steps of 90 ns and additional fine adjustment of 50 ns
- Two Y output signals; one of 180 ns less delay

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 10)		V <sub>p</sub>	10.8	12	13.2	V
Supply current (pin 10)		I <sub>p</sub>	—	35	50	mA
Y-signal delay at pin 12	S1 open; R <sub>14-18</sub> = 1.2 kΩ*	t <sub>17-12</sub>	670	730	790	ns
V <sub>15-18</sub> = 0 to 2.5 V						
V <sub>15-18</sub> = 3.5 to 5.5 V						
V <sub>15-18</sub> = 6.5 to 8.5 V						
V <sub>15-18</sub> = 9.5 to 12 V						
Y-signal attenuation	0.5 MHz	α <sub>Y</sub>	0	6.5	8.0	dB
(R-Y) and (B-Y) signal attenuation		α <sub>cd</sub>	-1	0	+1	dB
output transient time		t <sub>tr</sub>	—	100	200	ns

- \* Delay time is proportional to resistor R<sub>14-18</sub>.  
R<sub>14-18</sub> also influences the bandwidth; a value of 1.2 kΩ results in a bandwidth of 5 MHz (typ.).

pin 12		$\frac{V_{12} (5 \text{ MHz})}{V_{12} (0.5 \text{ MHz})}$	-3.0	—	2.0	dB

parameter	conditions	symbol	min.	typ.	max.	unit
DC output voltage pin 11	note 2	V <sub>11-18</sub>	1.8	2.3	2.6	V
pin 12		V <sub>12-18</sub>	9.8	10.3	10.8	V
Output current source		I <sub>11, 12</sub>	—	—	0.4	mA
sink		-I <sub>11, 12</sub>	—	—	1.0	mA

**Notes to the characteristics**

1. Output signal transient time measured with C<sub>6-18</sub> = C<sub>9-18</sub> = 220 pF without resistor (see Fig.3).
2. Output current measured with emitter follower with constant current source of 0.6 mA.
3. R<sub>14-18</sub> influences the bandwidth; a value of 1.2 kΩ results in a bandwidth of 5 MHz (typ.).
4. Delay time is proportional to resistor R<sub>14-18</sub>. Devices with suffix "A" require the value of the resistor to be 1.15 kΩ; a 27 kΩ resistor connected in parallel with R<sub>14-18</sub> = 1.2 kΩ.
5. Frequency response measured with V<sub>15-18</sub> = 9.5 V and switch S1 open.

APPLICATION INFORMATION

- (1) Residual carrier reduced to 20 mV peak-to-peak ( $R = 1 \text{ k}\Omega$ ,  $C = 100 \text{ pF}$ ).
- (2) Switching sequence for delay times shown in Table 1.
- (3)  $R_{14-18} = 1.2 \text{ k}\Omega$  for TDA4565  
 $R_{14-18} = 1.15 \text{ k}\Omega$  for TDA4565A (27 kΩ resistor connected in parallel to 1.2 kΩ).

Fig.3 Application diagram and test circuit.

Table 1 Switching sequence for delay times.

connection			voltage at pin 15	delay time (ns)*
(a)	(b)	(c)		
0	0	0	0 to 2.5 V	730
0	0	X	3.5 to 5.5 V	820
0	X	X	6.5 to 8.5 V	910
X	X	X	9.5 to 12 V	1000

Where: X = connection closed; 0 = connection open.

\* When switch (S1) is closed the delay time is increased by 50 ns.

TDA4566

## COLOUR TRANSIENT IMPROVEMENT CIRCUIT

### GENERAL DESCRIPTION

The TDA4566 is a monolithic integrated circuit for colour-transient improvement (CTI) and luminance delay line in gyrator technique in colour television receivers.

### Features

- Colour transient improvement for colour difference signals (R-Y) and (B-Y) with transient detecting-, storage- and switching stages resulting in high transients of colour difference output signals
- A luminance signal path (Y) which substitutes the conventional Y-delay coil with an integrated Y-delay line
- Switchable delay time from 550 ns to 820 ns in steps of 90 ns and additional fine adjustment of 37 ns
- Two Y output signals; one of 180 ns less delay

### QUICK REFERENCE DATA

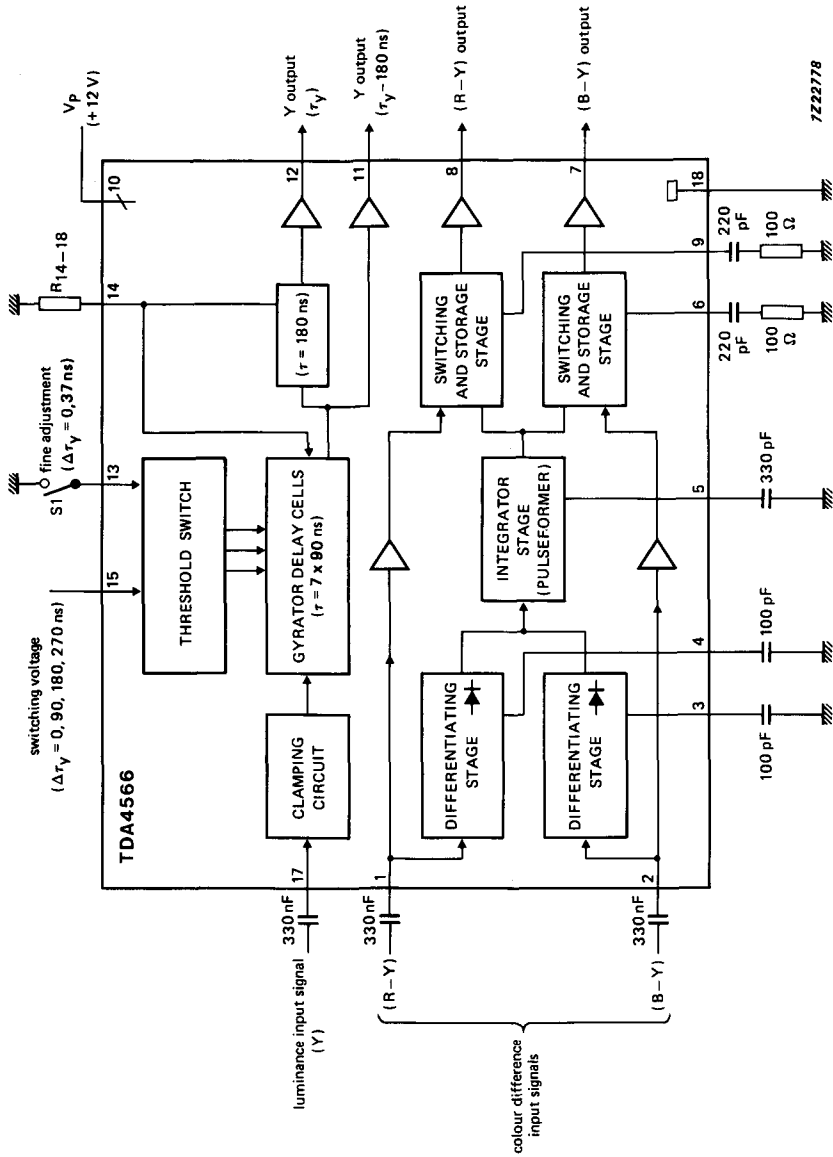

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 10)	S1 open; R <sub>14-18</sub> = 1.2 k $\Omega$ *	V <sub>p</sub>	10.8	12	13.2	V
Supply current (pin 10)		I <sub>p</sub>	—	35	50	mA
Y-signal delay at pin 12		t <sub>17-12</sub>	490	550	610	ns
V <sub>15-18</sub> = 0 to 2.5 V		t <sub>17-12</sub>	580	640	700	ns
V <sub>15-18</sub> = 3.5 to 5.5 V		t <sub>17-12</sub>	670	730	790	ns
V <sub>15-18</sub> = 6.5 to 8.5 V	t <sub>17-12</sub>	760	820	880	ns	
V <sub>15-18</sub> = 9.5 to 12 V						
Y-signal amplification	0.5 MHz	$\alpha_Y$	0	1	2	dB
(R-Y) and (B-Y) signal attenuation		$\alpha_{cd}$	-1	0	+1	dB
output transient time		t <sub>tr</sub>	—	100	200	ns

- \* Delay time is proportional to resistor R<sub>14-18</sub>.  
R<sub>14-18</sub> also influences the bandwidth; a value of 1.2 k $\Omega$  results in a bandwidth of 5 MHz (typ.).

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Input switching current		$-I_{15}$	—	15	25	$\mu A$
Y-signal attenuation	$f = 0.5 \text{ MHz}$					
pin 11 from pin 17		$V_{11}/V_{17}$	-1	0	+1	dB
pin 12 from pin 17		$V_{12}/V_{17}$	0	+1	+2	dB
Frequency response at 3 MHz referred to 0.5 MHz	note 5					
pin 11		$\frac{V_{11} (3 \text{ MHz})}{V_{11} (0.5 \text{ MHz})}$	0	—	3.0	dB
pin 12		$\frac{V_{12} (3 \text{ MHz})}{V_{12} (0.5 \text{ MHz})}$	0	—	3.0	dB

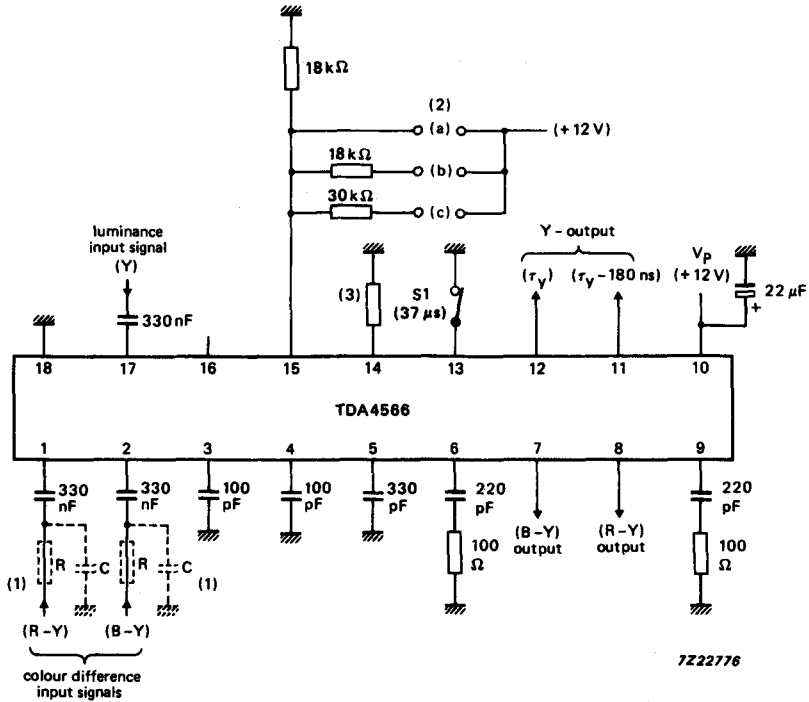

parameter	conditions	symbol	min.	typ.	max.	unit
Frequency response at 5 MHz referred to 0.5 MHz	note 5					
pin 11		$\frac{V_{11}(5\text{ MHz})}{V_{11}(0.5\text{ MHz})}$	-3.0	-	2.0	dB
pin 12		$\frac{V_{12}(5\text{ MHz})}{V_{12}(0.5\text{ MHz})}$	-3.0	-	2.0	dB
DC output voltage						
pin 11		$V_{11-18}$	1.8	2.3	2.6	V
pin 12		$V_{12-18}$	9.8	10.3	10.8	V
Output current	note 2					
source		$I_{11, 12}$	-	-	0.4	mA
sink		$-I_{11, 12}$	-	-	1.0	mA

**Notes to the characteristics**

- Output signal transient time measured with  $C_{6-18} = C_{9-18} = 220\text{ pF}$  without resistor (see Fig.3).
- Output current measured with emitter follower with constant current source of 0.6 mA.
- $R_{14-18}$  influences the bandwidth; a value of  $1.2\text{ k}\Omega$  results in a bandwidth of 5 MHz (typ.).
- Delay time is proportional to resistor  $R_{14-18}$ . Devices with suffix "A" require the value of the resistor to be  $1.15\text{ k}\Omega$ ; a  $27\text{ k}\Omega$  resistor connected in parallel with  $R_{14-18} = 1.2\text{ k}\Omega$ .
- Frequency response measured with  $V_{15-18} = 9.5\text{ V}$  and switch S1 open.

DEVELOPMENT DATA

APPLICATION INFORMATION

- (1) Residual carrier reduced to 20 mV peak-to-peak ( $R = 1 \text{ k}\Omega$ ,  $C = 100 \text{ pF}$ ).
- (2) Switching sequence for delay times shown in Table 1.
- (3)  $R_{14-18} = 1.2 \text{ k}\Omega$  for TDA4566.  
 $R_{14-18} = 1.15 \text{ k}\Omega$  for TDA4566A (27 k $\Omega$  resistor connected in parallel to 1.2 k $\Omega$ ).

Fig.3 Application diagram and test circuit.

Table 1 Switching sequence for delay times.

connection			voltage at pin 15	delay time (ns)*
(a)	(b)	(c)		
0	0	0	0 to 2.5 V	550
0	0	X	3.5 to 5.5 V	640
0	X	X	6.5 to 8.5 V	730
X	X	X	9.5 to 12 V	820

Where : X = connection closed; 0 = connection open.

\* When switch (S1) is closed the delay time is increased by 37 ns.

### NTSC DECODER

#### GENERAL DESCRIPTION

The TDA4570 is an integrated 3,58 MHz or 4,43 MHz NTSC decoder. It is pin sequence compatible with multi-standard decoder TDA4555 and pin compatible with the PAL decoder TDA4510.

#### Features:

##### Chrominance part

- Gain controlled amplifier with operating point control stage
- ACC (automatic chrominance control) with sampled rectification during burst-key signal
- Blanking circuit for the colour burst signal

##### Oscillator and control voltage part

- Voltage controlled reference oscillator for double subcarrier frequency
- Divider stages which provide the correct 90° phase between  $-(R-Y)$  and  $-(B-Y)$  reference signals for the demodulators
- Phase comparator which controls the frequency and phase of the reference oscillator and compares the  $(R-Y)$  reference with the burst pulse
- HUE control stage provides phase shifting via the combined service and hue control input (pin 11)
- Identification demodulator provides a positive-going identification signal at pin 14 for NTSC signals and acts as the automatic colour killer
- Two-function service switch:
  - position one ( $V_{14.3} < 1\text{ V}$ ): switches the colour-ON and switches the hue control and burst for the PLL oscillator-OFF, allowing the adjustment of the reference oscillator
  - position two ( $V_{14.3} > 5\text{ V}$ ): switches the colour-ON, the hue control OFF and allows the output signal to be observed
- Sandcastle pulse detector for burst-gate, horizontal and horizontal/vertical blanking pulse detection. The vertical part of the sandcastle pulse is used for the internal colour-ON and colour-OFF delay
- Pulse processing part for the prevention of premature switching ON of the colour. The colour-ON delay, two or three field periods after identification of the NTSC signal, is achieved by a counter. When there is no identification voltage present the colour is switched OFF immediately or, at the most, one field period later.

##### Demodulator part

- Two synchronous demodulators for the  $(R-Y)$  and  $(B-Y)$  signals, which incorporate stages for the blanking during line and field flyback
- Internal filtering of the residual carrier in the demodulated colour difference signals
- Colour switching stages controlled by the pulse processing part in front of the output stages
- The output stages for  $(R-Y)$  and  $(B-Y)$  signals are low resistance n-p-n emitter followers
- Separate colour switching output

Crystal frequency 7, 16 or 8,86 MHz; resonance resistance  $60\Omega$ ; load capacitance  $20pF$ ; dynamic capacitance  $22pF$  and static capacitance  $5,5pF$ .

### VIDEO CONTROL COMBINATION CIRCUIT

with automatic cut-off control

#### GENERAL DESCRIPTION

The TDA4580 is a monolithic integrated circuit which performs video control functions in television receivers with a colour difference interface. For example it operates in conjunction the multistandard colour decoder TDA4555. The required input signals are: luminance and negative colour difference  $-(R-Y)$  and  $-(B-Y)$ , and a 3-level sandcastle pulse for control purposes. Analogue RGB signals can be inserted from two sources. One with full performance adjustment possibilities. RGB output signals are available for driving the video output stages. This circuit provides automatic cut-off control of the picture tube.

#### Features

- Capacitive coupling of the colour difference, luminance and RGB input signals with black level clamping
- Two sets of analogue RGB inputs via fast switch 1 and fast switch 2
- First RGB inputs and fast switch 1 in accordance with peritelevision connector specification
- Saturation, contrast and brightness control acting on first RGB inputs
- Brightness control acting on second RGB inputs
- Equal black levels for television and inserted signals
- Clamping, horizontal and vertical blanking, and timing of automatic cut-off, controlled by a 3-level sandcastle pulse
- Automatic cut-off control with compensation for leakage current of the picture tube
- Measuring pulses of cut-off control start immediately after end of vertical part of sandcastle pulse
- Three selectable blanking intervals for PAL, SECAM and NTSC/PAL-M
- Two switch-on delays for run-in without discolouration
- Adjustable peak drive limiter
- Average beam current limiter
- G-Y and RGB matrix coefficients selectable for PAL/SECAM and NTSC (correction for FCC primaries)
- Bandwidth 10 MHz (typ.)
- Emitter-follower outputs for driving the RGB output stages

#### QUICK REFERENCE DATA

Supply voltage (pin 6)	$V_P = V_{6-24}$	typ.	12 V
Supply current (pin 6)	$I_P = I_6$	typ.	110 mA
Luminance input (pin 15)			
Composite video input signal (VBS) (peak-to-peak value)	$V_{15-24(p-p)}$	typ.	0,45 V
Colour difference input signals (peak-to-peak values)			
$-(B-Y)$	$V_{18-24(p-p)}$	typ.	1,33 V
$-(R-Y)$	$V_{17-24(p-p)}$	typ.	1,05 V
Inserted RGB signals (black to white values)	$V_{14, 13, 12-24}$	typ.	0,7 V
Inserted RGB signals for teletext use (black to white values)	$V_{23, 22, 21-24}$	typ.	1 V
Three-level sandcastle pulse (required input voltage)	$V_{10-24}$	typ.	2,5/4,5/8,0 V

DEVELOPMENT DATA

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range (pin 6)	$V_P = V_{6-24}$		0 to 13,2 V
Voltage range at pins 2, 4, 7, 9, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 27 to pin 24 (ground)	$V_{n-24}$		0 to $V_P$ V
Voltages ranges at pins 8, 11, 28	$V_{8, 11, 28-24}$		-0,5 to $V_P$ V
at pin 10	$V_{10-24}$		0 to $V_P + 0,7$ V
at pin 26	$V_{26-24}$		-0,7 to $V_P + 0,7$ V
Currents			
at pins 1, 3, 5 (average)	$-I_{1, 3, 5(AV)}$	max.	3 mA
at pins 1, 3, 5 (peak)	$-I_{1, 3, 5(M)}$	max.	10 mA
at pin 19 (average)	$I_{19(AV)}$	max.	5 mA
at pin 26	$I_{26}$	max.	1 mA
Total power dissipation	$P_{tot}$	max.	2 W
Storage temperature range	$T_{stg}$		-20 to + 150 °C
Operating ambient temperature range	$T_{amb}$		0 to + 70 °C

**THERMAL RESISTANCE**

From junction to ambient	$R_{th\ j-a}$	=	37 K/W
--------------------------	---------------	---	--------

**CHARACTERISTICS**

$V_p = 12\text{ V}$ ;  $T_{amb} = 25\text{ }^\circ\text{C}$ ; measured in a circuit similar to Fig. 4 at nominal settings (saturation, contrast, brightness), no beam current or peak drive limiting; all voltages with respect to pin 24 (ground) unless otherwise specified.

DEVELOPMENT DATA

parameter	symbol	min.	typ.	max.	unit
<b>Supply (pin 6)</b>					
Supply voltage range	$V_p = V_{6-24}$	10,8	—	13,2	V

## CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
<b>RGB/Y, (R-Y), (B-Y) – Matrix</b>					
Matrixed according to the equations					
$V_{(R-Y)} = 0,7 V_R - 0,59 V_G - 0,11 V_B$					
$V_{(B-Y)} = -0,3 V_R - 0,59 V_G + 0,89 V_B$					
$V_{(Y)} = 0,3 V_R + 0,59 V_G + 0,11 V_B$					
<b>Contrast control input (pin 19; note 3)</b> (contrast control acts on Y and CD signals or RGB1 signals respectively)					
Maximum contrast	$V_{19-24}$	–	4	–	V
Nominal contrast (6 dB below max.)	$V_{19-24}$	–	3	–	V
Attenuation of contrast at $V_{19-24} = 2$ V (related to max.)		–	22	–	dB
Input current at $V_{19-24} = 2$ to 4 V	$-I_{19}$	–	–	3	$\mu$ A
<b>Peak drive limiting input (pin 9; note 4)</b>					
Internal d.c. bias voltage	$V_{9-24}$	–	9	–	V
Input resistance at $V_{9-24} > 9$ V	$R_9$	–	10	–	k $\Omega$
Control current into contrast input (pin 19) during peak drive $V_{1, 2 \text{ or } 3-24} > V_{9-24}$	$I_{19}$	–	20	–	mA
<b>Average beam current limiting input (pin 25; note 5)</b>					
Start of contrast reduction at maximum contrast setting	$V_{25-24}$	–	8,5	–	V
Input range for full contrast reduction	$\Delta V_{25-24}$	–	1,0	–	V
Input resistance at $V_{25-24} < 6$ V	$R_{25}$	–	2,2	–	k $\Omega$
<b>Saturation control input (pin 16)</b> (saturation control acts on CD signals or RGB1 signals respectively)					
Maximum saturation	$V_{16-24}$	–	4	–	V
Nominal saturation (6 dB below max.)	$V_{16-24}$	–	3	–	V
Attenuation of saturation at $V_{16-24} = 1,8$ V (related to max. at 100 kHz)		50	–	–	dB
Input current at $V_{16-24} = 1,8$ to 4 V	$I_{16}$	–	–	10	$\mu$ A

parameter	symbol	min.	typ.	max.	unit
<b>Brightness control input</b> (pin 20; note 6 and 7)					
Control voltage range	V <sub>20-24</sub>	1	—	3	V
Input current at V <sub>20-24</sub> = 1 to 3 V	-I <sub>20</sub>	—	—	10	μA
Control voltage for nominal brightness	V <sub>20-24</sub>	—	2,2	—	V
Change of black level in the control range related to the nominal output signal (black/white) for ΔV <sub>20-24</sub> = 1 V		—	33	—	%
Signal switched off and black level equal to cut-off measuring level at	V <sub>20-24</sub>	11,5	—	—	V
<b>Y, (R-Y), (B-Y)/RGB – Matrix</b> (note 8)					
PAL matrix (V <sub>8-24</sub> = < 4,5 V)					
Matrixed according to the equation					
$V_{(G-Y)} = -0,51 V_{(R-Y)} - 0,19 V_{(B-Y)}$					
NTSC matrix (V <sub>8-24</sub> = > 5,5 V)					
(Adaption for NTSC-FCC primaries, nominal hue control set on -5°)					
Matrixed according to the equation					
$V_{(G-Y)}^* = -0,43 V_{(R-Y)} - 0,11 V_{(B-Y)}$					
$V_{(R-Y)}^* = 1,57 V_{(R-Y)} - 0,41 V_{(B-Y)}$					
$V_{(B-Y)}^* = V_{(B-Y)}$					
<b>RGB2 inputs (Teletext)</b> (R2 pin 23, G2 pin 22, B2 pin 21; note 2)					
(RGB signals controlled by brightness control)					
Input signal for 100% output signals (black to white value)	V <sub>21, 22, 23-24</sub>	—	1	—	V
Input current during scanning	I <sub>21, 22, 23</sub>	—	—	0,3	μA
Input resistance	R <sub>21, 22, 23</sub>	5	—	—	MΩ
<b>Signal switch 2 input</b> (pin 28)					
Input voltage level for insertion of Y, CD signals or RGB1 signals respectively					
RGB signals from matrix (note 9)					
V <sub>28-24</sub>					
— — 0,4 V					
RGB2 signals (note 9)					
V <sub>28-24</sub>					
0,9 — 3,0 V					
Internal resistor to ground					
R <sub>28-24</sub>					
— 10 — kΩ					

## CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
<b>Automatic cut-off control input</b> (pin 26; note 10) (leakage current measuring time and insertion of RGB cut-off measuring lines see Fig. 5; types of ultra-black level see Fig. 3)					
Allowed maximum external D.C. bias voltage	$V_{26-24}$	5,5	—	—	V
Voltage difference between cut-off current measurement and leakage current measurement	$\Delta V_{26-24}$	—	0,5	—	V
Warm-up test pulse	$V_{1, 3, 5-24}$	—	$V_{9-24}^*$	—	V
Threshold for warm-up detector	$V_{26-24}$	—	8	—	V
<b>Storage input for leakage current</b> (pin 27)					
Internal resistance during leakage current measuring time (current limiting at $I_{27} = 0,2$ mA)	$R_{27}$	—	400	—	$\Omega$
Input current except during cut-off control cycle	$I_{I27}$	—	—	0,5	$\mu A$
<b>Storage inputs for automatic cut-off control</b> (pins 2, 4, 7)					
Charge and discharge currents	$I_{I2, 4, 7}$	—	0,3	—	mA
Input currents of storage inputs out of control time	$I_{I2, 4, 7}$	—	—	0,1	$\mu A$
<b>Switch input for PAL/NTSC matrix and vertical blanking time</b> (pin 8; note 11)					
Switching voltage input for					
PAL matrix and vertical blanking period of					
25 lines	$V_{8-24}$	—	0	0,5	V
22 lines	$V_{8-24}$	1,5	2	2,5	V
18 lines	$V_{8-24}$	3,5	4	4,5	V
NTSC matrix and vertical blanking period of					
18 lines	$V_{8-24}$	5,5	6	12	V
Input current	$I_8$	—	—	50	$\mu A$

\* Maximum 8 V.

parameter	symbol	min.	typ.	max.	unit
<b>Sandcastle pulse detector</b> (pin 10; note 12)					
The following amplitudes are required for separating the various pulses:					
horizontal and vertical blanking pulses	V <sub>10-24</sub>	2,0	2,5	3,0	V
horizontal pulses for counter logic	V <sub>10-24</sub>	4,0	4,5	5,0	V
clamping pulses	V <sub>10-24</sub>	7,5	—	—	V
delay of leading edge of clamping pulse	t <sub>d</sub>	—	1	—	μs
Input current at V <sub>10-24</sub> = 0 V	-I <sub>10</sub>	—	—	100	μA
<b>Outputs for positive RGB signals</b> (R0 pin 1, G0 pin 3, B0 pin 5; note 13)					
Nominal signal amplitude (black/white)	V <sub>1, 3, 5-24</sub>	—	3	—	V
Spreads between channels		—	—	10	%
Maximum signal amplitude (black/white)	V <sub>1, 3, 5-24</sub>	4	—	—	V
Internal current source	I <sub>1, 3, 5</sub>	—	3	—	mA
Output resistance	R <sub>1, 3, 5</sub>	—	160	220	Ω
Minimum output voltage	V <sub>1, 3, 5-24</sub>	—	1	—	V
Maximum output voltage	V <sub>1, 3, 5-24</sub>	—	10	—	V
Horizontal and vertical blanking to ultra-black level 2 related to nominal signal black level in percentage of nominal signal amplitude		45	55	—	%
Vertical blanking to ultra-black level 1 related to cut-off measuring level in percentage of nominal signal amplitude		25	35	—	%
<i>Recommendation:</i>					
Range for cut-off measuring level 1,5 to 5,0 V; nominal value at 3 V (note 14)					
<b>Gain data</b> (note 15)					
Frequency response of Y path (0 to 8 MHz) pin 1, 3 and 5 to pin 15	d	—	—	3	dB
Frequency response of CD path (0 to 8 MHz) pin 1 to pin 17 = pin 5 to pin 18	d	—	—	3	dB
Frequency response of RGB1 path (0 to 8 MHz) pin 1 to pin 14 = pin 3 to pin 13 = pin 5 to pin 12	d	—	—	3	dB
Frequency response of RGB2 path (0 to 10 MHz) pin 1 to pin 23 = pin 3 to pin 22 = pin 5 to pin 21	d	—	—	3	dB

**Notes to the characteristics**

1. The value of the colour difference input signals,  $-(B-Y)$  and  $-(R-Y)$ , is given for saturated colour bar with 75% of maximum amplitude.
2. Capacitive coupled to a low ohmic source; recommended value  $600 \Omega$  (max.).
3. At pin 19 for  $V_{19-24} \leq 2,0 \text{ V}$ , no further decrease of contrast is possible.
4. The peak drive limiting of output signals is achieved by contrast reduction. The limiting level of the output signals is equal to the voltage  $V_{9-24}$ , adjustable in the range 5 to 11 V. After exceeding the adjusted limiting level at peak drive limiter will not be active during the first line.
5. The average beam current limiting acts on contrast and at minimum contrast on brightness (the external contrast voltage at pin 19 is not affected).
6. At nominal brightness the black level at the output is  $0,3 \text{ V}$  ( $\hat{=}$  10% of nominal signal amplitude) below the measuring level.
7. The internal control voltage can never be more positive than  $0,7 \text{ V}$  above the internal contrast voltage.
8. Matrix equation
 

$V_{(R-Y)}$ , $V_{(B-Y)}$	:	output of NTSC decoder of PAL type demodulating axis and amplitudes
$V_{(G-Y)^*}$ , $V_{(R-Y)^*}$ , $V_{(B-Y)^*}$	:	for NTSC modified CD signals; equivalent to demodulation with the following axes and amplification factors:—
$(B-Y)^*$ demodulator axis		$0^\circ$
$(R-Y)^*$ demodulator axis		$115^\circ$ (PAL 90°)
$(R-Y)^*$ amplification factor		1,97 (PAL 1,14)
$(B-Y)^*$ amplification factor		2,03 (PAL 2,03)

$V_{(G-Y)^*} = -0,27 V_{(R-Y)^*} - 0,22 V_{(B-Y)^*}$ .
9. During clamping time, in each channel the black level of the inserted signal is clamped on the black level of the internal signal behind the matrix (dependent on brightness control).
10. During warm-up time of the picture tube, the RGB outputs (pins 1, 3 and 5) are blanked to minimum output voltage. An inserted white pulse during the vertical flyback is used for beam current detection. If the beam current exceeds the threshold of the warm-up detector at pin 26, the cut-off current control starts operating, but the video signal is still blanked. After run-in of the cut-off current control loop, the video signal will be released.
 

The first measuring pulse occurs in the first complete line after the end of the vertical part of the sandcastle pulse. The absolute minimum vertical part must contain 9 line-pulses. The cycle time of the counter is 63 lines. When the vertical pulse is longer than 61 lines, the IC is reset to the switch-on condition. In this event the video signal is blanked and the RGB-outputs are blanked to minimum output voltage as during warm-up time.

During leakage current measurement, all three channels are blanked to ultra-black level 1. With the measuring level only in the controlled channel, the other two channels are blanked to ultra-black level 1. The brightness control shifts both the signal black level and the ultra-black level 2. The brightness control is disabled from line 4 to the end of the last measuring line (see Fig. 3).

With the most adverse conditions (maximum brightness and minimum black level 2) the blanking level is located 30% of nominal signal amplitude below the cut-off measuring level.

Fig. 3 Types of ultra-black levels.

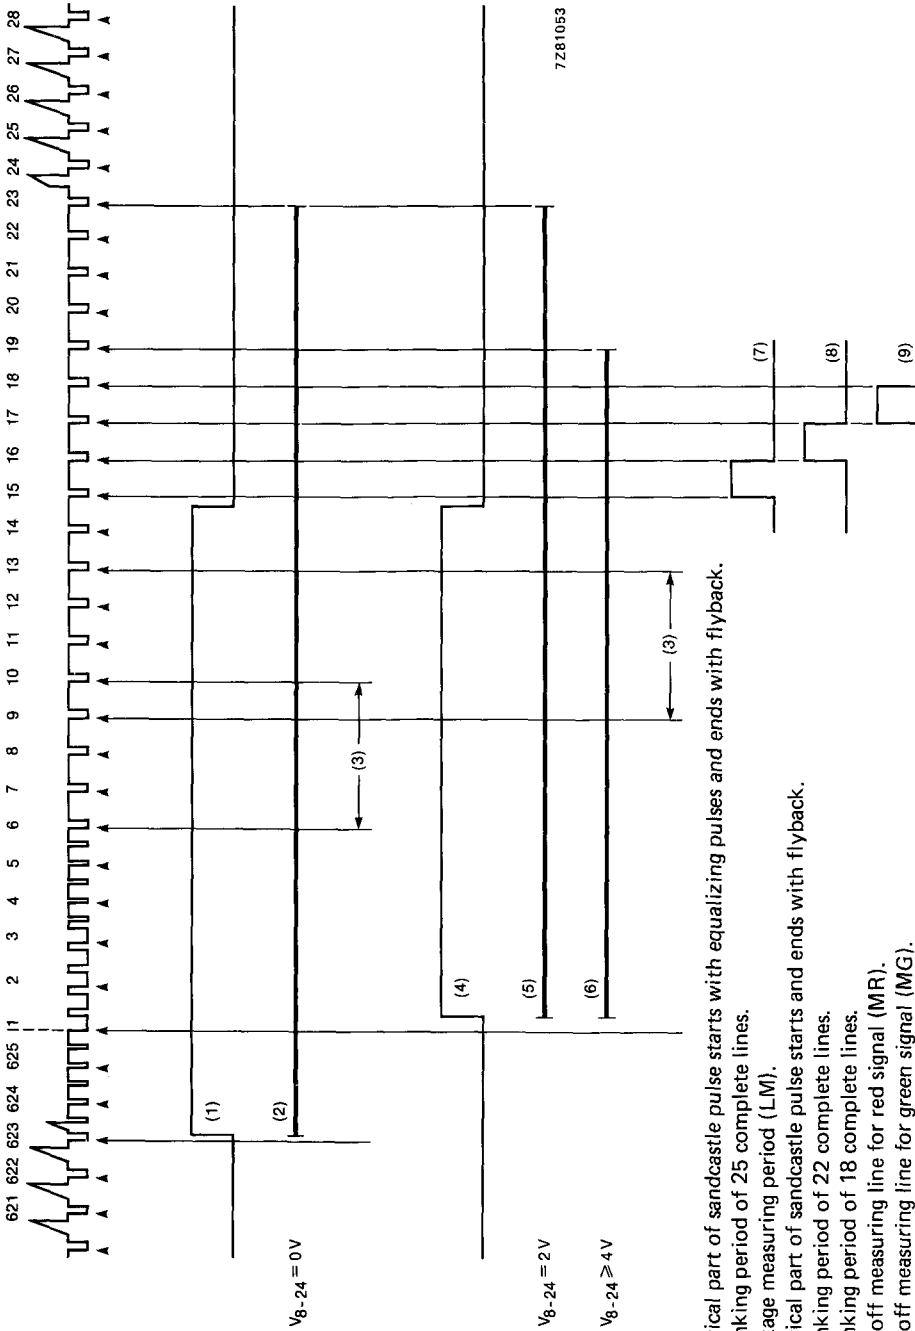

DEVELOPMENT DATA

11. The given blanking times are valid for the vertical part of the sandcastle pulse of 9 to 15 lines. If the vertical part is longer and the cut-off lines are outside the vertical blanking period of 18, 22 or 25 lines respectively, the blanking of the signal ends with the end of last of the three cut-off measuring pulses as shown in Fig. 5.
12. The sandcastle pulse is compared with three internal thresholds (proportional to  $V_p$ ) to separate the various pulses. The internal pulses are generated when the input pulse at pin 10 exceeds the thresholds. The thresholds are for:
  - Horizontal and vertical blanking  $V_{10-24} = 1,5 \text{ V}$
  - Horizontal pulse  $V_{10-24} = 3,5 \text{ V}$
  - Clamping pulse  $V_{10-24} = 7,0 \text{ V}$
13. The outputs at pins 1, 3 and 5 are emitter followers with current sources and emitter protection resistors.
14. The value of the cut-off control range for the positive RGB output signals is given for a nominal output signal. If the signal amplitude is reduced, the cut-off range can be increased.
15. The gain data is given for a nominal setting of the contrast and saturation controls, measured without load at the RGB outputs (pins 1, 3 and 5).

APPLICATION INFORMATION (continued)

- (1) vertical part of sandcastle pulse starts with equalizing pulses and ends with flyback.
- (2) blanking period of 25 complete lines.
- (3) leakage measuring period (LM).
- (4) vertical part of sandcastle pulse starts and ends with flyback.
- (5) blanking period of 22 complete lines.
- (6) blanking period of 18 complete lines.
- (7) cut-off measuring line for red signal (MR).
- (8) cut-off measuring line for green signal (MG).
- (9) cut-off measuring line for blue signal (MB).

Fig. 5 Blanking and measuring lines.

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA4720

## SECAM IDENTIFICATION AND CHROMINANCE CORRECTION CIRCUIT

The TDA4720T is a monolithic integrated circuit for SECAM identification and chrominance signal correction in VHS video cassette recorders (VCR). It can be applied as a stand-alone SECAM identification circuit and, when used in conjunction with TDA4710, together they provide all the functions necessary for PAL/SECAM B, G chrominance processing in VHS VCRs.

### Features

- Very reliable SECAM identification by means of chrominance burst amplitude, presence of both SECAM colour carriers and line alternation of both carriers
- Two identification outputs: SECAM YES/NO
- Internal phase correction of the demodulated burst
- Internal detection and switching for SECAM long-play VCR (for 'trick' modes)
- Internal buffers and switches for correction of the line-alternating colour carriers

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 13)	$V_p$	4,5	5,0	5,5	V
Supply current	$I_p$	—	16	17	mA
Chrominance input signal to phase detector (peak-to-peak value)	$V_{14,15-4(p-p)}$	60	—	300	mV
Chrominance input signal to line correction circuit (peak-to-peak value)	$V_{5,12-4(p-p)}$	—	—	1	V
Chrominance output signal from line correction circuit (peak-to-peak value)	$V_{7-4(p-p)}$	—	—	1	V

### PACKAGE OUTLINES

TDA4720: 16-lead DIL; plastic (SOT38).

TDA4720T: 16-lead mini-pack; plastic (SO16; SOT109A).

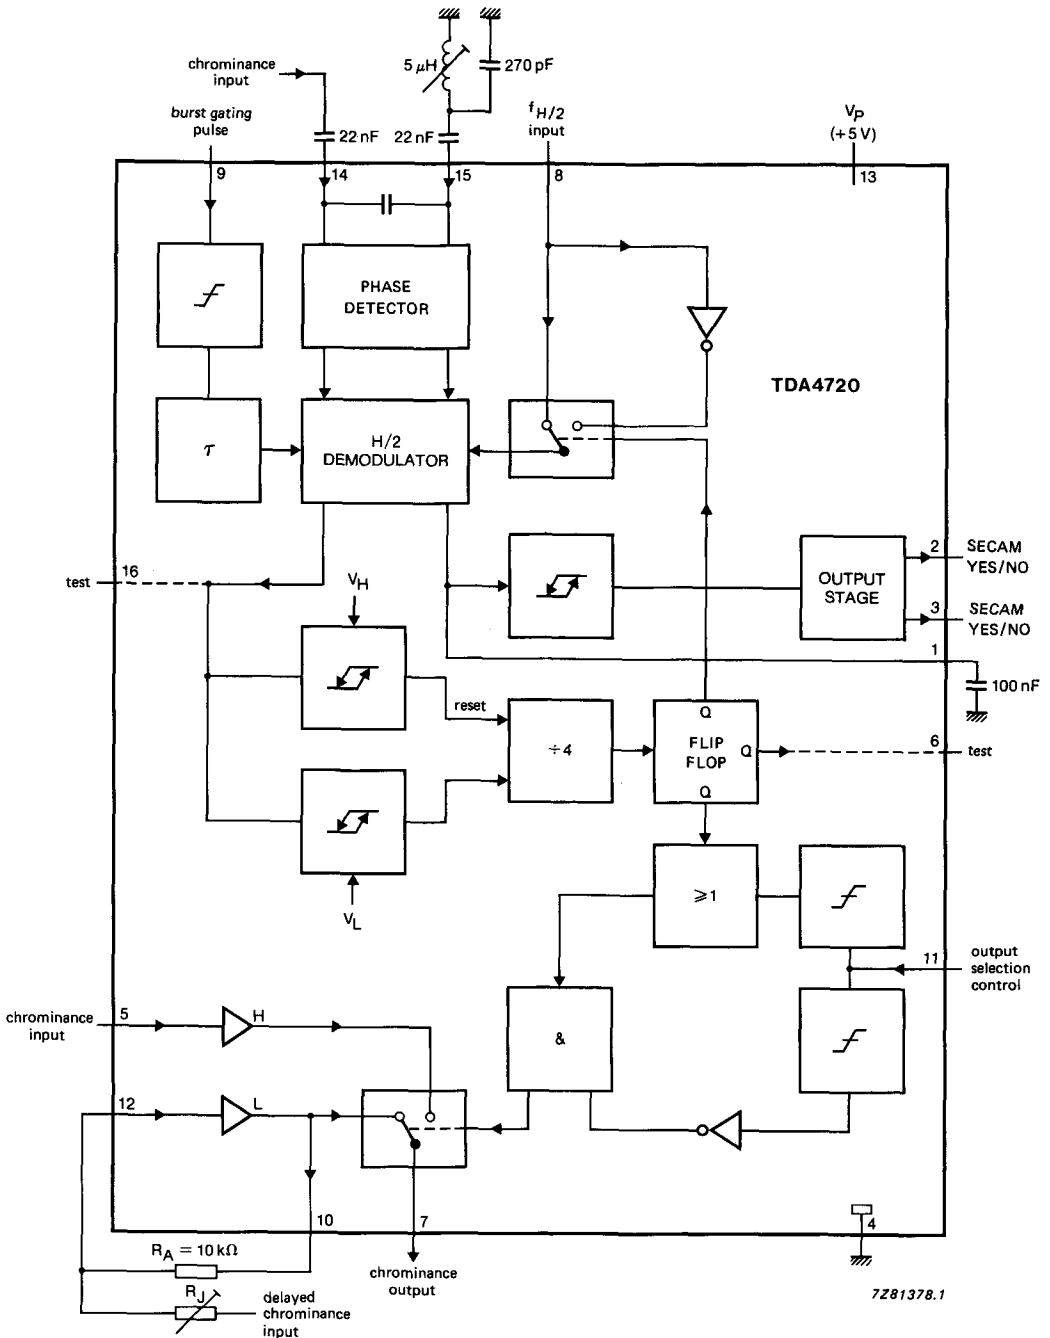

Fig. 1 Block diagram and test circuit.

**PINNING**

pin. no.	function
1	Integration of demodulated bursts.
2	Buffered output; SECAM YES/NO.
3	Buffered output; SECAM YES/NO.
4	Ground.
5	Chrominance input (only if line correction of SECAM carrier is used).
6	Test pin (internal connection).
7	Chrominance output (of line-corrected SECAM; only if line correction of SECAM carrier is used).
8	$f_H/2$ frequency input for chrominance burst demodulation.
9	Burst gating pulse input.
10	Feedback resistor for pin 12 signal path (only if line correction of SECAM carrier is used).
11	Output selection control (selects signal path to pin 7).
12	Delayed chrominance input (delayed by $1H$ ; only if line correction of SECAM carrier is used).
13	Positive supply voltage ( $V_P = +5\text{ V}$ ).
14,15	The LC circuit at pin 15 has to be tuned to the centre frequency between the two chrominance carriers (at pin 14). The phase detector then provides a positive or negative output voltage depending on the first or second chrominance carrier.
16	Test pin (internal connection).

DEVELOPMENT DATA

**RATINGS**

## TV VHF MIXER/OSCILLATOR/UHF PREAMPLIFIER

### GENERAL DESCRIPTION

The TDA5030A provides VHF local oscillator, VHF mixer and UHF IF preamplifier functions for VHF/UHF television receivers. It includes a buffered output from the VHF local oscillator, a VHF/UHF switching circuit and an IF amplifier stage for an external SAW filter.

### Features

- Balanced VHF mixer
- Voltage-controlled VHF local oscillator
- IF amplifier for SAW filter
- UHF IF preamplifier
- Local oscillator buffer output for external prescaler
- Voltage stabilizer
- UHF/VHF switching circuit
- Electrostatic discharge protection diodes at pins 10, 11, 12 and 13

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage	pin 15	$V_p$	10	—	13,2	V
Supply current		$I_p$	—	42	—	mA
VHF mixer frequency range		$f$	50	—	470	MHz
Conversion gain			—	24,5	—	dB
Conversion noise	300 MHz		—	10	—	dB
Input signal for 1% cross modulation			—	99	—	dB $\mu$ V
Storage temperature range		$T_{stg}$	-55	—	+ 125	°C
Operating ambient temperature range		$T_{amb}$	-25	—	+ 85	°C

## TV VHF MIXER/OSCILLATOR/UHF PREAMPLIFIER

## GENERAL DESCRIPTION

The TDA5030AT provides VHF local oscillator, VHF mixer and UHF IF preamplifier functions for VHF/UHF television receivers. It includes a buffered output from the VHF local oscillator, a VHF/UHF switching circuit and an IF amplifier stage for an external SAW filter.

## Features

- Balanced VHF mixer
- Voltage-controlled VHF local oscillator
- IF amplifier for SAW filter
- UHF IF preamplifier
- Local oscillator buffer output for external prescaler
- Voltage stabilizer
- UHF/VHF switching circuit
- Electrostatic discharge protection diodes at pins 11, 12, 13 and 14

## QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 17)		$V_p$	10	—	13,2	V
Supply current		$I_p$	—	42	—	mA
VHF mixer frequency range		$f$	50	—	470	MHz
Conversion gain			—	25	—	dB
Conversion noise	300 MHz		—	10	—	dB
Input signal for 1% cross modulation			—	99	—	dB $\mu$ V
Storage temperature range		$T_{stg}$	-55	—	+ 125	$^{\circ}$ C
Operating ambient temperature range		$T_{amb}$	-25	—	+ 80	$^{\circ}$ C

## PACKAGE OUTLINE

TDA5330T

## VHF, UHF AND HYPERBAND MIXER/OSCILLATOR FOR TV AND VCR 3-BAND TUNERS

### GENERAL DESCRIPTION

The TDA5330T is a monolithic integrated circuit that performs the band A, band B and band C mixer/oscillator functions in TV and VCR tuners. This device gives the designer the capability to design an economical and physically small 3-band tuner which will be capable of meeting the most stringent requirements e.g. FTZ or FCC. The tuner development time can be drastically reduced by using this device.

### Features

- Balanced mixer with a common emitter input for band A
- Amplitude-controlled oscillator for band A
- Balanced mixer with common base input for band B and C
- Balanced oscillator for band B and C
- Local oscillator buffer output for external prescaler
- SAW filter preamplifier with an output impedance of 100  $\Omega$
- Bandgap voltage stabilizer for oscillator stability
- Electronic bandswitch

**Notes to the characteristics**

1. Measured with an input circuit for optimum noise. (See Fig. 3).

DEVELOPMENT DATA

Fig. 3 Input circuit for optimum noise.

**Table 1** Component values

component	f = 50 MHz	f = 180 MHz
L	13 t, φ 5.5 mm, wire 0.7 mm	*
L2	rigid cable, 2.9 cm	*
L3	rigid cable, 4 cm	*
C	9.6 pF	*

\* Value to be fixed.

## Notes to the characteristics (continued)

Table 2 Electrical parameters of the circuit (for appropriate impedance and selectivity)

parameter	f = 50 MHz	f = 180 MHz	unit
Insertion loss	0.3	*	dB
Bandwidth	8	*	MHz
Image suppression	15	*	dB
Output impedance (source for IC)	2	*	k $\Omega$

2. The values have been corrected for hybrid and cable losses. The symmetrical output impedance of the circuit is 100  $\Omega$ .
3. The input level of a N+5 - 1 MHz signal (just visible).
4. The gain is defined as the transducer gain (measured in Fig. 9) plus the voltage transformation ratio of L6 to L7 (6:1, 16 dB).
5. All S parameters are referred to a 50  $\Omega$  system.
6. Measured with 50  $\Omega$  output impedance on pins 26 and 27 and a RF input signal level of:  
 RF level = 1 V at  $f < 180$  MHz  
 RF power = 0.5 dBm at  $100 \text{ MHz} < f < 225 \text{ MHz}$   
 RF power = -10 dBm at  $225 \text{ MHz} < f < 860 \text{ MHz}$

\* Value to be fixed.

TDA5332T

## DOUBLE MIXER/OSCILLATOR FOR TV AND VCR TUNERS

### GENERAL DESCRIPTION

The TDA5332T is an integrated circuit that performs the mixer/oscillator functions in TV and VCR tuners. This device gives the designer the capability to design an economical and physically small tuner which will be capable of meeting the most stringent requirements e.g. FTZ or FCC. The tuner development time can be drastically reduced by using this device.

### Features

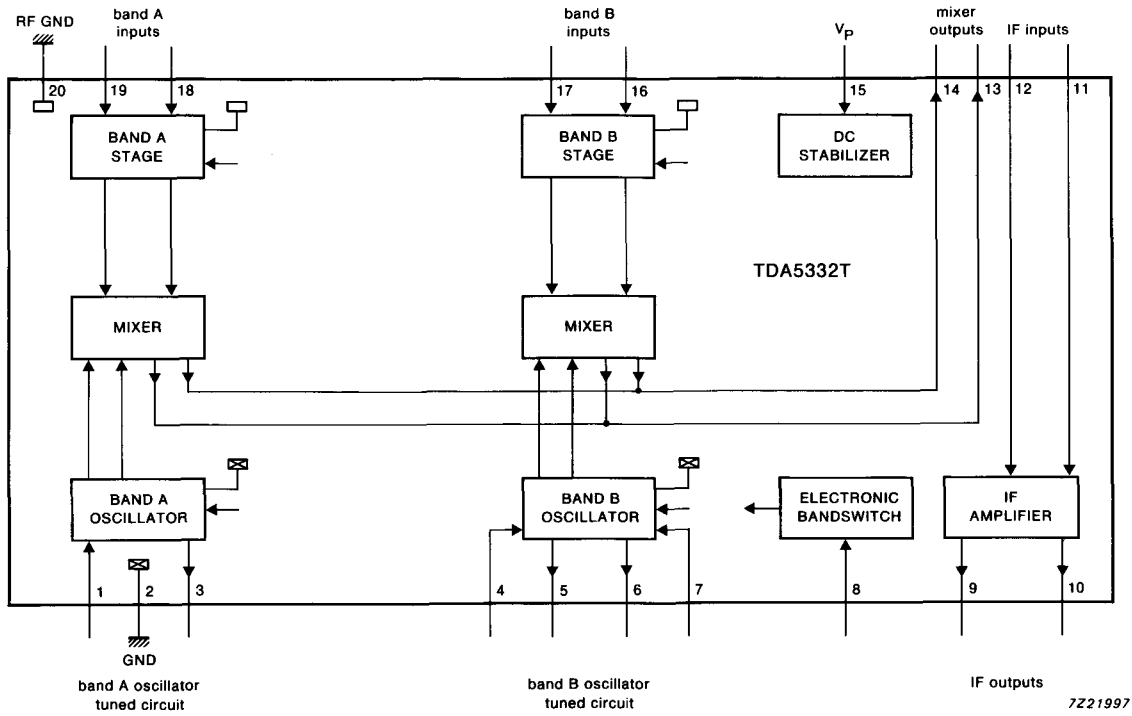

- Balanced mixer with a common emitter input for band A
- Amplitude-controlled oscillator for band A
- Balanced mixer with common base input for band B
- Balanced oscillator for band B
- SAW filter preamplifier with an output impedance of  $75 \Omega$  in application
- Bandgap voltage stabilizer for oscillator stability
- Electronic bandswitch

## Notes to the characteristics

- The values have been corrected for hybrid and cable losses. The symmetrical output impedance of the circuit is 100  $\Omega$ .
- The input level of a N + 5 – 1 MHz signal (just visible).
- The gain is defined as the transducer gain (measured in Fig.3) plus the voltage transformation ratio of L6 to L7 (6:1, 16 dB).
- All S parameters are referred to a 50  $\Omega$  system.
- The input power is defined as the power delivered by the generator on a 50  $\Omega$  load.
- The frequency shift is defined for a variation of power supply from;
  - $V_p = 12\text{ V}$  to  $V_p = 10.8\text{ V}$
  - $V_p = 12\text{ V}$  to  $V_p = 13.2\text{ V}$
 In both cases the frequency shift is below the specified value.
- The frequency drift is defined for a variation of ambient temperature from;
  - $T_{amb} = 25\text{ }^\circ\text{C}$  to  $T_{amb} = 0\text{ }^\circ\text{C}$
  - $T_{amb} = 25\text{ }^\circ\text{C}$  to  $T_{amb} = 50\text{ }^\circ\text{C}$
 In both cases the frequency shift is below the specified value.

APPLICATION INFORMATION

## VIDEO MODULATOR CIRCUIT

### GENERAL DESCRIPTION

The TDA6800 is a modulator circuit for modulation of video signals on a VHF/UHF carrier. The circuit requires a 5 V power supply and few external components for the negative modulation mode. For positive modulation an external clamp circuit is required. This circuit can be used as a *general purpose modulator without additional external components.*

### Features

- Balanced modulator
- Symmetrical oscillator
- Video clamp circuit for negative modulation
- Frequency range 50 to 800 MHz

### QUICK REFERENCE DATA

TDA8340;Q  
TDA8341;Q

## TELEVISION IF AMPLIFIER AND DEMODULATOR

The TDA8340;Q and TDA8341;Q are integrated IF amplifier and demodulator circuits for colour or black/white television receivers, the TDA8340;Q is for application with n-p-n tuners and the TDA8341;Q for p-n-p tuners.

The TDA8340;Q and TDA8341;Q are pin-compatible successors with improved performance to types TDA2540/2541;Q and TDA3540/3541;Q.

### Features

- Full range gain-controlled wide-band IF amplifier
- Linear synchronous demodulator with excellent intermodulation performance
- White spot inverter
- Wide-band video amplifier with noise protection
- AFC circuit with AFC on/off switching and sample-and-hold function
- Low impedance AFC output
- AGC circuit with noise gating
- Tuner AGC output for n-p-n tuners (TDA8340) or p-n-p tuners (TDA8341)
- External video switch for switching-off the video output
- Reduced sensitivity for high sound carriers
- Integrated filter to limit second harmonic IF signals
- Wide supply voltage range
- Requires few external components

### QUICK REFERENCE DATA

parameter	conditions	symbol	min.	typ.	max.	unit
Supply voltage (pin 11)		$V_{CC} = V_{11-13}$	9,4	12	13,2	V
Supply current (pin 11)		$I_{11}$	30	42	55	mA
IF input sensitivity (r.m.s. value)		$V_{1-16}(\text{rms})$	20	40	80	$\mu\text{V}$
IF gain control range		$G_v$	—	67	—	dB
Video output voltage (peak-to-peak value)	white signal; 10% top sync	$V_{12-13}(\text{p-p})$	2,4	2,7	3,0	V
Signal-to-noise ratio	$V_i = 10 \text{ mV}$	$S/(S+N)$	50	58	—	dB

### PACKAGE OUTLINES

TDA8340; TDA8341: 16-lead DIL; plastic (SOT38).

TDA8340Q; TDA8341Q: 16-lead QIL; plastic (SOT58).

Fig. 1 Block diagram.

**PINNING**

1 and 16	Balanced IF inputs
2 and 15	IF amplifier decoupling
3	Tuner AGC starting point adjustment
4	Tuner AGC output
5	AFC output
6	AFC on/off switch and sample-and-hold capacitor
7 and 10	Reference carrier $\pi/2$ rad. phase shift
8 and 9	IF picture carrier passive regeneration
11	Positive supply voltage ( $V_{CC}$ )
12	Video output
13	Ground ( $V_{EE}$ )
14	IF AGC capacitor and VCR switch

**FUNCTIONAL DESCRIPTION****IF amplifier**

This is a 3-stage, gain-controlled IF amplifier with a wide dynamic range. On-chip capacitors in the d.c. feedback loop of the amplifier maintain stability at maximum gain. Internal stabilization of the supply voltage ensures the desired sensitivity and gain control range over the whole supply voltage range and also gives very good power supply ripple rejection in this part of the circuit.

**Demodulator**

The redesigned IF demodulator is a quasi-synchronous circuit that employs passive carrier regeneration and logarithmic clamping to give improved signal handling. The demodulator input is a.c. coupled to the IF amplifier to reduce d.c. offsets and thus minimize residual IF carrier in the output signal.

**Video amplifier**

The linearity and bandwidth of the video amplifier are sufficient to meet all wide band requirements, e.g. for teletext transmissions. Second harmonics of the IF carrier are effectively reduced by a Sallen-Key low pass interstage filter between the demodulator output and the video amplifier input. An integrated filter in the noise inverter reduces the sensitivity of the video amplifier for high sound carriers.

White spot protection comprises a white spot clamp system combined with a delayed-action inverter which is also highly resistant to high sound carriers.

Note. To prevent radiated video output at the input pins, connect a 6,8  $\mu\text{H}$  inductor in series with pin 12 and fit as close as possible to the IC body. Use short leads.

**AGC detector**

A Bessel low-pass filter between the video output and the AGC detector improves the detector function in the presence of high sound carriers. No 'hang-up' occurs in the detector after pin 14 has been short-circuited to ground (VCR switch operated). The detector also generates the sample-and-hold pulse for the AFC system.

**AGC control circuit**

This converts the AGC detector voltage (pin 14) into a current signal which controls the gain of the IF amplifier. It also provides a tuner AGC control output from pin 4, current limiting is incorporated to prevent internal damage. The AGC starting point is adjusted via pin 3.

**FUNCTIONAL DESCRIPTION** (continued)

**AFC circuit**

The AFC circuit provides a voltage output which controls the IF frequency of the tuner. Video information on the AFC output (pin 5) is eliminated by a sample-and-hold circuit (external capacitor at pin 6). Coupling between the AFC and reference tuned circuits is via two small capacitors (or parasitic capacitance) between the respective tracks of the printed circuit board. If the capacitance is less than 1 pF, the steepness of the AFC characteristic is reduced.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	max.	unit

Max. AFC switch current	during AFC off; $V_{6-13} = 0 \text{ V}$	$I_6$	—	—	5	mA

**Notes to the characteristics**

1. All input signals are measured r.m.s. at top sync and 38,9 MHz.
2. Measured with 0 dB = 200  $\mu$ V.
3. Tuner AGC starting point is defined as 'level of input signal when tuner AGC current = 1 mA'.
4. Measured with pin 3 connected via 39 k $\Omega$  resistor to V<sub>CC</sub> (pin 11), with an r.m.s. voltage of 10 mV top sync input signal and with pin 12 not loaded.
5. At the 'projected zero point', e.g. with switched demodulator.
6. Measured in the circuit of Fig. 7:
  - the differential gain is expressed as a percentage of the difference in peak amplitudes between the largest and smallest value relative to the subcarrier amplitude at blanking level;
  - the differential phase is defined as 'the difference (in degrees) between the largest and smallest phase angles'.
7. Measured according to the test line shown in Fig. 9:
  - the non-linearity is expressed as a percentage of the maximum deviation of a luminance step from the mean step, with respect to the mean step;
  - the mean step is (white level – black level) divided by the number of steps.
8. Measured up to 45 dB gain control.
9. Test set-up and input conditions for intermodulation measurements as in Figs 6 and 7.
10. Measured with a 75  $\Omega$  source:
 
$$S/(S+N) = 20 \log \frac{V_{\text{out black to white}}}{V_{n(\text{rms})} \text{ at } B = 5 \text{ MHz}}$$
11. Video output waveform showing white spot and noise inverter threshold levels.
12. Measured with input signal V<sub>1-16</sub> = 10 mV and with no load at AFC output.

DEVELOPMENT DATA

## SYNCHRONIZATION PROCESSOR FOR TELEVISION RECEIVERS

### GENERAL DESCRIPTION

The TDA8370 is a sync processor designed to generate and synchronize horizontal and vertical signals in medium and high performance television receivers. The device is particularly suitable for application with teletext decoders and video tape recorders.

A video switch controlled by I<sup>2</sup>C bus command or analogue switched voltage selects internal or external composite video signals.

The processing of not line-locked vertical sync in non-standard mode is also possible.

### Features

- Two separate video inputs adapted to:
  - 1.F. detector (front-end output)
  - or
  - peri-television connector selected by the video switch
- Buffered video output
- Horizontal sync separator with self-aligning levels
- Vertical sync separator 1 with self-aligning levels when standard mode selected
- Vertical sync separator 2 with self-aligning levels when non-standard mode selected (e.g. video tape recorder signal)
- Noise inverter
- Gated phase discriminator with switchable time constant for non-standard applications
- 6 MHz VCO for generation of clock signal for teletext display
- Noise level detector
- Automatic low-current starting circuit
- $\varphi$  2 phase control with shift adjustment not affecting gain or time constant
- Horizontal output optimized for operation with self-oscillating power supply
- Vertical divider system with automatic selection of 625 or 525 standard
- 50/60 Hz identification output voltage
- Mute output
- Coincidence detector
- Vertical shaping and feedback system with automatic 60 Hz amplitude correction
- 3-level sandcastle output
- Vertical guard circuit active via sandcastle output
- Scan composite sync ( $\overline{S.C.S.}$ ) output as slave input for teletext decoder
- Special "sense" ground pin to ensure correct feedback voltage in the frame deflection circuit
- I<sup>2</sup>C bus controlled teletext non-interlaced signal (N.I.L.)
- Line and frame frequencies switched to nominal when noise only is received in standard mode

### PACKAGE OUTLINES

28-lead DIL; plastic (SOT117).

TDA8380

## CONTROL CIRCUIT FOR SWITCHED MODE POWER SUPPLIES

### GENERAL DESCRIPTION

The TDA8380 is an integrated circuit intended for use as a control circuit in low-cost switched mode power supplies for television, monitors and small industrial equipment. The TDA8380 operates using duty factor regulation in the fixed frequency mode.

### Features

- A low-current initialization circuit (maximum 150  $\mu$ A) which can be switched off
- A bandgap reference generator
- Circuitry for slow-start combined with an accurate setting of the maximum duty factor ( $D_{max}$ )
- Programmable low supply voltage protection with two default values
- High supply protection circuitry
- Error amplifier with a transfer characteristic generator (TCG)
- Protection against open- and short-circuited feedback loop
- An overload voltage foldback
- Primary current protection circuitry for both cycle-by-cycle and trip mode
- Protection against transformer saturation
- A direct drive output stage (sink current 2.5 A, source current 0.75 A)
- Anti-double pulse logic
- Protected against damage as a result of a short-circuited high-voltage transistor
- RC oscillator with synchronization input

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage	$V_{CC}$	—	14	—	V
Supply current	$I_{CC}$	—	—	15	mA
Output pulse repetition frequency range	$f_o$	10	—	100	kHz
Operating ambient temperature range	$T_{amb}$	-25	—	+70	$^{\circ}$ C

### PACKAGE OUTLINE

16-lead DIL; plastic (SOT38).

## FUNCTIONAL DESCRIPTION

The TDA8380 is a control circuit which generates the pulses required to drive the switching transistor in a switched mode power supply (SMPS).

### Supply

This device is intended to be used on the primary side of the power supply and can be supplied via a take-over (auxiliary) winding on the transformer.

The device is initialized via a high value resistor connected between the rectified mains voltage and the device's supply pin (pin 5), which causes the capacitor connected to this pin to charge slowly. When the voltage exceeds the initialization level (typically 17 V) the device will start up and the duty cycle will be slowly increased by the slow-start circuit. After a short period the take-over winding will supply the device. The value of the resistor is normally defined by the time taken to charge the capacitor. A one second delay between switching on and operation of the power supply is acceptable in most cases.

The operating voltage range is from 9 to 20 V. The supply pin is protected by a 23 V Zener diode. The supply protection circuit is activated once the Zener diode is conducting. The slow-start procedure begins after initialization, until then the output is off. The current drawn by the device during the initialization period is less than 150  $\mu$ A.

When the supply voltage falls below the minimum trip level, the device switches off and the start-up procedure is repeated. The minimum voltage supply threshold setting ( $V_{CCmin}$ ) can be set externally with a resistor connected between the  $V_{CCmin}$  pin (pin 4) and ground (pin 14) (see Fig.3).

Fig.3 Trip level setting of minimum  $V_{CC}$  protection level.

$V_{CCmin}$  can be set between 8.4 V (an internally fixed overriding protection level) and 17 V by means of an external resistor connected to pin 4. With pin 4 left open, the device takes a default value of 10.5 V. If the default value is chosen, care must be taken that no parasitic capacitance (due to wiring) is present at this pin as it will affect the correct operation of the device.

When choosing the initialization and minimum supply voltages the following should be taken into account:

- The difference between the two voltages should be large enough to enable a supply voltage dip during start-up.
- The value of the minimum supply voltage should be high enough to ensure that the high-voltage transistor is correctly driven. A high protection level makes it possible to have a large resistor value in series with the base drive.

For battery line input operation, the  $V_{CCmin}$  pin is connected to  $V_{CC}$ , the start-up circuit is then inhibited and the device starts operating when  $V_{CC}$  exceeds the 8.4 V protection level (this level has a hysteresis of approximately 70 mV). The device draws current continuously under these conditions.

### Reference block

A bandgap based reference generates a stabilized voltage of 7 V to supply most of the device's internal circuits, this decreases chip size and increases reliability. The only circuits connected to  $V_{CC}$  are:

- The initialization circuit
- The output circuitry
- The series transistor of the stabilized voltage

By means of a resistor ( $R_6$ ) connected to the  $I_{ref}$  input a reference current is defined which determines six other device settings.

Part of the reference current is used to charge the oscillator capacitor ( $C_{10}$ ), therefore, the charging time is proportional to  $R_6 \times C_{10}$ . The maximum duty factor ( $D_{max}$ ) is set by the resistor connected to pin 12 ( $R_{12}$ ) and is defined by the ratio  $R_6/R_{12}$ . The minimum supply voltage (pin 5) set by the resistor ( $R_4$ ) at input  $V_{CCmin}$  is defined by:  $4/6 \times V_6 \times R_4/R_6$ .

### Oscillator

The oscillator capacitor is charged and discharged between the high and low voltage levels as defined by the bandgap reference (high voltage typically 5 V and low voltage typically 1.4 V). The charge current is 1/6 of the reference current, the discharge current having the same value as the reference current. The period is therefore defined by  $10 \times R_6 \times C_{10}$ .

The oscillator flyback pulse is used to set the bistable in the output logic, however the output remains low until the positive ramp starts (see Fig.4). The oscillator can be synchronized by means of the SYNC pin. When this pin is connected to  $V_{CC}$ , the oscillator is free running. When it is between 0.85 and 5.6 V, the oscillator stops at the low voltage level prior to the next positive ramp.

DEVELOPMENT DATA

Fig.4 Oscillator levels.

**FUNCTIONAL DESCRIPTION** (continued)

**Synchronization**

The synchronization input (pin 11) can be driven by either an optocoupler or a loosely coupled pulse transformer.

Figure 5(a) illustrates synchronization using the 0.85 V threshold and a digital signal connected to the SYNC input (for example, an optocoupler between pin 11 and  $V_{CC}$ ); the duty factor of the pulse is not very important. The oscillator starts at the first negative going edge of the sync. signal after the low voltage level has been reached. The synchronization frequency must be lower than the free running frequency. Synchronization must never affect the period time as this will corrupt the setting of the maximum duty factor.

Fig. 5(a) DC coupled synchronization using the 0.85 V level.

In Fig.5(b) the disabling threshold (5.6 V) is used for synchronization. In this case the oscillator starts at the positive going edge of the sync. signal.

Fig.5(b) DC coupled synchronization using the 5.6 V level.

Figure 6 illustrates synchronization using a pulse transformer. Internal circuitry causes a DC shift which informs the device that synchronization pulses are present (spikes around 0 V at the output of the pulse transformer) or not present (DC 0 V at the output of the pulse transformer). When synchronization is not used the SYNC pin must be connected to  $V_{CC}$ , it must not be connected directly to ground or left open.

DEVELOPMENT DATA

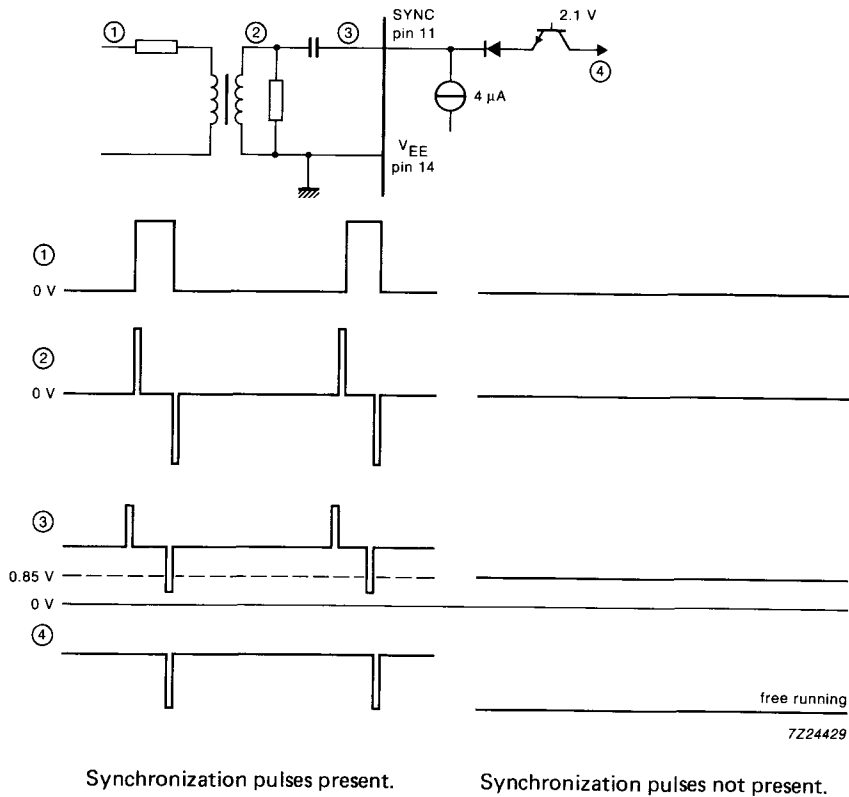

Fig.6 Synchronization using a pulse transformer.

## FUNCTIONAL DESCRIPTION (continued)

## Error amplifier

The error amplifier compares the feedback voltage of the SMPS with a reference voltage (nominally 2.5 V). The amplifier output at pin 8 enables gain setting. The amplifier is internally compensated for 0 dB feedback stability.

The output of the error amplifier is not internally connected to the Pulse Width Modulator (PWM). One input to the PWM is available at the DUTY input (pin 9) via the Control Slicing Level (CSL) circuit. Normally the STAB and DUTY pins are connected together, but direct driving of pin 9 via an optocoupler from the secondary side is also possible. A type of current mode control can be achieved by mixing the STAB signal with the primary current signal before applying it to the DUTY input.

The feedback (FB) input (pin 7) is used as the input to the Transfer Characteristic Generator (TCG) circuit which ensures well defined duty factors at low FB voltages; a voltage foldback is an inherent characteristic. In Fig.7, the duty factor is shown as a function of the voltages at the FB, DUTY and SS inputs. The input which gives the lowest duty factor overrides the others.

The left hand curve is passed through during a slow-start (via the slow-start input pin 12) when the duty cycle slowly increases linearly with respect to  $V_{12}$ . The right-hand curve is passed through at start-up. The FB voltage slowly increases from zero and the duty factor, starting at 12%, increases until the maximum duty factor ( $D_{max}$ ) is reached. A few hundred millivolts later, the FB voltage reaches the start of the regulation curve which is at approximately 2.5 V. The plateau area between reaching  $D_{max}$  and starting the regulation curve is kept as small as possible (typically 200 mV).

Fig.7 The duty factor as a function of the FB, SS and DUTY voltages.

7224430

Due to the characteristics of the TCG, and the fact that an open FB input results in a low voltage at the FB input, open- and short-circuit feedback loops will result in low duty factors. When DC feedback is used across the error amplifier, the current capability of the error amplifier must be considered when determining the feedback resistor value.

When the input to the PWM (pin 9) is driven by an optocoupler, the TCG can be used when a rough primary voltage is applied to the FB input. In this situation an open feedback loop will cause an increase in the FB voltage as the duty factor rises to its maximum. As soon as the FB voltage exceeds the reference by 0.7 V, the slow-start is triggered.

### Demagnetization sense circuit

To enable the SMPS to be kept in the non-continuous mode, an input is available which delays switch-on of the high-voltage transistor until the transformer currents have decayed to zero. This is an effective way of avoiding transformer saturation. The waveforms illustrated by Fig.8 show demagnetization with respect to the application diagram of Fig.12.

Fig.8 Demagnetization function.

7Z24431

DEVELOPMENT DATA

As long as the voltage of the take-over (auxiliary) winding (also used for supplying the device) is above 0.6 V ( $V_3$ ) the output will be prevented from switching on.

### Over-current protection

The over-current protection circuit (pin 13) senses the voltage across resistor  $R_5$  (see Fig.12), which reflects the primary current. This generated voltage is negative-going as the emitter of the high-voltage power transistor is grounded (this circuit arrangement provides the IC with the best safeguard against a possible collector-emitter short-circuit in the power transistor). At pin 13, the negative voltage signal is shifted to a positive level by a voltage across resistor  $R_{13}$ . This voltage is set by the reference current at pin 13 and is defined by resistor  $R_6$  at the  $I_{ref}$  input (pin 6) and  $= 1/6 \times V_{ref}/R_6$ . Therefore  $V_{shift}(V_{R13}) = V_{ref}/6 \times R_{13}/R_6$  or nominal  $0.416 \times R_{13}/R_6$  (V).

The positive current monitor voltage at pin 13 is compared with two voltage levels: the first level = 0.2 V and the second level = 0 V (see Fig.9).

The first trip level only switches off the high-voltage transistor for a cycle and puts the SMPS in a continuous cycle-by-cycle current protection mode.

The second trip level is only activated when the primary current rise is very fast which can occur during a short-circuited output. In this mode the high-voltage transistor is quickly switched off and the slow-start procedure is activated.

The difference between the first and second primary current peak levels is set by  $R_5$ :

$$I_2 - I_1 = 0.2/R_5$$

The absolute peak values are set by  $R_6$  and  $R_{13}$ :

$$I_2 \times R_5 = 0.416 \times R_{13}/R_6 \quad \text{or}$$

$$I_1 \times R_5 = (0.416 \times R_{13}/R_6) - 0.2$$

## FUNCTIONAL DESCRIPTION (continued)

## Over-current protection (continued)

Fig.9 Current protection.

**Slow-start circuit**

A slow-start occurs:

- At Switch-on of the SMPS
- After a current trip as described in the section **Over-current protection**
- After a low or high  $V_{CC}$  trip.

The capacitor at the SS input is discharged and the slow-start bistable is reset when the voltage at the SS input falls below 0.5 V after which the circuit is ready for a slow-start. The dead time (during which the capacitor at the SS input is being charged to the 1.4 V lower level of the sawtooth) before duty cycle regulation starts is minimal. The SS input can also be used for  $D_{max}$  setting by connecting a resistor to ground. The voltage across this resistor is then limited to  $1/6 \times V_{ref} \times R_{12}/R_C$ .

**Output stages**

The output stage consists of two NPN darlington transistors, their collector and emitter connected to separate pins (see Fig.12). The top transistor is capable of sourcing a maximum of 0.75 A to the high-voltage transistor while the bottom transistor can sink peak currents up to 2.5 A.

For low currents up to 10 mA, the saturation voltage of the sink darlington transistor is similar to that of a single transistor (see Fig.10). During switching of this transistor  $dV/dt$  is internally limited to reduce interference.

Care should be taken with the external wiring of the output pins to avoid oscillation or interference due to parasitic inductance and wire resistance.

During start-up a small current flows from  $V_{CC}$  to E2 to precharge the series capacitor at the output (see Fig.12).

Fig.10 Saturation curve.

TDA8390

## PAL DECODER AND RGB MATRIX

### GENERAL DESCRIPTION

The TDA8390 is a one-chip PAL colour decoder which is designed to be used in combination with the P<sup>2</sup> CCD Delay Line (TDA8451) and the Filter Combination (TDA8452). The IC combines the circuits that are required for the identification and demodulation of PAL signals, RGB matrixing and amplification. SECAM signals can be handled when the IC is used in combination with the SECAM decoder TDA8490.

Inductive components are not required due to the integration of the filters and the delay lines.

The TDA8390 provides a crystal precise reference signal for the clock generator circuits in TDA8451 and TDA8452. Therefore, no adjustments are required to the filters and delay times. The decoder contains separate inputs for RGB signal insertion (analogue or digital) which can, for example, be used for text display systems (e.g. channel number display, Teletext, Antiope etc.).

### Features

- A black-current stabilizer which controls the black currents of the three electron guns
- Contrast and brightness control of inserted RGB signals
- Self aligned oscillator
- Capacitive coupling with black level clamping of the luminance, colour difference and RGB inputs
- Equal black levels for internal TV and external signals
- 12 MHz bandwidth
- Emitter follower outputs for driving the RGB output stages

32. ACC reference voltage

## FUNCTIONAL DESCRIPTION

### Colour decoder

The input chroma signal is amplified and applied to the burst phase detector (reference signal R-Y phase), the ACC and identification detector (reference signal  $\pm$  R-Y phase) and the two demodulators. The burst phase detector controls the oscillator which operates at a frequency of 4.43 MHz. By connecting pin 6 to 12 V, the free-running frequency of the oscillator can be adjusted (phase detector and colour killer switched off). The gain control stage of the oscillator is biased in such a way that sine wave signals are generated. The output from the oscillator is fed to a Miller integrator in order to obtain the required 90° phase shift. The reference signals obtained from the oscillator and 90° phase shift network are applied to the various demodulators.

The output signal from the ACC and identification detector is peak detected to generate the ACC voltage and detected in a sample and hold circuit to obtain the identification and killer information. Because the P<sup>2</sup> CCD delay line (TDA8451) and the P<sup>2</sup> CCD filter combination (TDA8452) both require a reference signal ( $2 \times f_{sc}$ ) the oscillator frequency is doubled, internally, and is made available at pin 28. The demodulated signals, with the correct amplitude ratio, are applied to the TDA8451.

The TDA8390 can be combined with the SECAM decoder TDA8490 (Fig.3) by direct connection of their outputs. The output DC levels have been chosen so that the PAL decoder has priority (output level during PAL is higher than output level during SECAM).

### Control circuit

The luminance and colour difference signals together with the RGB inputs and fast switching pulse form the inputs to the control circuit. The required luminance input signal (from TDA8452) has a peak-to-peak value of 0.45 V (including sync). The colour difference input signals (from TDA8451) have a negative phase with a 0.62 V (R-Y) and 0.8 V (B-Y) peak-to-peak value. After amplification, the luminance signal is applied to the RGB matrix.

The colour difference signals are fed to the saturation control circuit before being applied to the RGB matrix (the G-Y signal is generated after the saturation control circuit).

The normal matrix for PAL is: (G-Y) = -0.51 (R-Y) - 0.19 (B-Y).

The signals from the RGB matrix are applied to a fast switching circuit from where external RGB signals can be selected. The fast switching circuit is controlled by the video switching input. After amplification the RGB signals (internal or external video) are controlled on the contrast and brightness before being fed to the outputs. A typical output signal amplitude is 4 V black-to-white (nominal controls).

The black level of the RGB output signals is determined by the black current stabilization circuit. The information regarding the black current level of the picture tube is obtained in the same manner as the TDA3562A. The beam current limiter input is used to reduce the output signal amplitude via the contrast and brightness control circuits.

A block diagram is given in Fig.1. Figure 2 illustrates the PAL decoder configuration and Figure 3 the PAL-SECAM configuration. Figures 4, 5 and 6 illustrate the Saturation, Contrast and Brightness control curves respectively.

## Notes to the characteristics

1. Indicated as a signal for a colour bar with 75% saturation (chrominance/burst ratio = 2.2 : 1).
2. All frequency variations are referred to 4.43 MHz carrier frequency.
3. The ratio between wanted and unwanted signals (e.g. crosstalk, phase errors and noise) is specified as the output signal amplitude (peak-to-peak value at nominal conditions) with respect to the RMS value of the unwanted signal.
4. Signal with negative going sync. Amplitude includes sync pulse amplitude.
5. For a resultant black-to-white output signal of 4 V at nominal contrast.
6. Difference in black level between RGB signals and inserted signals.
7. Nominal contrast is specified as maximum contrast  $-3$  dB. Nominal saturation as maximum saturation  $-6$  dB; nominal white point adjustment is maximum  $-3$  dB.
8. Nominal luminance input signal and nominal contrast.
9. Nominal contrast, nominal saturation no (R-Y) and no luminance signal.
10. With respect to the measuring pulse. At nominal brightness the black level of one output is identical to the measuring level.
11. With respect to the measuring pulse.
12. Pin 28 should be connected externally to a high-resistance voltage divider. Pins 14, 16 and 18 when unused, should be connected to ground via a 100 nF capacitor.

## TDA8405

### TV AND VTR STEREO/DUAL SOUND PROCESSOR WITH I<sup>2</sup>C BUS CONTROL

#### GENERAL DATA

The TDA8405 integrated circuit is a processor for stereo/dual-language signals for stereo-sound television receivers and VTR. The modulated signals at the TDA8405 inputs need to be "(L+R)/2" or "language A" on one channel and "R" or "language B" on the second channel (where L = left and R = right). The second channel is also modulated with the pilot carrier. The IC is controlled via the two-line, bidirectional I<sup>2</sup>C bus.

#### Features

- Amplification of the two a.f. input signals by integrated operational amplifiers.
- Low distortion stereo dematrix
- All operational amplifiers are offset compensated
- I<sup>2</sup>C bus transceiver for system control (port control, mute, mode select, identification, etc.)
- Input port for fast muting
- Two general purpose output ports (three-state, bus-controlled)

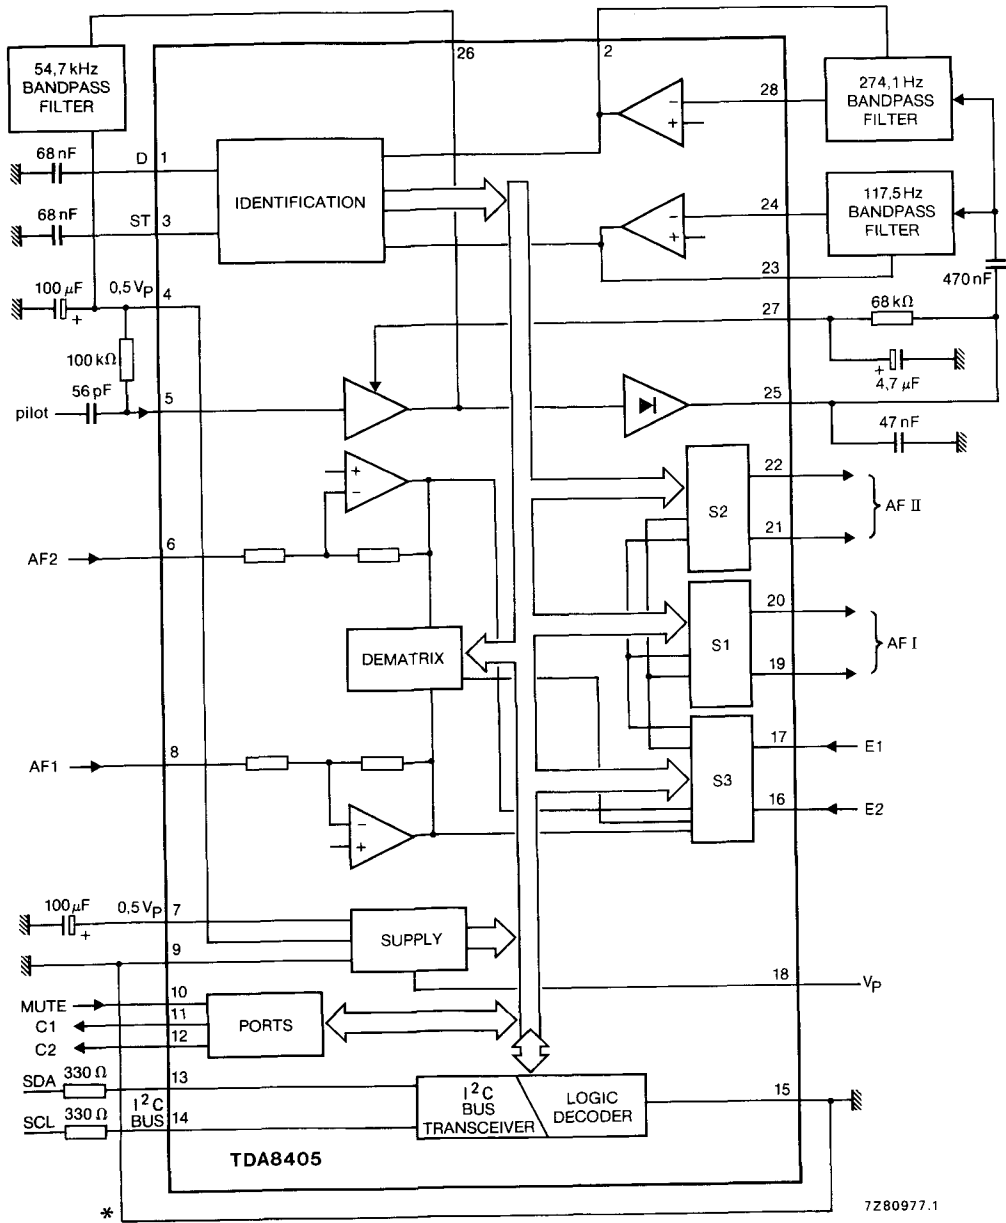

#### QUICK REFERENCE DATA

#### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

# TDA8405

\* Direct connection between pins 9 and 15 is needed.

Fig. 1 Block diagram.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 18)*	$V_P = V_{18-9, 15}$	max.	13,2 V
Output current (pins 19, 20, 21, 22)	$I_n$	max.	5 mA
Output current (pins 2, 23)	$I_n$	max.	1 mA
Output current (pins 11, 12)	$I_n$	max.	3 mA
Voltage range at any pin	$V_n$		0 to $V_P$ V
Total power dissipation	$P_{tot}$	max.	1 W
Storage temperature range	$T_{stg}$		-40 to + 150 °C
Operating ambient temperature range	$T_{amb}$		0 to + 70 °C

DEVELOPMENT DATA

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

\* Supply voltage may be applied only when pins 9 and 15 are connected to ground.

## CHARACTERISTICS

$T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $V_p = 12\text{ V}$ ;  $V_{i(af)rms} = 1\text{ V}$ ;  $f = 1\text{ kHz}$ ; dematrix aligned;  $V_{i\text{ pilot}(rms)} = 16\text{ mV}$ ; test circuit Fig. 2; unless otherwise specified.

Ident signal suppression		70	—	—	dB
Signal suppression during mute (notes 4 and 7)		70	—	—	dB

**Notes to the characteristics**

1. Full specification of the I<sup>2</sup>C bus will be supplied on request.
2. Programmable mute state. If the SC3 bit in the I<sup>2</sup>C bus is LOW then the mute input is active LOW; if the mute bit is set to HIGH then the mute input is active HIGH.
3. Crosstalk attenuation definition:  $20 \log$  (unwanted output signal/input signal).
4. Frequency range:  $40 \text{ Hz} < f < 12,5 \text{ kHz}$ .
5. In dual sound mode.
6. Test circuit as in Fig. 4: ripple rejection = output modulation due to hum on the supply line.
7. Related to 2 V (r.m.s.) output signal at pin 19, 20, 21 or 22; noise weighted according to CCIR 468/2.
8. Caused by any change of the switch position.
9.  $\alpha_S$  measured without de-emphasis network.

DEVELOPMENT DATA

\* Direct connection between pins 9 and 15 is needed.

## TDA8415

# TV AND VTR STEREO/DUAL SOUND PROCESSOR WITH INTEGRATED FILTERS AND I<sup>2</sup>C-BUS CONTROL

### GENERAL DESCRIPTION

The TDA8415 is a processor of stereo/dual language signals (B/G-standard) for stereo sound television receivers and VTRs, using the switched-capacitor technique. The AF signals at the TDA8415 inputs must be "(L+R)/2" or "language A" on one channel and "R" or "language B" on the second channel (where L = left and R = right). The carrier frequency of the second channel is also modulated by an identification signal (stereo or dual sound). The device is controlled by a microcomputer via the two-line, bidirectional I<sup>2</sup>C-bus.

### Features

- Use of the switched-capacitor technique for signal processing
- Small amount of peripheral components
- Integrated anti-aliasing filters
- Low distortion AF signal handling
- Integrated de-emphasis with a time constant of 50  $\mu$ s
- Function and software are compatible with the TDA8405
- Two general purpose output ports
- Full ESD protection

### QUICK REFERENCE DATA

8	Sound channel input AF1 (E1)	18	Mute input
9	External AF input (E4)	19	Control port C2
10	External AF input (E3)	20	Not connected, but reserved

**FUNCTIONAL DESCRIPTION****Anti-aliasing filters**

Frequency band limitation is performed by a second order Sallen and Key low-pass filter inserted in the AF signal path and the identification circuit. This limitation is necessary because of the time-discrete signal processing needed to meet the Nyquist criterium.

**Identification**

To enable the identification of the transmitted AF signal (mono, stereo or dual sound), the carrier frequency of the second channel (E2) is also modulated by an identification signal. The identification signal is a 54.6875 kHz pilot carrier signal which is 50% amplitude modulated by either a 117.4 Hz signal for stereo transmission or by a 274.1 Hz signal for dual sound transmission.

The identification section of the circuit consists of a 54 kHz high-pass filter followed by a gain controlled amplifier with an AM demodulator. The total gain of the high-pass filter and the amplifier is approximately 56 dB. The demodulated identification signal is filtered by the identification band-pass filters, (117.4 Hz for stereo transmission, 274.1 Hz for dual sound transmission). The output from either filter is converted to a DC signal by a peak detector and the necessary hysteresis is performed by a Schmitt-trigger. The resultant DC output signals indicate the status of the transmitter (mono, stereo or dual sound).

**De-matrix and de-emphasis**

Depending on the results of the identification circuit (mono, stereo or dual sound) the AF signals at the inputs E1 and E2 are converted to the signals at E1\* and E2\* as listed in Table 1.

**Table 1** Transmitter status

transmitter status	E1	E2	E1*	E2*
mono	0.7(L+R)	—	2(L+R)	—
stereo	0.7(L+R)	2R	4L	4R
dual sound	0.7A	B	2A	2B

Where L = left channel signal; R = right channel signal; A = first sound channel signal and B = second sound channel signal.

This section of the circuit also performs the de-emphasis (50  $\mu$ s time constant) with a high degree of accuracy.

**AF switch**

The AF switch is used to switch to either the internal sound sources (E1\* or E1\* and E2\*) or, to the external sound source (E3 and E4) and is controlled via the I<sup>2</sup>C-bus.

**Source selector**

The source selector is used to connect the outputs from the AF switch to the outputs A1 to A4 as illustrated by Table 5. The selector is controlled via the I<sup>2</sup>C-bus.

**Muting**

In this mode the AF outputs A1 to A4 are muted, and the identification circuit is deactivated (mono). The muting is active after power-on reset or as a result of user control (via the mute input and bit CR3 of the control byte of the mute and port control register; see Table 4).

**Sound mute**

If the switch register is set to (00) hex, (sound mute) only the AF outputs are muted, the identification circuit is still active and can be read (status register) via the I<sup>2</sup>C-bus.

**Power-on reset**

The following actions are carried out by the internal power-on reset when it is active:

- The AF outputs are muted
- The identification circuit is deactivated (mono)
- The control ports (C1 and C2) are set LOW
- The I<sup>2</sup>C-bus transceiver is initialized

When the power-on reset becomes passive the following occurs:

- The AF outputs are kept in the mute state until the contents of the switch register are changed from (00) hex via the I<sup>2</sup>C-bus
- The identification circuit is activated
- The control ports are LOW until the mute and control port register is changed (CR bits 10, 11, 20 and 21)
- The I<sup>2</sup>C-bus transceiver is activated

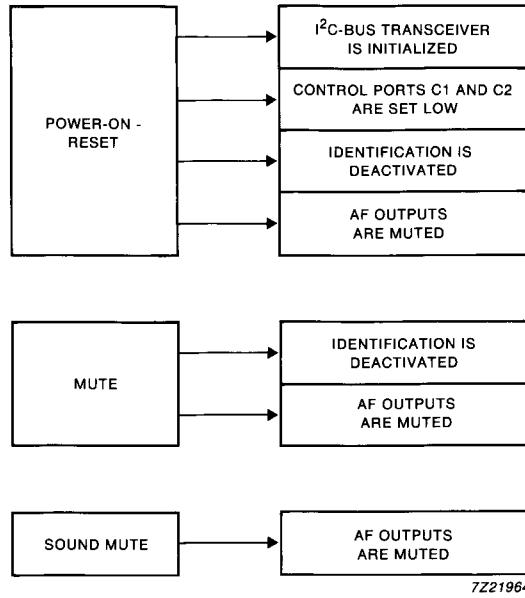

Fig.3 Mute modes.

**Control ports**

The general purpose control ports C1 and C2 can be set to LOW, HIGH or high impedance via the I<sup>2</sup>C-bus.

**I<sup>2</sup>C-bus receiver and data handling****Bus specification**

The TDA8415 is controlled, via the bidirectional 2-line I<sup>2</sup>C-bus, by a microcomputer. The two lines are a serial data line (SDA) and a serial clock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

When the bus is free both lines are HIGH. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in the CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as the start condition (S).

A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as the stop condition (P). The bus receiver will be reset on the reception of a start condition. The bus is considered to be busy after the start condition. The bus is considered to be free again after a stop condition.

**The I<sup>2</sup>C-BUS PROTOCOL OF THE TDA8415**

The TDA8415 is controlled by a microcomputer and can be written to or read from via the I<sup>2</sup>C-bus.

The first byte is the address and determines whether the TDA8415 is to be read from (status register) or written to (switch register or mute and port control register).

DEVELOPMENT DATA

Read from (TDA8415 is a slave transmitter)

Write to (TDA8415 is a slave receiver)

Where S = start bit and A = acknowledge bit

Fig.4 Address byte.

**Reading the TDA8415**

Reading the TDA8415 means reading the status register and the data stream will have the format as illustrated in Fig.5 below.

Where S = start bit; A = acknowledge bit and P = stop bit

Fig.5 Read format.

The second byte, the contents of the status register, is defined by Table 2.

Table 2 Status register

D7	D6	D5	D4	D3	D2	D1	D0
PONRES	ST	DS	0	0	0	0	0

PONRES = power on reset

1 = power on reset active after switching on or power breakdown

0 = after reading the status register

ST = stereo transmission

DS = dual sound transmission

The truth table for the ST and DS bits is provided by Table 3.

Table 3 Truth table for ST and DS bits

ST	DS	definition
0	0	mono transmission
0	1	dual sound transmission
1	0	stereo transmission
1	1	not possible

**Writing to the TDA8415**

Writing to the TDA8415 means, writing to either the switch register or the mute and port control register. Which one is to be addressed is defined by the subaddress (the second byte) as illustrated by Fig.6 below. The third byte contains the information to be stored in the specified register.

Where S = start bit; A = acknowledge bit and P = stop bit

Fig.6 Write format.

Table 4 defines the contents of the mute and port control register.

**Table 4** Mute and port control register

D7	D6	D5	D4 CR3	D3 CR21	D2 CR20	D1 CR11	D0 CR10	definition
X	X	X				0	0	control port C1 = LOW
X	X	X				0	1	control port C1 = HIGH
X	X	X				1	X	control port C1 = high impedance
X	X	X		0	0			control port C2 = LOW
X	X	X		0	1			control port C2 = HIGH
X	X	X		1	X			control port C2 = high impedance
X	X	X	0					<i>mute is active when pin 18 is LOW (default)</i>
X	X	X	1					<i>mute is active when pin 18 is HIGH</i>

Where: X = don't care.

**Notes to the characteristics**

1. Full specification of I<sup>2</sup>C-bus will be supplied on request.
2. Programmable mute state. If the CR3 bit of the mute and port control register is LOW, the mute is active LOW; if it is HIGH, the mute input is active HIGH.
3. Output current  $I_O \approx 1$  mA.
4. Unmodulated.
5.  $f = 400$  Hz;  $R_L = 1$  M $\Omega$ .
6.  $40$  Hz  $\leq f \leq 15$  kHz.
7. In dual mode: A(B)-signal into B(A)-channel.  
In stereo mode: R-signal into left, L-signal = 0, reference is 1 V RMS.
8. Source impedance  $|Z_S| < 1$  k $\Omega$ .
9. Equivalent to an output level of  $-3$  dB at  $f = 3.183$  kHz.
10.  $V_O = 1$  V RMS;  $f = 1$  kHz.
11. Test circuit see Fig.7.

- (1) These pins are not connected internally and should not be connected on the printed circuit board in order to maintain compatibility with future devices.
- (2) This potentiometer has to be adjusted to achieve the best stereo separation.
- (3) Direct connection between pins 5 and 16 is needed.

Fig.7 Application and test circuit.

DEVELOPMENT DATA

Fig.9 Total harmonic distortion diagram (stereo mode).

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

## HI-FI STEREO AUDIO PROCESSOR; I<sup>2</sup>C BUS

### GENERAL DESCRIPTION

The TDA8420 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel (CH1) and a headphone channel (CH2), digital controlled via the I<sup>2</sup>C bus, for application in hi-fi audio and television sound.

### Features

- Input selector
- Mode selector
- Loudspeaker channel (CH1)
- Headphone channel (CH2) } with volume control, balance control and mute
- Pseudo stereo and spatial function
- Bass and treble control

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 4)	V <sub>CC</sub>	7,5	12	14	V
Input signal handling	V <sub>I</sub>	2	—	—	V
Input sensitivity full power at the output stage	V <sub>i</sub>	—	200	—	mV
Signal plus noise-to-noise ratio	(S+N)/N	—	90	—	dB
Total harmonic distortion	THD	—	0,05	—	%
Channel separation	$\alpha$	—	75	—	dB
Volume control range CH1	G	-46	—	16	dB
Treble control range	G	-12	—	12	dB
Bass control range	G	-12	—	15	dB
Volume control range CH2	G	-62	—	0	dB

### PACKAGE OUTLINE

28-lead dual in-line; plastic (SOT117).

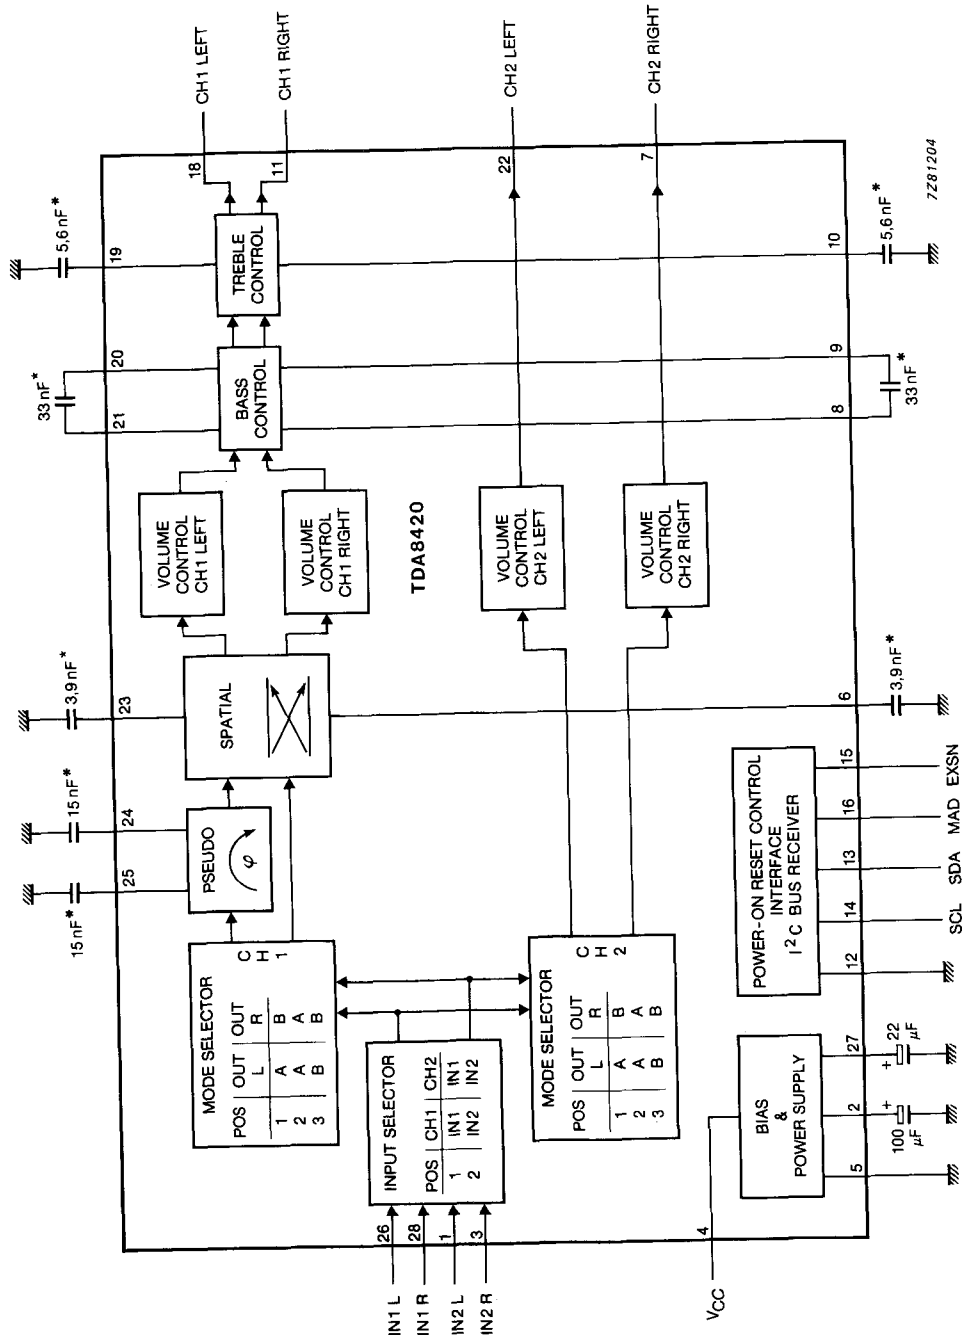

Fig. 1 Block diagram.

\* These values are dependent on the required frequency response and effect.

## PINNING

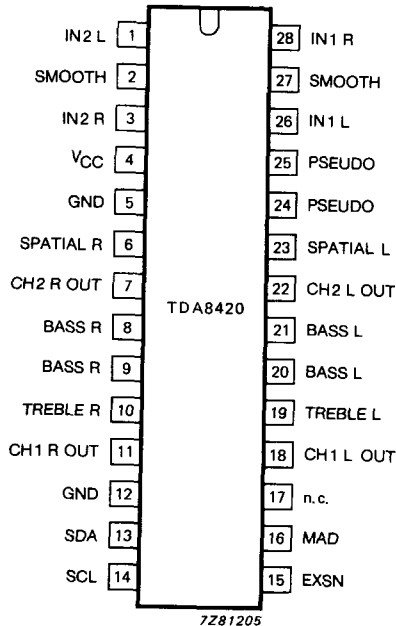

Fig. 2 Pinning diagram.

## FUNCTIONAL DESCRIPTION

## Input selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the input selector. The selection is made from the following AF input signals:

- IN1 L (pin 26); IN1 R (pin 28)  
or
- IN2 L (pin 1); IN2 R (pin 3)

Where IN1 is an internal input signal and IN2 an external input signal.

## Mode selector

For each channel (CH1 and CH2) there is a mode selector which selects between stereo, sound A and sound B in the event of bilingual transmission. Both mode selectors can be controlled independently.

## Headphone channel (CH2)

## Volume control and balance

The stages for volume control for CH2 consist of two parts for left and right. In each part the gain can be adjusted between 0 and -62 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 90$  dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

## Loudspeaker channel (CH1)

## Volume control and balance

The loudspeaker channel (CH1) also consists of two parts for volume control (left and right). In each part the gain can be adjusted between +16 dB and -62 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 90$  dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

## Stereo/pseudo stereo/spatial stereo mode

It is possible to select three modes. Stereo, pseudo or spatial stereo. The pseudo stereo mode receives mono transmissions and the stereo and spatial stereo mode receives stereo transmissions.

## Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

## Treble control

The treble control stage can be switched from + 12 dB to -12 dB in steps of 3 dB.

## Bias and power supply

The TDA8420 includes a bias and power supply stage, which generates a voltage of  $\frac{1}{2} V_{CC}$  with a low output impedance and injector currents for the logic part.

## Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both the loudspeaker channel (CH1) and the headphone channel (CH2). The muting can be switched by transmission of the mute bit.

## I<sup>2</sup>C bus receiver and data handling

### Bus specification

The TDA8420 is controlled via the 2-wire I<sup>2</sup>C bus by a microcomputer. The two wires (SDA — serial data, SCL — serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor. When the bus is free both lines are HIGH. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition. A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.

The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition. The bus is considered to be free again after a stop condition.

### Module address

Data transmission to the TDA8420 starts with the module address MAD.

Fig. 3 TDA8420 module address.

The module address is determined by pin 16. When connected to ground MAD = 0; when connected to V<sub>CC</sub> MAD = 1. Thus two TDA8420s can be selected within a system.

**Subaddress**

After the module address byte a second byte is used to select the functions for both channels:

- CH1 – Volume left, volume right, bass, treble and switch functions
- CH2 – Volume left, volume right and switch functions

The subaddress SAD is stored within the TDA8420. Table 1 defines the coding of the second byte after the module address MAD.

**Table 1** Second byte after module address MAD

function	128	64	32	16	8	4	2	1

**Sequence of data transmission**

After a power-on reset all eight functions have to be adjusted with eight data transmissions. It is recommended that data information for switch functions in CH1 are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 5. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

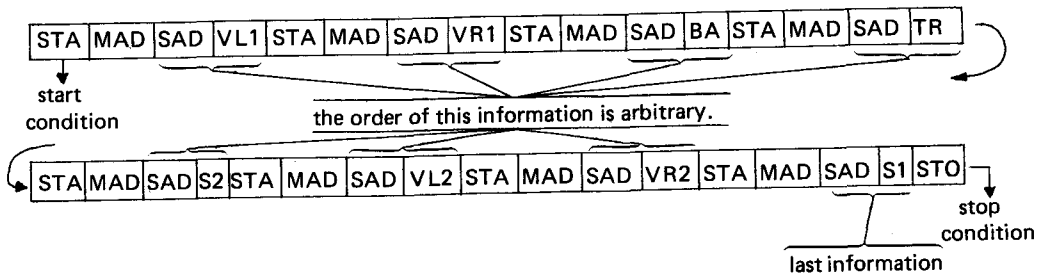

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission except after power-on reset.

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

## HI-FI STEREO AUDIO PROCESSOR; I<sup>2</sup>C BUS

### GENERAL DESCRIPTION

The TDA8421 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel (CH1) and a headphone channel (CH2), digital controlled via the I<sup>2</sup>C bus, for application in hi-fi audio and television sound.

### Features

- Input selector
- Mode selector
- Loudspeaker channel (CH1) } with volume control, balance control and mute
- Headphone channel (CH2) }
- Pseudo stereo and spatial function
- Bass and treble control
- Electrostatic discharge protection diodes

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit

Treble control range	G	-12	—	12	dB
Bass control range	G	-12	—	15	dB
Volume control range CH2	G	-62	—	0	dB

### PACKAGE OUTLINE

28-lead dual in-line; plastic (SOT117).

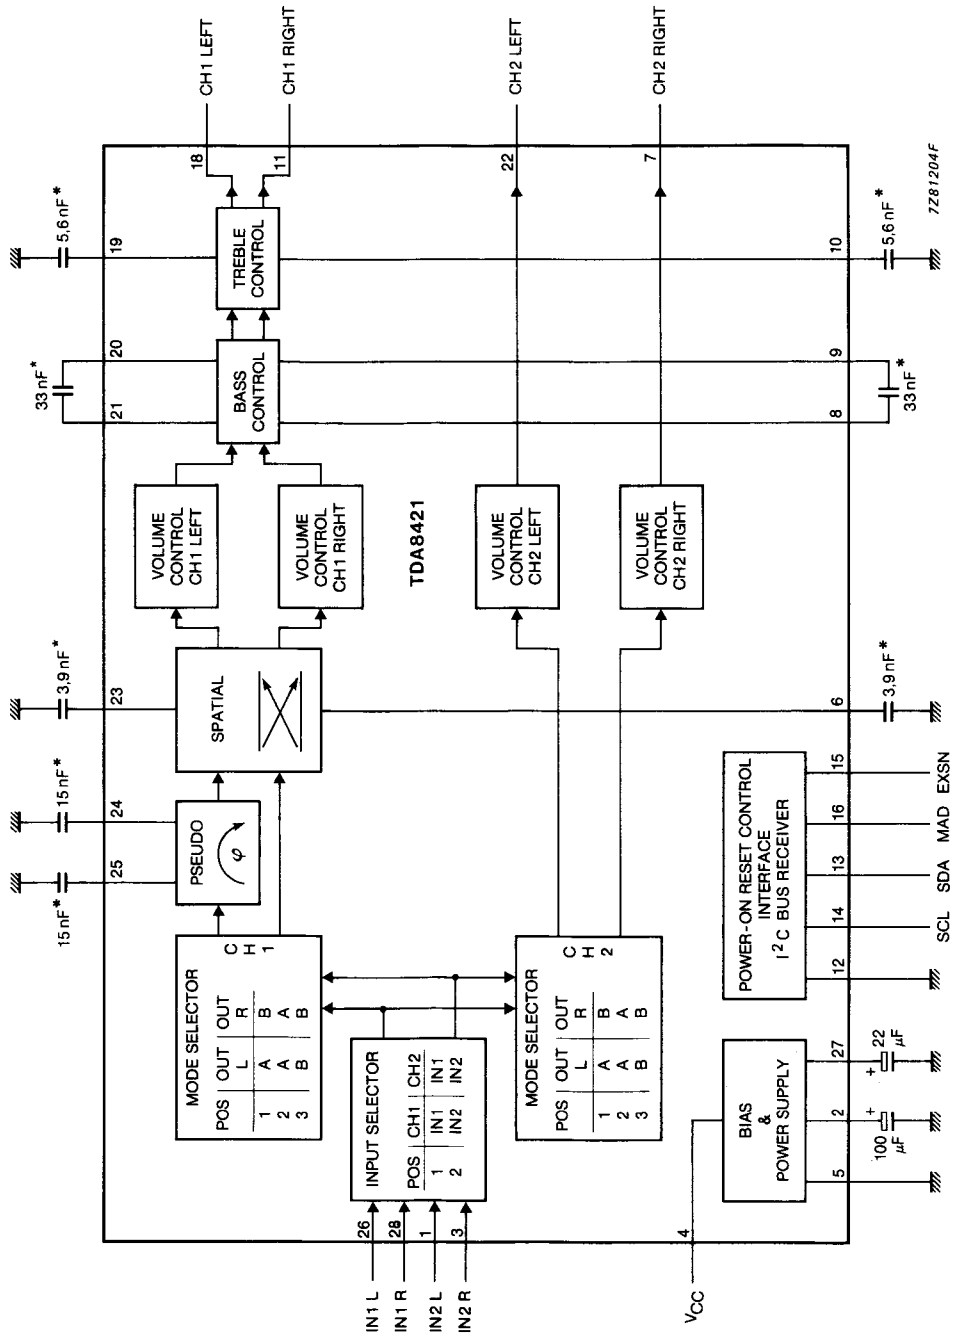

Fig. 1 Block diagram.

\* These values are dependent on the required frequency response and effect.

## PINNING

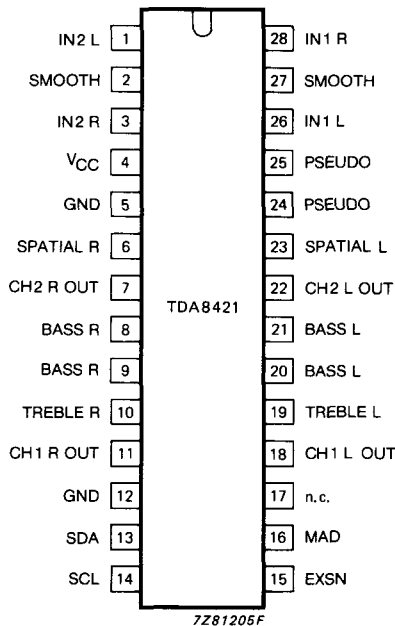

Fig. 2 Pinning diagram.

## FUNCTIONAL DESCRIPTION

## Input selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the input selector. The selection is made from the following AF input signals:

- IN1 L (pin 26); IN1 R (pin 28)  
or
- IN2 L (pin 1); IN2 R (pin 3)

Where IN1 is an internal input signal and IN2 an external input signal.

## Mode selector

For each channel (CH1 and CH2) there is a mode selector which selects between stereo, sound A and sound B in the event of bilingual transmission. Both mode selectors can be controlled independently.

## Headphone channel (CH2)

## Volume control and balance

The stages for volume control for CH2 consist of two parts for left and right. In each part the gain can be adjusted between 0 and -62 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 90$  dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

## Loudspeaker channel (CH1)

## Volume control and balance

The loudspeaker channel (CH1) also consists of two parts for volume control (left and right). In each part the gain can be adjusted between +16 dB and -62 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 90$  dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

**Stereo/pseudo stereo/spatial stereo mode**

It is possible to select three modes. Stereo, pseudo or spatial stereo. The pseudo stereo mode receives mono transmissions and the stereo and spatial stereo mode receives stereo transmissions.

**Bass control**

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

**Treble control**

The treble control stage can be switched from + 12 dB to -12 dB in steps of 3 dB.

**Bias and power supply**

The TDA8421 includes a bias and power supply stage, which generates a voltage of  $\frac{1}{2} V_{CC}$  with a low output impedance and injector currents for the logic part.

**Power-on reset**

The on-chip power-on reset circuit sets the mute bit to active, which mutes both the loudspeaker channel (CH1) and the headphone channel (CH2). The muting can be switched by transmission of the mute bit.

**I<sup>2</sup>C bus receiver and data handling****Bus specification**

The TDA8421 is controlled via the 2-wire I<sup>2</sup>C bus by a microcomputer. The two wires (SDA – serial data, SCL – serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor. When the bus is free both lines are HIGH. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition. A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition. The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition. The bus is considered to be free again after a stop condition.

**Module address**

Data transmission to the TDA8421 starts with the module address MAD.

Fig. 3 TDA8421 module address.

The module address is determined by pin 16. When connected to ground MAD = 0; when connected to  $V_{CC}$  MAD = 1. Thus two TDA8421s can be selected within a system.

**Subaddress**

After the module address byte a second byte is used to select the functions for both channels:

- CH1 – Volume left, volume right, bass, treble and switch functions
- CH2 – Volume left, volume right and switch functions

The subaddress SAD is stored within the TDA8421. Table 1 defines the coding of the second byte after the module address MAD.

**Table 1** Second byte after module address MAD

**Sequence of data transmission**

After a power-on reset all eight functions have to be adjusted with eight data transmissions. It is recommended that data information for switch functions in CH1 are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 5. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

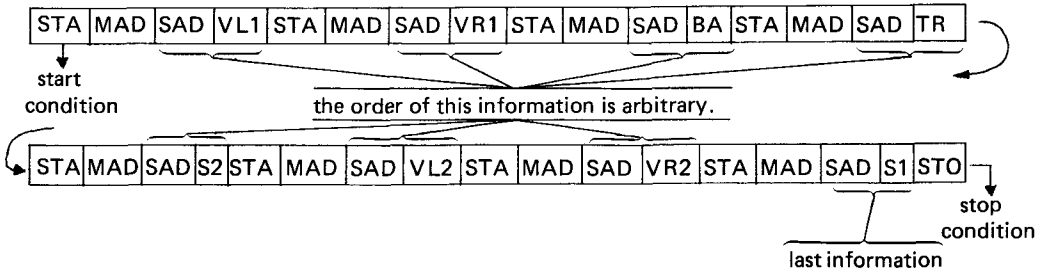

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission except after power-on reset.

TDA8425

## HI-FI STEREO AUDIO PROCESSOR; I<sup>2</sup>C-BUS

### GENERAL DESCRIPTION

The TDA8425 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel facility, digitally controlled via the I<sup>2</sup>C-bus for application in hi-fi audio and television sound.

#### Features

- Source and mode selector for two stereo channels
- Pseudo stereo, spatial stereo, linear stereo and forced mono switch
- Volume and balance control
- Bass, treble and mute control
- Power supply with power-on reset

### QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit
Supply voltage (pin 4)	V <sub>CC</sub>	10.8	12.0	13.2	V
Input signal handling	V <sub>I</sub>	2	—	—	V
Input sensitivity full power at the output stage	V <sub>i</sub>	—	300	—	mV
Signal plus noise-to-noise ratio	(S+N)/N	—	86	—	dB
Total harmonic distortion	THD	—	0.05	—	%
Channel separation	$\alpha$	—	80	—	dB
Volume control range	G	-64	—	6	dB
Treble control range	G	-12	—	12	dB
Bass control range	G	-12	—	15	dB

### PACKAGE OUTLINE

20-lead dual in-line; plastic (SOT146).

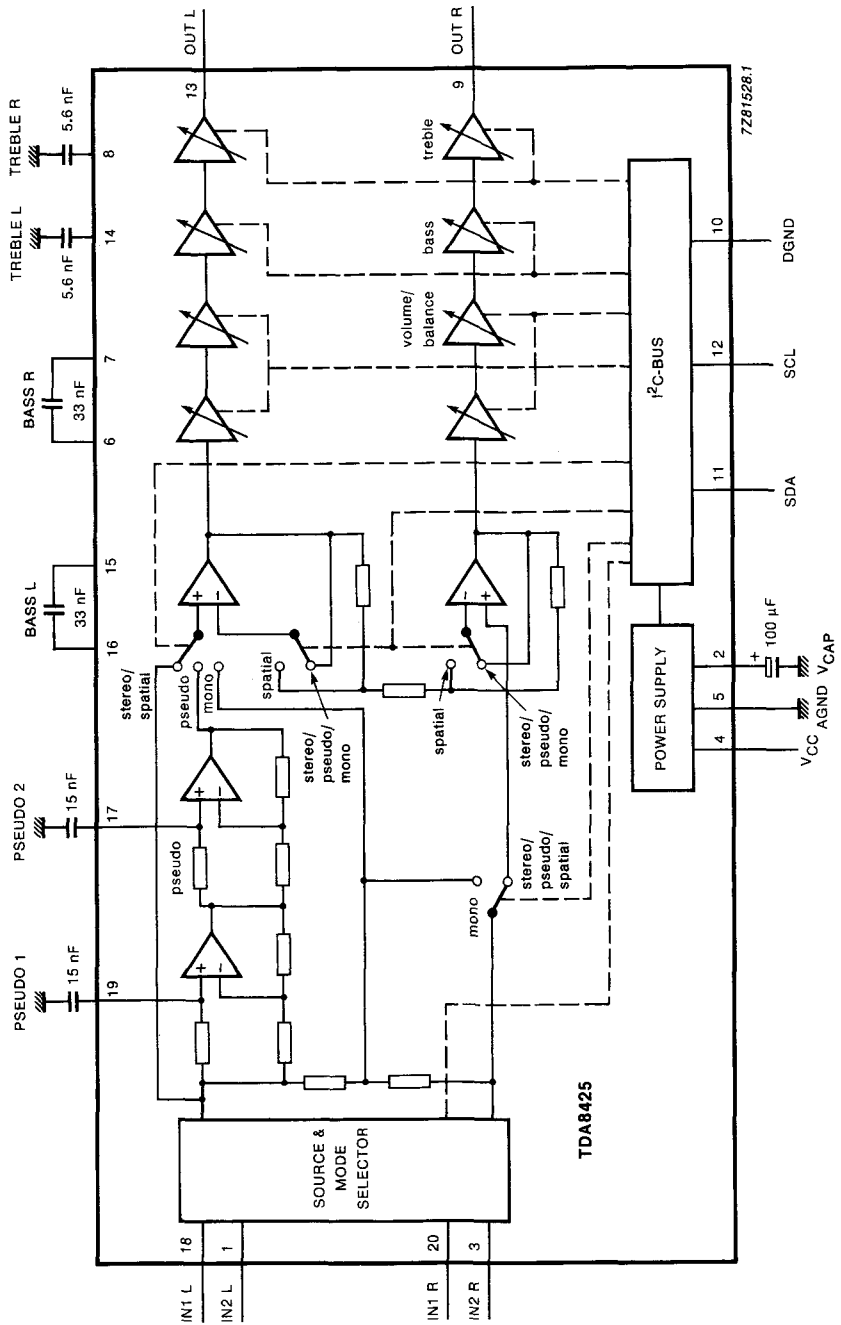

Fig. 1 Block diagram.

## PINNING

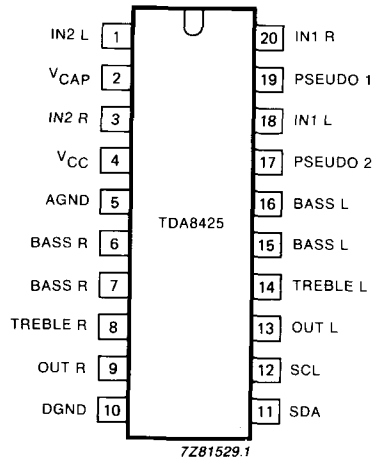

Fig. 2 Pinning diagram.

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

## Source selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the source selector. The selection is made from the following AF input signals:

- IN1 L (pin 18); IN1 R (pin 20)  
or
- IN2 L (pin 1); IN2 R (pin 3)

## Mode selector

The mode selector selects between stereo, sound A and sound B (in the event of bilingual transmission) for OUT R and OUT L.

## Volume control and balance

The volume control consists of two stages (left and right). In each part the gain can be adjusted between +6 dB and -64 dB in steps of 2 dB. An additional step allows an attenuation of  $\geq 80$  dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right output channels.

## Linear stereo, pseudo stereo, spatial stereo and forced mono mode\*

It is possible to select four modes: linear stereo, pseudo stereo, spatial stereo or forced mono. The pseudo stereo mode handles mono transmissions, the spatial stereo mode handles stereo transmissions and the forced mono can be used in the event of stereo signals.

## Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

\* During forced mono mode the pseudo stereo mode cannot be used.

## Treble control

The treble control stage can be switched from + 12 dB to -12 dB in steps of 3 dB.

## Bias and power supply

The TDA8425 includes a bias and power supply stage, which generates a voltage of  $0.5 \times V_{CC}$  with a low output impedance and injector currents for the logic part.

## Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both parts of the treble amplifier. The muting can be switched by transmission of the mute bit.

## I<sup>2</sup>C-bus receiver and data handling

### Bus specification

The TDA8425 is controlled via the 2-wire I<sup>2</sup>C-bus by a microcomputer.

The two wires (SDA – serial data, SCL – serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor.

When the bus is free both lines are HIGH.

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition.

A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.

The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition.

The bus is considered to be free again after a stop condition.

## Module address

Data transmission to the TDA8425 starts with the module address MAD.

Fig. 3 TDA8425 module address.

**Subaddress**

After the module address byte a second byte is used to select the following functions:

- Volume left, volume right, bass, treble and switch functions

The subaddress SAD is stored within the TDA8425. Table 1 defines the coding of the second byte after the module address MAD.

**Table 1** Second byte after module address MAD

function	128	64	32	16	8	4	2	1
	MSB				LSB			
	7	6	5	4	3	2	1	0
volume left	0	0	0	0	0	0	0	0
volume right	0	0	0	0	0	0	0	1
bass	0	0	0	0	0	0	1	0
treble	0	0	0	0	0	0	1	1
switch functions	0	0	0	0	1	0	0	0
subaddress SAD								

The automatic increment feature of the slave address enables a quick slave receiver initialization, within one transmission, by the I<sup>2</sup>C-bus controller (see Fig. 5).

**Definition of 3rd byte**

A third byte is used to transmit data to the TDA8425. Table 2 defines the coding of the third byte after module address MAD and subaddress SAD.

**Table 2** Third byte after module address MAD and subaddress SAD

function		MSB							LSB

DEVELOPMENT DATA

**Sequence of data transmission**

After a power-on reset all five functions have to be adjusted with five data transmissions. It is recommended that data information for switch functions are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 6. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

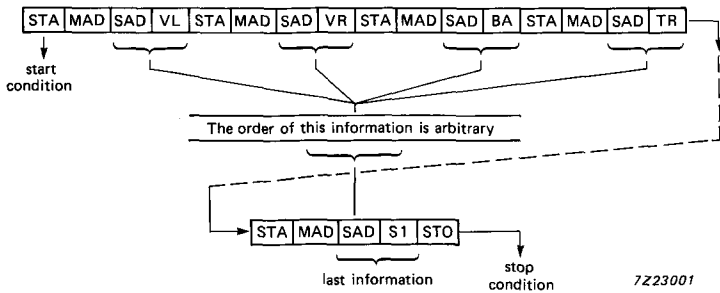

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission after a power-on reset with auto increment.

TDA8440

## SWITCH FOR CTV RECEIVERS

### GENERAL DESCRIPTION

The TDA8440 is a versatile video/audio switch, intended to be used in CTV receivers equipped with an AUXILIARY VIDEO/AUDIO plug.

It provides two 3-state switches for audio channels and one 3-state switch for the video channel and a video amplifier with selectable gain (times 1 or times 2).

The integrated circuit can be used in conjunction with a microcontroller from the MAB8400 family, and is controlled via a bidirectional I<sup>2</sup>C bus. Sufficient sub-addressing is provided for the I<sup>2</sup>C bus mode. It can also be controlled directly by d.c. switching signals.

### Features

- Combined analogue and digital circuitry gives maximum flexibility in channel switching
- 3-state switches for all channels
- Selectable gain for the video channels
- Sub-addressing facility
- I<sup>2</sup>C bus or non-I<sup>2</sup>C bus mode (controlled by d.c. voltages)
- Slave receiver in the I<sup>2</sup>C bus mode
- External OFF command
- System expansion possible up to 7 devices (14 sources)
- Static short-circuit proof outputs

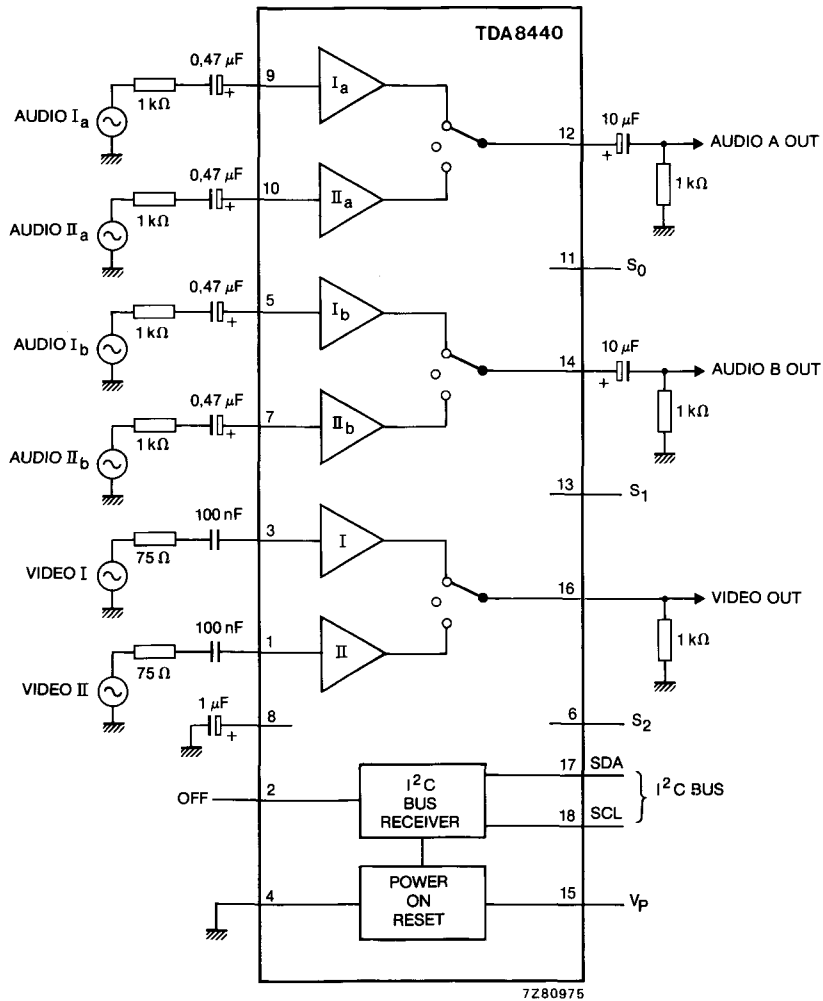

### QUICK REFERENCE DATA

Supply voltage range	V <sub>15-4</sub>	10 to 13,2 V
Supply current (without load)	I <sub>15</sub>	typ. 33 mA
		max. 50 mA
Storage temperature	T <sub>stg</sub>	max. +125 °C
Operating ambient temperature range	T <sub>amb</sub>	0 to +70 °C

### PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

S0, S1, S2 and OFF (pins 11, 13, 6 and 2) connected to Vp or GND.  
 If more than 1 device is used, then the outputs and the pins 8 (bias decoupling of the audio inputs) may be connected in parallel.

Fig. 1 Block diagram and test circuit.

## FUNCTIONAL DESCRIPTION

The TDA8440 is a monolithic system of switches and can be used in CTV receivers equipped with an AUXILIARY VIDEO/AUDIO plug.

The IC incorporates 3-state switches they comprise:

- An electronic video switch with selectable gain (times 1 or times 2) for switching between an internal video signal (from the IF amplifier) and an AUXILIARY input signal.
- Two electronic audio switches, for two sound channels (stereo or dual language), for switching between internal audio sources and signals from the AUXILIARY VIDEO/AUDIO plug.

A selection can be made between two input signals and an OFF-state. The OFF-state is necessary if more than one TDA8440 device is used.

The SDA and SCL pins can be connected to the I<sup>2</sup>C bus or to d.c. switching voltages. Inputs S<sub>0</sub> (pin 11), S<sub>1</sub> (pin 13), and S<sub>2</sub> (pin 6) are used for selection of sub-addresses or switching to the non-I<sup>2</sup>C mode. Inputs S<sub>0</sub>, S<sub>1</sub> and S<sub>2</sub> can be connected to the supply voltage (H) or to ground (L). In this way no peripheral components are required for selection.

**Table 1** Sub-addressing

S <sub>2</sub>	S <sub>1</sub>	S <sub>0</sub>	sub-address		
			A <sub>2</sub>	A <sub>1</sub>	A <sub>0</sub>

L	L	H	0	0	1
L	H	L	0	1	0
L	H	H	0	1	1
H	L	L	1	0	0
H	L	H	1	0	1
H	H	L	1	1	0
H	H	H	non I <sup>2</sup> C addressable		

DEVELOPMENT DATA

## NON-I<sup>2</sup>C BUS CONTROL

If the TDA8440 switching device has to be operated via the AUXILIARY VIDEO/AUDIO plug, inputs S<sub>2</sub>, S<sub>1</sub> and S<sub>0</sub> must be connected to the supply line (12 V).

The sources (internal and external) and the gain of the video amplifier can be selected via the SDA and SCL pins with the switching voltage from the AUXILIARY VIDEO/AUDIO plug:

- Sources I are selected if SDA = 12 V (external source)
- Sources II are selected if SDA = 0 V (TV mode)
- Video amplifier gain is 2 x if SCL = 12 V (external source)
- Video amplifier gain is 1 x if SCL = 0 V (TV mode)

If more than one TDA8440 device is used in the non-I<sup>2</sup>C bus system, the OFF pin can be used to switch off the desired devices. This can be done via the 12 V switching voltage on the AUXILIARY VIDEO/AUDIO plug.

- All switches are in the OFF position if OFF = H (12 V)
- All switches are in the selected position via SDA and SCL pins if OFF = L (0 V)

## I<sup>2</sup>C BUS CONTROL

Detailed information on the I<sup>2</sup>C bus is available on request.

## OFF FUNCTION

With the OFF input all outputs can be switched off (mode high ohmic), depending on the value of D<sub>0</sub>.

### D<sub>0</sub>/OFF gating

D <sub>0</sub>	OFF input	Outputs
0 (off input active)	H	OFF
0	L	in accordance with last defined D <sub>7</sub> -D <sub>1</sub> (may be entered while OFF = HIGH)
1 (off input inactive)	H	in accordance with D <sub>7</sub> -D <sub>1</sub>
1	L	in accordance with D <sub>7</sub> -D <sub>1</sub>

**Power-on reset**

The circuit is provided with a power-on reset function.

When the power supply is switched on an internal pulse will be generated that will reset the internal memory  $S_0$ , in the initial state all the switches will be in the off position and the OFF input is active ( $D_7-D_0 = 0$ ) ( $I^2C$  mode), position defined via SDA and SCL inputs (non- $I^2C$  mode).

When the power supply decreases below 5 V a pulse will be generated and the internal memory will be reset. The behaviour of the switches will be the same as described above.

**Notes to the characteristics**

1. Caused by drive on any other input at maximum level, measured in B = 5 MHz, source impedance for the used input 75  $\Omega$ ,

$$\text{crosstalk} = 20 \log \frac{V_{out}}{V_{IN \text{ max}}}$$

2.  $S/N = 20 \log \frac{V_O \text{ video noise (p-p) (2 V)}}{V_O \text{ noise rms B = 5 MHz}}$

3. Supply voltage ripple rejection =  $20 \log \frac{V_r \text{ supply}}{V_r \text{ on output}}$  at f = max. 100 kHz.

4.  $S/N = 20 \log \frac{V_O \text{ nominal (0,5 V)}}{V_O \text{ noise B = 20 kHz}}$

5. Caused by drive of any other input at maximum level, measured in B = 20 kHz, source impedance of the used input = 1 k $\Omega$ ,

$$\text{crosstalk} = 20 \log \frac{V_{out}}{V_{in \text{ max}}} \text{ according to DIN 45405 (CCIR 468).}$$

6. f = 20 Hz to 20 kHz.
7. All outputs are short-circuit proof (static).
8. The inputs and output (apart from SDA, SCL and OFF) withstand tests of MIL-STD-883 C. It is advisable to connected series resistors to these pins.
9. Timings t<sub>S</sub>, DAT and t<sub>H</sub>, DAT deviate from the I<sup>2</sup>C bus specification. After reset has been activated, transmission may only be started after a 50  $\mu$ s delay.

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

## I<sup>2</sup>C-BUS INTERFACE FOR COLOUR DECODERS

### GENERAL DESCRIPTION

The TDA8442 provides control of four analogue functions and has one high-current and two switching outputs. Control of the IC is performed via the two-line, bidirectional I<sup>2</sup>C-bus.

### Features

- Four analogue control outputs
- One high-current output port (npn open emitter)
- Two switching output ports (npn collector with internal pull-up resistor)
- I<sup>2</sup>C-bus slave receiver
- Power-down reset

### QUICK REFERENCE DATA

## FUNCTIONAL DESCRIPTION

## Control

Analogue control is facilitated by four 6-bit digital-to-analogue converters (DAC0 to DAC3). The values of the output voltages from the DACs are set via the I<sup>2</sup>C-bus.

The high-current output port (P1) is suitable for switching between internal and external RGB signals. It is an open npn emitter output capable of sourcing 14 mA (min.).

The two output ports (P2 and P2N) can be used for NTSC/PAL switching. These are npn collector outputs with internal pull-up resistors of 10 k $\Omega$  (typ.). Both outputs are capable of sinking up to 2 mA with a voltage drop of less than 400 mV. If one output is switched on (LOW), the other output is switched off, and vice versa.

## Reset

The power-down-reset mode occurs whenever the positive supply voltage falls below 8.5 V (typ.) and resets all registers to a defined state.

**OPERATION**

**Write**

The TDA8442 is controlled via the I<sup>2</sup>C-bus (specifications for the I<sup>2</sup>C-bus will be supplied on request). Programming of the TDA8442 is performed using the format shown in Fig. 3.

Fig. 3 TDA8442 programming format.

Acknowledge (A) is generated by the TDA8442 only when a valid address is received and the device is not in the power-down-reset mode ( $V_p > 8.5$  V (typ.)).

**Control**

Control is implemented by the instruction bytes POD (port output data) and DACX (digital-to-analogue converter control) together with the corresponding data/control bytes (see Fig. 4).

Fig. 4 Control programming.

**POD bit P1:** If a logic 1 is programmed, the P1 output is switched on. If a logic 0 is programmed or after a power-down-reset, the P1 output is switched off (high-impedance state).

**POD bit P2/P2N:** If a logic 1 is programmed, the P2 output is switched off and the P2N output is switched on (LOW). If a logic 0 is programmed or after a power-down-reset, the P2 output is switched on (LOW) and the P2N output is switched off.

**DAX bits AX5 to AX0:** The digital-to-analogue converter selected corresponds to the decimal equivalent of the two bits X1 and X0. The output voltage of the selected DAC is programmed using bits AX5 to AX0, the lowest value being with all data AX5 to AX0 at logic 0 or when power-down-reset has been activated.

**RATINGS**

# DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA8443A

## I<sup>2</sup>C-BUS CONTROLLED YUV/RGB SWITCH

### GENERAL DESCRIPTION

The TDA8443A is a general purpose two-channel switch for YUV or RGB signals. One channel provides matrixing from RGB to YUV, which can be bypassed.

The IC is controlled via I<sup>2</sup>C-bus by seven different addresses or can be used in a non-I<sup>2</sup>C-bus mode. In the non-I<sup>2</sup>C-bus mode, control of the circuit is achieved by DC voltages.

### Features

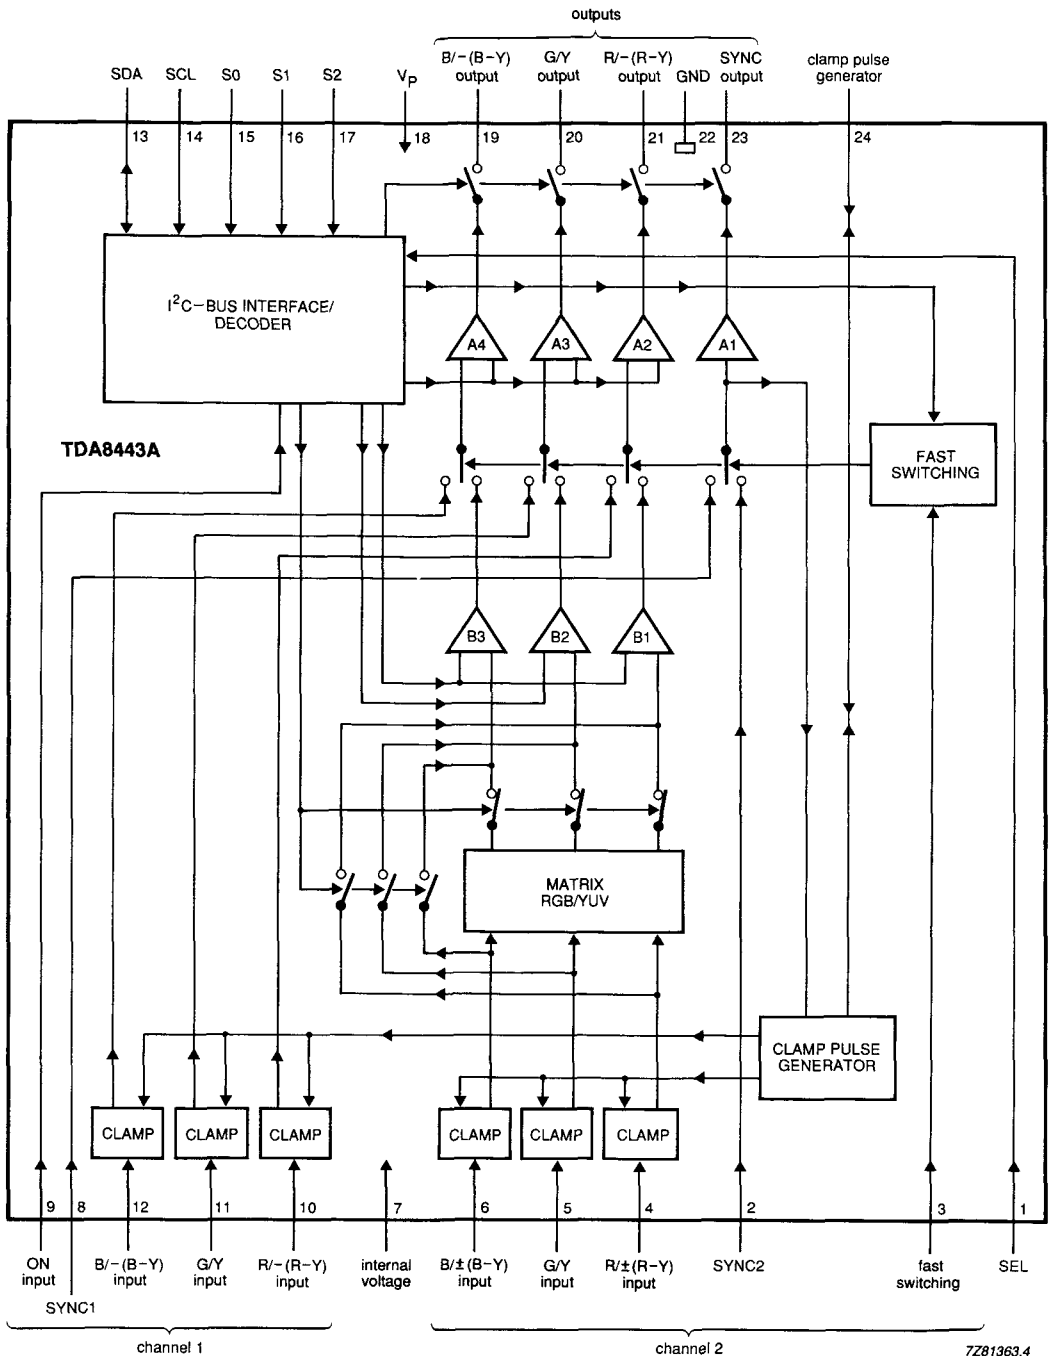

- Two RGB/YUV selectable clamped inputs with associated synchronization
- RGB/YUV matrix
- 3-state switching with an OFF-state
- Selectable gain
- I<sup>2</sup>C-bus or non-I<sup>2</sup>C-bus mode
- Address selection for 7 devices
- Fast switching

**FUNCTIONAL DESCRIPTION**

The circuit contains two sets of inputs (see Fig.1). Both channels can receive RGB or YUV signals. Each set of inputs has its own synchronization input, which internally generates a pulse to clamp the inputs. The internal clamping pulse can also be controlled by a signal (e.g. a sandcastle pulse) applied to pin 24. The pulse will occur during the time that the signal at pin 24 is between 5.5 and 6.5 V. If both a sync signal and a pin 24 signal are used the signal should be applied to pin 24 via a 1 k $\Omega$  resistor.

RGB signals of channel 2 can be matrixed to YUV signals.

The outputs can be set in a high impedance OFF state, which allows the use of up to seven devices in parallel (I<sup>2</sup>C-bus mode).

The circuit can be controlled by an I<sup>2</sup>C-bus compatible microcontroller or directly by DC voltages. The fast switching input can be operated via pin 16 of the peritelevision connector.

**I<sup>2</sup>C-bus mode**

The protocol for the devices in I<sup>2</sup>C-bus mode is shown in Fig.3.

MSA003

Fig.3 I<sup>2</sup>C-bus protocol.

**Where:**

- STA : start condition
- MA2, MA1, MA0 : address selection bits, see Table 1
- ACK : acknowledge bit
- D7 : channel selection bit, see Table 2
- D6 : matrix selection bit, see Table 2
- D5, D4, D3 : gain control bits, see Table 3
- D2 : fast switching priority bit, see Table 4
- D1, D0 : output state control bits, see Table 5
- STO : stop condition

## Notes to the characteristics

1. Crosstalk is defined as the unwanted data transfer from an output, driven at nominal level, to other inputs and outputs on the IC and is expressed as a ratio in dBs.

$$2. \text{ Signal-to-noise ratio} = 20 \log \frac{V_{O(p-p)}}{V_{O \text{ noise (RMS)}} B = 5 \text{ MHz}}$$

$$3. \text{ Supply voltage ripple rejection} = 20 \log \frac{V_{RR \text{ supply}}}{V_{RR \text{ on the output}}}$$

Input = 0 V (input 1; Mode 2)  
Input = 0.75 V (RGB; Mode 1)

Purchase of Philips' I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C-system provided the system conforms to the I<sup>2</sup>C specifications defined by Philips.

OCTUPLE 6-BIT DAC WITH I<sup>2</sup>C-BUS

## GENERAL DESCRIPTION

The TDA8444 comprises eight digital-to-analogue converters (DACs) each controlled via the two-wire I<sup>2</sup>C-bus. The DACs are individually programmed using a 6-bit word to select an output from one of 64 voltage steps. The maximum output voltage of all DACs is set by the input  $V_{\max}$  and the resolution is approximately  $V_{\max}/64$ . At power-on all DAC outputs are set to their lowest value. The I<sup>2</sup>C-bus slave receiver has a 7-bit address of which 3 bits are programmable via pins A0, A1 and A2.

## Features

- Eight discrete DACs
- I<sup>2</sup>C-bus slave receiver
- 16-pin DIL package

## FUNCTIONAL DESCRIPTION

I<sup>2</sup>C-bus

The TDA8444 I<sup>2</sup>C-bus interface is a receive-only slave. Data is accepted from the I<sup>2</sup>C-bus in the following format:

Where:

S	= start condition	A2, A1, A0	= programmable address bits
P	= stop condition	I3, I2, I1, I0	= instruction bits
A	= acknowledge	SD, SC, SB, SA	= subaddress bits
X	= don't care	D5, D4, D3, D2, D1, D0	= data bits

Fig. 3 Data format.

## Address byte

Valid addresses are 40, 42, 44, 46, 48, 4A, 4C, 4E (hexadec), depending on the programming of bits A2, A1 and A0. With these addresses, up to eight TDA8444 ICs can be operated independently from one I<sup>2</sup>C-bus. No other addresses are acknowledged by the TDA8444.

## Instruction and data bytes

Valid instructions are 00 to 0F and F0 to FF (hexadec); the TDA8444 will not respond to other instruction values.

Instructions 00 to 0F cause auto-incrementing of the subaddress (bits SD to SA) when more than one data byte is sent within one transmission. With auto-incrementing, the first data byte is written into the DAC addressed by bits SD to SA and then the subaddress is automatically incremented by one position for the next data byte in the series.

Auto-incrementation does not occur with instructions F0 to FF. Other than auto-incrementation there is no difference between instructions 00 to 0F and F0 to FF. When only one data byte per transmission is present, the DAC addressed by the subaddress will always receive the data.

Valid subaddresses (bits SD to SA) are 0 to 7 (hexadec) relating numerically to DAC0 to DAC7. When the auto-incrementing function is used, the subaddress will sequence through all possible values (0 to F, 0 to F, etc.).

I<sup>2</sup>C-bus

Input SCL (pin 3) and input/output SDA (pin 4) conform to I<sup>2</sup>C-bus specifications.\* Pins 3 and 4 are protected against positive voltage pulses by internal zener diodes connected to the ground plane and therefore the normal bus line voltage should not exceed 5.5 V.

The address inputs A0, A1, A2 are programmed by a connection to GND for A<sub>n</sub> = 0 or to V<sub>p</sub> for A<sub>n</sub> = 1. If the inputs are left floating, A<sub>n</sub> = 1 will result.

**FUNCTIONAL DESCRIPTION** (continued)**Input  $V_{\max}$** 

Input  $V_{\max}$  (pin 2) provides a means of compressing the output voltage swing of the DACs. The maximum DAC output voltage is restricted to approximately  $V_{\max}$  while the 6-bit resolution is maintained, so giving a finer voltage resolution of smaller output swings.

**Digital-to-analogue converters**

Each DAC comprises a 6-bit data latch, current switches and an output driver. Current sources with values weighted by  $2^0$  up to  $2^5$  are switched according to the data input so that the sum of the selected currents gives the required analogue voltage from the output driver. The range of the output voltage is approximately 0.5 to 10.5 V when  $V_{\max} = V_p$ .

The DAC outputs are protected against short-circuits to  $V_p$  and GND.

To avoid the possibility of oscillations, capacitive loading at the DAC outputs should not exceed 2 nF.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

TDA8451

## P<sup>2</sup>CCD DELAY LINE AND MATRIX

### GENERAL DESCRIPTION

The TDA8451 is an integrated P<sup>2</sup>CCD (Profiled Peristaltic Charge Coupled Device) delay line and matrix which has been designed to be used in conjunction with various colour decoder ICs (e.g. TDA8461, TDA8390). The device incorporates two comb filters with a delay length of 64  $\mu$ s on the base-band frequencies and clock drivers for the delay lines which are driven from an internal voltage controlled oscillator (VCO) locked to the  $2 \times f_{sc}$  signal. The  $2 \times f_{sc}$  signal is obtained from the decoder IC.

### QUICK REFERENCE DATA

9. (R-Y) input
10. (R-Y) output
11. (B-Y) output
12. (B-Y) input
13. Not connected
14. Voltage drain reset generator decoupling
15. Sandcastle input
16. Supply voltage input (digital)

DEVELOPMENT DATA

**FUNCTIONAL DESCRIPTION**

When the (R-Y) and (B-Y) signals have been demodulated in the decoder, the resultant signals are applied to the comb-filter delay lines via pins 9 and 12. The delay lines are only active when a PAL or SECAM signal is received. When NTSC signals are received the delayed signal is suppressed so that the colour decoded signals are fed directly to the output.

The decoder (e.g. TDA8461) establishes whether or not the received signal is NTSC. This signal is then applied to the P<sup>2</sup> CCD delay lines via the DC level of the  $2 \times f_{SC}$  signal at pin 6.

The delay lines are driven by the internal clock drivers. The outputs from the delay lines are applied to the sample-and-hold low-pass filter output stages which are used to reduce the clock signals.

The reference for the PLL is obtained from the decoder IC which derives the  $2 \times f_{SC}$  signal from its reference oscillator (the amplitude of this signal may be small, min. 200 mV(p-p)). The VCO operates at  $4 \times f_{SC}$  and the delay lines are 4 phase clocked at  $f_{SC}$ .

The P<sup>2</sup> CCD delay line and matrix requires a supply voltage of 12 V. The output stages require a higher voltage (approximately 14 V). This voltage is generated internally with a decoupling capacitor connected to pin 14. A circuit for the TDA8451 together with PAL decoder (TDA8390) is illustrated in Fig.2.

A circuit for the TDA8451 together with PAL/NTSC decoder (TDA8461) and the SECAM decoder (TDA8490) is illustrated in Fig.3. The TDA8490 can also be used in combination with the TDA8390.

at 7.16 MHz reference input		$t_d$	775	800	825	ns

DEVELOPMENT DATA

**Notes to the characteristics**

1. During NTSC, the delayed channel is switched off (switching information fed from the decoder) thereby halving the amplification in comparison with other signal conditions.  
During SECAM, the input signal is only available during one of two sequential lines thereby halving the output signal in comparison with the PAL signal. This can be compensated for if the NTSC decoder (e.g. TDA8461) and the SECAM decoder (TDA8490) supply colour difference signals of double amplitude (as compared to PAL) to the TDA8451.
2. The sandcastle input is LOW. The rest clock signals are measured with an FET probe (3.5 pF in parallel with a 1 MHz resistor) connected directly to pin 1 and pin 10 or pin 1 and pin 11.
3. The signal-to-noise ratio is calculated by:

$$\frac{V_{O(p-p)}}{V_{noise(rms)} (0 - 1 \text{ MHz})}$$

at an input voltage of 0.8 V(p-p), 0 dB gain.

4. The linearity is defined as the amplification of the given input voltage swing divided by the amplification when the input voltage swing is decreased to 70%.

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

The composite video signal (CVBS1 and CVBS2) is applied to pin 14 and/or pin 16. The signal is then routed through three separate paths before being applied to the sample-and-hold filter output stages as follows:

- via a CVBS delay line, the output signal can be used to drive the sync separation circuit, teletext and SECAM decoders etc.
- via a luminance delay line with chrominance trap.
- via a chrominance bandpass filter.

The outputs from the delay lines are applied to the sample-and-hold low-pass filter output stages which are used to reduce the clock signals.

The reference for the PLL is obtained from the decoder IC which derives the  $2 \times f_{SC}$  signal from its reference oscillator (the amplitude of this signal may be small, min. 200 mV(p-p)). The VCO operates at  $4 \times f_{SC}$  and the delay lines are 4 phase clocked at  $f_{SC}$ .

The  $P^2$  CCD filter combination requires a supply voltage of 12 V. The output stages require a higher voltage (approximately 14 V). This voltage is generated internally with a decoupling capacitor connected to pin 13. A circuit for the TDA8452 together with PAL decoder (TDA8390) is illustrated in Fig.5.

A circuit for the TDA8452 together with PAL/NTSC decoder (TDA8461) and the SECAM decoder (TDA8490) is illustrated in Fig.6. The TDA8490 can also be used in combination with the TDA8390. Figure 9 illustrates the luminance and CVBS channel response on T and 2T pulse.

#### Notes to the characteristics

- Unless otherwise specified all figures are related to a CVBS input signal of 0.7 V (peak-to-peak value); 100% contrast; 75% saturation.  
In this condition the input signal is formed by the following components:  
210 mV(p-p) sync pulse  
490 mV(p-p) black-to-white  
465 mV(p-p) chrominance
- The sandcastle input is LOW. The rest clock signals are measured with an FET probe (3.5 pF in parallel with a 1 MHz resistor) connected directly to pins 1 and 3, pins 1 and 4 or pins 1 and 5.
- The signal-to-noise ratio is specified as nominal  $V_{out(p-p)}/V_{noise(rms)}$  (0-5 MHz) at a CVBS input signal specified in note 1.
- The linearity is defined as the amplification at the given input voltage swing, divided by the amplification when the input voltage swing is decreased to 70%.

### PAL/NTSC DECODER WITH I<sup>2</sup>C BUS CONTROL

#### GENERAL DESCRIPTION

The TDA8461 is a multistandard colour decoder used in conjunction with delay line TDA8451, filter TDA8452 and SECAM decoder TDA8490. It combines all the functions required for the identification and demodulation of PAL/NTSC signals. The decoder comprises an I<sup>2</sup>C bus interface used to control the following functions:

- contrast
- saturation
- brightness
- hue, when in the NTSC position
- white point adjustment of the three colours
- peak white limiter adjustment

Via the I<sup>2</sup>C bus the decoder can be forced into the following modes: PAL, NTSC (4,43 MHz), NTSC (3,58 MHz) and SECAM when applied with the TDA8490.

The bus also indicates, as slave transmitter, the mode of the incoming signal (PAL, NTSC or SECAM). The decoder contains separate inputs for data insertion, analogue as well as digital, which can be used for text display systems (e.g. channel number display, Teletext, Antiope, etc.).

#### Features

- I<sup>2</sup>C bus control
- Integrated filters (TDA8452) and delay lines (TDA8451) used in combination with TDA8461 eliminate the need for wire-wound components and adjustments
- A black-current stabilizer which controls the black currents of the three electron guns to a level low enough to omit the black level adjustment
- Inputs for RGB signals and fast switching
- Contrast and brightness control of inserted RGB signals
- Self-aligned oscillator
- Capacitive coupling of the luminance, colour difference and RGB inputs with black level clamping
- Equal black levels for internal TV and external signals
- Adjustable peak white limiter
- Matrix coefficients selectable for PAL/SECAM and NTSC (correction for FCC primaries)
- 12 MHz bandwidth
- Emitter follower outputs for driving the RGB output stages
- Two sandcastle pulse inputs for maximum design flexibility
- I<sup>2</sup>C bus on controlled DAC output

40	τ <sub>OUT</sub>	Scan switch output

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

### Colour decoder

The chrominance signal is amplified and is supplied to three detectors; the burst phase detector (ref. sign. R-Y phase), the automatic colour control (ACC) + NTSC synchronous detector (ref. sign. B-Y phase) and the PAL identification detector (ref. sign.  $\pm$  R-Y phase).

The burst phase detector controls the oscillator which can operate at either 3,58 or 4,43 MHz. The internal switching selects the required crystal. The oscillator is followed by a Miller integrator to obtain the required 90° phase shift and is biased to provide a sine-wave output.

Reference signals obtained from the oscillator and phase shift circuit are then used for the synchronous demodulation of the (B-Y) and (R-Y) signals. The demodulated colour difference signals then have the required amplitude ratio and are fed to the delay line circuit of the TDA8451. If the SECAM decoder TDA8490 is used, then the outputs from this device can be directly connected to the outputs of the TDA8461. The output levels have been chosen so as to give the PAL decoder priority (output level during PAL or NTSC is higher than output level during SECAM reception).

To provide the ACC voltage, the output signal from the ACC and NTSC detector is peak detected and delivered to a sample and hold circuit. The output from the PAL identification detector is also applied to a sample and hold circuit. These two circuits provide the incoming signal identification and the colour killer information.

### Signal identification

The decoder scans the various systems sequentially (four fields per system).

As soon as a signal is identified, the scanning stops and the decoder remains locked to that standard until the killer indicates that the signal has disappeared. After this indication, the scanning will resume. If the TDA8461 is to be used in conjunction with the TDA8490 SECAM decoder, the TDA8461 will be forced into the PAL mode on reception of a SECAM signal. This is because the delay lines for the colour difference signals in the TDA8451 are only operative in this mode.

The scanning system does not remain active during black/white reception as this would cause switching of the filters in the TDA8452. Scanning stops when no ACC voltage is present.

Both TDA8451/2 require a reference signal of  $2 \times f_0$ . To provide this, the oscillator frequency is internally doubled and is available at pin 34. Depending upon the incoming signal (PAL or NTSC), the DC voltage level on this pin is subject to change. This level change is detected by the TDA8451 so that the delayed signal can be switched OFF for NTSC (3,58 MHz and 4,43 MHz).

When an NTSC signal is identified the hue control circuit is switched-on. Hue control is provided by combining the two quadrature colour reference signals.

### Control circuit

The luminance signal is derived from the TDA8452. The control circuit has inputs for luminance and colour difference signals, plus RGB inputs with fast switching. The required luminance signal amplitude is 0,45 V (p-p). After amplification, this signal is supplied to the R, G and B matrix where the colour difference signals are controlled on saturation. The (G-Y) signal is generated after control. The ratio of the colour difference signals which are fed to the RGB matrix is different for both PAL and NTSC signals:

For PAL the normal matrix is followed i.e.  $(G-Y) = -0,51 (R-Y) - 0,19 (B-Y)$ .

For NTSC a new (R-Y) signal is generated consisting of:

$$1,57(R-Y) - 0,41(B-Y).$$

Furthermore, the (G-Y) matrix is changed to  $-0,43(R-Y) - 0,11(B-Y)$ .

The (B-Y) factor remains unchanged, this is to obtain the preferred phase angle and amplitude ratio as normally used for NTSC.

After matrixing, the R, G and B signals are supplied to a switch circuit on which external RGB signals can be chosen. After amplification the RGB signals are controlled for contrast and brightness. The signals are fed to the output via white point adjustment. Typical output signal amplitudes are 4 V black to white (nominal controls). The black level of the three output signals is controlled by a black current stabilization circuit. The black current of the picture tube is obtained in the usual way (see TDA3566).

The TDA8461 has a peak-white limiting circuit. Because the black level at the outputs is dependent upon the black current feedback, the peak-white limiting circuit is adjustable via the I<sup>2</sup>C bus. Peak white reduces the signal amplitude via contrast. The device has a separate input for average beam current which reduces the signal amplitude via contrast and/or brightness, this is also adjustable via the I<sup>2</sup>C bus.

### I<sup>2</sup>C BUS SPECIFICATION

#### Write

The TDA8461 is controlled via the 2-line I<sup>2</sup>C bus as specified in the user manual "Single-chip 8-bit microcontrollers". In order to set up the TDA8461, a control message comprising a slave address, a R/W bit, a subaddress byte and one or more data bytes must be written to the device. The control word format is shown in Fig. 3, where AO (pin 9) is a pin programmable slave address bit.

If more than one data byte follows the subaddress, these bytes are stored in the successive registers by the automatic subaddress increment feature.

Fig. 3 Control word format for slave receiver.

Note: An acknowledge is only generated when a valid address is received.

I<sup>2</sup>C BUS SPECIFICATION (continued)

## Control

Table 1 shows the bit arrangement and function of each data byte used in the control word.

Table 1 Control data

function	sub-address	data byte							
		D7	D6	D5	D4	D3	D2	D1	D0
brightness	00	X	X	A05	A04	A03	A02	A01	A00

red output gain	0A	X	X	AA5	AA4	AA3	AA2	AA1	AA0
green output gain	0B	X	X	AB5	AB4	AB3	AB2	AB1	AB0
blue output gain	0C	X	X	AC5	AC4	AC3	AC2	AC1	AC0

## Control bit definition

MTRX control bit:

1	YUV/RGB matrix in PAL mode
0	YUV/RGB matrix in NTSC mode

If colour decoder mode control bits are set to non-forced mode, the YUV/RGB matrix will follow the "own intelligence" PAL or NTSC mode setting.

CDM2 - CDM0: Colour decoder mode bits

CDM2	CDM1	CDM0	function
0	0	0	not forced mode, own intelligence
0	0	1	forced NTSC, 3,58 MHz if a 3,58 MHz crystal is connected to pin 3
0	1	0	forced PAL -B, G, N or M if the correct crystal is connected to pin 5
0	1	1	forced SECAM*
1	0	0	forced NTSC 4,43 MHz mode*
1	0	1	forced PAL -B, G, N or M if the correct crystal is connected to pin 3
1	1	0	no function, reserved
1	1	1	no function, reserved

\* If a 4,43 MHz crystal is connected to pin 5.

CVBSS control bit:

0	CVBS output LOW (CVBS1 selected)
1	CVBS output HIGH (CVBS2 selected)

RGBS source select control bit:

0	internal RGB selected
1	external RGB source selected (e.g. from TXT)

OFFN RGB output control bit:

0	RGB outputs are switched off, dark screen
1	RGB outputs are not switched off

SWOFF switch-off phase detector and killer bit:

0	phase detector and killer not switched off
1	phase detector and killer switched off*

OUTP output control bit:

0	output = LOW
1	output = HIGH; input mode

BLM0/BLM1 beam limiting control bits:

BLM1	BLM0	mode
0	0	inactive
0	1	active on contrast
1	0	active on brightness
1	1	active on contrast and brightness

DEVELOPMENT DATA

**Read**

The status of TDA8461 can also be read. Figure 4 illustrates status read format for the TDA8461 in the slave transmitter mode.

Note: change in direction of read/write bit.

Fig. 4 Status read format slave transmitter.

\* Only allowable in forced colour decoding mode.

**I<sup>2</sup>C BUS SPECIFICATION** (continued)

The general format of the data byte is shown in Fig. 5.

MSB

LSB

PONRES	DECM2	DECM1	DECM0	0	0	0	INP
--------	-------	-------	-------	---	---	---	-----

Fig. 5 Format of data byte.

**Bit definition**

PONRES power-on reset bit:

A power failure or a power-on reset will set this bit. A successful read of the data byte will reset this bit.

DECM2/DECM1/DECM0 colour decoder mode bits:

DECM2	DECM1	DECM0	function
0	0	0	no colour standard identified
0	0	1	NTSC 3,58 MHz
0	1	0	PAL -B, G, N or M*
0	1	0	SECAM
1	0	0	NTSC 4,43 MHz
1	0	1	PAL -B, G, N or M**
1	1	0	unused
1	1	1	unused

INP input function status bit:

0	Input LOW	operates only as input if bit OUTP is logic 1
1	Input HIGH	

Unused status bits are transmitted as logic 0

\* Depending upon the crystal connected to pin 5.

\*\* Depending upon the crystal connected to pin 3.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	max.	unit

**Notes to the characteristics**

1. Indicated is a signal for a colour bar with 75% saturation (chroma/burst ratio of 2,2 :1).
2. All frequency variations are referred to the 3,58 MHz or 4,43 MHz carrier frequency.
3. The oscillator can run on two frequencies (i.e. when two crystals are connected to the device). Switching between the two reference frequencies is controlled internally or via the I<sup>2</sup>C bus.
4. The various modes are sequentially scanned (four field periods per mode) until a signal is identified. The voltage levels on the two detection pins in the various modes are given.
5. The ratio between wanted and unwanted signals (e.g. crosstalk, phase errors and noise) is specified as the output signal amplitude (peak-to-peak value at nominal conditions) with respect to the r.m.s. value of the unwanted signal.
6. Signal with negative going sync. Amplitude contains sync pulse amplitude.
7. For a resultant B/W output signal of 4 V, at nominal contrast and nominal white point adjustment.
8. Difference in black level between RGB signals and inserted signals.
9. For normal use, the input voltage should be 3 V maximum. (The range between 4 V and 12 V is used for testing).
10. Nominal contrast is specified as maximum contrast -3 dB. Nominal saturation as maximum saturation -6 dB; nominal white point adjustment is maximum -3 dB.
11. Nominal luminance, contrast and white point adjustment.
12. Nominal contrast, saturation control set and no (R-Y) luminance signal.
13. With respect to the measuring pulse. At nominal brightness the black level of one output is identical to the measuring level.
14. With respect to the measuring pulse.
15. Pin 28 should be externally connected to a high-resistance voltage divider. Pins 13, 19, 22 and 23 when unused, should be connected to ground via a 75  $\Omega$  (typ.) resistor.
16. See I<sup>2</sup>C bus specification.
17. Higher output currents are allowed but this will decrease V<sub>OH</sub>.

TDA8490

## SECAM DECODER

### GENERAL DESCRIPTION

The TDA8490 is a monolithic integrated SECAM decoder. This circuit is intended to be used in conjunction with TDA8390 or TDA8461 (PAL decoder), TDA8451 (delay) and TDA8452 (filter). In this application the TDA8490 is placed in parallel with the demodulation circuit of the PAL decoder.

### Features

- Limiter input for chrominance signal
- SECAM demodulator
- Clamp circuits and de-emphasis for colour difference signals
- Sandcastle pulse detector
- Identification circuit for horizontal and vertical SECAM identification

## FUNCTIONAL DESCRIPTION

## Demodulation

The TDA8490 comprises a chrominance and an identification demodulator, both using the same reference tuned circuit. The identification circuit automatically detects whether the incoming signal at pin 3 (applied via a bandpass filter with a bell-shaped response) is SECAM or non-SECAM (NTSC, PAL or black-and-white).

When the SECAM signal is detected, it is applied to a limiter/amplifier after which it is demodulated. The (R-Y) and (B-Y) signals are applied sequentially, therefore, only one demodulator is required. After demodulation the signals are applied to the (R-Y) and (B-Y) clamp circuits, where the black levels are clamped to the same DC level.

Artificial black levels are inserted during line blanking period. The clamp circuits then react upon these levels instead of the demodulated burst signal (necessary in case there are no line burst signals available). The inserted signals may not be identical to the detected black levels, because of circuitry spread. This can be corrected by detuning the demodulator tuned circuit.

### R-Y and B-Y output signals

The R-Y and B-Y signals are available every other line. A new black level is reinserted during blanking and timing b (Fig. 5). If a non-SECAM signal is present the R-Y output will generate a DC level of approximately 3,8 V (the same as the black level generated during normal SECAM condition on both outputs). The B-Y output generates a DC level of approximately 0,8 V in this condition.

SECAM or non-SECAM signals may also be identified by the information at pin 10:

- 2,6 V indicates a SECAM signal.
- 0 V indicates a non-SECAM signal.

The SECAM or non-SECAM signals can be identified by using the (B-Y) demodulator output level at pin 11. Depending on the PAL decoder used in conjunction with this device, the information can be passed to the microcomputer via the I<sup>2</sup>C bus.

### Priority identification

The two chrominance outputs of TDA8490 are connected to the chrominance outputs of the PAL decoder TDA8461 or TDA8390. The output signal of the TDA8490 and PAL decoder alternately determine the priority of the overall system. In the event of a clash on these outputs, caused by a reflected PAL signal being detected as a SECAM signal by TDA8490, the total system will default to PAL priority.

### Identification

The identification circuit compares the voltage difference, which is obtained after demodulation, with the state of the flip-flop. For line identification this comparison occurs during the internally generated pulse 'B' (Fig. 3). Only SECAM signals provide voltage difference from line to line during comparison. If the phase relationship between both the signals is incorrect, the flip-flop will receive an extra input pulse.

The identification (as above) occurs when the line identification system is active. When the frame identification system is switched on (pin 4), the system only compares the demodulator output voltage during a 4-line gate pulse, which is present during frame blanking. The 4-line gate pulse starts 10 burst gate pulses after the start of the vertical blanking part of the sandcastle signal. The operation is identical to the line identification. Timing of the 4-line gate pulse is shown in Fig. 4.

### Sandcastle detector

The sandcastle pulse detector requires a 3-level sandcastle pulse. It detects the various blanking and gating pulses and generates the correct drive pulses for the clamping circuits (Fig. 3).

Fig. 3 Burst and derived pulses.

**Note**

The separated burst pulse is divided into two parts (Fig. 3). Required burst gate pulse:  $> 3,45 \mu s$ .

Pulse 'A':

- timing R-Y clamp (only present during a red line)
- timing B-Y clamp (only present during a blue line)

Pulse 'B':

- SECAM line identification timing

Required pulse width	note 5, see Fig. 3 pulse B		0,6	—	—	μs

## Notes to the characteristics

- For alignment of the reference tuned circuit the input signal on pin 3 must be a SECAM signal at 100 mV(p-p) without deviation during a red and a blue line (black colour information, SECAM). The reference tuned circuit must be aligned to generate a colour output which corresponds to the new reinserted black level information.
- If the input signal of the limiter is changed from 300 mV(p-p) to 15 mV(p-p), the zero point of the chrominance FM demodulator ( $f_o$  is typically 4,33 MHz) will typically shift by 5 kHz.
- Definition of R-Y linearity =  $V_{out\ cyan}/V_{out\ red}$ :
  - $f_{nom\ cyan} = 4,68\text{ MHz}$
  - $f_{nom\ red} = 4,12\text{ MHz}$
- Definition of B-Y linearity =  $V_{out\ yellow}/V_{out\ blue}$ :
  - $f_{nom\ yellow} = 4,02\text{ MHz}$
  - $f_{nom\ blue} = 4,48\text{ MHz}$

5. The burst gate pulse width must be larger than  $(2,85 + 0,6) = 3,45\ \mu s$ .

6. Demodulated black level at temperature X = A and at temperature Y = B.

Artificial black level at temperature X = C and at temperature Y = D.

Demodulated output signal ( $f_o - \Delta f$ ) at temperature X = E1 and at temperature Y = F1.

Demodulated output signal ( $f_o + \Delta f$ ) at temperature X = E2 and at temperature Y = F2.

$$E = \frac{E1 - E2}{2} \quad \text{and} \quad F = \frac{F1 - F2}{2}$$

$$\text{specification result} = \frac{(B-D)/F - (A-C)/E}{Y-X} \times \Delta f \text{ (kHz)/}^\circ\text{C}$$

for B-Y  $f_o = f_{ob} = 4,25\text{ MHz}$  and  $\Delta f = 230\text{ kHz}$ .

for R-Y  $f_o = f_{or} = 4,40625\text{ MHz}$  and  $\Delta f = 280\text{ kHz}$ .

- Due to different deviations (230 or 280 kHz) and correction figures (1,9 or 1,5 x) the total B-Y signal path needs a gain, which is 1,55 x higher than the R-Y path.

TDA9045

## VIDEO PROCESSOR AND INPUT SELECTOR

### GENERAL DESCRIPTION

The TDA9045 is a monolithic integrated circuit for video signal processing and input selection.

### FEATURES

- Selection stage for three different inputs
- 4 dB amplifier
- Constant output signal amplifier controlled by synchronizing level and peak white level
- Clamping stage for a constant black level
- Circuit for stopping clamping pulses during the sync pulses
- Emitter follower output stage

### VIDEO CONTROL COMBINATION CIRCUIT WITH AUTOMATIC CUT-OFF CONTROL

#### GENERAL DESCRIPTION

The TDA9080 is an integrated circuit which performs video control functions in a PAL/SECAM decoder.

The required input signals are: luminance and negative colour difference  $-(R-Y)$  and  $-(B-Y)$ , and a 2-level sandcastle pulse for control purposes. Linear RGB signals can be inserted from an external source. RGB output signals are available for driving the video output stages. This circuit provides automatic cut-off control of the picture tube.

#### Features

- Capacitive coupling of the colour difference and luminance input signals with black level clamping in the input stages
- Linear saturation control acting on the colour difference signals
- $(G-Y)$  and RGB matrix
- Linear transmission of inserted signals
- Equal black levels for inserted and matrixed signals
- 3 identical channels for the RGB signals
- Linear contrast and brightness controls, operating on both the inserted and matrixed RGB signals
- Peak beam current limiting input
- Clamping, horizontal and vertical blanking of the three input signals controlled by a 2-level sandcastle pulse
- 3 DC gain controls for the RGB output signals (white point adjustment)
- Emitter-follower outputs for driving the RGB output stages
- Input for automatic cut-off control with compensation for leakage current of the picture tube

#### PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

## Notes to the characteristics

1. Values are proportional to the supply voltage.
2. When  $V_{11,24} < 0.4$  V during clamping time — the black levels of the inserted RGB signals are clamped on the black levels of the internal RGB signals.  
When  $V_{11,24} > 0.9$  V during clamping time — the black levels of the inserted RGB signals are clamped on an internal DC voltage (correct clamping of the external RGB signals is possible only when they are synchronous with the sandcastle pulse).
3. When pins 21, 22 and 23 are not connected, an internal bias voltage of 5.5 V is supplied.
4. Automatic cut-off control measurement occurs in the following lines after start of the vertical blanking pulse:
  - line 20: measurement of leakage current (R + G + B)
  - line 21: measurement of red cut-off current
  - line 22: measurement of green cut-off current
  - line 23: measurement of blue cut-off current
5. Black level of the measured channel is nominal; the other two channels are blanked to ultra-black.
6. All three channels blanked to ultra-black.  
The cut-off control cycle occurs when the vertical blanking part of the sandcastle pulse contains more than 3 line pulses.  
The internal blanking continues until the end of the last measured line.  
The vertical blanking pulse is not allowed to contain more than 34 line pulses, otherwise another control cycle begins.
7. The sandcastle pulse is compared with two internal thresholds (proportional to V<sub>p</sub>) and the given levels separate the various pulses.
8. Blanked to ultra-black (-25%).

APPLICATION INFORMATION

## CONTROL CIRCUIT FOR SMPS

### GENERAL DESCRIPTION

The TEA1039 is a bipolar integrated circuit intended for the control of a switched-mode power supply. Together with an external error amplifier and a voltage regulator (e.g. a regulator diode) it forms a complete control system. The circuit is capable of directly driving the SMPS power transistor in small SMPS systems.

#### Features

- Suited for frequency and duty factor regulation.
- Suited for flyback converters and forward converters.
- Wide frequency range.
- Adjustable input sensitivity.
- Adjustable minimum frequency or maximum duty factor limit.
- Adjustable overcurrent protection limit.
- Supply voltage out-of-range protection.
- Slow-start facility.

### QUICK REFERENCE DATA

Supply voltage	$V_{CC}$	nom.	14 V
Supply current	$I_{CC}$	max.	13 mA
Output pulse repetition frequency range	$f_o$		1 Hz to 100 kHz
Output current LOW	$I_{OL}$	max.	1 A
Operating ambient temperature range	$T_{amb}$		-25 to +125 °C

### PACKAGE OUTLINE

9-lead SIL; plastic (SOT110B).

7	$V_{EE}$	common
8	Q	output
9	$V_{CC}$	positive supply connection

**FUNCTIONAL DESCRIPTION**

The TEA1039 produces pulses to drive the transistor in a switched-mode power supply. These pulses may be varied either in frequency (frequency regulation mode) or in width (duty factor regulation mode).

The usual arrangement is such that the transistor in the SMPS is ON when the output of the TEA1039 is HIGH, i.e. when the open-collector output transistor is OFF. The duty factor of the SMPS is the time that the output of the TEA1039 is HIGH divided by the pulse repetition time.

**Supply  $V_{CC}$  (pin 9)**

The circuit is usually supplied from the SMPS that it regulates. It may be supplied either from its primary d.c. voltage or from its output voltage. In the latter case an auxiliary starting supply is necessary.

The circuit has an internal  $V_{CC}$  out-of-range protection. In the frequency regulation mode the oscillator is stopped; in the duty factor regulation mode the duty factor is made zero. When the supply voltage returns within its range, the circuit is started with the slow-start procedure.

When the circuit is supplied from the SMPS itself, the out-of-range protection also provides an effective protection against any interruption in the feedback loop.

**Mode input M (pin 6)**

The circuit works in the frequency regulation mode when the mode input M is connected to ground ( $V_{EE}$ , pin 7). In this mode the circuit produces output pulses of a constant width but with a variable pulse repetition time.

The circuit works in the duty factor regulation mode when the mode input M is left open. In this mode the circuit produces output pulses with a variable width but with a constant pulse repetition time.

**FUNCTIONAL DESCRIPTION** (continued)**Oscillator resistor and capacitor connections RX and CX** (pins 4 and 5)

The output pulse repetition frequency is set by an oscillator whose frequency is determined by an external capacitor C5 connected between the CX connection (pin 5) and ground ( $V_{EE}$ , pin 7), and an external resistor R4 connected between the RX connection (pin 4) and ground. The capacitor C5 is charged by an internal current source, whose current level is determined by the resistor R4. In the frequency regulation mode these two external components determine the minimum frequency; in the duty factor regulation mode they determine the working frequency (see Fig. 4). The output pulse repetition frequency varies less than 1% with the supply voltage over the supply voltage range.

In the frequency regulation mode the output is LOW from the start of the cycle until the voltage on the capacitor reaches 2 V. The capacitor is further charged until its voltage reaches the voltage on either the feedback input FB or the limit setting input LIM, provided it has exceeded 2,2 V. As soon as the capacitor voltage reaches 5,9 V the capacitor is discharged rapidly to 1,3 V and a new cycle is initiated (see Figs 5 and 6).

For voltages on the FB and LIM inputs lower than 2,2 V, the capacitor is charged until this voltage is reached; this sets an internal maximum frequency limit.

In the duty factor regulation mode the capacitor is charged from 1,3 V to 5,9 V and discharged again at a constant rate. The output is HIGH until the voltage on the capacitor exceeds the voltage on the feedback input FB; it becomes HIGH again after discharge of the capacitor (see Figs 7 and 8). An internal maximum limit is set to the duty factor of the SMPS by the discharging time of the capacitor.

**Feedback input FB** (pin 3)

The feedback input compares the input current with an internal current source whose current level is set by the external resistor R4. In the frequency regulation mode, the higher the voltage on the FB input, the longer the external capacitor C5 is charged, and the lower the frequency will be. In the duty factor regulation mode external capacitor C5 is charged and discharged at a constant rate, the voltage on the FB input now determines the moment that the output will become LOW. The higher the voltage on the FB input, the longer the output remains HIGH, and the higher the duty factor of the SMPS.

**Limit setting input LIM** (pin 2)

In the frequency regulation mode this input sets the minimum frequency, in the duty factor regulation mode it sets the maximum duty factor of the SMPS. The limit is set by an external resistor R2 connected from the LIM input to ground (pin 7) and by an internal current source, whose current level is determined by external resistor R4.

A slow-start procedure is obtained by connecting a capacitor between the LIM input and ground. In the frequency regulation mode the frequency slowly decreases from  $f_{max}$  to the working frequency. In the duty factor regulation mode the duty factor slowly increases from zero to the working duty factor.

**Overcurrent protection input CM** (pin 1)

A voltage on the CM input exceeding 0,37 V causes an immediate termination of the output pulse. In the duty factor regulation mode the circuit starts again with the slow-start procedure.

**Output Q** (pin 8)

The output is an open-collector n-p-n transistor, only capable of sinking current. It requires an external resistor to drive an n-p-n transistor in the SMPS (see Figs 9 and 10).

The output is protected by two diodes, one to ground and one to the supply.

At high output currents the dissipation in the output transistor may necessitate a heatsink. See the power derating curve (Fig. 3).

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range, voltage source	$V_{CC}$	-0,3 to +20 V
Supply current range, current source	$I_{CC}$	-30 to +30 mA
Input voltage range, all inputs	$V_I$	-0,3 to +6 V
Input current range, all inputs	$I_I$	-5 to +5 mA
Output voltage range	$V_{B-7}$	-0,3 to +20 V
Output current range output transistor ON	$I_B$	0 to 1 A
output transistor OFF	$I_B$	-100 to +50 mA
Storage temperature range	$T_{stg}$	-55 to +150 °C
Operating ambient temperature range (see Fig. 3)	$T_{amb}$	-25 to +125 °C
Power dissipation (see Fig. 3)	$P_{tot}$	max. 2 W

Fig. 3 Power derating curve.

## CHARACTERISTICS

APPLICATION INFORMATION SUPPLIED ON REQUEST

## PAL/NTSC COLOUR ENCODER

**GENERAL DESCRIPTION**

The TEA2000 is a monolithic integrated circuit, which encodes colour information and provides composite video output for driving a VHF or UHF modulator.

**Features**

- European PAL and American NTSC/M standard selectable
- Internal generation of burst timing and PAL-switch-function
- 6 bit binary TTL compatible input provides 64 different colours
- TTL compatible colour blanking input
- TTL compatible sync input

**QUICK REFERENCE DATA**

Supply voltage	$V_{11-9}$	typ.	12 V
Supply current at $V_{11-9} = 12$ V	$I_{11}$	typ.	55 mA
Input voltage pins 1,2,3,4,5,14,16,17,18	$V_{IL}$	max.	0,8 V
	$V_{IH}$	min.	2,0 V
Composite video output (sync tip to white)	$V_{6-9(p-p)}$	typ.	2,0 V
Operating temperature range	$T_{amb}$		0 to + 70 °C

**PACKAGE OUTLINE**

18-lead DIL; plastic with internal heat spreader (SOT102).

16. Composite sync input ( $\overline{\text{CSYNC}}$ )
17. Composite blanking input (CBLNK)
18. Red 0 binary input

**FUNCTIONAL DESCRIPTION**

The TEA2000 PAL/NTSC colour encoder and video summer integrated circuit has an internal oscillator from which the (R-Y) and (B-Y) waveforms are generated. The TEA2000 accepts timing signals (composite sync, composite blanking) and a 6 bit binary coded input giving colour information. The inputs are organized as 2 bits per primary colour and gamma correction is applied to the resultant luminance and chrominance levels. Each of the equally spaced intensity levels (for each primary colour) is combined with those of the other primary colours. This produces 64 output colours comprising a wide range of saturated and desaturated colours, black, white and two levels of grey. The resultant output is a composite video signal compatible with the PAL and NTSC/M standards.

**PIN DESCRIPTION**

R0, R1, G0, G1, B0, B1, pins 18, 1,2,3,4 and 5.

These are the red, green and blue logic inputs. 2 bits per primary colour. These inputs are TTL compatible.

$\overline{\text{CSYNC}}$ , pin 16.

Composite sync input requiring a negative logic signal, TTL compatible. For PAL operation the field sync must include line sync information.

XTALA, XTALB, pins 12 and 13.

Oscillator inputs. A crystal in series with a trimmer capacitor is connected between pins 12 and 13. The output of the oscillator is divided to provide the four subcarrier phases required in the encoder. The crystal frequencies are:

PAL mode 8,867238 MHz  
NTSC mode 7,15909 MHz

LUMO, LUMI, pins 7 and 8.

Luminance output and input. The combined luminance and sync signal appearing at pin 7 must be d.c. coupled to pin 8 via an appropriate luminance delay line or resistor network. Resistors must have a tolerance of  $\pm 5\%$ , or better, as they affect the d.c. level at COVO, pin 6.

**CHRBL**, pin 10.

Chrominance filtering can be accomplished by connecting a chrominance frequency tuned filter (4,43 MHz or 3,57 MHz), via a blocking capacitor to pin 10. This point is the chrominance summing junction and has a nominal internal impedance of 1,5 k $\Omega$ . If a filter is used at this point then the delay caused to the chrominance signal should be compensated by an appropriate luminance delay line.

**COVO**, pin 6.

Composite video output is internally buffered giving a nominal output voltage swing of 2 V sync-white and a nominal sync 5 V level.

**PL/NT**, pin 14.

PAL/NTSC, select input selects PAL mode when HIGH and NTSC mode when LOW. This input is TTL compatible. An internal pull-up resistor selects PAL if the pin is not connected.

**RAMP**, pin 15.

Ramp timing component connection. A capacitor and resistor connected to pin 15 provide timing information for the colour burst and for PAL phase switching. Alternative components may be used to optimise for NTSC operation.

**VCC**, pin 11.

12 volt supply.

**GND**, pin 9.

Ground connection, zero volts.

**CBLNK**, pin 17.

Blanking input when high, switches off colour inputs. CBLNK must be high during sync and colour burst unless colour inputs are all low at this time. This input is TTL compatible.

TSA5510

## 1.3 GHz I<sup>2</sup>C-BUS CONTROLLED FREQUENCY SYNTHESIZER

### GENERAL DESCRIPTION

The TSA5510 is a bipolar single-chip frequency synthesizer. It performs all the tuning functions of a phase-locked loop (PLL) television tuning system. The IC is designed for application in all types of television receivers.

Control data is entered via the I<sup>2</sup>C-bus; five serial bytes are required to address the device, select the oscillator frequency, program the 8 output ports and set the programmable current amplifier (charge pump) current. Three of these ports can also be used as general purpose I/O ports.

Digital information concerning these ports can be read out of the TSA5510 on the serial data line (SDA), one status byte, during a READ operation.

A flag is set when the PLL is "in-lock" and read during a READ operation. The TSA5510 has one fixed I<sup>2</sup>C-bus address and 3 programmable addresses, programmed by applying a specific voltage on Port 3. The phase comparator operates at a frequency of 7.8125 kHz when a 4 MHz crystal is used.

### Features

- Complete 1.3 GHz single-chip system
- Low power: 5 V at 35 mA
- I<sup>2</sup>C-bus programming
- In-lock flag
- Variable capacitor drive disable
- Low radiation
- Address selection for Picture-in Picture Controller (PIPICO), Direct Broadcast Satellite tuner (DBS), etc.
- 8 controllable outputs, 3 bidirectional
- Power-down flag

I<sup>2</sup>C-bus

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

The TSA5510 is controlled via the 2-wire I<sup>2</sup>C-bus. For programming there is one 7-bit module address and a R/ $\bar{W}$  bit for selecting READ or WRITE mode.

**WRITE mode: R/ $\bar{W}$  = 0** (see Table 1)

After the address transmission (first byte), data bytes can be sent to the device. Four data bytes are required to fully program the TSA5510. The bus transceiver has an auto-increment facility which permits the programming of the TSA5510 within one single transmission (address + 4 data bytes).

The TSA5510 can also be partially programmed on the condition that the first data byte following the address is byte 2 or byte 4. The meaning of the bits in the data byte is explained in Table 1. The first bit of the first data byte transmitted indicates whether frequency data (first bit = 0) or charge-pump and ports information (first bit = 1) will follow. Until an I<sup>2</sup>C-bus STOP condition is sent by the controller, additional data bytes can be entered without the need to re-address the device. This allows a smooth frequency sweep for fine tuning or AFC purpose. At power-on ports are set to a high impedance state.

The 7.8125 kHz reference frequency is obtained by dividing the output of the 4 MHz oscillator by 512. As the input of the UHF/VHF signal is first divided by 8 the minimum step is 62.5 kHz.

**FUNCTIONAL DESCRIPTION** (continued)

**READ mode:**  $R/\bar{W} = 1$  (see Table 2)

Data can be read from the TSA5510 by setting the  $R/\bar{W}$  bit to 1. After the slave address has been recognized, the TSA5510 generates an acknowledge pulse and the first data byte (status word) is transferred on the SDA line (MSB first). Data is valid on the SDA line during a high position of the SCL clock signal.

A second data byte can be read out of the TSA5510 if the processor generates an acknowledge on the SDA line. If no acknowledge is generated, end of transmission will occur. The TSA5510 will then release the data line to allow the processor to generate a STOP condition.

When ports P3 to P5 and P7 are used as inputs, they must be programmed in their high-impedance state.

The power-on reset (POR) flag is set to logic 1 when  $V_{CC}$  drops below 3 V and at power-on. It is reset when an end of data is detected by the TSA5510 (end of READ sequence).

A control of the loop is made possible with the in-lock flag FL which indicates ( $FL = 1$ ) when the loop is phase-locked.

Bits I0, I1 and I2 represent the status of the I/O ports P4, P5 and P7 respectively. A logic 0 indicates a low level and a logic 1 indicates a high level (TTL levels).

**Address selection** (see Table 3)

The module address contains programmable address bits (MA0 and MA1) which offer together with the I/O port P3 the possibility of having up to 3 synthesizers in one system. The relationship between bits MA0 and MA1 and the input voltage on I/O port P3 is given in Table 3.

**Table 1** Write data format

	MSB					LSB				
address	1	1	0	0	0	MA1	MA0	0*	A	byte 1
programmable divider	0	N14	N13	N12	N11	N10	N9	N8	A	byte 2
programmable divider	N7	N6	N5	N4	N3	N2	N1	N0	A	byte 3
charge-pump and test bits	1	CP	T1	T0	1	1	1	OS	A	byte 4
I/O port control bits	P7	P6	P5	P4	P3	P2	P1	P0	A	byte 5

\*  $R/\bar{W}$  bit = 0 for WRITE mode;  
 $R/\bar{W}$  bit = 1 for READ mode.

**Where**

A is the acknowledge bit.

N14 to N0 are the programmable divider bits;

$$N = N14 \times 2^{14} + N13 \times 2^{13} + \dots + N1 \times 2 + N0.$$

CP is the charge-pump current;

CP = 0 : 50  $\mu$ A

CP = 1 : 220  $\mu$ A.

P3 to P0 = 1 : limited current output is active.

P7 to P4 = 1 : open-collector output is active.

P7 to P0 = 0 : outputs are in high-impedance state.

T1, T0, OS = 0, 0, 0 : normal operation.

T1 = 1, P6 =  $f_{ref}$ , P7 =  $f_{DIV}$ .

T0 = 1 : 3-state charge pump.

OS = 1 : operational amplifier output is switched off (variable capacitor drive is disabled).

**Table 2** Read data format

	MSB						LSB			
address	1	1	0	0	0	MA1	MA0	1*	A	byte 1
status byte	POR	FL	I2	I1	I0	X	X	X	A	byte 2

**Where**

POR is the power-on reset flag;

POR = 1 : on power-on.

FL is the in-lock flag;

FL = 1 : loop is phase-locked.

I2, I1, I0 : digital information for I/O ports P4, P5 and P7 respectively.

X = don't care

**Table 3** Address selection

MA1	MA0	voltage input on P3
0	0	0 to 0.1 VCC
0	1	always valid
1	0	0.4 to 0.6 VCC
1	1	0.9 VCC to 13.5 V

\* R/ $\bar{W}$  bit = 0 for WRITE mode;

R/ $\bar{W}$  bit = 1 for READ mode.

### 1.3 GHz I<sup>2</sup>C-BUS CONTROLLED FREQUENCY SYNTHESIZER

#### GENERAL DESCRIPTION

The TSA5510T is a bipolar single-chip frequency synthesizer. It performs all the tuning functions of a phase-locked loop (PLL) television tuning system. The IC is designed for application in all types of television receivers.

Control data is entered via the I<sup>2</sup>C-bus; five serial bytes are required to address the device, select the oscillator frequency, program the output ports and set the programmable current amplifier (charge pump) current. Three of these ports can also be used as general purpose I/O ports.

Digital information concerning these ports can be read from the TSA5510T on the serial data line (SDA), one status byte, during a READ operation.

A flag is set when the PLL is "in-lock" and read during a READ operation.

The TSA5510T has one fixed I<sup>2</sup>C-bus address and 3 programmable addresses, which can be programmed by applying a specific voltage to Port 3.

The phase comparator operates at a frequency of 7.8125 kHz when a 4 MHz crystal is used.

#### Features

- Complete 1.3 GHz single-chip system
- Low power: 5 V at 35 mA
- I<sup>2</sup>C-bus programming
- In-lock flag
- Variable capacitor drive disable
- Low radiation
- Address selection for Picture-in Picture Controller (PIPICO), Direct Broadcast Satellite tuner (DBS), etc.
- 5 controllable outputs, 3 bidirectional
- Power-down flag

DEVELOPMENT DATA

## FUNCTIONAL DESCRIPTION

The TSA5510T is controlled via the 2-wire I<sup>2</sup>C-bus. For programming there is one 7-bit module address and a R/ $\bar{W}$  bit for selecting READ or WRITE mode.

**WRITE mode: R/ $\bar{W}$  = 0** (see Table 1)

After the address transmission (first byte), data bytes can be sent to the device. Four data bytes are required to fully program the TSA5510T. The bus transceiver has an auto-increment facility which permits the programming of the TSA5510T within one single transmission (address + 4 data bytes).

The TSA5510T can also be partially programmed on the condition that the first data byte following the address is byte 2 or byte 4. The meaning of the bits in the data byte is explained in Table 1. The first bit of the first data byte transmitted indicates whether frequency data (first bit = 0) or charge-pump and ports information (first bit = 1) will follow. Until an I<sup>2</sup>C-bus STOP condition is sent by the controller, additional data bytes can be entered without the need to re-address the device. This allows a smooth frequency sweep for fine tuning or AFC purpose. At power-on, ports are set to a high impedance state.

The 7.8125 kHz reference frequency is obtained by dividing the output of the 4 MHz oscillator by 512. As the input of the UHF/VHF signal is first divided by 8 the minimum step is 62.5 kHz.

**FUNCTIONAL DESCRIPTION** (continued)**READ mode:  $R/\bar{W} = 1$**  (see Table 2)

Data can be read from the TSA5510T by setting the  $R/\bar{W}$  bit to 1. After the slave address has been recognized, the TSA5510T generates an acknowledge pulse and the first data byte (status word) is transferred on the SDA line (MSB first). Data is valid on the SDA line when the SCL clock signal is HIGH.

A second data byte can be read from the TSA5510T if the processor generates an acknowledge on the SDA line. If no acknowledge is generated, end of transmission will occur. The TSA5510T will then release the data line to allow the processor to generate a STOP condition.

When ports P3 to P5 and P7 are used as inputs, they must be programmed in their high-impedance state.

The power-on reset (POR) flag is set to logic 1 when  $V_{CC}$  drops below 3 V and at power-on. It is reset when an end of data is detected by the TSA5510T (end of READ sequence).

Control of the loop is made possible with the in-lock flag FL which indicates ( $FL = 1$ ) when the loop is phase-locked.

Bits I0, I1 and I2 represent the status of the I/O ports P4, P5 and P7 respectively. A logic 0 indicates a low level and a logic 1 indicates a high level (TTL levels).

**Address selection** (see Table 3)

The module address contains programmable address bits (MA0 and MA1) which offer, together with the I/O port P3, the possibility of having up to 3 synthesizers in one system. The relationship between bits MA0 and MA1 and the input voltage on I/O port P3 is given in Table 3.

**Table 1** Write data format

	MSB					LSB				
address	1	1	0	0	0	MA1	MA0	0*	A	byte 1
programmable divider	0	N14	N13	N12	N11	N10	N9	N8	A	byte 2
programmable divider	N7	N6	N5	N4	N3	N2	N1	N0	A	byte 3
charge-pump and test bits	1	CP	T1	T0	1	1	1	OS	A	byte 4
I/O port control bits	P7	P6	P5	P4	P3	—	—	—	A	byte 5

\*  $R/\bar{W}$  bit = 0 for WRITE mode;  
 $R/\bar{W}$  bit = 1 for READ mode.

**Where**

A is the acknowledge bit.

N14 to N0 are the programmable divider bits;

$$N = N14 \times 2^{14} + N13 \times 2^{13} + \dots + N1 \times 2 + N0.$$

CP is the charge-pump current; CP = 0 : 50  $\mu$ A; CP = 1 : 220  $\mu$ A

P3 = 1 : limited current output is active.

P7 to P4 = 1 : open-collector output is active.

P7 to P3 = 0 : output is in high-impedance state.

T1, T0, OS = 0, 0, 0 : normal operation.

T1 = 1, P6 =  $f_{ref}$ , P7 =  $f_{DIV}$ .

T0 = 1 : 3-state charge pump.

OS = 1 : operational amplifier output is switched off  
(variable capacitor drive is disabled).

**Table 2** Read data format

	MSB					LSB				
address	1	1	0	0	0	MA1	MA0	1*	A	byte 1
status byte	POR	FL	I2	I1	I0	X	X	X	A	byte 2

**Where**

POR is the power-on reset flag;

POR = 1 : on power-on.

FL is the in-lock flag;

FL = 1 : loop is phase-locked.

I2, I1, I0 : digital information for I/O ports P7, P5 and P4 respectively.

X = don't care.

**Table 3** Address selection

MA1	MA0	voltage input on P3
0	0	0 to 0.1 $V_{CC}$
0	1	always valid
1	0	0.4 to 0.6 $V_{CC}$
1	1	0.9 $V_{CC}$ to 13.5 V

\*  $R/\bar{W}$  bit = 0 for WRITE mode;  
 $R/\bar{W}$  bit = 1 for READ mode.

**ELECTROSTATIC DISCHARGE PROTECTION**

Inputs and outputs have electrostatic discharge protection in accordance with specification MIL-STD-883C, class A.

**RATINGS**

Limiting values in accordance with the Absolute Maximum System (IEC 134)

# $\mu$ A733/733C Differential Video Amplifier

## Product Specification

### DESCRIPTION

The 733 is a monolithic differential input, differential output, wide-band video amplifier. It offers fixed gains of 10, 100, or 400 without external components, and adjustable gains from 10 to 400 by the use of an external resistor. No external frequency compensation components are required for any gain option. Gain stability, wide bandwidth, and low phase distortion are obtained through use of the classic series-shunt feedback from the emitter-follower outputs to the inputs of the second stage. The emitter-follower outputs provide low output impedance, and enable the device to drive capacitive loads. The 733 is intended for use as a high-performance video and pulse amplifier in communications, magnetic memories, display and video recorder systems.

### FEATURES

- 120MHz bandwidth
- 250k $\Omega$  input resistance
- Selectable gains of 10, 100, and 400
- No frequency compensation required
- MIL-STD-883A, B, C available

### APPLICATIONS

- Video amplifier
- Pulse amplifier in communications
- Magnetic memories
- Video recorder systems

## 8-PIN PLASTIC SO (D PACKAGE)

### NOTES:

1. Package dimensions conform to JEDEC specification MS-012-AA for standard small outline (SO) package, 8 leads, 3.75mm (.150") body width (issue A, June 1985).
2. Controlling dimensions are in mm. Inch dimensions in parentheses.
3. Dimensions and tolerancing per ANSI Y14.5M-1982.
4. "T", "D" and "E" are reference datums on the molded body and do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .15mm (.006") on any side.
5. Pin numbers start with pin #1 and continue counterclockwise to pin #8 when viewed from top.
6. Signetics ordering code for a product packaged in a plastic small outline (SO) package is the suffix D after the product number.

## 44-LEAD QUAD FLAT-PACK; PLASTIC (SOT205A)

## 64-LEAD TAPE-AUTOMATED-BONDING (TAB) MODULE (SOT267A,C,D)

Dimensions in mm

- (1) 1 pattern = 4 perforation pitch intervals (contains two modules)
- (2) Circuit-test holes
- (3) Fixed by the user

SOLDERING

## SOLDERING PLASTIC MINI-PACKS

### 1. By hand-held soldering iron or pulse-heated solder tool

Fix the component by first soldering two, diagonally opposite end leads. Apply the heating tool to the flat part of the lead only. Contact time must be limited to 10 seconds at up to 300 °C. When using proper tools, all other leads can be soldered in one operation within 2 to 5 seconds at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages).

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to substrate by dipping or by an extra thick tin/lead plating before package placement.

### 2. By wave

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 seconds, if allowed to cool to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

### 3. By solder paste reflow

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing, for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 seconds according to method. Typical reflow temperatures range from 215 to 250 °C.

Pre-heating is necessary to dry paste and evaporate binding agent.

Pre-heating duration: 45 minutes at 45 °C.

### 4. Repairing soldered joints

The same precaution and limits apply as in (1) above.

## SOLDERING PLASTIC DUAL IN-LINE PACKAGES

### 1. By hand

Apply the soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 and 400 °C, for not more than 5 seconds.

### 2. By dip or wave

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

### 3. Repairing soldered joints

The same precautions and limits apply as in (1) above.

## **SOLDERING TAB MODULES**

### **1. Fluxing**

- (a) a flux that does not have to be removed,  
or
- (b) a water-soluble flux.

### **2. Soldering**

The reflow soldering method using a pulse-heated soldering tool is usually suitable. Limit the soldering operation to 3 seconds at 250 °C at the leads.

### **3. Cleaning**

Avoid cleaning if possible.

If cleaning is necessary, use cold or hot water.

A detergent may be added to the water. Finally rinse with de-ionized water.

*Do not* use ultrasonic cleaning methods as these may damage the inner or outer leads.

*Do not* use solvents.

# The Philips Components technical handbook system... a comprehensive data library

The Philips Components handbook is made up of four sets of Books, each comprising several parts:-

Book 1 (light blue)	Semiconductor devices
Book 2 (orange)	Electronic tubes
Book 3 (green)	Components, materials and assemblies
Book 4 (dark blue)	Integrated circuits

Most of the devices for which full data is given in these books are those around which we would recommend equipment to be designed. Where appropriate, other types no longer recommended for new equipment designs but generally available for equipment production, are listed separately. Data sheets for these types may be obtained on request.

**The current Philips Components Quick Reference Guide should always be consulted for details of our preferred range.**

The data contained in these books is as accurate and up to date as possible at the time of going to press. It must be understood, however, that no guarantee can be given on the availability of the various devices, or that their specifications may not be changed before the next edition is published.

Each part is reviewed regularly, revised and re-issued where necessary. Requests for copies of the Quick Reference Guide and individual data sheets (please quote the type number) should be sent to:-

Technical Publications Department, Philips Components Limited,  
New Road, Mitcham, Surrey CR4 4XY. Telex 22194.

Prices and availability information for our products can be obtained from Mullard House, or from one of our Distributors listed on the back cover.

# Philips Components Data Base

---

For the equipment designer, technical information on electronic components is vital. Philips Components markets the widest range of electronic components in the UK, supported by a comprehensive information service – the Philips Components Data Base.

Brief details are given here. For further information, please write to:

**Technical Publications  
Department,**  
Philips Components  
Limited,  
New Road, Mitcham,  
Surrey CR4 4XY.

## **Philips Components News**

A must for designers, this bi-monthly newspaper-style publication, describes new components and offers further information on subjects of interest. Make sure your name is on our mailing list.

## **Consumer Electronics**

A review, in newspaper style, published every four months. It features articles and news items of interest to those in the consumer electronics industry, with an emphasis on television technology and allied subjects.

---

**Prestel too!**

---

# Philips Components technical handbook

## **Book 4 Integrated circuits**

Book 4 consists of the following parts:

- Part 1 Radio, audio and associated systems:  
bipolar, MOS
- Part IC02 Television, video and associated systems:  
bipolar, MOS
- Part 3 ICs for telecom:  
Subscriber sets, Cordless telephones
- Part 4 CMOS logic 4000 series
- Part 5 High-speed CMOS logic HC/HCT family
- Part 5 Supplement High-speed CMOS Designer's  
Guide and Applications Handbook
- Part IC05 Advanced Low-power Schottky (ALS) logic  
series
- Part 6 Linear products
- Part 6 Supplement Linear products
- Part 7 Memories: MOS, TTL, ECL
- Part IC07 Advanced CMOS Logic (ACL)
- Part 8 TTL digital ICs
- Part 8a FAST TTL digital ICs
- Part 8a Supplement FAST TTL digital ICs
- Part 9a Microprocessors and peripherals
- Part 12 I<sup>2</sup>C-bus compatible ICs
- Part 13 ASIC Programmable Logic Devices (PLD)
- Part 14 Microcontrollers
- Part 17 ICs for telecom:  
Radio pagers, Mobile telephones, ISDN
- Part 19 Data communication products

# PHILIPS

## **Electronic Components and Applications**

A quarterly technical journal covering, in depth, developments in electronics based on the work of Philips laboratories worldwide.

## **Quick Reference Guide**

This lists all components marketed by Philips Components, together with brief data.

## **Technical Publications, Brochures and Catalogues**

Philips Components publishes a wide range of publications on electronic components and their applications. New publications are described and offered in Philips Components News.

## **Technical Data Service**

This service provides detailed up-to-date information on the characteristics and performance of Philips components. Subscribers receive all relevant handbooks, loose-leaf binders, a monthly mailing of new data, and new handbook parts as they are published.

For those not wishing to subscribe to the Data Service, handbook parts can be purchased individually.

Individual data sheets are available free-of-charge and can be obtained by quoting the type number.

## **Prestel**

Philips publications can be ordered via Prestel. The Philips Components data base begins on page 53389.
