RADIO HOME RECORDING

To record radio programs set "PhonoRadio Switch" so that number "5" is opposite brass marker above the knob. Set volume control for loud and clear reception. Then set switch so that number"3" is opposite the marker and record the program. Do not allow needle to cut disc when it reaches the inner label. Do not allow the fine threads which form to collect under the needle, brush lightly with a soft cloth or brush towards the center of the disc.

MICROPHONE

For microphone recording set switch so that number 1 is opposite marker and test for operation. Then turn switch so that number "2" is opposite the marker. Turn volume control fully to the right. In speaking use normal voice with microphone at least six inches from the mouth.

NOTE:-Be sure needle is firmly in place and that the flat side points towards the rear of the cabinet. Check that the small pin projects through one of the three holes on the blank to prevent

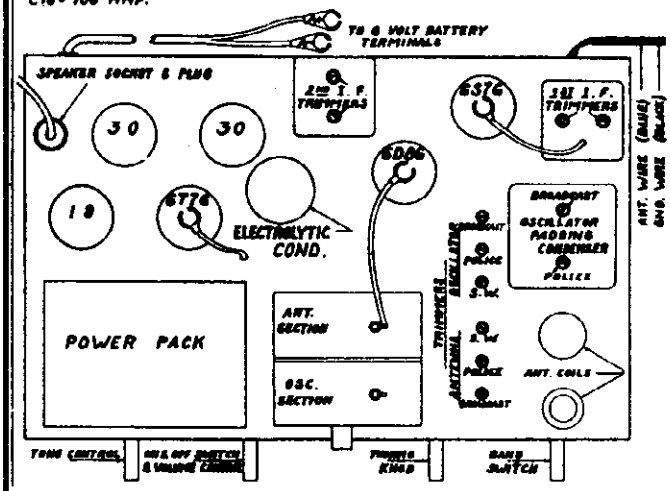
R15 - 600,000 Ω 1/2 W.



FREQUENCY RANGE-

550 to 1700 KC
1700 to 5400 KC
5600 to 18100 KC

I.F. ALIGNMENT

With the wave switch in the broadcast band and the gang condenser set at minimum, adjust the test ocillator to 456 KC and connect the output to the grid of the first detector tube (6D8G) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum and the oscillator to 1730 KC and adjust the "oscillator trimmer" to receive this signal. Make no other adjustments at this frequency. Then set the generator to 1400 KC and tune in this signal by rotating the gang to 1400 on the dial. Adjust the "antenna" trimmer to maximum signal. Set the signal generator to 600 KC and tune in the signal on the receiver. **Note:** Approximately the same sensitivity should be noted at this point as was at 1400 KC. The signal strength may sometimes be improved by padding the circuits. This is done by slowly increasing or decreasing the oscillator padding condenser and, at the same time, continuously tuning back and forth across the signal with the receiver until the maximum reading is obtained on the output meter. This adjustment may seem a little complicated but is the easiest way to adjust the oscillator to the antenna. Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

POLICE BAND ALIGNMENT

The police band is adjusted by first replacing the .0002 dummy with a 400 ohm resistor and setting the generator to 5600 KC. With the gang set at minimum, adjust the "police oscillator trimmer" to receive this signal, then set the signal generator to 4000 KC and adjust "police antenna trimmer" to give maximum output. Next, set the oscillator to 1800 KC and "pad" the circuit at this frequency as described in the instructions for padding the broadcast circuits.

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the generator to 18,100 KC and with the gang at minimum, adjust the "short wave oscillator trimmer" to receive the signal. Set the generator at 16,000 KC and adjust the "short wave antenna" to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the .004 mica padding condenser, should be tested for defects as sometimes these components become subject to mechanical or electrical injuries, despite their rugged construction and liberal ratings.

SERVICE DATA FOR ALL BANDS

If it is suspected that the oscillator has stopped but is doubtful due to the presence of the usual amount of noise level, it is suggested that the oscillator plate voltage be checked. To ascertain whether the tube is oscillating, ground the oscillator grid of the 6D8G (short stator and rotor plates of oscillator section on gang condenser). If oscillating properly, grounding the grid will cause an appreciable drop in oscillator voltage.

ALLIED RADIO CORP.

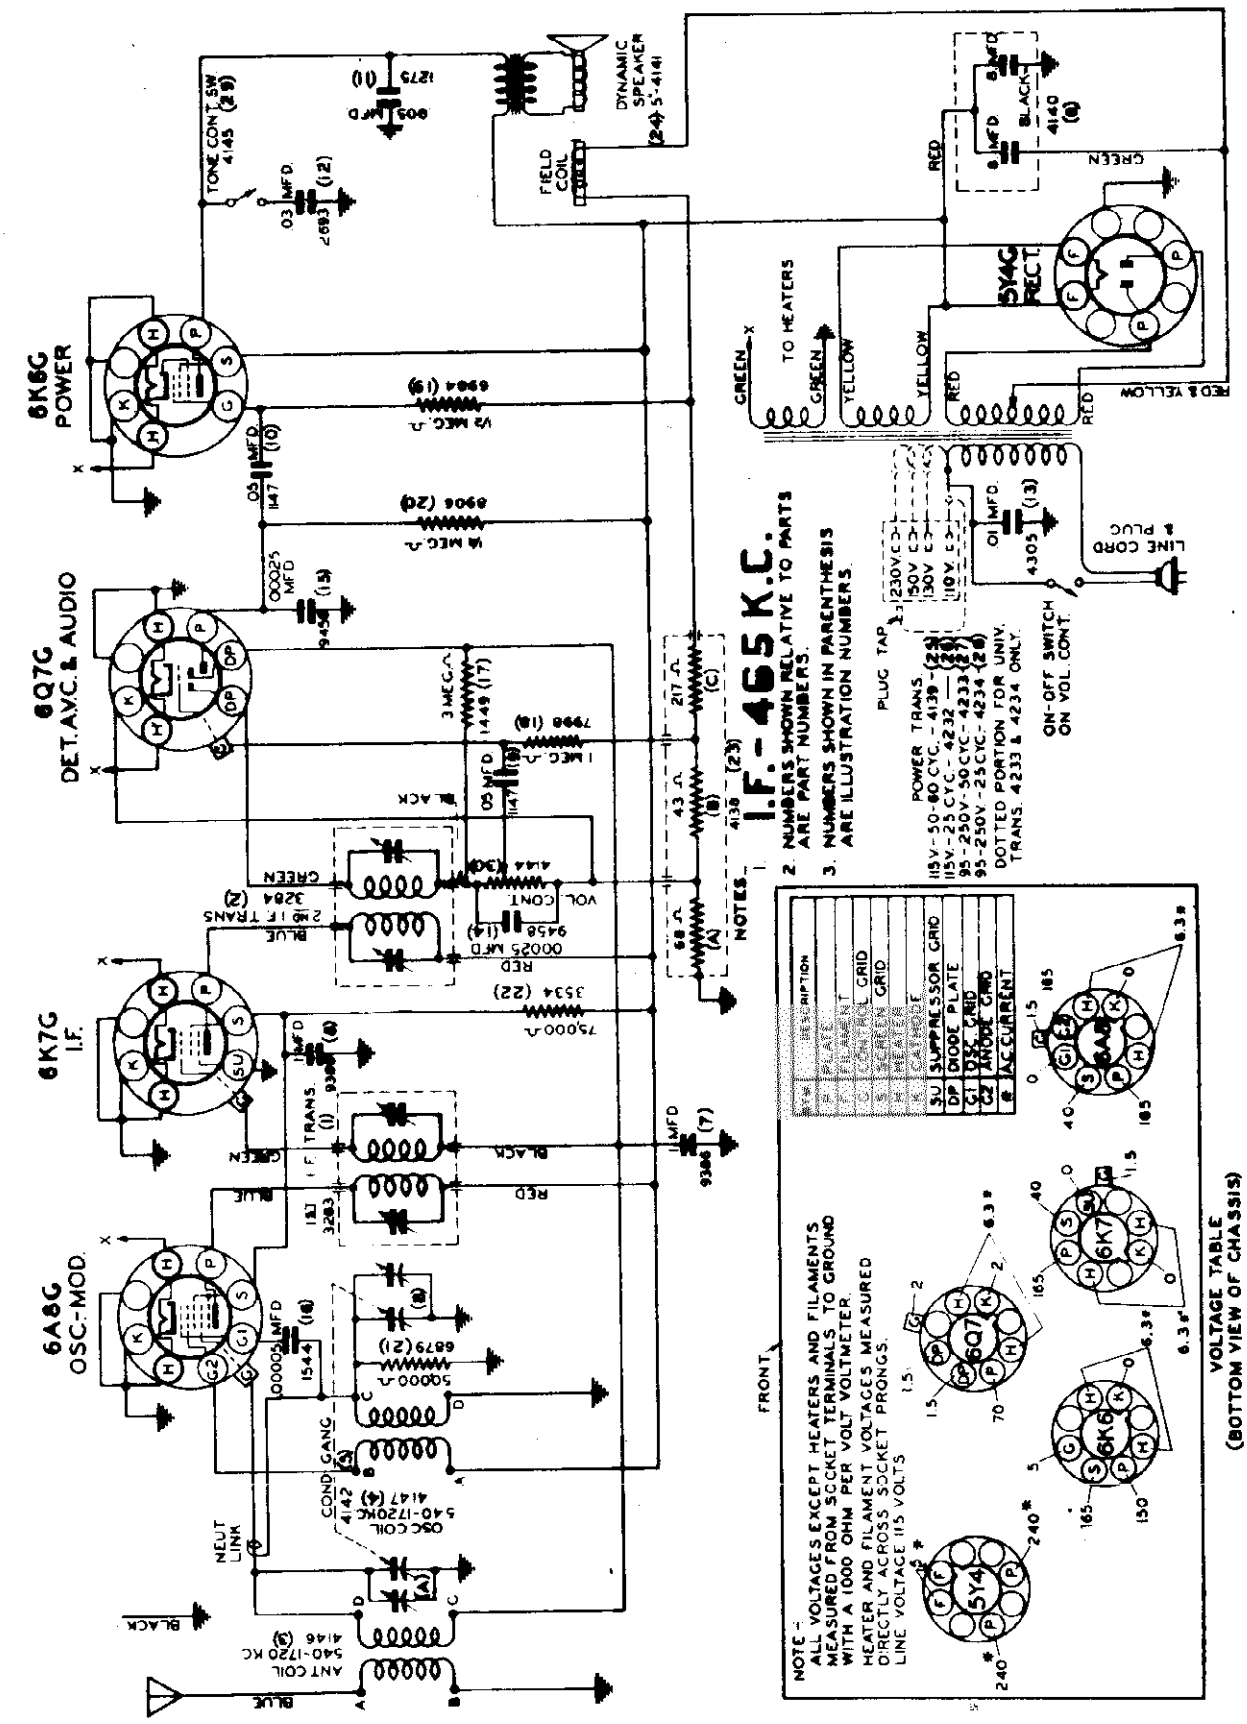
MODELS B10577,B1057
Schematic, Voltage
Socket



THIS RADIO IS DESIGNED SO THAT IT MAY BE PLACED IN A HORIZONTAL OR UPRIGHT POSITION. AS THE OPERATION AND PERFORMANCE OF THE RECEIVER IS THE SAME IN EITHER POSITION, IT IS A MATTER OF PERSONAL PREFERENCE AS TO WHICH POSITION TO USE.

The approximate position on the dial that any nine stations will be tuned in may be quickly determined—by pressing a paper tab having the station call letters into the round depressions on the front of the cabinet.

THE STATIONS SELECTED MUST OPERATE ON A FREQUENCY 40 KILOCYCLES OR MORE APART, OTHERWISE IT WILL BE IMPOSSIBLE TO PLACE THE CALL LETTER TABS IN THEIR PROPER POSITION IN CABINET DEPRESSIONS.

While it will be found that only the approximate location will be indicated, the station call tabs properly located will be an extremely helpful tuning aid.

To set the proper station call letter tabs into the cabinet depressions proceed as follows:

(a) Determine which nine stations call letters you wish to have on the cabinet—press call letter tabs out of the call letter sheets provided.

(b) Carefully tune in the selected station that broadcasts on the lowest frequency—the least number of kilocycles.

(c) Place a little mucilage or celluloid on back of paper tab. Press the paper call letter tab—so that the printed call letters of the station tuned in are at the same angle as the printing on the dial—into the round depression on the cabinet front that is nearest to the dial pointer. By placing call letter tab on angle the call letter can easily be read with cabinet in either a horizontal or upright position.

(d) Tune in the next selected station having the next lowest station frequency, pressing the call letter for this station into the round cabinet depression nearest to the dial pointer needle—continuing on in this way until station call letters have been placed into all nine cabinet depressions.

After the station call letters are set it will be a simple matter to determine the approximate dial position of any of these stations—just rotate tuning knob until dial pointer needle points to station call letter of desired station. It must be remembered that only the approximate tuning location will be indicated by the dial pointer needle—each station must be correctly tuned in by ROTATING THE TUNING CONTROL KNOB UNTIL A STATION IS TUNED IN WITH GREATEST CLARITY.

ALIGNMENT PROCEDURE:

NOTE: BE SURE TO FOLLOW PROCEDURE CAREFULLY WHEN ALIGNING, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS AND PADDING CONDENSERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER.

ALIGNING I.F. STAGE AT 465 KILOCYCLES:

(a) Connect the ground lead of the test oscillator to the chassis or set ground lead. Connect the other lead of the test oscillator to the grid cap of the 6A8G tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.

(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.

(c) Peak each of the second I.F. transformer trimmers.

(d) Peak each of the first I.F. transformer trimmers.

To assure most accurate trimmer setting repeat above adjustment several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING 1720-540 KILOCYCLE BAND:

(a) Remove test oscillator lead from grid of 6A8G tube and attach it to the receiver antenna lead through a .00025 Mfd. series condenser.

(b) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move needle to correct position

(c) Set receiver dial and test oscillator frequency to EXACTLY 1720 kilocycles.

(d) Bring in 1720 KC test oscillator signal to maximum output by adjusting the trimmer condenser mounted on top of the oscillator section of the gang condenser. Looking at the front of the receiver the rear section of the gang condenser is the oscillator section.

(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles.

(f) Adjust trimmer on top of the front section gang condenser (antenna section) for maximum 1400 kilocycle test signal response.

MODEL B10579
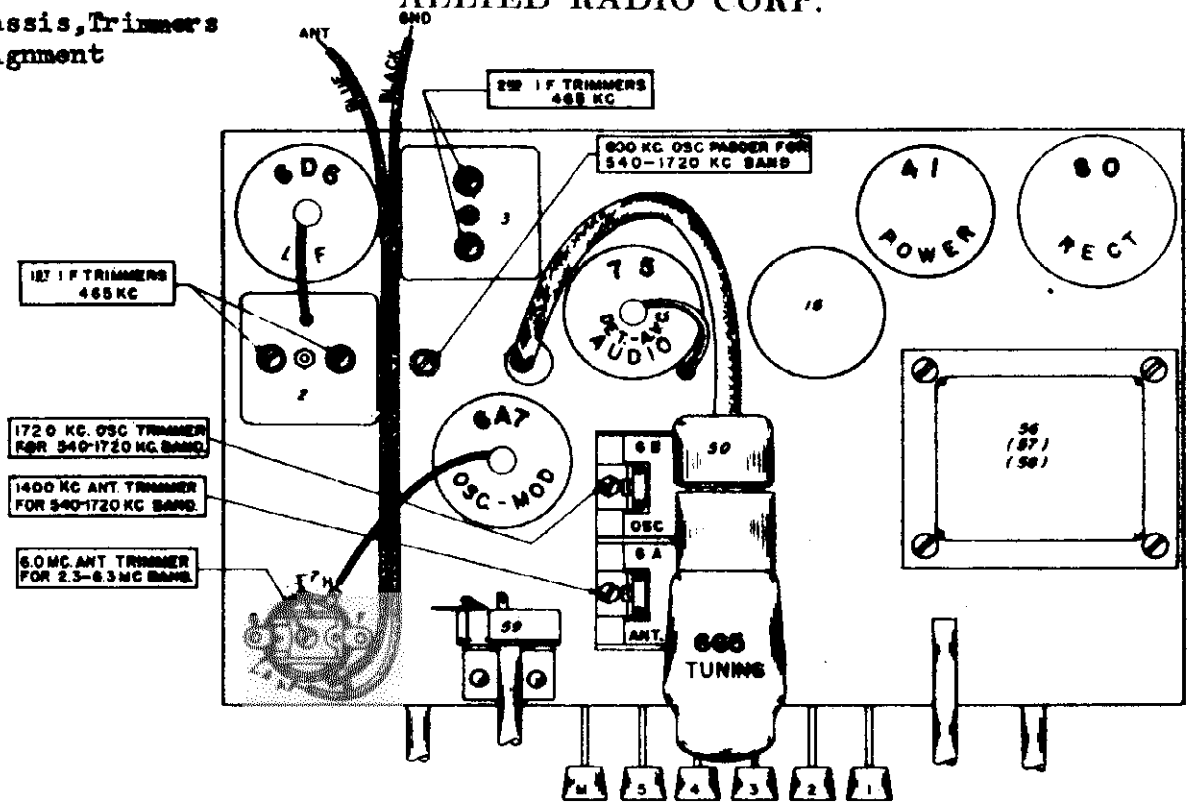
Chassis, Trimmers
Alignment

ALLIED RADIO CORP.



ALIGNMENT PROCEDURE:

ALIGNING I.F. STAGE AT 465 KILOCYCLES:

(a) Connect the ground lead of the test oscillator to the chassis or set ground lead. Connect the other lead of the test oscillator to the grid cap of the 6A7 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.
(b) Set test oscillator to EXACTLY 465 kilocycles and turn receiver volume control on full.
(c) Peak each of the second I.F. transformer trimmers.
(d) Peak each of the first I.F. transformer trimmers.
To assure most accurate trimmer setting repeat above adjustment several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

ALIGNING 1720-540 KILOCYCLE BAND:

(a) Remove test oscillator lead from grid of the 6A7 tube and attach it to the receiver antennae lead through a .0025 Mfd. series condenser.
(b) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line move needle to correct position.
(c) PLACE BAND SELECTOR SWITCH FOR 1720-540 K.C. OPERATION. PRESS IN MANUAL PUSH-BUTTON AND set receiver dial and test oscillator frequency to EXACTLY 1720 kilocycles.
(d) Bring in 1720 KC. test oscillator signal to maximum output by adjusting the trimmer condenser mounted on top of the oscillator section of the gang condenser. Looking at the front of the receiver the rear section of the gang condenser is the oscillator section.
(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles.
(f) Adjust trimmer on top of the front section gang condenser (antenna section) for maximum 1400 kilocycle test signal response.
(g) Tune receiver dial and set test oscillator frequency to approximately 600 kilocycles.
(h) While rocking the tuning condenser back and forth adjust 600 KC oscillator padder condenser which is accessible through the hole in the top of chassis adjacent to the gang condenser for maximum 600 kilocycle signal response.

ALIGNING 2.3-6.3 MEGACYCLE BAND:

(a) Replace .0025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.
(b) Adjust band selector switch for 2.3-6.3 megacycle band operation. Tune receiver dial and set test oscillator frequency to EXACTLY 6.3 megacycles.
(c) Bring in 6.3 megacycle test oscillator signal to maximum output by adjusting 6.3 M.C. oscillator trimmer.
(d) Tune receiver dial and test oscillator frequency to EXACTLY 6 megacycles, and adjust 6 M.C. antenna trimmer for maximum sensitivity.

MODELS B10750, B10770, B10771, B10760, B10761, B10762.

SETTING UP SELECTOR MECHANISM

1. Using the manual selector knob, tune in station No. 1, the station near the left hand end of the dial—the 170 K.C. end. Make certain that the station is properly tuned in.

2. From the back of the receiver loosen thumb screw No. 1 (See Figure 2) just enough to allow it to slide freely in the groove.

3. Now adjust the thumb screw until the contact is resting directly on the fibre dead spot.

4. Tighten thumb screw securely, making sure that in tightening you do not move the contact off the fibre dead spot.

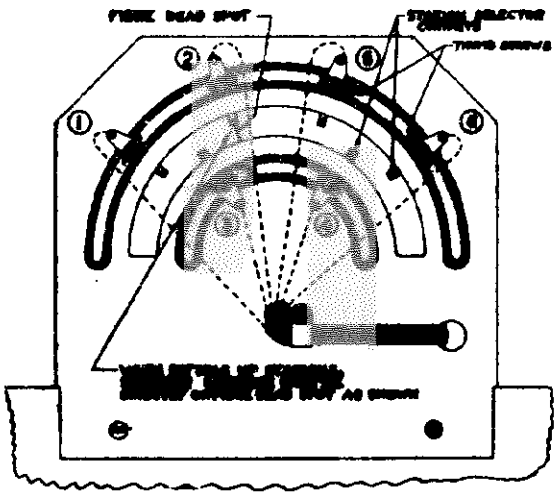
5. Check the above operation by pressing button No. 1 and note if there is any pointer movement. If there is no pointer movement, the contact is properly set. If the pointer moves, the contact was not set directly on fibre dead spot. In this case, the station should be re-tuned manually, and procedure No. 3 should be repeated.

6. Using the same procedure, set up the remaining five stations, in each case using the station of the next highest frequency and the thumb screw having the same number as the corresponding button. Never skip buttons, always set up in numerical order from button 1 to 6 from left to right.

7. After all the stations have been set up, insert the proper station call tabs (found with the instructions) into the recesses of their respective buttons.

8. To receive any of the six stations set up as described above turn receiver "ON" by rotating the left hand knob to the right until the switch clicks. Allow the tubes to heat up, press the buttons designated by the call letter of the station desired and hold the button in until the pointer stops moving and the station comes in. Adjust tone and volume. IMPORTANT: Be sure the band switch is in the position for Standard Broadcast Reception.

Fig. 2



(b) BE SURE TO OPERATE THE SET AT LEAST ONE-HALF HOUR BEFORE ADJUSTING TRIMMERS. If set is not thoroughly warmed up when trimmers are adjusted, the trimmers may shift position after they become warm resulting in poor tone, weak signal, and excessive background noise.

(c) FOR BEST RESULTS SET PUSH-BUTTONS FOR LOCAL OR STRONG, NEARBY STATIONS ONLY. Obtain the transmitter frequency—number of kilocycles—and call letters of the station you wish to "Push-Button" tune.

(d) Place band selector switch for operation on 1720-540 kilocycle band.

(e) Press in "MANUAL" tuning button—see diagram.

(f) It is advisable that if a station is selected whose transmitter frequency is somewhere between 540-935 kilocycles that the two trimmers marked "540-935 K.C." on paper label attached to back of chassis be adjusted first.

(g) Using "MANUAL" tuning knob carefully tune in selected station whose transmitter frequency is between 540-935 kilocycles.

(h) Press in [illegible] marked "540-935 K.C."—see diagram.
NOTE: STATION SIGNAL WILL DISAPPEAR, OR MAY BE DISTORTED, AND IN SOME INSTANCES ANOTHER STATION MAY BE HEARD.

(i) With a small screw driver carefully tune in the selected 540-935 kilocycle station by slowly adjusting trimmer 1A—then adjust trimmer 1B for maximum volume. BE SURE TO WATCH TUNING EYE AND ADJUST TRIMMERS SO THAT THE TWO GREEN ENDS OF THE GREEN INVERTED "V" ON THE TUNING EYE ARE CLOSEST TOGETHER. AT THIS POINT THE SIGNAL WILL BE HEARD WITH GREATEST VOLUME AND CLEAREST TONE.

(j) Mount gummed back of selected 540-935 Kc station [illegible] tab and press into round depression in 540-935 Kc push-button.

(k) After trimmers 1A and 1B have been properly set for the selected station operating between 540-935 kilocycles, adjust other trimmers in the same manner and in the following order.

(l) Set trimmers 5A and 5B for selected station operating between 935-1400 kilocycles.

(m) Adjust trimmers 3A and 3B for the selected station operating between 935-1170 kilocycles.

(n) Set trimmers 4A and 4B for selected station operating between 900-1540 kilocycles.

(o) Adjust trimmers 5A and 5B for selected station operating between 1400-1720 kilocycles.

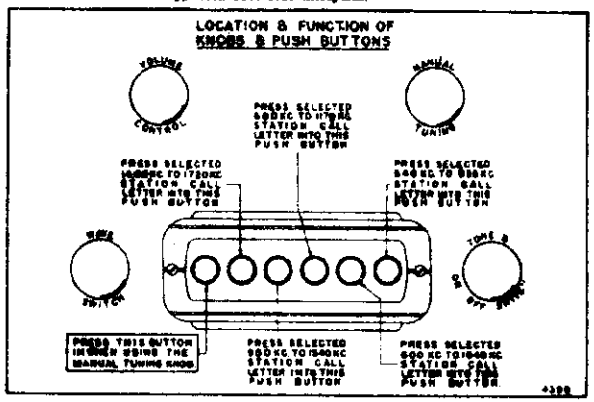
MODEL B10579

INSTRUCTIONS FOR INSTALLING AND OPERATING "AUTOMATIC PUSH BUTTON"

Five stations operating in the 1720-540 kilocycle broadcast band may be "AUTOMATIC PUSH-BUTTON" tuned by properly setting the ten trimmer screws accessible through holes in the back of the chassis.

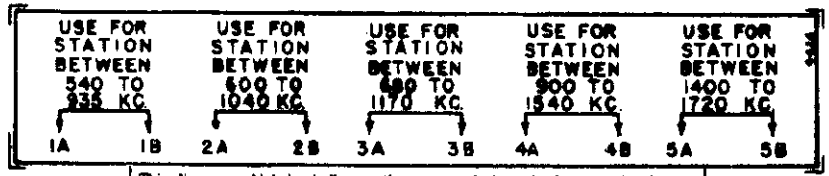
AS THE PUSH-BUTTONS ARE NOT PRE-SET AT THE FACTORY FOR ANY DEFINITE STATION BE SURE TO SET THEM BY:

(a) It is important to have the aerial, which will be used with the set, attached to the radio when adjusting the trimmers.



AS THE TRIMMERS SHOULD NEVER BE TOO LOOSELY OR TOO TIGHTLY ADJUSTED IT IS IMPORTANT THAT THE PROPER TRIMMERS BE USED.

In some instances it may be necessary after the set is operated for a period of time to reset the trimmers as they may drift due to heat, humidity, etc.



This diagram, which is similar to the one attached to the back of chassis over trimmer holes, shows the minimum-maximum range of the five groups of trimmers.

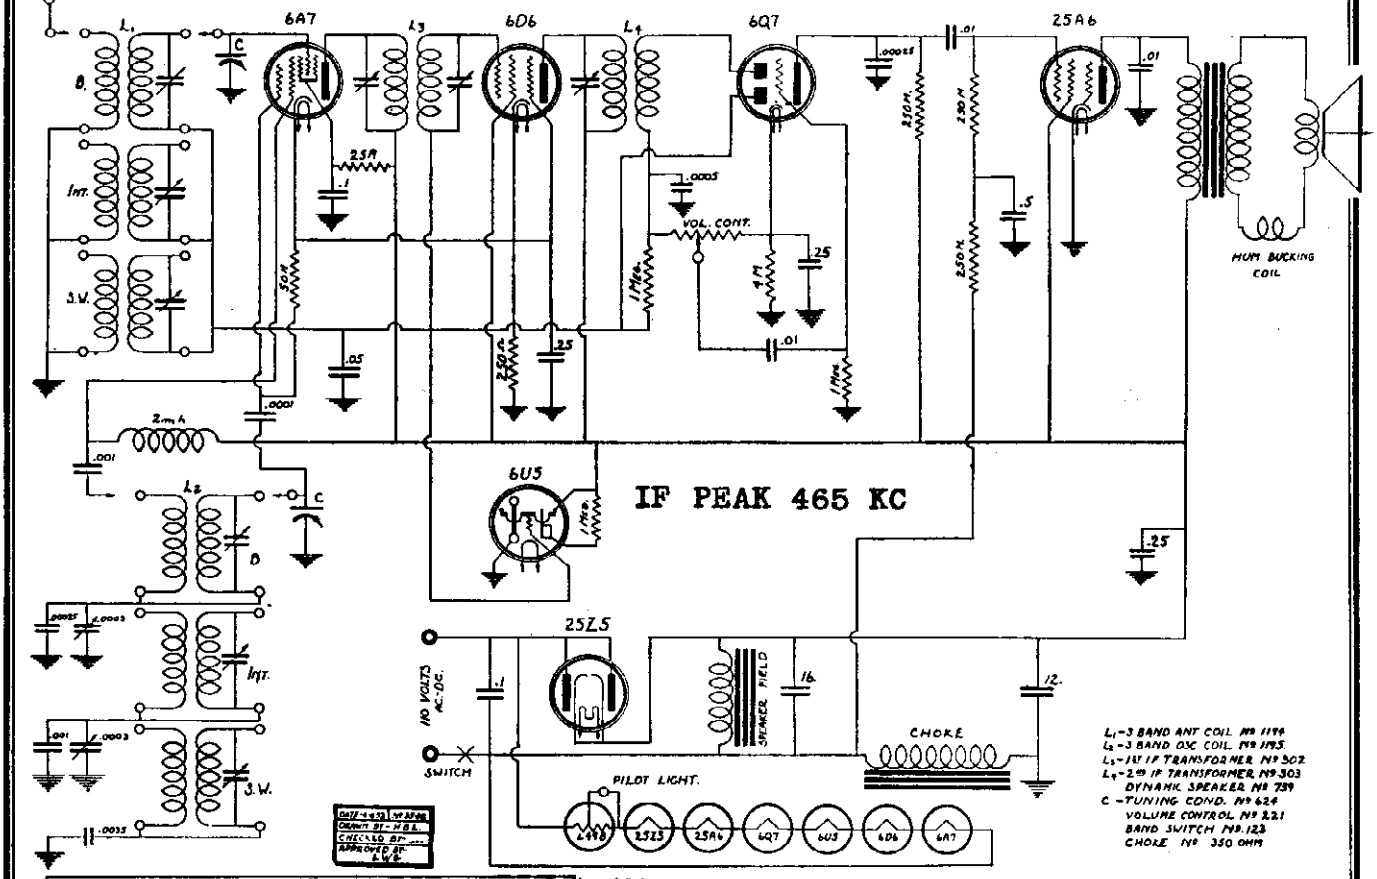
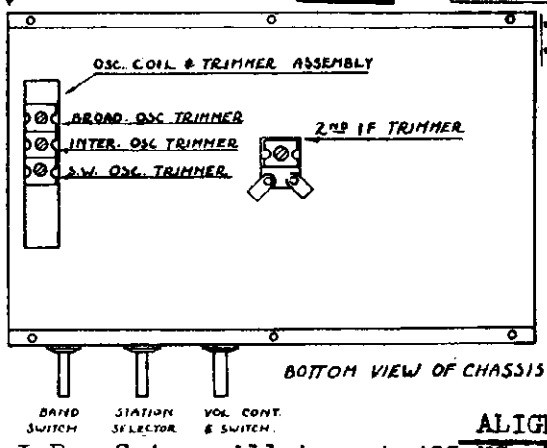
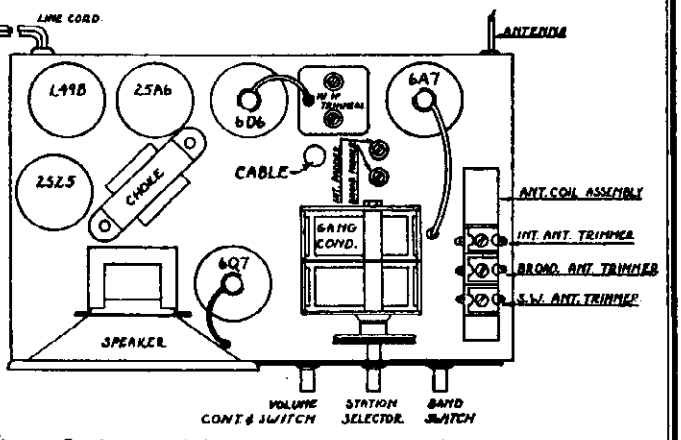
Schematic, Socket, Trimmers Alignment







ALIGNMENT

I.F. Set oscillator at 465 KC. Feed signal to grid of the 6A7 tube. Adjust trimmers on the intermediate frequency transformers for peak readings.

B.C. Turn switch to B.C. position. Set oscillator and receiver dial to 1400 KC. Use a .0002 mfd. condenser in the signal lead. Set volume control at maximum. Adjust B.C. OSC trimmer to maximum. Reset dial and oscillator to 600 KC and adjust B.C. Pad. Recheck at 1400 KC.

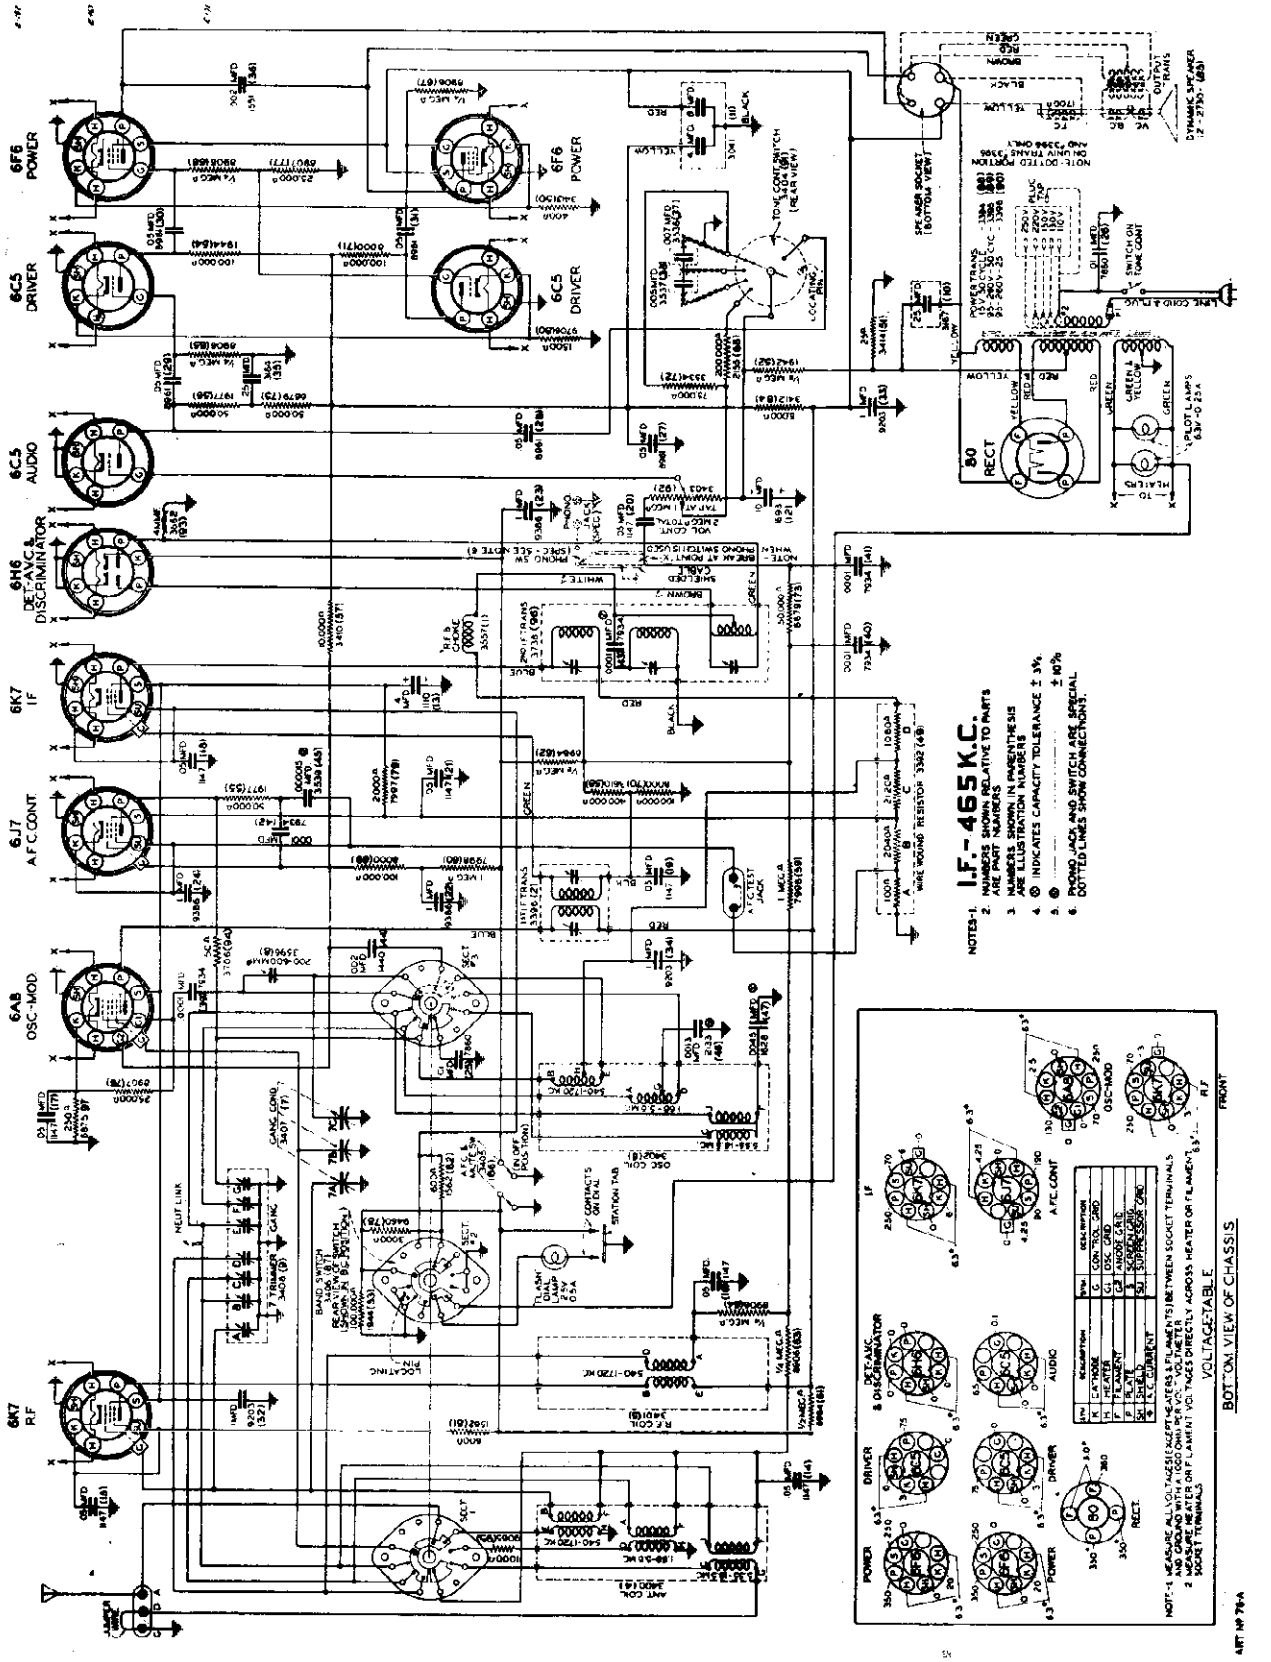
INT. Turn switch to INT. position. Use .0002 mfd. condenser with 400 ohm series resistor as dummy antenna. Set dial and oscillator at 5100 KC. Adjust antenna and oscillator trimmers to maximum. Reset dial and oscillator to 1800 KC and adjust padder. Recheck alignment at 5100 KC.

S.W. With switch in S.W. position, using a 400 ohm resistor as a dummy with oscillator and dial set to 15 MC., adjust S.W. antenna and oscillator trimmers to maximum

Check sensitivity at 6000 KC. If receiver lacks sensitivity check the .0035 mica condenser for short circuit.

ALLIED RADIO CORP.

MODELS B10580,B105
B10582
Schematic, Voltage
Socket



ALIGNING I.F. STAGE AT 465 KILOCYCLES:

(a) Place automatic frequency control in the maximum left hand A.F.C. "off" position.

(b) Attach the ground lead of the test oscillator to the chassis. Connect the other lead to the grid cap of the 6A8 tube through a .02 Mfd. series condenser. DO NOT REMOVE GRID CLIP.

(c) Set test oscillator to EXACTLY 465 kilocycles and turn volume control on full.

(d) Remove shields held in position by snap fasteners over A.F.C. test jack and over trimmer screw holes in the first and second I.F. transformer shield cans.

(e) Peak second I.F. transformer trimmers for maximum 465 kilocycle output by adjusting the two trimmers accessible through the two top holes in the second I.F. transformer shield can. DO NOT TOUCH DISCRIMINATOR (BOTTOM) SCREW.

(f) Peak each of the first I.F. transformer trimmers for maximum 465 kilocycle signal output.

ALIGNING 1720-540 KILOCYCLE BAND:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh), at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If the dial needle does not point exactly to the last line, move needle to correct position.

(b) Remove test oscillator lead from grid of 6A8 tube and connect to receiver "A" antenna post through a .00025 Mfd. condenser.

(c) Adjust A.F.C. control to maximum left hand A.F.C. "off" position and band selector switch for operation on the 1720-540 kilocycle band.

(d) Set test oscillator frequency and receiver dial to EXACTLY 1720 kilocycles, and BRING IN 1720 KILOCYCLE TEST OSCILLATOR SIGNAL TO MAXIMUM OUTPUT BY ADJUSTING 1720 KILOCYCLE OSCILLATOR TRIMMER.

(e) Tune receiver dial and set test oscillator frequency to EXACTLY 1400 kilocycles. Adjust 1400 K.C. R.F. and antenna trimmers for maximum sensitivity.

(f) Set test oscillator frequency and receiver dial to approximately 600 kilocycles. Then while rocking gang condenser slightly to right and left, adjust 600 K.C. oscillator padder for maximum signal response.

ALIGNING DISCRIMINATOR CIRCUIT:

(a) After completing 1720-540 kilocycle adjustment, set test oscillator to EXACTLY 465 KILOCYCLES and connect to grid of 6A8 tube through a .02 Mfd. Condenser—insert lead of double scale 0 to 1 and 0 to 5 milliammeter into A.F.C. test jack located on top of chassis adjacent to the 6L7 tube. To avoid possibility of damaging the meter should one of the milliammeter leads short to the metal chassis, ALWAYS TURN OFF RECEIVER WHEN INSERTING OR REMOVING MILLIAMMETER LEADS FROM A.F.C. TEST JACK.

(b) Short out A.F.C. mute switch by grounding the second from the left (looking at the front of the chassis) of the four lugs mounted on top of the dial assembly. The proper lug to ground is indicated in the "Note X" on chassis top parts view.

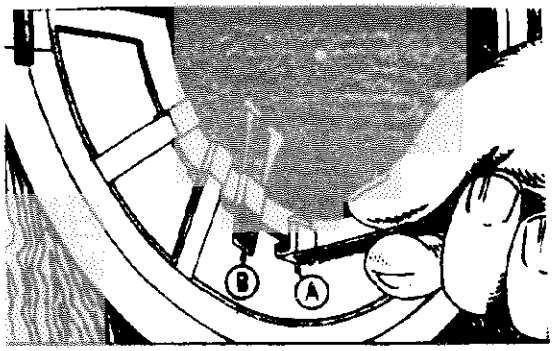
(c) Turn receiver on, place A.F.C. switch knob in A.F.C. "on" position and if meter needle jumps off scale adjust output of test oscillator until an approximate 2 M.A. deflection is obtained on the 0 to 5 milliammeter scale.

(d) Place band selector switch for operation on 1720-540 K.C. broadcast band—and set receiver dial somewhere near 1000 kilocycles at a point where no station is heard.

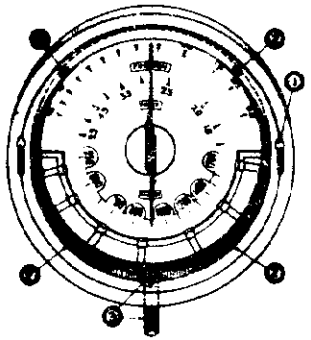
(e) Rotate A.F.C. switch knob from A.F.C. "on" to A.F.C. "off" position and note whether the milliammeter reading changes as the position of the A.F.C. switch is changed. No change in reading indicates probable proper discriminator trimmer adjustment, while a noticeable change indicates improper discriminator trimmer adjustment.

(f) IMPORTANT: DO NOT ADJUST DISCRIMINATOR TRIMMER UNLESS IT IS ABSOLUTELY NECESSARY. Place A.F.C. switch in A.F.C. "off" position and note milliammeter reading, then place A.F.C. switch in A.F.C. "on" position and CAREFULLY ADJUST DISCRIMINATOR TRIMMER UNTIL MILLIAMMETER READING IS EXACTLY THE SAME AS IT WAS WITH THE A.F.C. SWITCH IN THE "OFF" POSITION.

NOTE: As the discriminator trimmer screw is screwed in (increasing capacity) the milliammeter reading should decrease and as the discriminator trimmer is unscrewed (decreasing capacity) the milliammeter reading should increase. IF WHEN ADJUSTING THE DISCRIMINATOR TRIMMER THE MILLIAMMETER READING DOES NOT SHARPLY INCREASE OR DECREASE AS THE TRIMMER IS ADJUSTED EVEN AFTER SEVERAL TURNS OF THE TRIMMER SCREW, THIS DOES NOT INDICATE PROPER BALANCING BUT DOES INDICATE INCORRECT ADJUSTMENT AND THE DISCRIMINATOR TRIMMER SHOULD BE SET TO ABOUT ½ CAPACITY AND THE ADJUSTMENT OF THE DISCRIMINATOR TRIMMER MADE ALL OVER AGAIN.



Above Diagram shows method of inserting and setting tabs.



ALIGNING 1.66-5.6 MEGACYCLE BAND:

(a) Replace .00025 Mfd. test oscillator antenna lead series condenser with a 400 ohm resistor.

(b) Adjust band selector switch to 1.66-5.6 megacycles, tune receiver dial and set test oscillator frequency to EXACTLY 5.6 megacycles. Bring in 5.6 megacycle test signal to maximum output by adjusting 5.6 M. C. oscillator trimmer.

(c) Tune receiver dial and test oscillator frequency to EXACTLY 5 Megacycles and adjust 5 M.C. antenna trimmer for maximum sensitivity.

ALIGNING 5.55-18.5 MEGACYCLE BAND:

(a) Leave 400 ohm resistor in series with test oscillator lead and place band selector switch for operation on 5.55-18.5 megacycle band, tune receiver dial and set test oscillator frequency to EXACTLY 18.5 megacycles.

(b) Adjust 18.5 M.C. oscillator trimmer to bring in 18.5 megacycle test signal to maximum output.

NOTE: When adjusting this trimmer two peaks, the fundamental and the image peak will be noticed. CARE MUST BE TAKEN THAT THE FUNDAMENTAL PEAK AND NOT THE IMAGE PEAK IS USED FOR ALIGNING THE RECEIVER AT 18.5 MEGACYCLES. Always back off the trimmer to minimum capacity, then screw down the trimmer (add capacity) until the FIRST peak which is the fundamental and the proper one to use is tuned in. If the trimmer is screwed down beyond the point where the first peak is received the incorrect image peak will be tuned in. After completing adjustment of the oscillator trimmer at 18.5 megacycles, always check to see if the proper peak has been used. To do this leave test oscillator frequency at 18.5 megacycles, increase the output of the test oscillator and tune receiver dial to approximately 17.5 megacycles. Then vary the receiver dial slightly to the right and left of 17.5 megacycles, and if the fundamental peak was used in aligning at 18.5 megacycles the test oscillator signal will be heard at approximately 17.5 megacycles on the receiver dial.

(c) Tune receiver dial and set test oscillator frequency to EXACTLY 15 megacycles.

(e) Rock gang condenser slightly to right and left and adjust 15 M.C. antenna trimmer for maximum 15 megacycle test signal response.

To assure more accurate trimmer setting, repeat all above adjustments several times always using lowest possible test oscillator output consistent with readable output meter scale deflection.

PROCEDURE FOR REMOVING RECEIVER FROM CABINET.

1. Unscrew the two knurled head screws mounted on front of the glass frame and then holding onto the screws pull dial glass away from the cabinet.
2. Swing 'rapid tuning' lever to center position as shown, loosen (do not remove) screw thru hole in bottom center, and remove lever knob.
3. Loosen set screws on all five tuning knobs, and remove knobs from shafts. (Not shown in sketch).
4. Remove four bolts at bottom side of chassis mtg. shelf (not shown in sketch.)
5. Remove wood screws on the pressure brackets at rear of chassis (not shown in sketch) and then slide receiver out of cabinet.
6. When replacing receiver in cabinet, reverse entire procedure given above.

I.F. ALIGNMENT. Adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tubes (6A8) through a .05 or .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the output of the oscillator to the antenna lead of the receiver through a 50 mmfd condenser. This antenna lead should be a two foot length of standard low capacity shielded loom fitted with the proper bayonet type plug to accomodate the antenna input receptacle on the receiver. Set the oscillator to 1550 KC and with the gang condenser at minimum, adjust the oscillator trimmer to receive this signal. Then set the oscillator to 1400 KC and adjust the antenna trimmer to give maximum output.

ALIGNMENT DATA

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 175, 600, 1400 and 1550 K.C., and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignment should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the A.V.C. from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) transformers should be aligned properly as the first step.

I.F. ALIGNMENT. Adjust the test oscillator to 175 K.C. and connect the output to the grid of the first detector tube, 6A8G, through a .1 mfd. condenser. The ground on the test oscillator can be connected to the chassis ground. Align the trimmers of the first and second I.F. transformers to peak or maximum reading on the output meter.

R.F. ALIGNMENT. Adjust the test oscillator to 1550 K.C. and connect the output to the antenna through a .00005 mfd. mica condenser to give the equivalent of a low capacity average auto antenna. When this adjustment is made, the signal must be introduced into the receiver through the shielded lead supplied with the receiver. The plug should be inserted to conform with the "Low Capacity" position. (See Figure 18). Set the gang condenser to minimum and adjust the ascillator trimmer to peak. (Center section of gang condenser). The next step is to set the test oscillator and receiver to 1400 K.C. and adjust the front and rear trimmers of the gang condenser to peak. The rear section of the gang condenser tunes the antenna amplifier stage (6K7 tube), and the front condenser section tunes the detector grid coil of the 6A8G tube.

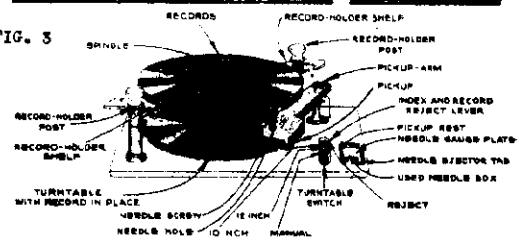

FIG. 3

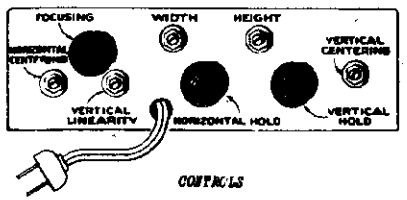
DEFLECTION CHASSIS - "DF-12"

CONTROLS - There are eight controls on the end of the Deflection Chassis. Three of these are knobs and five are screwdriver adjustments.

1. Horizontal Centering - This is a screwdriver adjustment on the extreme left of the control panel. It serves to center the picture horizontally on the Kinescope screen and is made at the time of installation of the complete receiver. It will require resetting due primarily to the earth's magnetic field whenever the receiver location is changed, the cabinet turned around, or the Kinescope replaced.



CONTROLS

2. Focusing Control - The next control is a knob for adjustment of the first anode voltage to properly focus the picture. Make this adjustment carefully when the receiver is first placed in operation and it should then remain permanent but may be occasionally checked to insure continuous best focusing.

3. Vertical Linearity - This is controlled by means of a screwdriver adjustment. It is operated in conjunction with the Height Control to give the correct vertical proportions to the picture. It may require readjustment if the Vertical Centering Control is reset.

4. Width - This screwdriver control determines the width of the picture and should be adjusted when the receiver is installed. Further adjustment will occasionally be necessary in order to compensate for the gradual reduction in horizontal deflection with tube life.

5. Horizontal Hold - This is a knob which controls the free running speed of the horizontal oscillator. It is adjusted to a point approximately at the center of the range in which the picture "locks in" horizontally. Synchronizing voltage, when properly applied, will hold the horizontal oscillator in step, and then correct setting will be indicated by the horizontal stability of the picture.

6. Height - This screwdriver control determines the height of the picture and should be adjusted in conjunction with vertical linearity when the receiver is installed. Further adjustment will occasionally be necessary in order to compensate for the gradual reduction in vertical deflection with tube life.

7. Vertical Hold - This is a knob which controls the free running speed of the vertical oscillator. It is adjusted to a point approximately in the center of the range in which the picture "locks in" vertically. Synchronizing voltage, when properly applied, will hold the vertical oscillator interlaced in step and the correct setting will be indicated by the vertical stability of the picture.

8. Vertical Centering - This is a screwdriver adjustment on the extreme right of the control panel. It serves to center the picture vertically on the Kinescope screen and is made at the time of installation of the complete receiver. It will require resetting whenever the receiver location is changed, the cabinet turned around or the Kinescope replaced. Some readjustment of linearity may be required if the centering is shifted appreciably.

CAUTION - THE POWER SUPPLY TO THE DEFLECTION CHASSIS SHOULD NEVER BE CUT OFF WHILE THE HIGH VOLTAGE SUPPLY IS TURNED ON. A BURNED SPOT MAY APPEAR ON THE KINESCOPE SCREEN IF THIS WARNING IS DISREGARDED. AN INTENSE BRIGHT SPOT THAT MAY CAUSE A BURN WILL ALSO APPEAR IF THE KINESCOPE YOKE IS REMOVED, THE YOKE PLUG PULLED OUT, OR BOTH DEFLECTION CIRCUITS RENDERED INACTIVE BY TUBE REMOVAL OR OTHER MEANS.

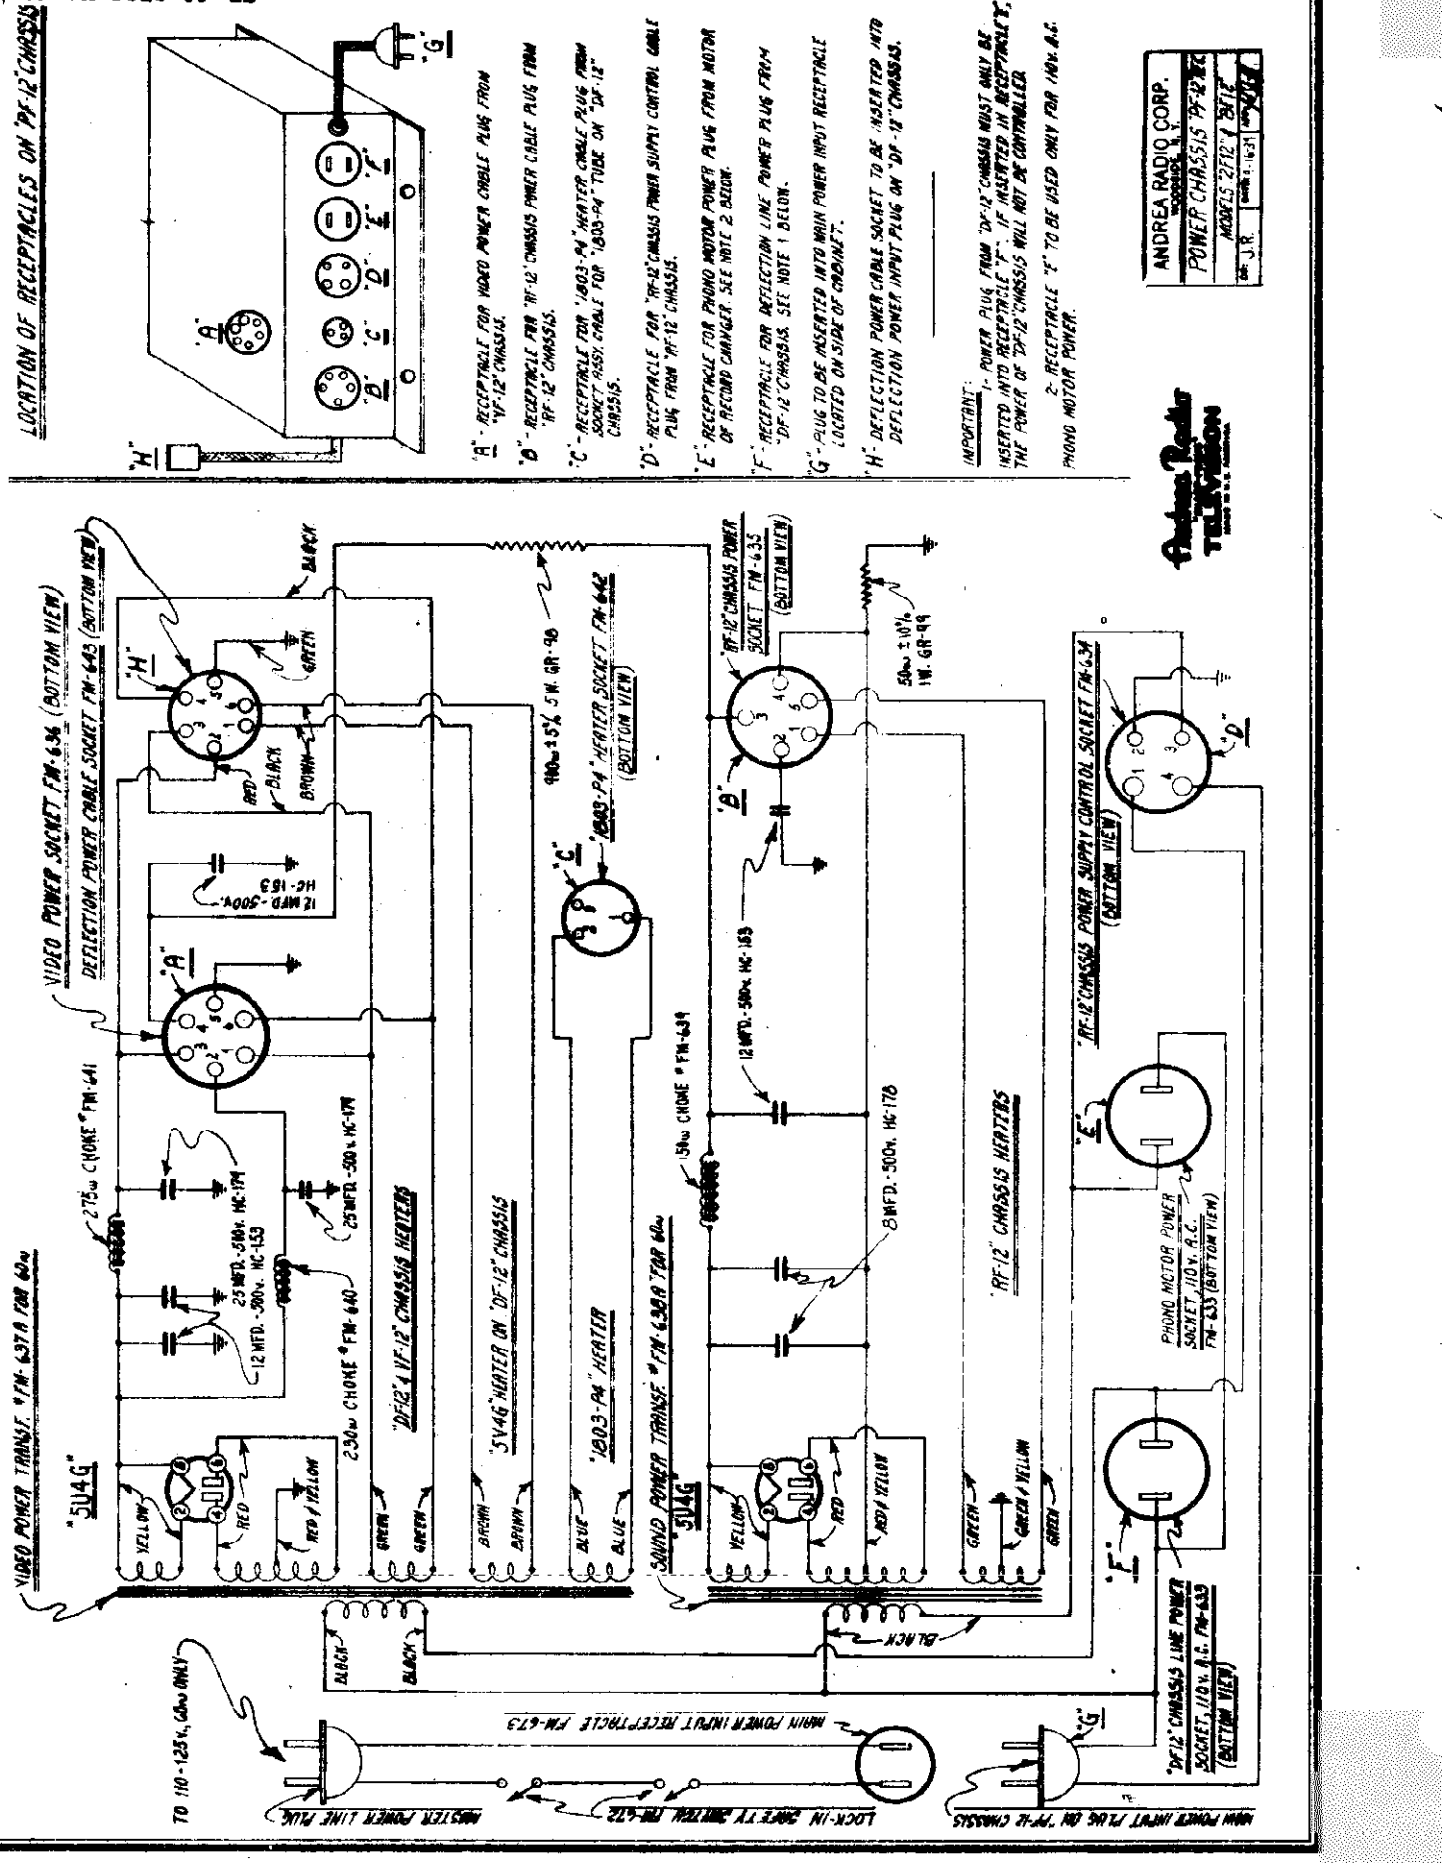
MODELS 2F12,8F12
Power Chassis PF-12

ANDREA RADIO CORP.

Schematic Notes



POWER RATING The ANDREA 2F12 and 8F12 receivers operate only on 110 to 125 volt, 60 cycle AC current. Make sure your current supply is correct for the instrument before you plug it into the house outlet or socket.

This receiver is equipped with two safety lock-in switch devices and when the back is removed, power is cut off from all apparatus. The two switches are on the inside of the two side panels. No danger is possible from the high voltage television apparatus unless these two switches are simultaneously pushed in. Under no circumstances should these switches be tampered with.

ANTENNA A television receiving antenna and its installation must conform to much higher standards than an antenna for reception of international short wave and standard broadcast signals because:

1. At the ultra short wave lengths employed in television, intervening obstacles have a pronounced shielding effect, causing low intensity signals, and often severe trouble with multi-path transmissions. These produce blurring and multi-image pictures. See picture chart - figure 20 - for effect.
2. The picture signal is comprised of a very wide band or range of frequencies, all of which must be received with good efficiency.
3. The discernment of the eye is much more critical than that of the ear.

The receiver antenna should preferably be at a good height, without interuption in direct "line of sight" of the transmitter antenna, of the correct type, and correctly installed. Buildings and other structures may obstruct and reflect the television waves. Automobile ignition systems, diathermy apparatus in hospitals and airplanes flying low may al. have an adverse effect.

Television pictures may be compared in certain ways with motion pictures. The illumination in the room should be dimmed - no light close to or falling on the screen. During the day it will usually suffice to draw the curtains.

The special ANDREA Teleceptor - picture and sound antenna - Model 66 - is available.

TELEVISION OPERATION

CAUTION Before the receiver is turned on at any time, turn wave band Selector control knob (Fig.1) to either the S, I, M, A or P position, and rotate counter-clockwise contrast and brightness controls (Fig.1) all the way.

HOW TO TURN RECEIVER ON AND OFF AND CONTROL TONE Turn master Off-on Tone Control knob clockwise (Fig.1) to switch power "on". Further rotation varies the tone of the television sound - full tone reproduction being with the knob turned fully counter-clockwise. This knob is the master control knob for turning the entire instrument "off" or "on". After about 30 seconds, turn the Wave Band Selector knob (Fig.1) to position "T". This turns the television section of the instrument "on" and automatically removes the dial illumination. Allow sufficient time for the tubes to heat before proceeding further.

HOW TO CONTROL TELEVISION SOUND VOLUME Turning Volume Control knob (Fig.1) clockwise increases the television sound volume; counter-clockwise decreases volume.

TELEVISION CHANNEL SELECTOR CONTROL SWITCH The television Channel Selector Control (Fig.1) selects automatically, the desired station and accompanying sound from which it is desired to receive television programs. This knob is marked 1,2,3,4,5 - representingthe first,second, third, etc. television channel:

CHANNEL 1 - 44-50 MC
" 2 - 50-56 MC
" 3 - 66-72 MC
4 - 78-84 MC
5 - 84-90 MC

Set the knob to the channel corresponding to the television station desired.

FINE TUNING CONTROL This control is used to obtain best picture reception by eliminating possible distortion from interfering signals which show a moving ripple in the picture. Should the control be incorrectly set, picture distortion will result. In most cases this control should be adjusted for each television channel by listening to the accompanying sound until maximum volume is obtained, using a medium or low level and noting that the picture is not distorted at this setting. See picture chart - (Fig.5) illustrates the test chart picture when all controls are correctly adjusted. (Fig.9) shows the effect on the picture of extraneous interference that in some cases can be eliminated by a slight readjustment of the fine tuning control. (Fig.10) shows what also may occur when the fine tuning control is incorrectly set.

CONTRAST CONTROL The contrast knob, located in the top panel (Fig.1), regulates the contrast level of the picture. Turning this control slowly clockwise increases the picture contrast from grays to black and white. Excessive contrast gives blurred or feathered outline to the images which lack half tones, while too little contrast results in an extremely gray image without character or depth. The correct adjustment is to set the controls (both Contrast and Brightness) where black objects appear on the screen as a very dark grey. See picture chart - (Fig.5) shows the received test chart picture with the controls set correctly. (Fig.6) illustrates the picture with the contrast advanced too far.

BRIGHTNESS CONTROL For controlling brightness level of picture, observe the difference between operating this control and the Contrast control. Both controls should be operated together. For example, if the contrast is adjusted correctly and the picture illumination is too low or too bright, and the Brightness control readjusted for more or less illumination, the picture contrast will change. Hence, the Contrast control must be readjusted. Therefore, whenever the Contrast control is turned clockwise, the Brightness control must be turned counter-clockwise. (See picture chart - (Fig.7 and Fig.8).

NOTE FIG.8 If the Brightness control is operated too high and the Contrast control too low, white diagonal lines will be seen across the picture, which indicates that the Brightness control must be reduced. In some cases, if the antenna pickup is insufficient, the same results will occur.

Always remember to turn the Brightness and Contrast controls completely counter-clockwise when viewing is over.

(Fig.7) indicates what occurs to the picture when the Brightness control is advanced too far. The picture is thin and lacks blacks.

HOW TO RECEIVE THE PICTURE Before turning the receiver on, proceed as follows:

1. Turn Brightness and Contrast controls (Fig.1) completely counter-clockwise.
2. Open doors of radio panels (Fig.1). Turn wave band Selector knob marked S-I-M-A-P-T to any position but "T".
3. Turn master OFF-ON Control (Fig.1) clockwise until click is heard.
4. Turn Volume Control (Fig.1) 1/4 turn clockwise.
5. Turn Wave Band Selector knob S-I-M-A-P-T to position "T".
6. Turn Television Selector switch to correct position.
7. Turn Contrast control fully counter-clockwise and then turn Brightness Control clockwise slowly until a slight illumination appears on the screen. Then turn counter-clockwise until illumination just disappears.
8. Advance the Contrast Control until the picture appears at its best. Then advance Brightness Control clockwise slowly, if necessary, and readjust both controls for most suitable picture. A little practice of these adjustments will enable you to easily obtain the correct setting. Incorrect control settings give similar results to under or over exposed photograph prints.
9. If an interfering ripple is observed in the picture, adjustment of the fine tuning knob (Fig.1) may reduce or eliminate the trouble.
10. Readjust the sound volume and tone controls (Fig.1) to your liking.
11. Always turn wave band Selector knob (Fig.1) to any position but that marked "T" before turning receiver "off".

RADIO OPERATION

THE DIAL AND CONTROLS In Fig.1 is shown the cabinet front, incorporating the controls necessary for correct operation.

Turn Master Power OFF-ON Tone Control clockwise to apply power to receiver. Should tuning scale fail to light, then the Wave Band Selector knob is in position "T". Turning to another position will light the scale.

WAVE RANGE SELECTOR CONTROL The Wave Range Selector controls the type of service.

The knob is marked S-I-M-A-P-T.

"S" position - short wave reception.
"I" position - intermediate short wave reception.
"M" position - manual tuning of standard broadcast.
"A" position - automatic push-button tuning of your six favorite Standard Broadcast stations.
"P" position - phonograph operation.
"T" position - television and accompanying sound.

PHONOGRAPH Model 8F12 contains an Automatic Record Changer which plays either eight 10" records or seven 12" records automatically. In Figure 3 is illustrated the method of operation.

Model 2F12 can be used with an external phonograph pickup of 4000 ohms or more by plugging into the phone jacks provided on the rear of the radio chassis.

EXTERNAL INTERCONNECTING OF COMPONENTS Figure 4 illustrates the interconnecting of the parts in the cabinet chassis assembly.

SERVICE NOTES

ANTENNA-GROUND — Connect the ANDREA Teleceptor transmission cable to the terminals marked "T" - "T".

Attach well-grounded insulated wire to terminal marked "G". Note that a wire from the rear of terminal marked "B" is connected to one side of screw terminal "T". This connection utilizes the Teleceptor antenna for all-wave radio reception.

Should a separate all-wave noise reducing antenna, such as the ANDREA No.50, be used for broadcast reception, remove above wire connection from terminal "T" and connect to terminal "B". Connect all-wave coupler to terminal "B" and "G".

HORIZONTAL CENTERING — The horizontal centering control is a screw driven adjustment located as shown in Fig.2 and made at the time of installation. It serves to center the picture horizontally on the picture screen. It may require slight resetting if the receiver location is changed, tubes replaced or power line conditions varied. See picture chart - Figure 11 indicates what occurs when this control is incorrectly set. Figure 5 is the correct position.

VERTICAL CENTERING — The Vertical Centering control is a screw driver adjustment shown in Fig.2 and is used to center the picture vertically with respect to the screen opening. Resetting may be necessary for the same conditions outlined under "Horizontal Centering". See picture chart - Figure 12 indicates what occurs when this control is incorrectly adjusted. Figure 5 is the correct position.

PICTURE HEIGHT — This control varies the height of the picture and is a screw driver adjustment made when the receiver is installed. See picture chart - Figure 13 shows what occurs when this control is incorrectly adjusted. Figure 5 is the correct position.

PICTURE WIDTH — This control increases or decreases the width of the picture and is a screw driver adjustment made at the time of installation. See picture chart - Figure 14 shows what occurs when this control is incorrectly set. Figure 5 is the correct picture.

FOCUS CONTROL — Located as shown in Fig.2, this control is designed to bring the television images into sharp focus or definition. This control, once adjusted, should not be tampered with. When correctly focused the lines of which the picture is composed are sharply defined. A slight rotation one or other direction will indicate defocusing. See picture chart - Figure 15 illustrates what happens when the focus control is incorrectly set. Figure 5 when correctly set.

At times during a given program, scenes may be out of focus while others are sharp. This condition arises at the transmitter and cannot be corrected at the receiver.

HORIZONTAL HOLD CONTROL — The purpose of this control is to reconstruct the receiver picture lines in exact synchronization with the transmitter. If they are not, the scan will be affected as follows:

(a) Distortion in shape.
(b) Several images will be seen.
(c) Numerous black dashes over screen.

A slight adjustment of this control in the one or the other direction will eliminate the above effects. See picture chart - Figures 16 and 17 shows what the picture looks like when this control is incorrectly set. Figure 5 shows the correct setting.

VERTICAL HOLD CONTROL — This control synchronizes the pictures at the receiver vertically with the transmitter. When out of adjustment, the picture may slip or revolve upwards or downwards at either a slow or fast rate. Turn the control in one direction. If the revolving motion is faster, then turn in other direction until the picture "locks in" as a single complete scene. See picture chart - Figure 18 illustrates the effect on the picture when this control is incorrectly set. Figure 5 shows the correct picture setting.

VERTICAL LINEARITY — This is controlled by means of a screw driver adjustment. The adjustment must be correct and in conjunction with the Height control to give the correct Vertical proportions to the picture. It may require readjustment if the Vertical Centering control is reset. See picture chart - Figure 19 indicates the unbalance in Vertical Height of the picture when this control is incorrectly set. Figure 5 shows the correct setting.

SETTING RADIO STATION BUTTON CONTROLS — The simplicity of the ANDREA RADIO push-button controls, requiring only the use of a thin-blade screw driver, makes it easy to set them accurately. This essential, for unless the controls are set exactly, the tone quality will be destroyed.

CHOOSING YOUR STATIONS — Make a list of the desired six stations to operate on the push-buttons. Set down their call letters and put them in the order of their kilocycle rating, the highest at the left to correspond to station 1 selecting button at the left. The kilocycle tuning ranges of the button controls are as follows:

Extreme Left	Station 1 -	1100 to 1600 KC.
	Station 2 -	800 to 1450 KC.
	Station 3 -	700 to 1250 KC.
	Station 4 -	700 to 1250 KC.
	Station 5 -	580 to 1050 KC.
Extreme Right	Station 6 -	530 to 1000 KC.

It is necessary to choose stations whose kilocycle ratings come within these push-button tuning ranges. The ranges given in the list above are conservative. Consequently, it may be possible to tune in a station which is just outside the range of any particular push-button control. For example, on Station 3, although the range is shown as 700-1250 KC., it may be possible to tune in a station on 660 KC., or one on 1300 KC. Select the proper markers for the stations on your list, insert the markers in the same order as your kilocycle list, starting with Station 1 on the first button on the left. Do not attempt to glue the markers in place. In the event you want to change a marker, you can pry it out with the point of a pin.

ADJUSTING THE PUSH-BUTTON STATION CONTROLS — Remove push-button escutsheon cover plate (Fig.1). All station adjustment screws and switch are now accessible for station adjustment from the front of the cabinet.

Remember to set the push-button adjusting switch: Located in the right hand corner of the push-button opening is a small lever. When adjusting the station controls, and only at that time, the lever should be turned to upper position, designated by red dot. Put wave band Selector switch in the "M" position for dial tuning.

Tune in the station manually, using call letters you have put on the first push-button. Then turn the Band switch to position "A". Push in the push-button you are going to adjust, and turn the volume control to maximum. When the set has been turned "ON" for at least 10 minutes so that it has become thoroughly warm, you will be ready to make the push-button adjustments. The adjusting screws can be reached easily. Each push-button has two adjustment controls marked "ANT" and "OSC", in pairs. The pair corresponding to Station 1 on your list at the extreme left. This set is so designed that the tuning indicator operates with the push-buttons as well as with manual tuning. Therefore, you can adjust the controls with absolute accuracy by watching the opening and closing of the indicator.

The exact setting for each adjustment is obtained when the Mystic Ray indicator is closed as far as possible.

Use a thin-blade screw driver to adjust the screws: Do not force a thick blade into the slots. First adjust the oscillator screw for Station 1, turning it until you hear the station you tuned in previously on the dial. If the speaker breaks into a howl during this adjustment, turn the Station 1 antenna screw to the right or left until the howl stops.

After you have an accurate setting of the oscillator screw, adjust the corresponding antenna screw for maximum volume. The final adjustment should be made by turning the oscillator screw while you watch the opening of the Mystic Ray indicator. Then, in the same way, get a final adjustment for the antenna screw.

Repeat the same routine adjustments for Station 2 by tuning the station on the dial first with Wave Selector switch in "M" position, then changing "OSC" screws. Continue this method for each station and button.

To check the accuracy of the settings, turn the Wave Band switch to position "M". The station should sound practically the same whether the switch is in the "A" or "M" position. If there is considerable difference, the station is not tuned accurately with the dial, or else the corresponding push-button controls were not set correctly.

To change any button to another station, if the station's kilocycle rating is within the range of the corresponding controls, it is only necessary to put in a new button marker, and to reset the controls in accordance with the preceding instructions.

CAUTION — This is very important: When all adjustments have been made, it is necessary to touch up each one again, to assure absolute accuracy. After this has been done, turn the push-button adjusting lever down to black dot marked normal operation. Otherwise, loss of efficiency and quality will result. Replace push-button escutscheon cover plate, taking care that the holes in cover align with buttons.

MODEL 21-F-5 AND 21A-F-5

WHEN R.F. REALIGNMENT IS NECESSARY, LOOP TRIMMING AT 1500 KC. AND OSC. AT 600 K.C. ADJUSTMENT MUST BE MADE WITH CHASSIS INSTALLED IN CABINET, AND BACK OF CABINET (CONTAINING LOOP) CLOSED, OTHERWISE POOR PERFORMANCE WILL RESULT.

A.C.-D.C. LINE PLUG MUST BE INSERTED IN CHANGE OVER PLATE FOR BATTERY OPERATION.

ALIGNMENT PROCEDURE

Set the signal generator at 455 kc., and connect the high side to the grid of the 1A7GT, through a .1 mfd. condenser. Align the two trimmers on the 1st and 2nd I.F. transformers, indicated in the illustration, for maximum output.

Connect the high side of the signal generator through a 200 mmfd. condenser to the ANT post of the receiver, and the ground side to the GND post of the receiver. Connect a copper-oxide meter across the voice coil of the loudspeaker.

Set the signal generator at 1500 kc., the dial pointer at 1500 kc., and adjust the oscillator trimmer on the gang condenser for maximum output.

With the back of the set closed, remove the plug button at the rear of the case and adjust the loop shunt condenser through the hole for maximum output at 1500 kc.

Set the signal generator at 600 kc., and the dial pointer on the set at 600 kc. Remove the plug button at the back of the case, and adjust the oscillator series condenser through the hole for maximum output. While you make this adjustment, rock the tuning condenser control knob slightly for each small adjustment of the oscillator series condenser. Otherwise, the alignment will not be accurate.

I.F. = 455 K.C.

Set the signal generator at 1500 kc., and check the dial calibration. If the calibration is off, readjust the oscillator shunt trimmer on the gang condenser.

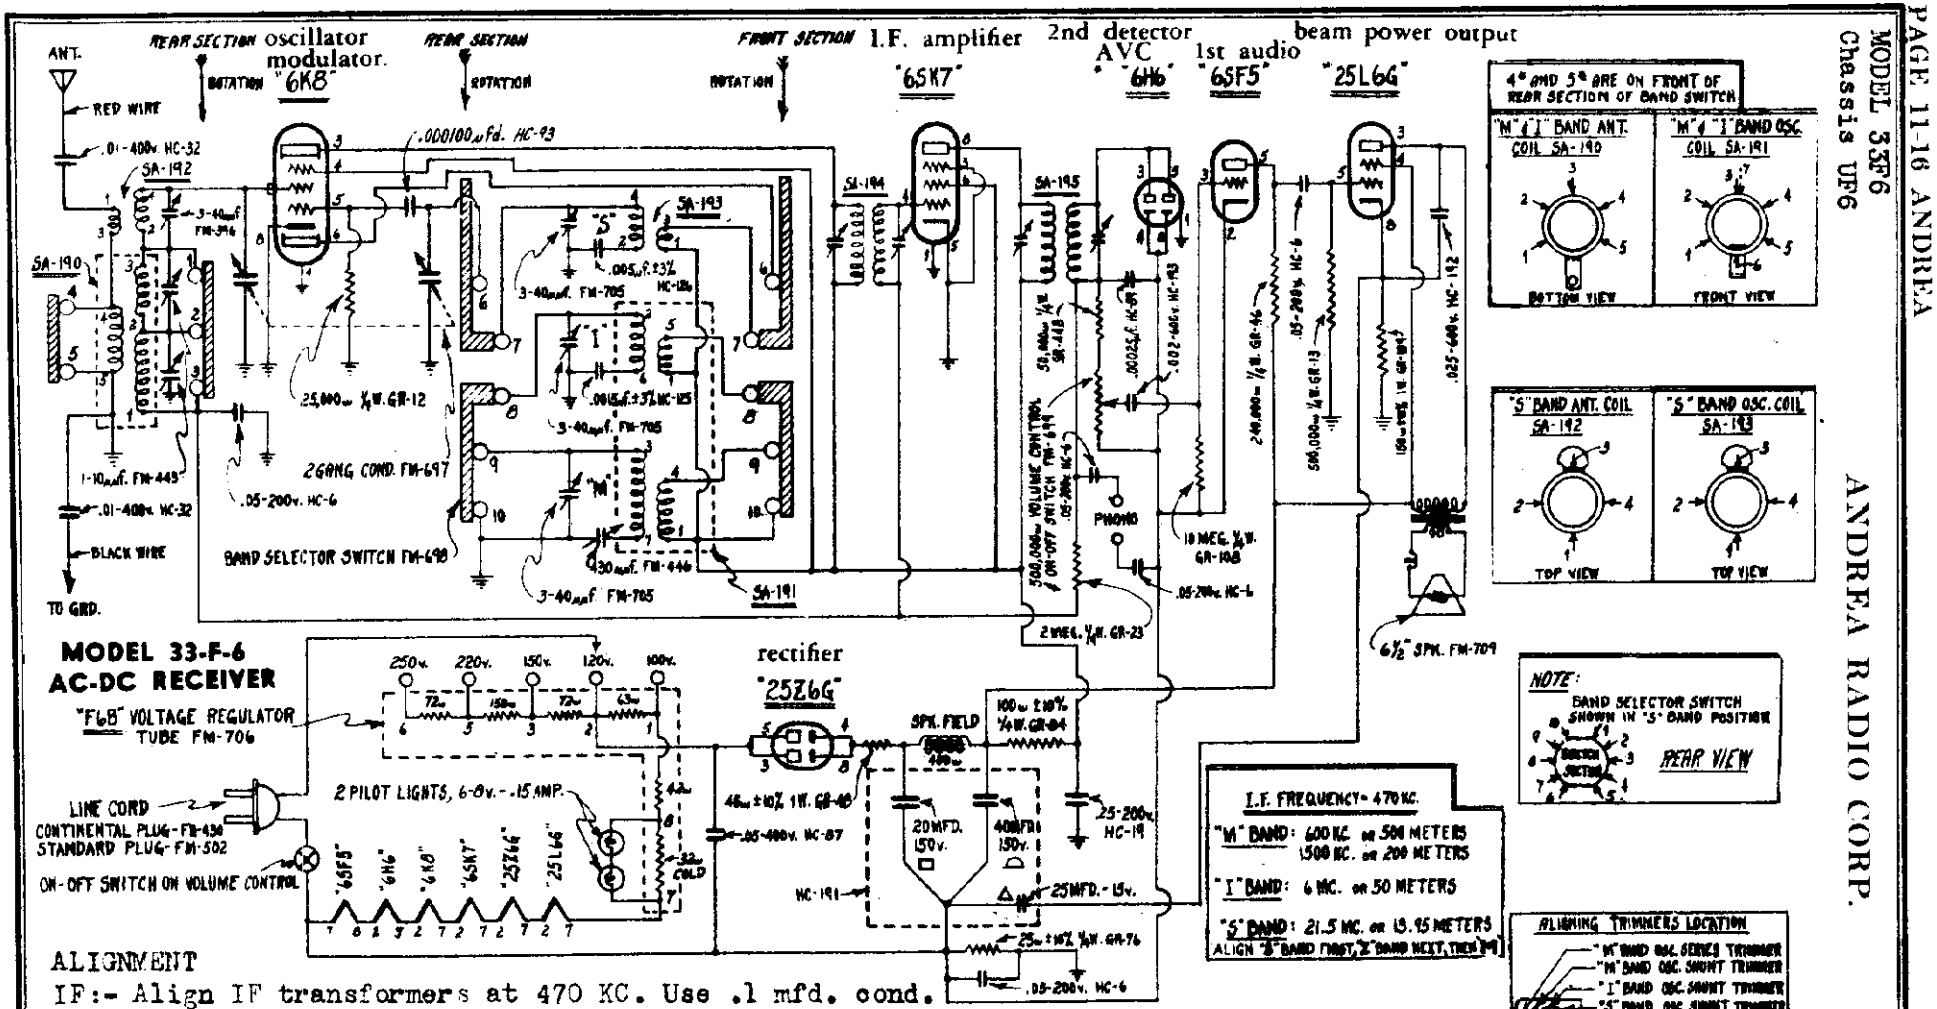
Alignment



ALIGNMENT

IF:- Align IF transformers at 470 KC. Use .1 mfd. cond. "dummy" to 6K8 grid.

"S" Band:- Use 400 ohm series "dummy" to antenna (red) lead, switch at "S". Align Osc. Shunt Trimmer at 21.5 mc. Peak at minimum capacity. Now adjust antenna shunt Trimmer while rocking condenser, to maximum signal response.

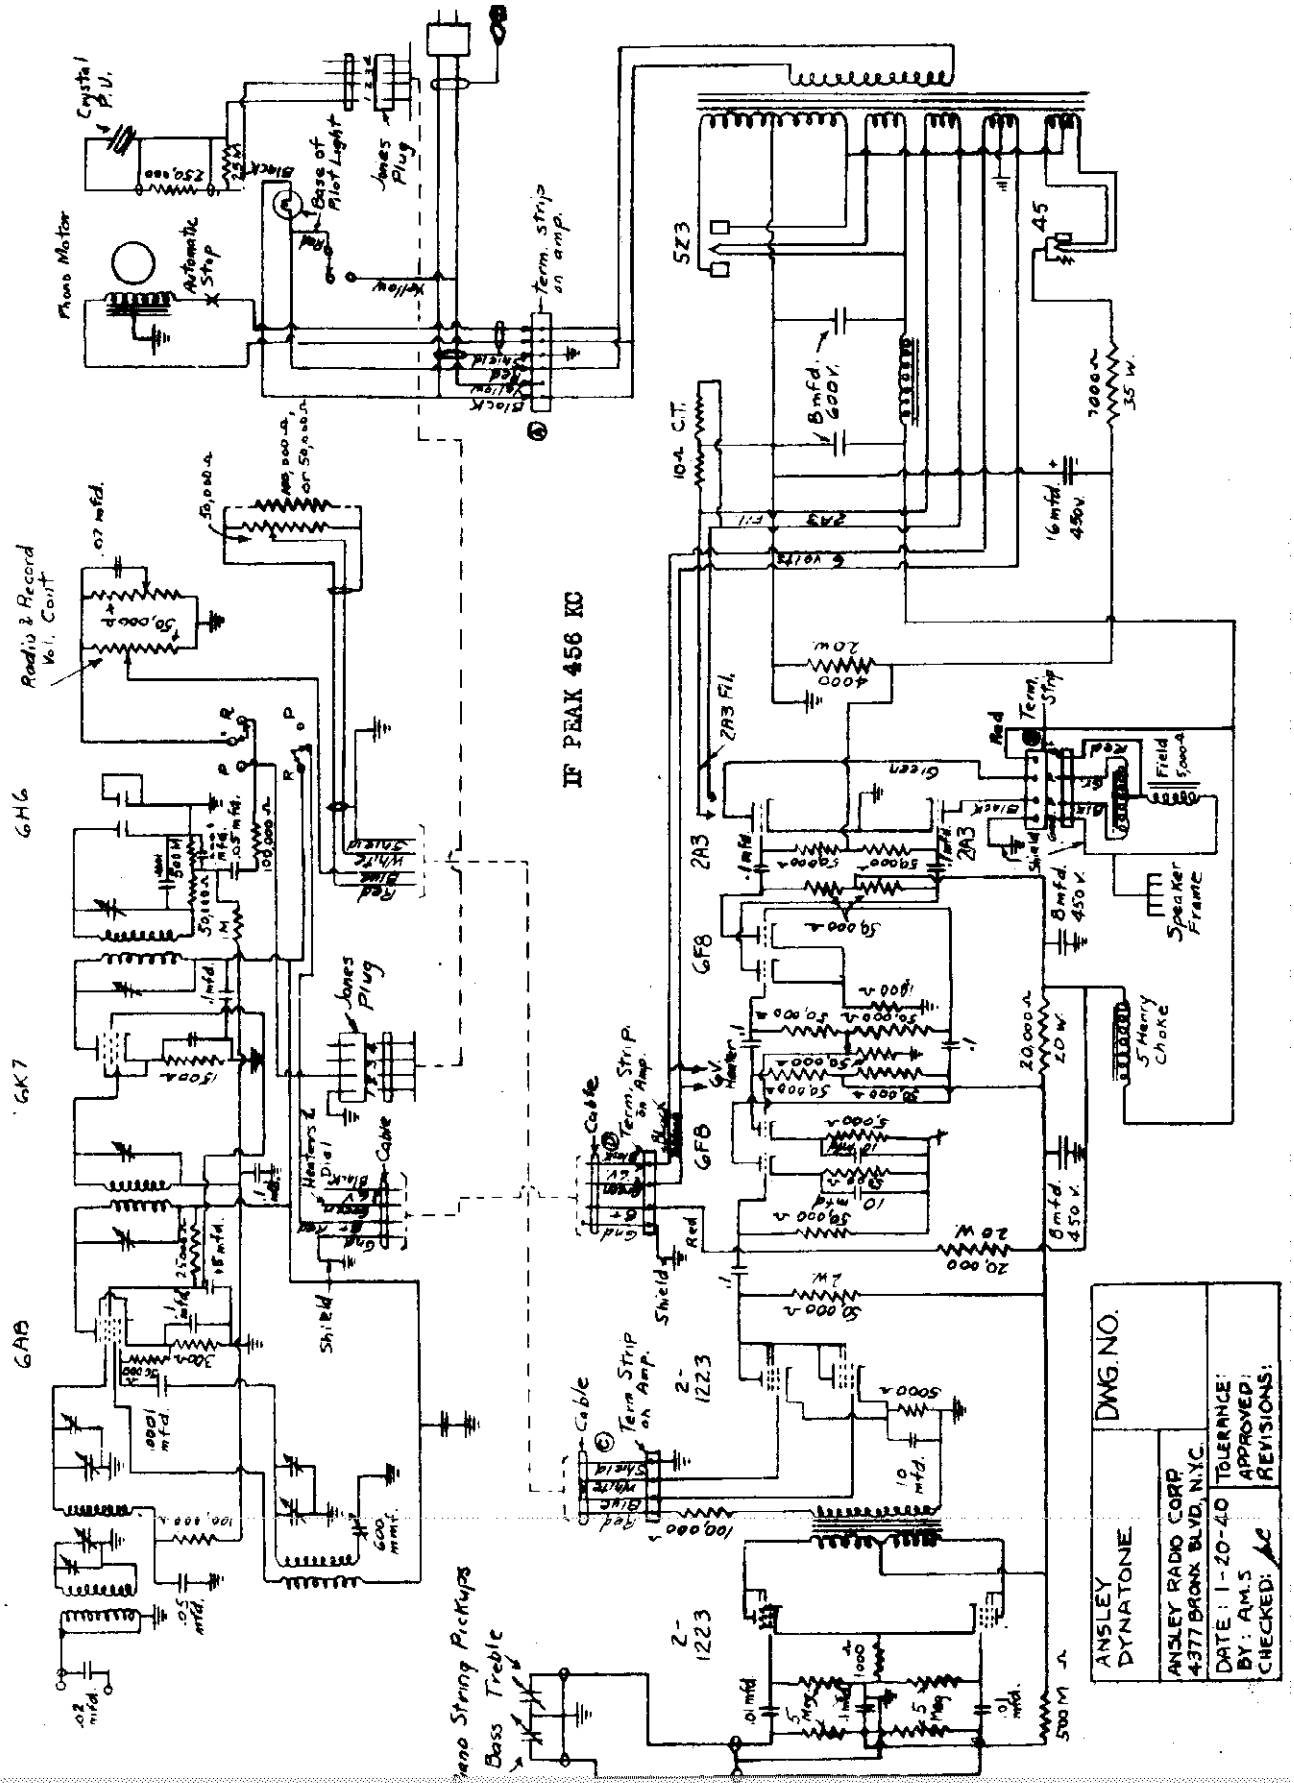
"I" Band:- With connections as for "S" band, switch at "I", dial and generator at 6 mc. align "I" Osc. Shunt Trimmer to maximum signal while rocking condenser.

"M" Band:-Use .00025 mfd. cond. as "dummy". Switch at "M", dial and generator at 1500 KC, adjust "M" Osc. Shunt, then "M" Ant. Shunt trimmer to maximum response. Adjust "M" Series trimmer at 600 KC for maximum response. Check adjustment at 1500 KC

PHONOGRAPH RECORDS: Use a pick-up of 2,000 to 8,000 ohms. Lower resistance requires a matching transformer.

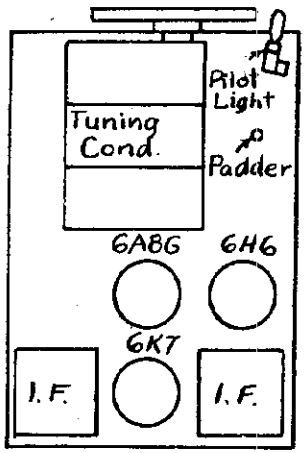
MODEL Dynaton
Schematic

ANSLEY RADIO CORP.



ANSLEY RADIO CORP.

SERVICE: ELECTRICAL SYSTEM. The most common cause of trouble is dirt falling bet. strings and pick-up heads causing noise. To elim. this shut off current, press down sustaining pedal, and bang on keys up and down the keyboard. If not dislodged take off back panel and blow out obstruction with hand bellows. Another source of trouble might be tube with microphonic characteristics, which would show up as high-pitched whistle or singing noise in speaker. If any note is too loud or soft take off back panel, trace strings to lower end, loosen lock nut and turn screw back a bit to soften, or in a bit to louden the note, being careful that pick-up head never touches strings at their extreme of vibration. Tighten lock nut after this operation. Amplifier is located under top cover. For tuning strings remove the 2 large screws holding amplifier brackets to back frame. Amp. can then be tilted back and held in raised pos. by 2 hinged wooden strips designed to hold it up for tuning or service. INSTALLATION (AC only). Ground spring clip. If pilot light does not indicate current flowing, a fuse in cable plug may have blown out. Use a five-ampere fuse - never more than 10-ampere. Connect lead-in wire from aerial to upper binding post marked "ANT". Gnd.conn. in cable usually suffices, but may be improved if cable clip is conn. to plate of wall socket, extra gnd.wire run from lower bind. post to clamp on radiator or pipe. CONTROLS: RADIO DIAL. Covers standard American bc band, 550 to 1,600 kc. TUNING KNOB. Operating pointer on radio dial. TONE CONTROL KNOB. For records and radio - variable. Turned to left, high freq. reduced, static and needle scratch reduced; to right for high fidelity. VOL. CONTROL KNOB. For records and radio, increasing to right. Should be turned to "off" pos. when neither is in use, or when switching from one to the other. DYNAPHONE TURNTABLE. Motor speed regulator set for correct 78 r.p.m. with pointer in center of scale. MAIN SWITCH & PILOT LIGHT. Pilot light glows if power is on. VOL. CONTROL FOR DYNATONE. Turned to extreme left there is no amplification and harpsichord quality is produced; to right, piano quality; in median pos., to 6-ft. grand piano. Should be turned off when Dynaphone or Radio is in use, unless to accompany a record at the keyboard. SOFT PEDAL, at left. SUSTAINING PEDAL, at right. Keyboard and action are standard in every way. Pedals are regular soft and sustaining or "loud", having usual functions in correct location of the lyre of the grand piano. There is nothing unusual about playing the ANSLEY DYNATONE. The pianist simply has the privilege of altering the general volume level and character of the tone by means of the controls provided; an advantage the earlier or acoustical piano cannot offer.



Below the keyboard at the right, back of the small door, are the customary controls for Dynaphone and Radio. In case of serious trouble with amplifier and power units, it may be necessary to disconnect and return to the factory. All connections to these parts are made with detachable plugs. RADIO-DYNAPHONE SELECTOR KNOB. Turn to the left to play records, to the right for radio.

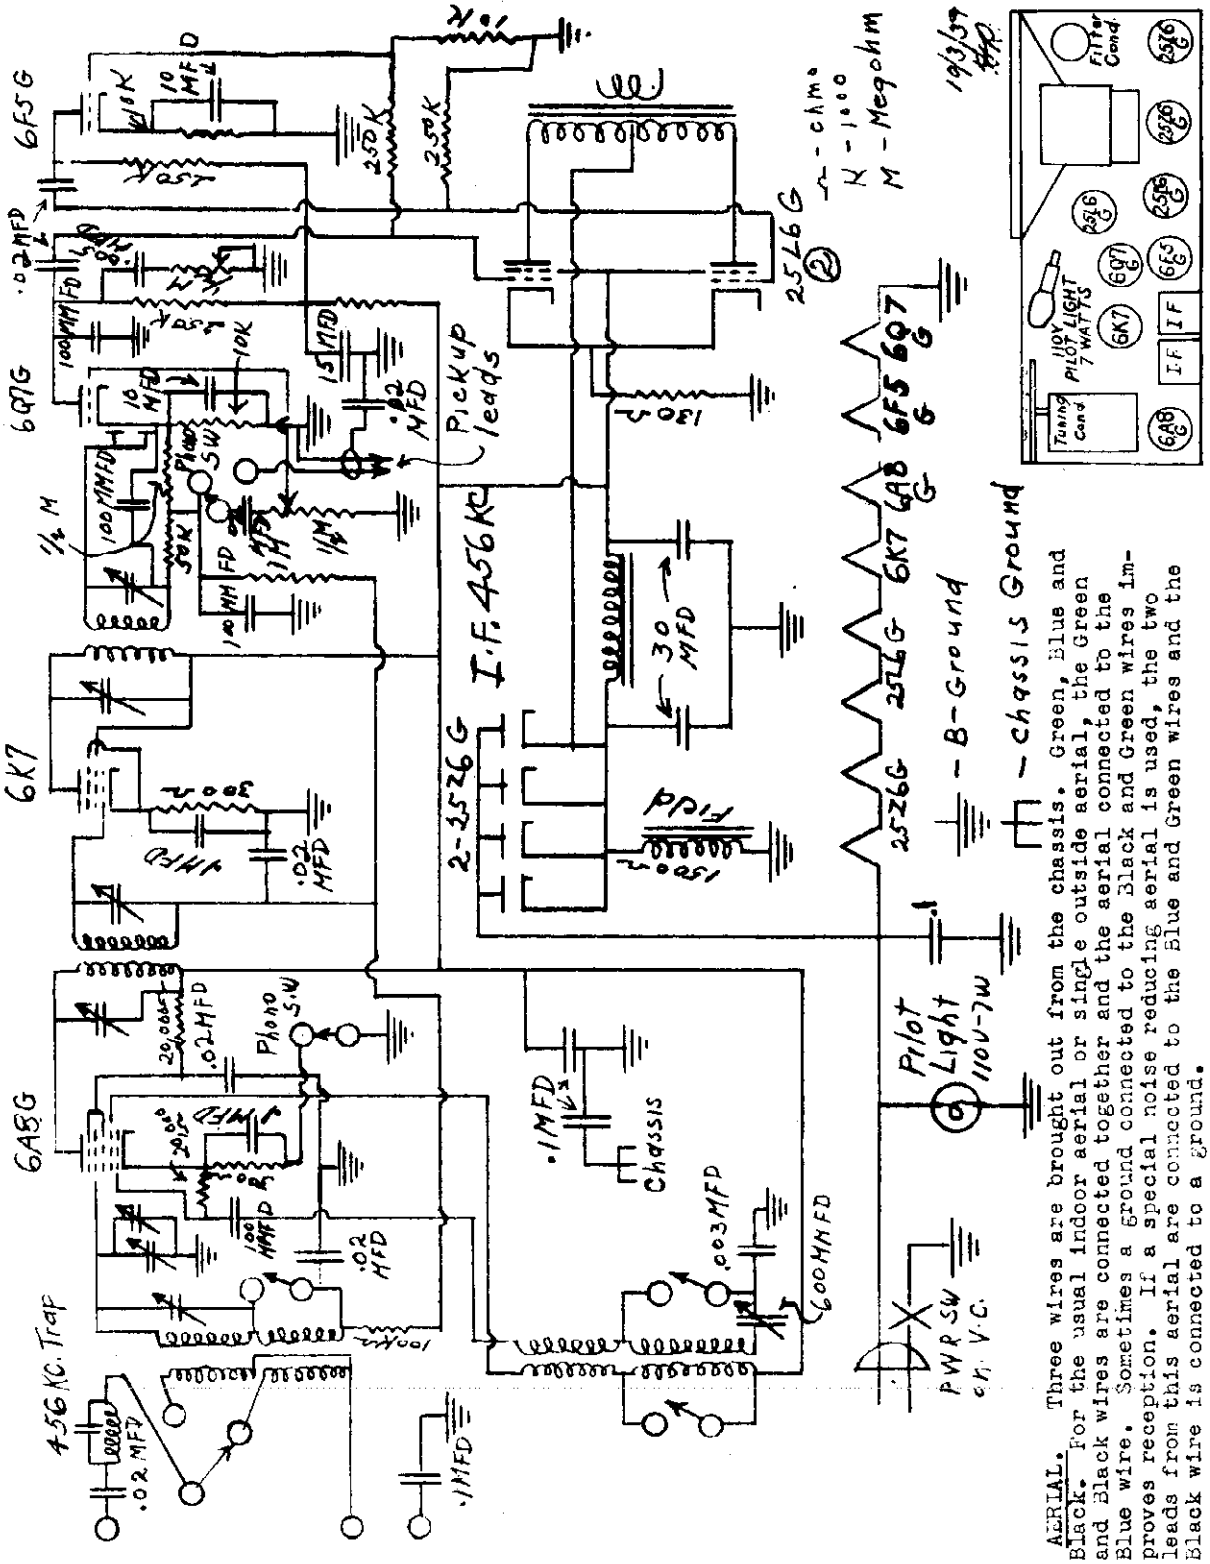
Schematic, Socket



AERIAL. Three wires are brought out from the chassis. Green, Blue and Black. For the usual indoor aerial or single outside aerial, the Green and Black wires are connected together and the aerial connected to the Blue wire. Sometimes a ground connected to the Black and Green wires improves reception. If a special noise reducing aerial is used, the two leads from this aerial are connected to the Blue and Green wires and the Black wire is connected to a ground.

SETTING PUSH BUTTONS MODELS 106, 148, 148-2, 168, 359.

1. By means of the Station Selector Knob tune in WITH THE RIGHT HAND AS ACCURATELY AS POSSIBLE the station having the lowest frequency—that is, your selected station which is tuned in nearest the right-hand side of the dial.

2. After the station has been tuned in accurately with the right hand, continue to hold it in its exact position firmly, and with the left hand loosen the Push-Button to be set up for that station by unscrewing the Push-Button about one turn to the left (counter-clockwise).

3. Continuing to hold the Station Selector Knob in its exact position, PUSH THE PUSH-BUTTON IN ALL THE WAY with the left hand.

4. After the Push-Button has been depressed all the way, tighten it gently toward the right (clockwise). Release Push-Button slowly and when in normal position grip button and tighten firmly.

The Push-Button tuning system is now correctly set up for your first selected station of lowest frequency and the Call Letter Tab for this station should be at the extreme right of the Call Letter Holder.

ALIGNMENT PROCEDURE MODELS 148, 148-2, 168.

All alignments must be made with the volume control turned full on and with the signal input from the generator reduced to as low a value as possible while still giving a sufficient output to be easily read on the output meter.

Connect the output meter, through a .5 M.F. condenser and a resistance of such a value as to make the total meter resistance approximately 7000 ohms, to plate of output tube and B+, or a low voltage A. C. meter may be used connected across speaker voice coil. The output meter remains connected during the entire alignment procedure.

Connect the signal generator to the grid cap of the 6A7 tube through a .1 M.F. condenser. Connect the ground of the generator to the ground lead of the receiver. Set the dial to about 1000 K.C., feed in a 455 K.C. signal: Adjust first and second I.F. trimmers for maximum output. Refer to chassis lay-out for location of trimmers.

Turn the dial to the extreme high frequency end. Feed a 1760 KC signal to the receiver antenna lead through a .00025 MF mica condenser. Adjust the 1760 KC oscillator trimmer until maximum output is shown. Set the generator to 1500 KC and tune in this signal on the receiver. Then adjust the 1500 KC antenna trimmer to the maximum output. Then impress a 600 KC signal into the receiver antenna lead and tune in this signal on the receiver. Adjust oscillator padding condenser to the maximum output. Follow through with this procedure several times in order to obtain the best alignment adjustment possible. This completes the alignment.

TUBE SOCKETS ARE VIEWED FROM UNDER SIDE OF CHASSIS.
VOLTAGE READINGS AT INDICATED SOCKET PRONGS ARE TO CHASSIS.
VOLTAGES MUST BE MEASURED WITH NO SIGNAL.
ALIGNMENT IS TO BE MADE AT THE FREQUENCIES SHOWN AT THE TRIMMER CONDENSERS.
WHERE NO VOLTAGE READING IS SHOWN AT SOCKET PRONG, IT INDICATES ZERO VOLTAGE OR A VERY LOW READING.
FIGURES AT CATHODES ARE CATHODE CURRENT IN MILLIAMPERES
CAPACITY VALUES ARE IN MICROFARADS.

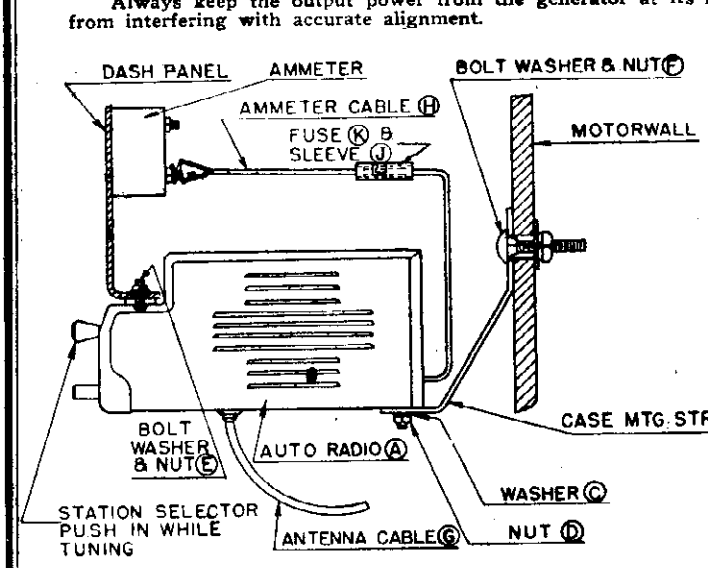
Output Meter Connections ..... **Across Loud Speaker Voice Coil**
Output Meter Reading to Indicate 1 Watt ..... **1.85 Volts**
Generator Ground Lead Connection ..... **Receiver Chassis**
Generator Modulation ..... **30%, 400 Cycles**
Position of Volume Control ..... **Fully On**

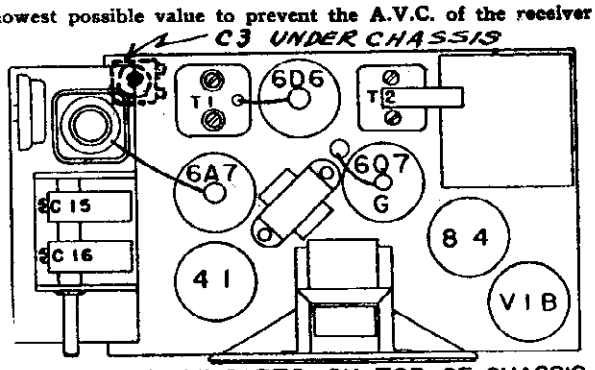
Position of Variable	Generator Frequency	Dummy Antenna	Generator Connection	Trimmer Adjustments (In Order Shown)	Trimmer Function
Closed	456 KC	.1 mfd.	6A7 Grid	T2, T1	I. F.
Fully Open	1580 KC	.0002 mfd.	Antenna Conn.	C16	Oscillator Trimmer
1400 KC	1400 KC	.0002 mfd.	Antenna Conn.	C15	Antenna Trimmer
600 KC	600 KC	.0002 mfd.	Antenna Conn.	C3	Antenna Padder

The variable condenser should be at 600 k.c. for antenna adjustment.

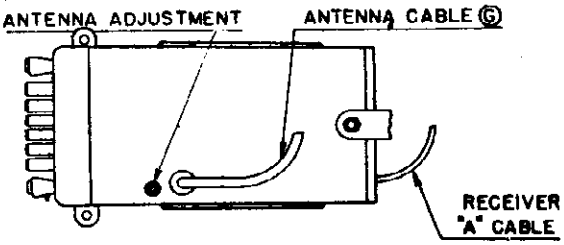
The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy. A final adjustment of antenna padder condenser C 3 is always made after the receiver is installed in the car, in order to match the car antenna.

Always keep the output power from the generator at its lowest possible value to prevent the A.V.C. of the receiver from interfering with accurate alignment.





LOCATIONS OF PARTS ON TOP OF CHASSIS



If an antenna was located coming from the corner post of the car, it will probably have an inner wire covered with the metal braid. (If it has a plug at its end, cut off the plug). Scrape clean and solder the white wire of the receiver's antenna lead to the inner wire of the car antenna lead. Be certain these inner wires do not at any time touch the outer shield. (See Fig. 5.)

After the connection is cleaned and connected, cover the joint carefully with tape. (See Fig. 6.)

Connect the pigtail of the receiver's antenna wire to the pigtail braid of the car's antenna lead-in. Wrap pigtails and solder together using rosin core solder. IMPORTANT—Make certain when bolting soldered pigtail ends to car that the section is scraped clean and a good chassis ground. (See Fig. 7.)

MODEL P72

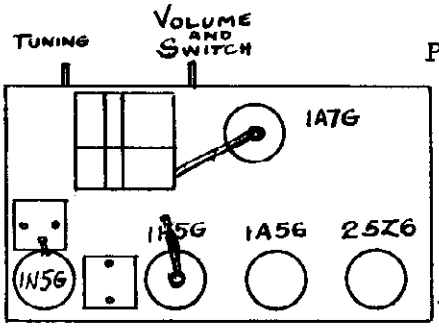
PUSH-BUTTON LINE-UP MODELS 442,443,446

To adjust push-buttons to desired stations:

1. Press second button from right and tune in manually the one of the four desired stations having the lowest number of kilocycles (nearest right hand end of tuning dial). Note its program.
2. Press third button from right with volume control set to full volume, insert screwdriver blade into slot of large screw in corresponding hole at rear of set directly behind this button, and rotate one turn or two in either direction until same station is heard at maximum volume, then adjust small screw in same hole until greatest volume and best quality are obtained.
3. Adjust fourth button in the same manner to the desired station with the next higher kilocycle reading (next station to the left on the manual tuning dial).
4. Repeat this procedure for buttons 5 and 6.

In some cases it may be desirable to make a slight final readjustment on all four buttons some time after the original setting, to compensate for changes due to temperature and climatic conditions.



MODEL P57

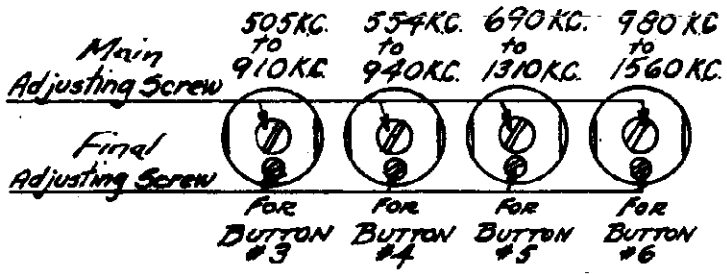
PUSH-BUTTON DATA MODELS 402,403,404,405,406,408

1. Loosen all buttons by turning them counter-clockwise.
2. Locate a desired station by manual tuning.
3. Adjust one button to this station by pushing button in as far as it will go, keeping the station tuned in, then release.
4. When button returns to original position, tighten it by turning clockwise. Station is now tuned in permanently on this button.
5. Repeat operations 2, 3 and 4 on each succeeding button until all have been adjusted to stations desired.

In some cases it may be desirable to make a slight final readjustment on all four buttons some time after the original setting to compensate for changes due to temperature and climatic conditions.

CAUTION: In setting up push buttons, for consistent reception, be sure the adjustments are made to the *local* station on a network broadcast, and that a weaker, distant station with the same program is not selected.

PUSH-BUTTON DATA MODELS 442,443,446



NOTE: To adjust to desired station, press in corresponding button directly in front. Turn main adjusting screw to obtain selected station, then turn final adjusting screw to obtain best clarity and volume. Do not turn volume control on full while making adjustments.

ALIGNMENT AND TRIMMER LOCATIONS

IF. Connect signal lead at 456 KC to the 6A8 control grid. Connect output meter across secondary of speaker output transformer. With weakest signal necessary to obtain .5 volt deflection on the output meter, peak the trimmers on the first and second IF transformers.

RF. Align intermediate band first. Follow procedure carefully. Connect a 200 mmf. condenser in series with the signal lead to the antenna terminal of the receiver. Turn the band switch counter-clockwise to the intermediate band position. Adjust oscillator trimmer located at the rear of the variable condenser, to 1560 KC with the variable condenser set at mechanical zero. Pad lower section of the dual padder, located under the composite coil, to 600 KC. Trim antenna section (front) of the variable condenser at 1400 KC.

Turn wave switch to the clockwise or long wave position. Adjust oscillator trimmer mounted on the wave switch to 346 KC with the variable condenser set at mechanical zero. Pad upper section of the dual padder at 149 KC. Adjust antenna trimmer to 300 KC through hole on top of the antenna coil.

When installed in an automobile best results will be had on the long wave band if the trimmer is readjusted. Tune in some station near 900 meters; remove the plug located on the right hand side of the receiver; insert a screwdriver into the trimmer condenser slot; and rotate slowly in either direction until best results are obtained.

MODEL 411, Series A
MODEL 510, Series A
Alignment

BELMONT RADIO CORP.

The alignment procedures for Belmont Model 411, Series A, and Model 510, Series A, are given below. Note "C" for Model 411 applies also to Models 407, 635, Series A, and 636, Series A and B.

MODEL 411 (Series A)

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 1A7G Tube	"M.W."	Rotor full open (Plates out of mesh)	Four trimmers on top (See Fig. 1)	Output and input I. F.	(See Note "A") Adjust to maximum output
MEDIUM WAVE BAND	1700 Kc.	.1 MFD.	Grid of 1A7G Tube	"M.W."	Rotor full open (Plates out of mesh)	Trimmer (C3) front section of gang (See Fig. 4)	Medium Wave Oscillator	(See Note "A") Adjust to maximum output
	1400 Kc.		See Note "C"	"M.W."	Set dial at 1400 Kc.	Trimmer (C2) rear section of gang (See Fig. 4)	Antenna	(See Note "B") Adjust to maximum output
LONG WAVE BAND	375 Kc.		See Note "C"	"L.W."	Rotor full open (Plates out of mesh)	Trimmer (C16) (See Fig. 5)	Long Wave Oscillator	Adjust to maximum output
	375 Kc.		See Note "C"	"L.W."	Rotor full open (Plates out of mesh)	Trimmer (C15) (See Fig. 5)	Antenna	Adjust to maximum output
	150 Kc.		See Note "C"	"L.W."	Set dial at 150 Kc.	Trimmer (C17) (See Fig. 5)	Long Wave Osc. Pad.	Adjust to maximum rock dial. (See note "D")

NOTE "A"—A 1 megohm resistor must be connected between the two loop antenna leads from the chassis when aligning the I. F. transformers and setting the oscillator trimmer, (C3). The loop antenna must be disconnected from the chassis.

NOTE "B"—Remove the 1 megohm resistor from the loop antenna leads; mount the chassis and the loop antenna in the cabinet, connect the loop antenna to the chassis. Adjust trimmer (C2). (See note "C").

NOTE "C"—Lay the output lead from the signal generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the signal generator.

NOTE "D"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

TEST FREQUENCIES USED:	Kilocycles	Meters
I. F.	465	645.1
Long Wave	150	2000
	375	800
Medium Wave	1400	214
	1700	177

MODEL 510 (Series A)

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Trimmer (C6) (See bottom of Radio, Fig. 3)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Trimmer (C3) (See bottom of Radio, Fig. 3)	Antenna	Adjust to maximum output (See Note "A")
	1400 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1400 Kc.	Adjust position of antenna coil up or down (see Fig. 4)	Antenna Coil Adjustment	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1720 Kc.	Adjust trimmer (C3) (See Fig. 3)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable up or down. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

Connect -B of radio chassis to ground post of signal generator through .1 mf condenser.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C3) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1720 Kc.

tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. All voltages are indicated on the voltage chart.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

The approximate current consumption is as follows: "A"—50 ma., "B"—8 ma.

SERVICE NOTES—

Voltages taken from different points of circuit to

ALIGNMENT NOTES

NOTE "A"—The loop antenna need not be connected to the radio when making these adjustments. The ground of the signal generator is connected to the negative "B" wire of the radio and the other lead from the signal generator in series with .1 MFD. dummy to the grid of the 1A7GT tube.

NOTE "B"—This adjustment should be made with the ground lead of the signal generator connected to the ground terminal of the loop assembly. The other lead of the signal generator is connected in series with a 200 Mmf. dummy to the antenna terminal of the loop assembly.

ALIGNMENT PROCEDURE CHASSIS 539.

No aligning adjustments should be attempted with the chassis in the cabinet.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 Mf., 200 Mmf., 400 Ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7 I. F. Tube	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SA7	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C7) (See Fig. 3)	Short wave oscillator	See Note "A" Adjust to maximum output
	21 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 21 MC	Trimmer (C1) (See Fig. 3)	Short wave antenna	Adjust to maximum output
MEDIUM WAVE BAND	6 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6 MC	Trimmers (C8, C2) (See Fig. 3)	Medium wave oscillator and antenna	Adjust to maximum output
	2.3 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 2.3 MC	Trimmer (C9) (See Fig. 5)	Medium wave osc. series pad	Adjust to maximum rock dial. (See note "B")
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Trimmer (C10) (See Fig. 3)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmer (C3) (See Fig. 3)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C11) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "B")

NOTE "A"—It is extremely necessary when making this adjustment that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental.

NOTE "B"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS MODEL 577D

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever an opening is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings of each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 1) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 1) to the right (clockwise) as far as it will turn, and tighten the special locking screw ("C") located on left side of tuner dial assembly (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns, select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

S1		On-Off Switch on Volume Control

Slight adjustments to the oscillator and antenna circuits can be made without removing the chassis from the cabinet through a hole which is provided on the bottom of the cabinet. (Remove snap-in button.)

The two adjustments on the trimmer assembly can be reached with a long insulated type screwdriver through this hole.

SERVICE NOTES:

Voltages taken from different points of circuit to —B are measured with all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 117 volt A.C. line.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

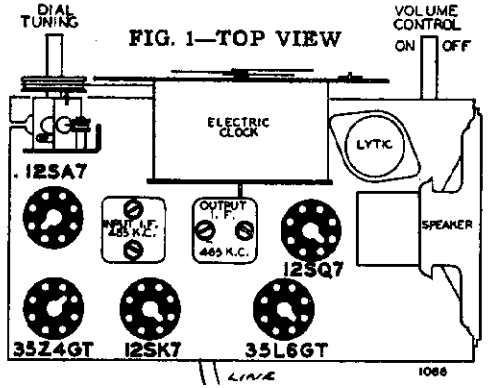

FIG. 1—TOP VIEW

Power Consumption——35 Watts
Power Output——800 Milliwatts Undistorted
1.2 Watts Maximum

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect —B of radio chassis to ground post of signal generator through .1 Mfd. Condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.

Model 571 Series A (Serial No. 189300 and up)

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Trimmer (C5) (See bottom of Radio, Fig. 3)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Trimmer (C2) (See bottom of Radio, Fig. 3)	Antenna	Adjust to maximum output
	1400 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1400 Kc.	Adjust position of antenna coil up or down (see Fig. 4)	Antenna Coil Adjustment	Adjust to maximum output (See Note "A")
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1720 Kc.	Adjust trimmer (C2) (See Fig. 3)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable up or down. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C2) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track; if the trimmer requires considerable change, it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1720 Kc.

MODEL 629 SERIES A (Serial No. 9L225000 and up)

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SA7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	18.3 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Rotor full open (Plates out of mesh)	Trimmer (C4) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 MC.	Trimmer (C3)	Short Wave antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C8) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1400 Kc.	Trimmer (C6)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C7) (See Fig. 5)	Broadcast oscillator series pad (Bottom of chassis)	Adjust to maximum rock dial. (See note "A")

NOTE "A." Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

CHASSIS 706, 707, and 708
ALIGNMENT PROCEDURE

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

- Tone control—in treble position.
- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf. 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7* I. F. Tube	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	23 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Set Dial at 23 MC	Trimmer (C15) (See Fig. 3)	Short wave oscillator	See Note "A" Adjust to maximum output
	23 Mc.	400 ohms	Antenna lead	Short Wave (Extreme Right Rotation)	Dial Set at 23 MC	Trimmer (C2, C12) (See Fig. 3)	Short wave antenna and R. F.	See Note "B" Adjust to maximum output
MEDIUM WAVE BAND	6.5 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6.5 MC	Trimmer (C16) (See Fig. 3)	Medium wave oscillator	Adjust to maximum output
	6.5 Mc.	400 ohms	Antenna lead	Medium Wave	Set Dial at 6.5 MC	Trimmer (C3, C13) (See Fig. 3)	Medium wave antenna and R. F.	Adjust to maximum output
BROADCAST BAND	2000 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme Left Rotation)	Rotor full open (Plates out of mesh)	Trimmer (C18) (See Fig. 3)	Broadcast oscillator	Adjust to maximum output
	1800 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1800 Kc.	Trimmer (C4, C11) (See Fig. 3)	Broadcast antenna and R. F.	Adjust to maximum output
	550 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 550 Kc.	Trimmer (C20) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "C")

NOTE "A"—It is extremely necessary when making this adjustment that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. As an example of this a fundamental 23 megacycle signal can be tuned in not only at 23 on the dial, but also at approximately 22 megacycles.

NOTE "B"—When adjusting the antenna and R.F. trimmers be sure and "follow" the signal to exact resonance by slight readjustment of the gang condenser as trimmer reaction on oscillator frequency is quite noticeable at high frequencies.

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

BELMONT RADIO CORP.

MODEL 709 S.P.U.
Installation Note:
CHASSIS 706
Voltage, Tuner

INSTALLING THE MODEL 709 POWER UNIT

(For 100-250 Volt 40/60 Cycle A. C. Operation)

In Chassis 706.

1. **Remove the chassis from the cabinet,** by removing the four chassis mounting bolts from the bottom of the cabinet.
2. Referring to Fig. 1, note that the **6-volt power unit** is fastened to the top of the radio chassis with **eight copper head screws,** (six on top of chassis, and two on rear flange of chassis).
3. Remove the eight copper head screws.
4. Disconnect the four flexible leads of the power unit from the chassis connector strip. These leads clip into pin jacks.

   Note that the color of each flexible lead matches the color dot on the chassis pin jack connector strip.
5. Place the model 709 A.C. power unit (see Fig. 2) on the top of the radio chassis and plug the four flexible leads into the pin jacks on the chassis connector strip.

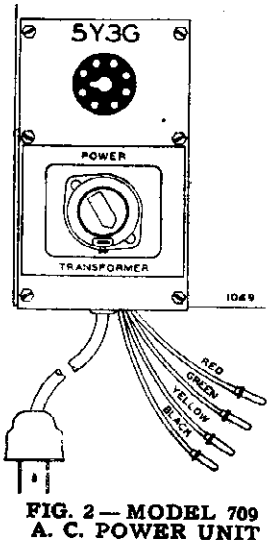

FIG. 2 — MODEL 709 A. C. POWER UNIT

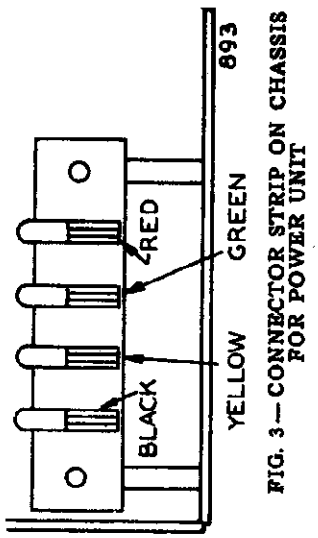

FIG. 3 — CONNECTOR STRIP ON CHASSIS FOR POWER UNIT

(a) The **red lead** should be plugged into the pin jack which is marked with a **red dot.**

(b) The **green lead** connects to the pin jack which is marked with a **green dot.**

(c) The **yellow lead** connects to the pin jack which is marked with a **yellow dot.**

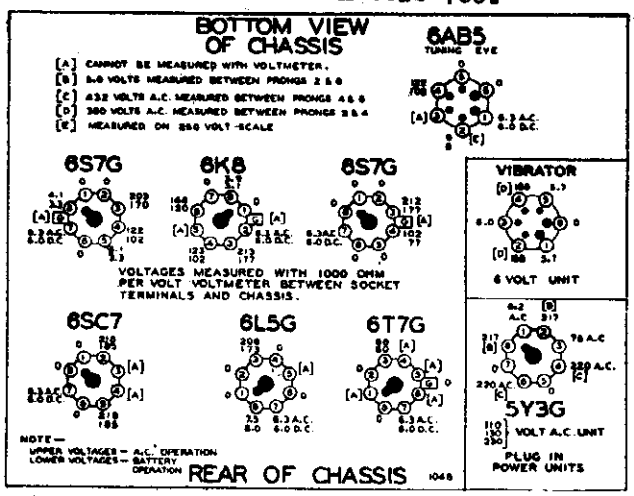
(d) The **black lead** connects to the pin jack which is marked with a **black dot.**

6. **Mount the power unit to the chassis using the eight copper head screws.**

IMPORTANT:

After the A.C. power unit has been installed check the connections again to make sure you have followed the instructions correctly. Set the switch on the top of the power transformer to the proper voltage.

VOLTAGE DATA CHASSIS 706.



All voltages as indicated on the voltage chart are measured with a fully charged 6 volt storage battery or from 117 volt A. C. line if the Model 709 A. C. power unit is installed in place of the 6 volt power unit.

PROCEDURE FOR SETTING THE AUTOMATIC PUSH BUTTONS

For Chassis 706, 707, 708, 792, and 793B.

1. Pull the "Reset" button **all the way out** (see control No. 6,), and rotate the button to the **left** (counter-clockwise) until it cannot be turned any further.

You will note that as the button is rotated it will turn easily until the pointer reaches the end of the dial scale and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point the button will turn quite easily again until the tuner mechanism is **completely unlocked.** At this point do not force the button any further. The tuner mechanism is now **unlocked.**

(NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

2. Push in **all the way** any one of the push buttons and at the same time **push in firmly on the dial tuning knob. Both** the **dial tuning knob** and the **push button should be pushed hard** enough to make them **stay latched in.**

You may find it necessary to **rotate the dial tuning knob slightly when pushing it in to make certain that the gears mesh properly.**

For Chassis 792 and 793B only.

3. **Both the pushbutton and the dial tuning knob are now latched in. Do not hold the pushbutton in by hand while tuning** in a station. Tune in by means of the dial tuning knob the station indicated on the station call letter tab on the pushbutton which is latched in. Turn the dial tuning knob very slowly back and forth until the station is clearest. The station will then be accurately tuned in.

For Chassis 706, 707, and 708 only.

3. Press in on the **push button which is latched in.** Holding it in **firmly,** tune in by means of the dial tuning knob the station indicated on the station call letter tab on this push button. Turn the dial tuning knob very slowly back and forth (while still pressing in firmly on the push button).

For all Models

4. Push in **all the way** another push button, at the same time push the dial tuning knob in so that **both the push button** and the **dial tuning knob** are **latched in together.** Holding the push button in **firmly,** tune in the station indicated on the call letter tab on this push button.

5. Follow this procedure until you have tuned in all of your favorite stations.

6. Pull the "Reset" button **all the way out** and rotate the button to the **right** (clockwise) until it cannot be turned any further. This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place.

CHANGING STATIONS:

If you should desire to change any station you selected to another, pull the "Reset" button all the way out and rotate the button to the left (counter-clockwise) and unlock the tuner mechanism. Select the new station as explained.
(NOTE:—If the dial mechanism works hard when setting up a new station for one of the automatic tuner push buttons, it is due to the tuner mechanism not being unlocked all the way. Pull the "Reset" button out all the way and rotate the button to the left (counter-clockwise) until it will turn no further. The dial mechanism should work freely with the tuner push button pressed in).

After you have selected the new station, pull the "Reset" button all the way out and rotate the button to the right (clockwise) to lock the tuner mechanism. Be sure the button is turned until it will turn no further.

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes.

The type and function of each tube is as follows.

1—Type 12SK7 R. F. Amplifier.

1—Type 12SA7 Mixer, First Detector-oscillator.

1—Type 12SK7 I. F. Amplifier.

1—Type 12SQ7 Second Detector, A.V.C. and First Audio.

1—Type 35L6GT Beam Output Amplifier.

1—Type 35Z5GT High Vacuum Rectifier.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control at minimum, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 117 volt A.C. or D.C. line.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this radio, the chassis should be removed from the cabinet. **It is important during alignment that the same distance between the loop antenna and the chassis be maintained as when the chassis is installed in the cabinet.**

ALIGNMENT PROCEDURE

IMPORTANT: SEE ALIGNING INSTRUCTIONS.

- Loop antenna connected to radio.
- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf.

BAND	SIGNAL GENERATOR Frequency Setting	SIGNAL GENERATOR Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 12SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	4050 Kc.	200 mmf.	Antenna Clip	Short Wave	Rotor full open (Plates out of mesh)	Trimmer C7 (See Fig. 3)	Short Wave oscillator	Adjust to maximum output

(See Fig. 2) FOR MODEL 792 SERIES A.

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the Short Wave Band and to the grid of the 12A8GT tube and ground terminal when setting the Broadcast Band oscill or end frequencies, (1550 and 540 K.C.).

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals. (See Fig. 1).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

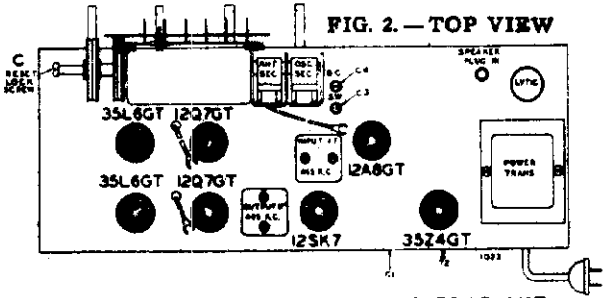

FIG. 2.—TOP VIEW

CHASSIS 792, 793B. ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning.

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 12A8GT Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C3 (See Fig. 5)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C8 (See Fig. 5)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C10 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROADCAST BAND (See Note A)	1550 Kc.	200 mmf.	Grid of 12A8GT	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C4 (See Fig. 5)	Broadcast oscillator	Adjust to maximum output
	540 Kc.	200 mmf.	Grid of 12A8GT	Broadcast	Set Dial at 540 Kc.	Trimmer C9 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGNMENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C1 (See Fig. 5)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer T2 (See Fig. 5)	Iron Core Tracking Coil	Adjust to maximum output

It is important during loop alignment that the same distance between the loop antenna and the chassis be maintained as when the chassis is installed in the cabinet.

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the **Short Wave Band** and to the grid of the **12A8GT** tube and ground terminal when setting the **Broadcast Band** oscillator end frequencies, (1550 and 540 K.C.).

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals and the jumper on the terminal board connected to "EXT." terminal (See Fig. 1).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 12A8GT Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 2)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C3 (See Fig. 5)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 17 Mc.	Trimmer C2 (See Fig. 5)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 6 Mc.	Trimmer C10 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROAD-CAST BAND (See Note A)	1550 Kc.	200 mmf.	Grid of 12A8GT	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C4 (See Fig. 5)	Broadcast oscillator	Adjust to maximum output
	540 Kc.	200 mmf.	Grid of 12A8GT	Broadcast	Set Dial at 540 Kc.	Trimmer C8 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGN-MENT (See Note B)	1400 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 1400 Kc.	Trimmer C1 (See Fig. 5)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer T2 (See Fig. 5)	Iron Core Tracking Coil	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the **Short Wave Band** and to the grid of the 12A8GT tube and ground terminal when setting the **Broadcast Band** oscillator end frequencies, (1550 and 540 K. C.).

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals and the jumper on the terminal board connected to "EXT." terminal. (See Fig. 1).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

BAND SWITCH	BAND	FREQUENCY RANGE
Extreme Right Rotation	Short Wave	5.7 to 18.3 MC.
Extreme Left Rotation	Broadcast	540 to 1550 KC.

Power Consumption (Radio Chassis only, less Phono Motor).....55 Watts
Power Output.....3 Watts Undistorted, 3.6 Watts Maximum
Intermediate Frequency.....465 K.C.

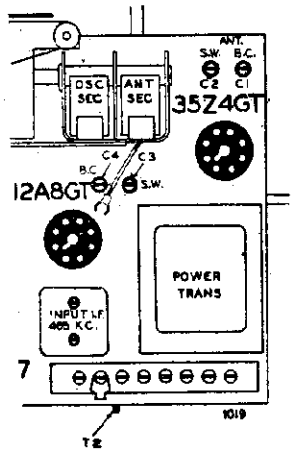

FIG. 5—TOP VIEW

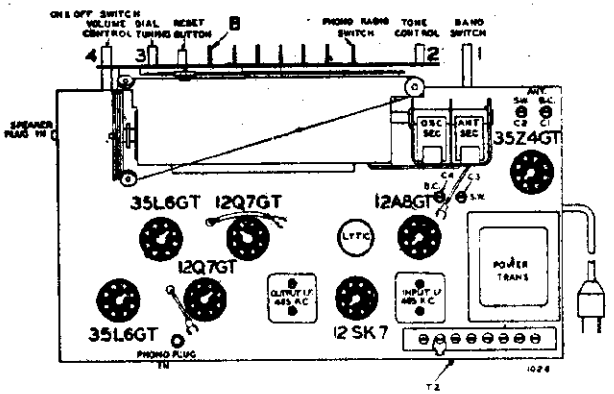

FIG. 2.—TOP VIEW

PHONOGRAPH OPERATION:

The Phono-Radio switch is of the push button type, (See button 5, fig. 3).

For Phono operation push Phono push button all the way in. This will disconnect the radio and connect the phonograph pick-up. The volume and tone controls on the front panel of the radio are used for either radio or for phonograph.

To switch back to radio playing position push in on any one of the automatic tuning push buttons or the manual dial tuning control knob.

Included with this manual is a separate instruction manual for the Automatic Record Changer. Before operating the Record Changer familiarize yourself with the controls and the operation of the mechanism.

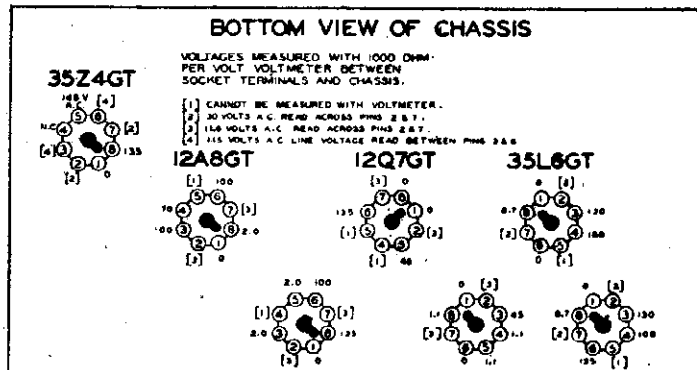
FOR ALIGNMENT SEE INDEX



SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts A. C. on the primary of the power transformer.

Consumption (Radio Chassis only, less Phono Motor).—55 Watt
Power Output.....3 Watts Undistorted, 3.6 Watts Maximu

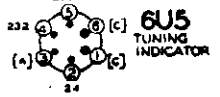
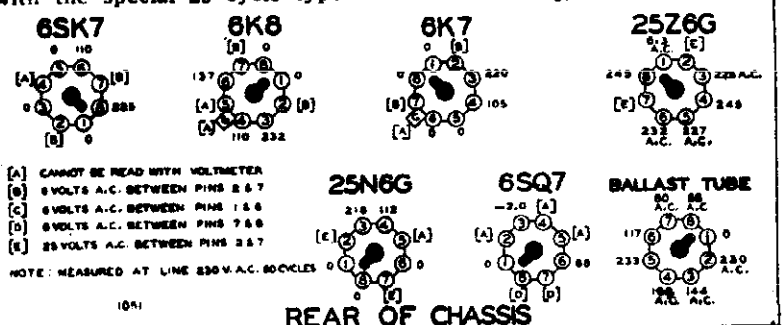
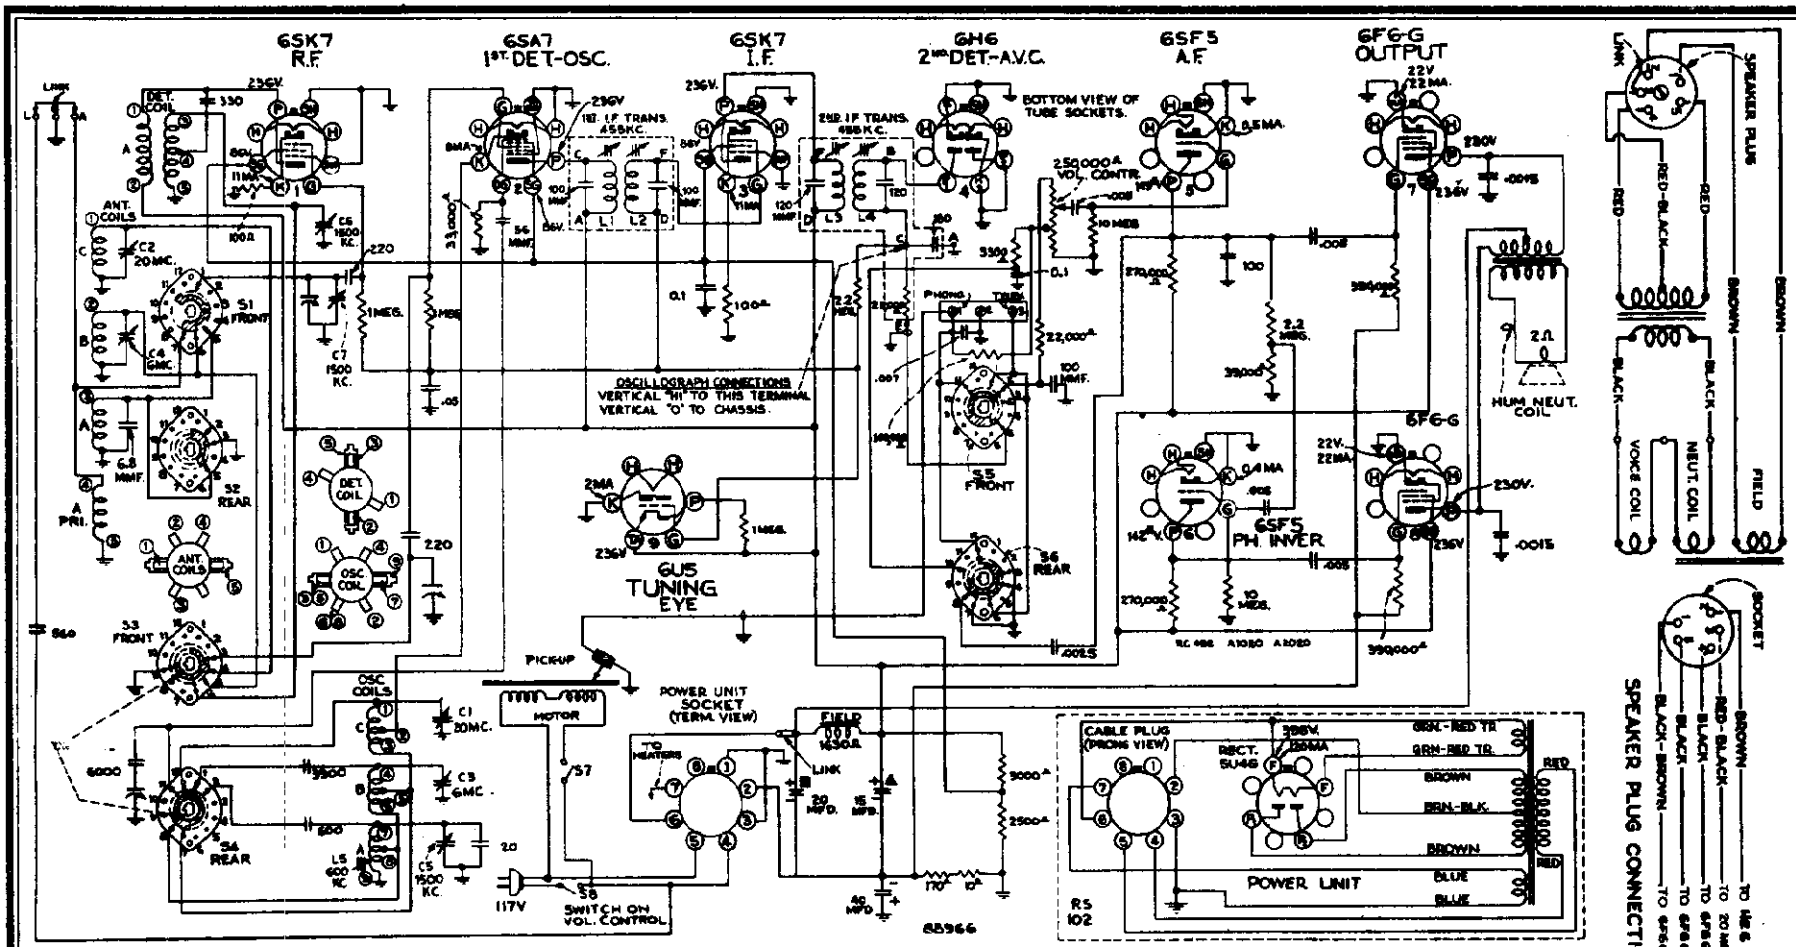
BOTTOM VIEW OF CHASSIS

VOLTAGES MEASURED WITH 1000 OHM PER VOLT VOLTMETER BETWEEN SOCKET TERMINALS AND CHASSIS.





REAR OF CHASSIS



Voltages should hold within ±20% with 117 V. A.C. supply.
*** Starred Voltages are operating voltages in circuits with high series resistance; the actual measured voltages will be lower, depending on the voltmeter loading.**

Models A-1020 and A-2020 Brunswick Panatropes are combination ten-tube, three-band superheterodyne receivers and automatic phonographs.

Power Supply Rating

Rating A..... 105-125 volts, 50-60 cycles, 130 watts

Power Output

Undistorted..... 10 watts
Maximum..... 12 watts

Loudspeaker (RL-70K2)

Type..... 12-inch electrodynamic
V-C Impedance..... 2.2 ohms at 400 cycles

hole is located in the motor casting, adjacent to the spindle bearing, and is covered with a screw plug.

Television Attachment.—A terminal board is provided on the rear of the chassis for connecting a Television attachment into the audio-amplifying circuit. The cable from the attachment should be connected to terminals 2 and 3, the shielded or ground lead going to terminal 2.

A Radio-Phono-Television switch is built into the chassis, allowing switching to be accomplished through the "Tone-Radio-Phono-Television" control on the control panel.

Loudspeaker.—To center the loudspeaker voice coil, first remove the front dust cover, then loosen the screws holding the spider assembly. Insert three narrow feelers into the air gap, and tighten the spider screws. Remove the feelers and fasten a dust cover in place with loudspeaker cement.

The crystal pickup is sealed in a metal case as protection

MODELS 1680,2660,2689, A2600,3689

BRUNSWICK DIV.-MERSMAN BROS.

Alignment, Trimmers, Socket, Dial Drive Data

1680, 2660, 2689 & A-2600

Alignment Procedure

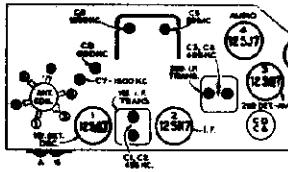
Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

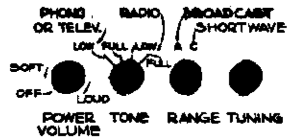
Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver ground binding-post, and keep the output as low as possible to avoid A.V.C. action.

Calibration Marks.—The tuning dial is fastened in the cabinet and can not be used for reference during alignment. Therefore calibration marks corresponding to dial readings of 600 kc, 1,500 kc, 6.1 mc, and 20 mc have been stamped in the plate on the front of the chassis as shown in the accompanying drawing. These marks are used for reference during alignment. With the gang condenser in full mesh, the indicator should point 1/16 inch to the left of the maximum capacity mark on the calibration plate.

Dial Indicator Adjustment.—When the chassis is placed in the cabinet and with the gang condenser in full mesh, the indicator should point to the mark at the extreme left (low frequency) end of the glass dial scale.



Tube and Trimmer Locations

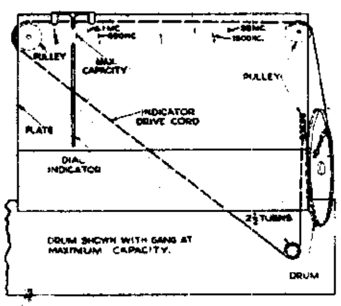


Controls

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	Antenna terminal	455 kc	"A" Band Quiet point between 550-750 kc	C3 and C4 (2nd I-F trans.)
2				C1 and C2 (1st I-F trans.)
3	Antenna terminal in series with 300 ohms	20 mc	"C" Band 20 mc calibration mark	C5 (osc.)*
4	Antenna terminal in series with 200 mmfd.	1,500 kc	"A" Band 1,500 kc calibration mark	C7 (osc.) C6 (ant.)
5		600 kc	"A" Band 600 kc calibration mark	C8 (osc.) Rock gang
6	Repeat step 4			

* Use minimum peak if two can be obtained. Check to determine that C5 has been adjusted properly by tuning receiver to approximately 19.09 mc where a weaker signal should be received.

Note: Oscillator tracks above signal on both bands.



Dial-Indicator and Drive Mechanism

Refer to "Alignment Procedure" for explanation of the "calibration marks" shown in this drawing

Adjustments for Push-Button Tuning

1680, 2660, 2689 & A-2600 A-1020 & A-2020

The push-buttons should be adjusted for six favorite stations after the receiver has been operating for a brief warm-up period. Each button may be set up to any standard broadcast station. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

1. Loosen the push-buttons by turning counter-clockwise about one turn from their tight position so they turn freely.

2. Check to be sure the Phono-Radio switch is in "Radio" position.

3. Press in push-button No. 1 (left) as far as it will go without undue pressure, hold in, retune station with manual control if necessary for best reception, and then carefully tighten up the button. Do not tighten more than ¼ turn after the screw begins to grip or damage to the mechanism may result.

4. Proceed in a similar manner for the remainder of the push-buttons.

5. Insert the station marker tabs in the recesses above the push-buttons.

A-1020 & A-2020

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic drawing.

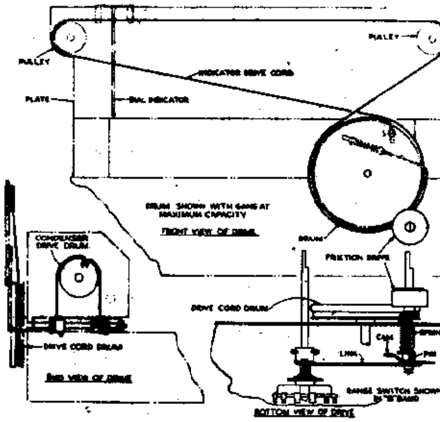
Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the tuning drum. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 120° mark on the drum scale must be vertical and directly under the center of the shaft of the tuning drum when the plates are fully meshed. The drum is held to the shaft by means of two set-screws, which must be tightened securely when the drum is in the correct position.

On the inner side of the tuning drum are two projections which serve as stops to prevent extreme rotation of the gang condenser. The tuning drum should be set so that the stop limiting clockwise movement of the drum takes effect just as the gang condenser plates are becoming fully meshed, thus preventing stress on the gang due to extreme rotation.



Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc	"A" band Quiet point between 550-750 kc	L3 and L4 (2nd I-F trans.)
2	6SA7 grid in series with .01 mfd.			L1 and L2 (1st I-F trans.)
3	Ant. terminal in series with 300 ohms	20 mc	20 mc (204.5°) "C" band	C1 (osc.)* C2 (ant.)
4		6 mc	6 mc (194°) "B" band	C3 (osc.)** C4 (ant.)
5	Ant. terminal in series with 200 mmfd.	1,500 kc	1,500 kc (198.5°) "A" band	C5 (osc.) C6 (det.) C7 (ant.)
6		600 kc	600 kc (38°) "A" band	L5 (osc.) Rock gang
7	Repeat step 5.			

* Use minimum capacity peak if two can be obtained. Check to determine that C1 has been adjusted to correct peak by tuning receiver to approximately 19.09 mc where a weaker signal should be received.

** Use minimum capacity peak if two can be obtained. Check to determine that C3 has been adjusted to correct peak by tuning receiver to approximately 5.09 mc where a weaker signal should be received.

Note.—Oscillator tracks above signal on all bands.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the chassis, and bend the wire so that it points to the 0° mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.

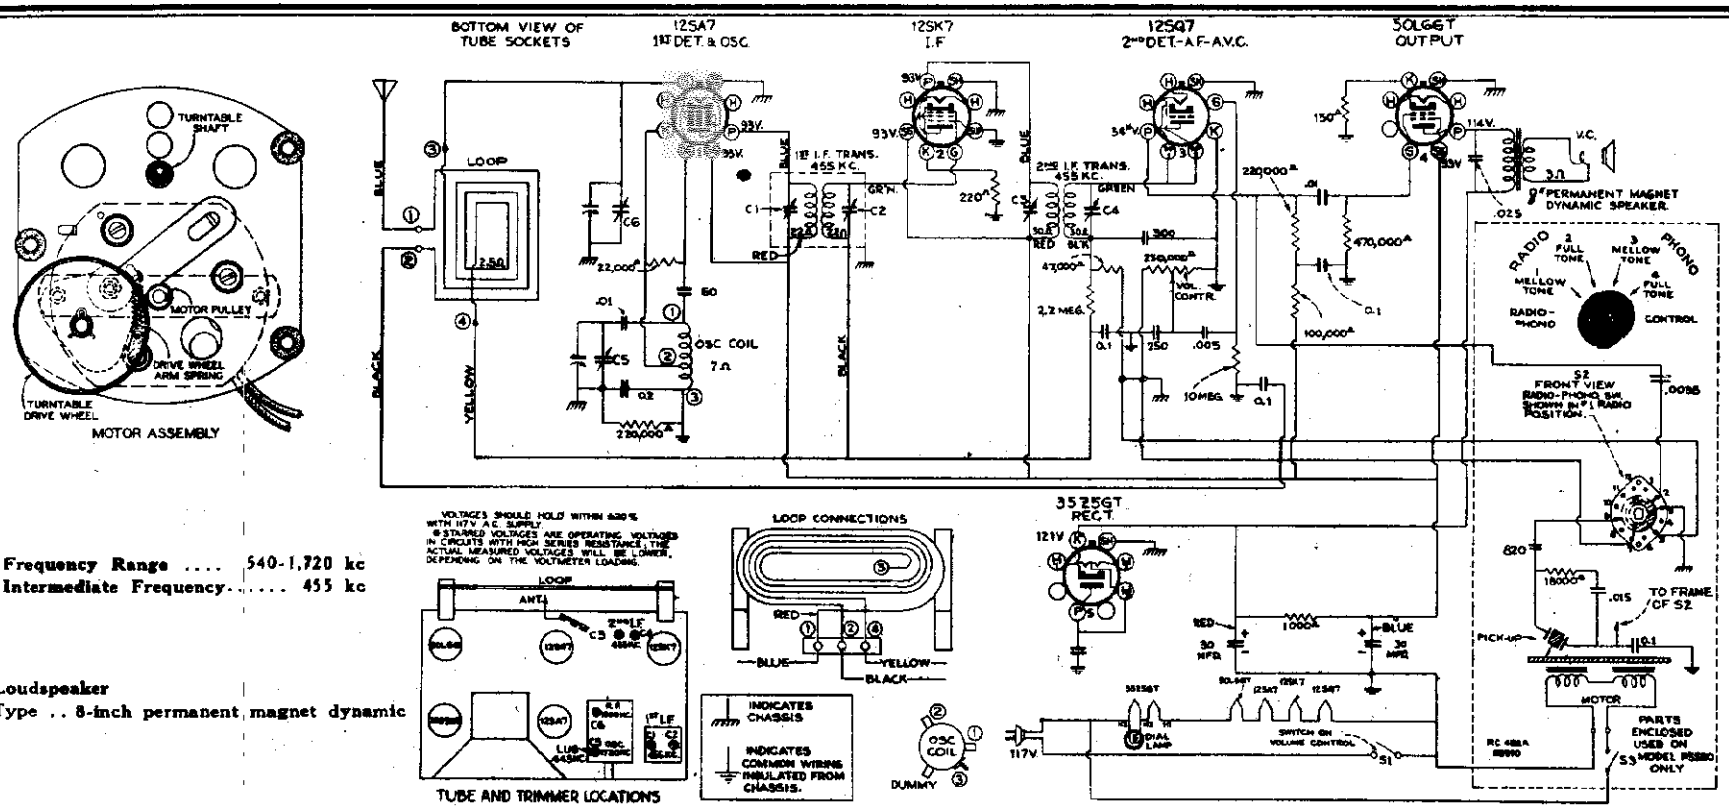
Schematic,Voltage
Alignment,Notes



Frequency Range .... 540-1,720 kc
Intermediate Frequency..... 455 kc

Loudspeaker
Type .. 8-inch permanent magnet dynamic

Alignment Procedure

Output Meter Alignment.—Connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—Connect the low side of the test-oscillator to the receiver chassis, through a .01 mfd. capacitor, and keep the output as low as possible.

Pre-setting Dial.—With gang condenser in full mesh, the pointer should be horizontal.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. peak output—
1	Tuning condenser stator (osc.) in series with .01 mfd.	455 kc	Quiet point at 1,600 kc end of dial	C1, C2, C3, C4 (1st and 2nd I-F transformers)
2	Antenna term. of ant. loop in series with 100 mmfd.	1,720 kc	Full clockwise (out of mesh)	C5 (oscillator)
3		1,500 kc	Resonance on 1,500 kc signal	C6 (antenna)

Power Output (125 volts, 60 cycle supply)

Undistorted	0.75 watts
Maximum	1.5 watts
Dial Lamp	Mazda 51, 7.5 volts, 0.2 amp.

Power Supply Rating (Models 3580, 4580, T-1580 and T-2580)

A-C Rating	105-125 volts, 50-60 cycles, 30 watts
D-C Rating	105-125 volts, direct current, 30 watts

Model P-5580—Although this model employs an ac-dc chassis it is not suitable for use on dc, as this would damage the motor.

The phonograph motor on Model P5580 is a self-starting, constant-speed induction type. It should be lubricated every six months by applying a few drops of light machine oil to the top and bottom motor spindle bearings, to the turntable spindle and to the turntable drive wheel bearing.

CAUTION: Keep oil away from drive bushing on top of motor spindle and from rubber driving tire on turntable drive wheel.

Power-Supply Polarity.—For operation on d-c (except Model P5580) the power plug must be inserted in the outlet for correct polarity. If the set does not function, reverse the plug. On a-c, reversal of the plug may reduce hum.

Antenna.—The set is equipped with a built-in loop antenna. If an outdoor antenna is used, it may be connected to the "ANT" lead on rear of cabinet. It should not be longer than 100 feet, including lead-in. If it is longer, connect a 100 to 200 mmf. capacitor in series

MODELS A1020,A2020 MODELS 1700,A2700,A3720

MODEL A2600 BRUNSWICK DIV.-MERSMAN BROS. Automatic Record Changer Notes

Automatic Record Changer

Before servicing the automatic record changer, inspect the assembly to see that all levers, parts, gears, springs, etc. are in good order and are correctly assembled.

A bind or jam in the mechanism can usually be relieved by rotating the turntable in the reverse direction.

The changer can be conveniently rotated through its change cycle by pushing the index lever to "Reject" and revolving the turntable by hand. Six turntable revolutions are required for one change cycle.

If the record changer or cabinet is not perfectly level, normal operation is likely to be affected.

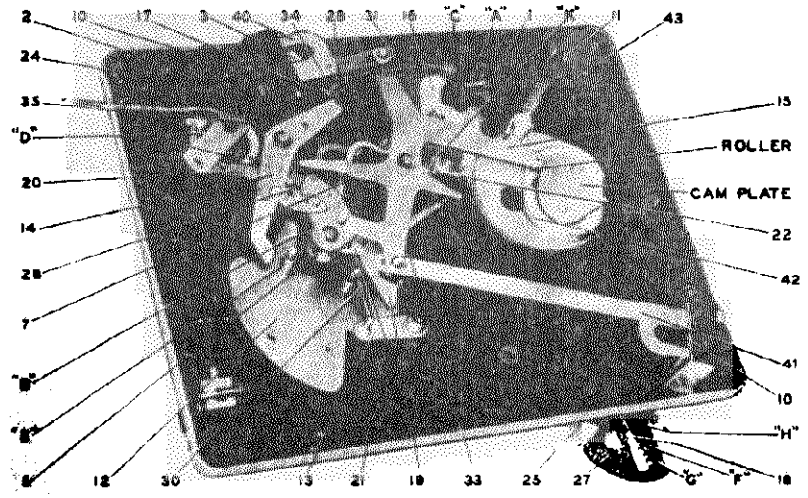
The 10 and 12 inch records must be absolutely flat for smooth operation when using a mixture of the two sizes.

A shorting switch, located in the pickup head, operates due to pressure when the pickup is placed on the pickup rest.

ADJUSTMENTS

A. Main Lever.—This lever is basically important in that it interlinks the various individual mechanisms which control needle landing, tripping, record separation, etc. One adjustment is provided for the main lever. Rotate the turntable until the changer is out-of-cycle; and adjust rubber bumper bracket (A) so that the roller clears the nose of the cam plate by 1/16 inch.

B. Friction Clutch.—The motion of the tone arm toward the center of the record is transmitted to the trip pawl "22" by the trip lever "7" through a friction clutch "5." If the motion of the pickup is abruptly accelerated or becomes irregular due to swinging in the eccentric groove, the trip finger "7" moves the trip pawl "22" into engagement with the pawl on the main gear, and the change cycle is started. Proper adjustment of the friction clutch "5" occurs when movement of the tone arm causes positive movement of the trip pawl "22" without tendency of the clutch to slip. The friction should be just enough to prevent slippage, and is adjustable by means of screw "B." If adjustment is too tight, the needle will repeat grooves; if too loose, tripping will not occur at the end of the record.



NOTE: Numbers refer to parts—letters refer to adjustments

C. Pickup Lift Cable Screw.—During the record change cycle, lever "16" is actuated by the main lever "15" so as to raise the tone arm clear of the record by means of the pickup lift cable. To adjust pickup for proper elevation, stop the changer "in-cycle" at the point where pickup is raised to the maximum height above turntable plate, and has not moved outward; at this point adjust locknuts "C" to obtain 1 inch spacing between needle point and turntable top surface.

D. & E. Needle Landing on Record.—The relation of coupling between the tone arm vertical shaft and lever "20" determines the landing position of the needle on a 10 inch record. Position of eccentric stud "E" governs the landing of the needle on a 12 inch record; this, however, is dependent on the proper 10 inch adjustment.

To adjust for needle landing, place 10 inch record on turntable; push index lever to reject position and return to the 10 inch position; see that pickup locating lever "17" is tilted fully toward turntable; rotate mechanism through cycle until needle is just ready to land on the record; then see that pin "V" on lever "14" is in contact with "Step T" on lever "17." The correct point of landing is 4-11/16 inches from the nearest side of the turntable spindle; loosen the two screws "D" and adjust horizontal position of tone arm to proper dimension, being careful not to disturb levers "14" and "17." Leave approximately 1/32 inch end play between hub of lever "20" and pickup base bearing, and tighten the blunt nose screw "D"; run mechanism through several cycles as a check, then tighten cone pointed screw "D."

After adjusting for needle landing on a 10 inch record, place 12 inch record on turntable; push index lever to reject and return to 12 inch position; rotate mechanism through cycle until needle is just ready to land on the record; the correct point of landing is 5-11/16 inches from nearest side of spindle. If the landing is incorrect, turn stud "E" until the eccentric end adjusts lever "14" to give correct needle landing. The eccentric end of the stud must always be toward the rear of the motor board, otherwise incorrect landing may occur with 10 inch records.

F. & G. Record Separating Knife.—The upper plate (knife) "26" on each of the record posts serves to separate the lower record from the stack and to support the remaining records during the change cycle. It is essential that the spacing between the knife and the rotating record shelf "27" be accurately maintained. The spacing for the 10 inch record is nominally .058 inch, and for the 12 inch record is .075 inch.

To adjust, rotate the knife to the point of minimum vertical separation from the record shelf and turn screw and locknut "F" to give .055—.061 inch separation. Screw "G" must not be depressed during this adjustment. After setting screw "F" adjust screw "G" so that when its tip is depressed flush with top of record shelf, the vertical spacing between the knife, in its lowest rotational position, and the shelf, is .072—.078 inch.

H. Record Support Shelf.—The record shelf revolves during the change cycle to allow the lower record to drop onto the turntable. Both posts are rotated simultaneously by a gear and rack coupled to the main lever "15," and it is necessary that adjustment be such that the record is released from both shelves at the same instant. To adjust, place a 12 inch record on the turntable, rotate mechanism into cycle to the point where tone arm is at maximum distance outward from turntable; lift record upward until it is in contact with both separating knives, then loosen screws "H" and shift record shelves so that the curved inner edges of the shelves are uniformly spaced at least 1/16 inch from record edge. Tighten the blunt nose screw "H," run mechanism through cycle several times to check action, then tighten cone pointed screw "H."

If record shelves or knives are bent, or not perfectly horizontal, improper operation and jamming of mechanism will occur.

J. Tone Arm Rest Support (not shown).—When the changer is out-of-cycle, the front lower edge of the pickup head should be 5/16 inch above surface of motor board. This may be adjusted by bending the tone arm support bracket, which is associated with the tone arm mounting base, in the required direction.

K. Trip Pawl Stop Pin.—The position of the trip pawl stop pin "K" in relation to the main lever "15" governs the point at which the roller enters the cam. By bending the pin support either toward or away from trip pawl bearing stud, the roller can be made to enter the cam later or earlier, respectively. This adjustment should be made so that the roller definitely clears the cam outer guide as well as the nose of the cam plate.

Lubrication.—Petrolatum or petroleum jelly should be applied to cam, main gear, spindle pinion gear, and gears of record posts.

Light machine oil should be used in the tone arm vertical bearing, record post bearings, and all other bearings of various levers on underside of motor board.

Apply a few drops of light machine oil to the motor spindle bearing and oil hole adjacent to the spindle bearing. The oil hole has a screw plug.

Do not allow oil or grease to come in contact with, rubber mounting of tone arm base, rubber bumper, or rubber spindle cap.

MISCELLANEOUS SERVICE HINTS

Incorrect adjustment of a particular mechanism of the changer is generally exhibited in a specific mode of improper operation. The following relations between effects on operation and the usual misadjustments will enable ready adjustment in most cases.

1. For any irregularity of operation, the adjustment of the main lever "15" should be checked first as in "A."
2. Needle does not land properly on both 10 and 12 inch records—Make complete adjustments "D" and "E."
3. Needle does not land properly on 12 inch record but correct on 10 inch—Effect adjustment "E."
4. Failure to trip at end of record—Increase clutch "5" friction by means of screw "B." Also, see that levers "7" and "12" are free to move without touching each other.
5. Pickup strikes lower record of stack or drags across top record on turntable—Adjust lift cable per adjustment "C."
6. Needle does not track after landing—Friction clutch "5" adjustment "B" may be too tight; bind in tone arm vertical bearing; levers "7" and "12" fouled; or pickup output cable twisted.
7. Cycle commences before record is complete—Record is defective, or adjustment "B" of friction clutch "5" is too tight.
8. Wow in record reproduction—Record is defective; or instrument is not being operated at normal room temperature (65° F).
9. Record knives strike edge of records—Records warped; record edges are rough; or knife adjustments "F" and "G" are incorrect.
10. Record not released properly—Adjust record shelf assemblies in respect to shaft by means of adjustment "H."
11. Needle lands in 10 inch position on 12 inch record or misses record when playing both types mixed—Increase tension of pickup locating lever spring "34."

Receiver Dial Scales, and Corresponding 0-240° Calibration Scales

The corresponding position of the dial indicator for any setting of the calibration scale can be determined by drawing a line from this point on the bottom calibration scale to the same point on the top calibration scale. For example, 40° on the calibration scale corresponds to 600 kc on "A" band. Read instructions under "Alignment Procedure."

Note: In the Dial Indicator Drive Cord Assembly drawing at the right the mechanism is shown with the range switch in the "B" band position. In the "A" band position the trip arm on the range shaft must be adjusted so that when the push-buttons are operated, the drive cord drum will turn freely without rubbing or binding against the drive roller.

Alignment,Trimmers,
Socket,Tuner Data

BRUNSWICK DIV.-MERSMAN BROS.

Alignment Procedure

Cathode-Ray Alignment is the preferable method. Connections for the oscillograph are shown in the schematic drawing.

Output Meter Alignment.—If this method is used, connect the meter across the voice coil, and turn the receiver volume control to maximum.

Test-Oscillator.—For all alignment operations, connect the low side of the test-oscillator to the receiver chassis, and keep the output as low as possible to avoid a-v-c action.

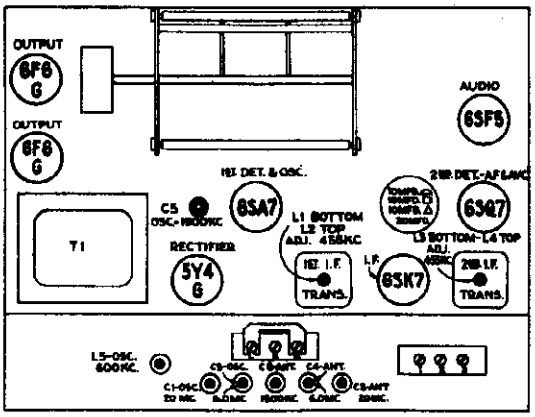
Calibration Scale on Indicator-Drive-Cord Drum.—The tuning dial is fastened in the cabinet and cannot be used for reference during alignment; therefore, a calibration scale is attached to the tuning drum. The setting of the gang condenser is read on this scale, which is calibrated in degrees. The correct setting of the gang in degrees, for each alignment frequency, is given in the alignment table.

As the first step in r-f alignment, check the position of the drum. The 120° mark on the drum scale must be vertical and directly under the center of the shaft of the tuning drum when the plates are fully meshed. The drum is held to the shaft by means of two set-screws, which must be tightened securely when the drum is in the correct position.

On the inner side of the tuning drum are two projections which serve as stops to prevent extreme rotation of the gang condenser. The tuning drum should be set so that the stop limiting clockwise movement of the drum takes effect just as the gang condenser plates are becoming fully meshed, thus preventing stress on the gang due to extreme rotation.

Pointer for Calibration Scale.—Improvise a pointer for the calibration scale by fastening a piece of wire to the chassis, and bend the wire so that it points to the 0° mark on the calibration scale when the plates are fully meshed.

Dial-Indicator Adjustment.—After fastening the chassis in the cabinet, attach the dial indicator to the drive cable with indicator at the 530 kc mark, and gang condenser fully meshed. The indicator has a spring clip for attachment to the cable.



Tube and Trimmer Locations

Steps	Connect the high side of the test-osc. to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for maximum peak output
1	6SK7 grid in series with .01 mfd.	455 kc	"A" band Quiet point between 550-750 kc	L3 and L4 (2nd I-F trans.)
2	6SA7 grid in series with .01 mfd.			L1 and L2 (1st I-F trans.)
3	Ant. terminal in series with 300 ohms	20 mc	20 mc (199°) "C" band	C1 (osc.)* C2 (ant.)
4		6 mc	6 mc (187.2°) "B" band	C3 (osc.)** C4 (ant.)
5	Ant. terminal in series with 200 mmfd.	1,500 kc	1,500 kc (198.2°) "A" band	C5 (osc.) C6 (ant.)
6		600 kc	600 kc (40°) "A" band	L5 (osc.) Rock gang
7	Repeat step 5.			

* Use minimum capacity peak if two can be obtained. Check to determine that C1 has been adjusted to correct peak by tuning receiver to approximately 19.09 mc where a weaker signal should be received.

** Use minimum capacity peak if two can be obtained. Check to determine that C3 has been adjusted to correct peak by tuning receiver to approximately 5.09 mc where a weaker signal should be received.

Note.—Oscillator tracks above signal on all bands.

Adjustments for Push-Button Tuning

The push-buttons should be adjusted for six favorite stations after the receiver has been operating for a brief warm-up period. Each button may be set up to any standard broadcast station. The preferable arrangement is to adjust for stations in the order of frequency, from low to high. Proceed as follows:

1. Loosen the push-buttons by turning counter-clockwise about one turn from their tight position so they turn freely.

2. Check to be sure the Phono-Radio switch is in "Radio" position.

3. Press in push-button No. 1 (left) as far as it will go without undue pressure, hold in, retune station with manual control if necessary for best reception, and then carefully tighten up the button. Do not tighten more than ¼ turn after the screw begins to grip or damage to the mechanism may result.

4. Proceed in a similar manner for the remainder of the push-buttons.

5. Insert the station marker tabs in the recesses above the push-buttons.

The crystal pickup is sealed in a metal case as protection against extreme changes of climate. If failure occurs, do not attempt to repair the unit, but install a new crystal unit.

SERVICE HINTS

Disassembling For Parts Replacements

To replace condensers, resistors, coils, etc., remove eight screws as shown in Fig. 1. Raise the bottom edge of the speaker cover, keeping it pushed forward so that the speaker field will clear the power supply shield, as shown in Figs. 2 and 3.

Unsolder voice coil lead "A" in Fig. 3 and set the speaker to the left of the set, as shown in Fig. 4. This exposes all of the wiring side of the chassis and component parts.

To replace tubes, vibrator or to realign when required, it is only necessary to remove the back cover.

To replace dial drive cord, remove the speaker and back cover as outlined above and remove eight screws holding the tuner cover, as shown in Fig. 5. Lay the cover back, as shown in Fig. 6, exposing the tuner unit and component parts.

Dial Cord or Pointer Replacement

1. Unhook the cord eyelets from drive pulley. Illustration 99 in Fig. 10.
2. Move pointer by hand toward the 1500 KC end of the dial until the pointer pivot pin drops through the enlarged end of the pointer guide slot.
3. Lift the pointer and pointer cord out of the tuner from the dial side.
4. File off the lower tip of the pointer guide pin, releasing the retaining washer and the cord pivot arms. Fig. 10.
5. With the pointer upside down and pointing away from the operator, put the long cord pivot arm on the left. Cord side up.
6. Place the short pivot arm (spring assembly) on the right. Cord side up.
7. Replace the retaining washer and solder it to the guide pin.
8. Replace the pointer. Place pivot pin in the enlarged end of the guide slot and then slide the rear end of the pointer into the rear support bearing.
9. Place the long cord behind the pointer and over pulleys. (Illustration 92 in Fig. 9 Page 130) Hook the cord eyelet over the drive pulley hook nearest the front of the tuner and push the cord into position around the pulley rim.
10. Put the spring loaded cord over pulleys in between the longer string and the tuner frame before hooking the cord eyelet to the drive pulley.

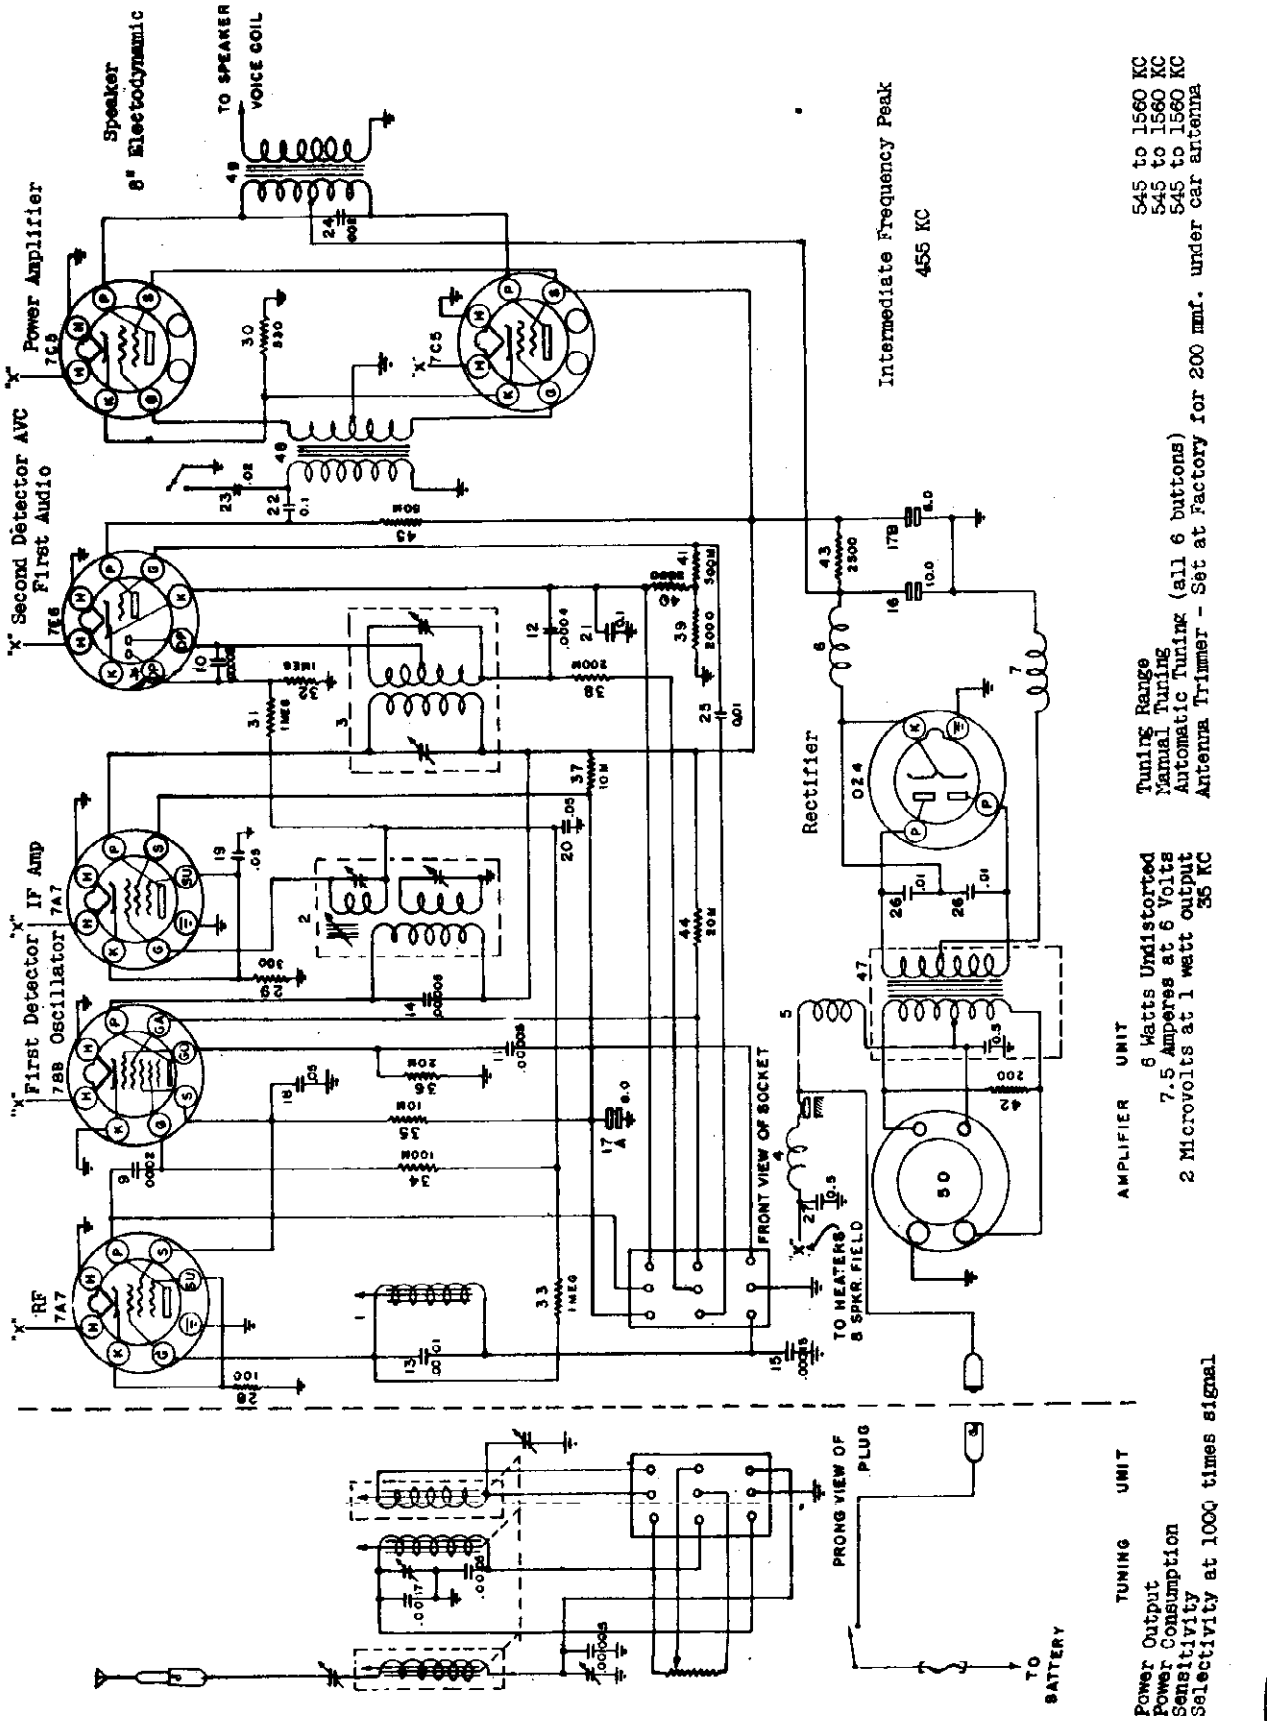
Schematic



ANTENNA INSTALLATION INSTRUCTIONS

Three Vacuum Antenna packages released for use on 1940 Cadillac and LaSalle cars are:

Part Number	Series
1436388	40-50
1436389	40-52,60S,62,72
1436390	40-75,90

These packages are identical except for the insulators and attaching parts, but it is extremely important that the proper assembly be used for the particular car on which the installation is being made, else the bakelite insulators will not properly fit the hood contours.

TO INSTALL VACUUM ANTENNA

1. Place the template supplied in the antenna package on the cowl and punch the center of the 1-1/32" hole with a center punch, using the 1/4" pilot drill of Hinkley-Myers J-1272-C tool to drill through the cowl at the angle shown in the top view of Fig. 1. After this hole is drilled raise the drill to a vertical position as shown in the lower view of Fig. 1 and drill through with the 1-1/32" cutter.

   If a Hinckley-Myers J-1272-C tool is not available this hole may be cut by drilling around the edge of the outline of the hole on the template with a 5/32" drill and filing off the rough edges. Care should be exercised so that the finished hole will not be too large.

   Hinckley-Myers tool J-1272-C may be purchased direct from Hinckley-Myers Co., Jackson, Michigan.

2. Remove side panel kick pad.

3. Assemble the hoses supplied with the antenna to the control valve as shown in Fig. 2 and install in the far left hole provided in the left end of the lower flange of the instrument panel.

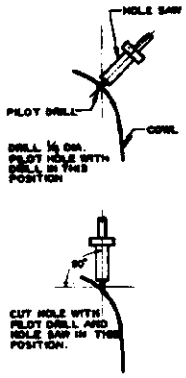


FIG. 1

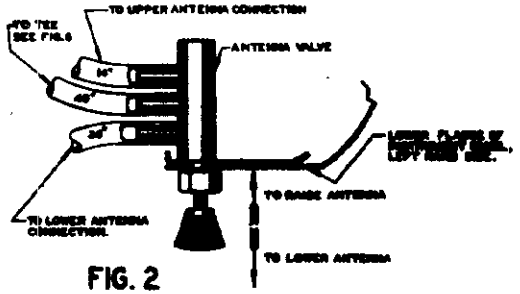

FIG. 2

4. Attach the bottom antenna support bracket (L) to the front end body brace on Series 40-50,52,62 and 72 with self tapping screw, as shown in Fig. 3. The hole is provided in Series 40-50 but must be drilled in Series 40-52,62 and 72. On Series 40-60S,75 and 90 this support is built into the body brace and it is only necessary to insert the rubber grommet through the hole.

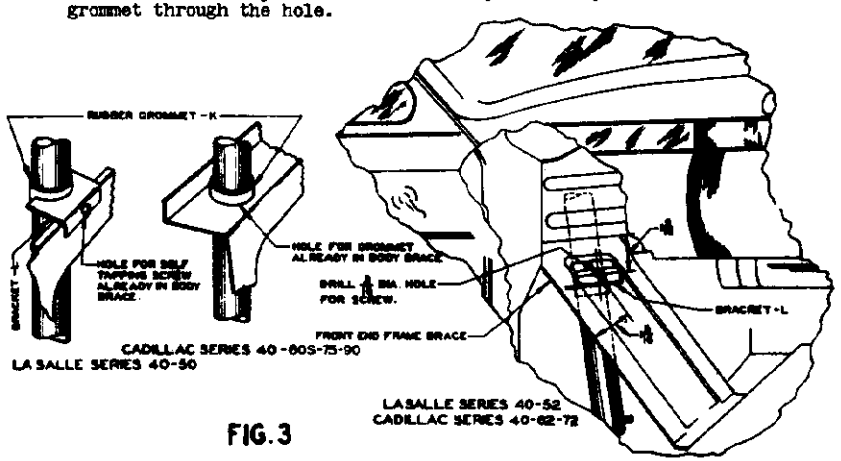

FIG. 3

5. Lower the antenna assembly through the hole in the cowl and put on rubber grommet (K) in Fig. 3 and washer (J) and rubber spacer (H) in Fig. 4.

6. Assemble lower hose connection to the bottom of the antenna, as shown in Fig. 5.

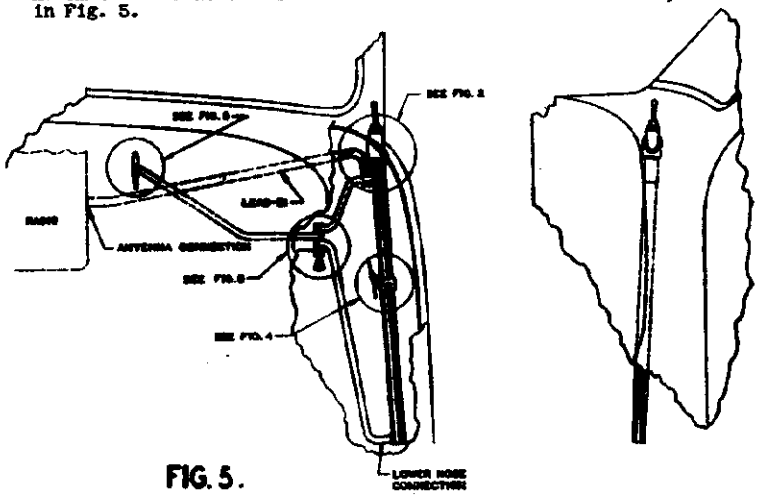

FIG. 5.

7. Assemble antenna lead and upper hose connection with parts in order as shown in Fig. 4.

8. Ground antenna lead shield to upper body brace with self tapping screw. The hole for this screw is provided on Series 40-50,60S,75 and 90. On Series 40-62, 62 and 72 it will be necessary to drill a 9/64" hole for this screw.

9. Attach the 14" length of hose securely to the upper antenna connection through cap, as shown in Fig. 4.

10. Attach the 36" length of hose to the lower hose connection on the antenna, as shown in Fig. 5.

11. Raise the antenna through the hole in the cowl and install the rubber pad (G) Bakelite insulator (F) Washer (E) Spring (D) Brass Washer (C) Packing gland (B) and nut (A). Tighten nut (A) until the shoulder and the antenna insulator seats against the top of antenna shield, as shown in Fig. 4. IMPORTANT - When tightening nut (A) do not get it too tight. Turn it down carefully until the stop is reached, then back off slightly.

12. Push grommet (K) into place in bracket (L) or the hole in the support brace, as shown in Fig. 3.

13. Cut windshield wiper hose and insert the tee connection. Attach the 40-inch length of hose to the tee connection, as shown in Fig. 6.

14. Plug the antenna lead into the radio set and check adjustment of the antenna trimmer for proper setting. Radios shipped from the factory are set for use with the vacuum aerial.

15. Start the motor and check the operation of the antenna. Push the control valve up to raise the antenna and pull down and lower the antenna. For best operation occasionally wipe the antenna rod free of dust and other accumulation.

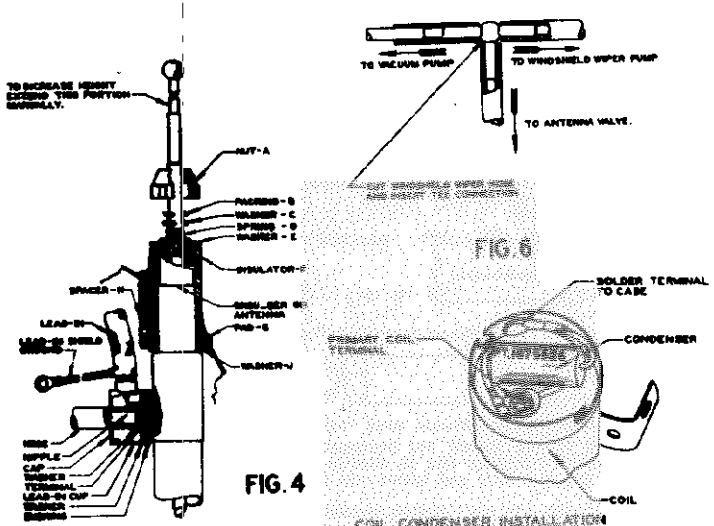

FIG. 4

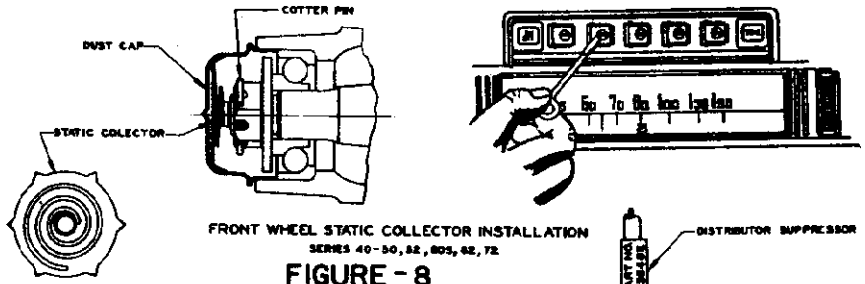
FIG. 6

COIL CONDENSER INSTALLATION

Install coil condenser, Part #1879528, in the top of the ignition coil, using Tool J-726 to remove the cover. Make sure the coil is well grounded to the dash by scraping off the paint on the dash and coil bracket.

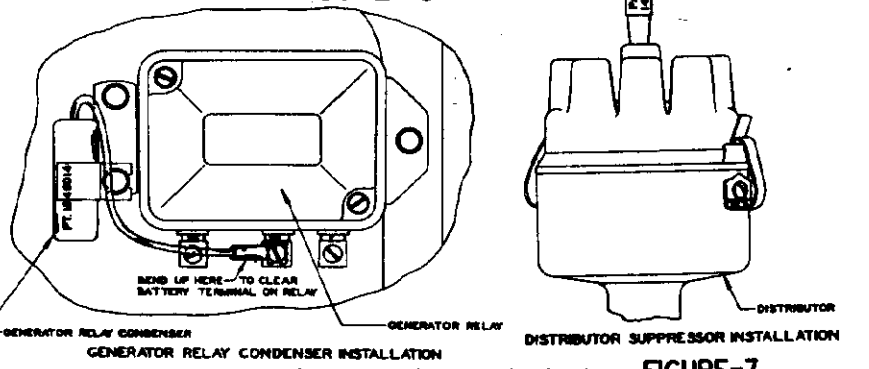
TO SET UP PUSH BUTTONS

It is important that the buttons be set accurately. This may be accomplished by lowering the vacuum aerial to a point where the signal is just being heard. Setting the stations selected by the push buttons has been made easy. Pulling off a button reveals a screwdriver slot recessed in a brass tube next to the button plunger arm. This screw, when rotated counterclockwise by means of a screwdriver furnished with the set in the call letter envelope, unlocks the tuner setting for that particular button. The plunger arm is then held in a fully depressed position while the station is tuned in by means of the manual tuning wheels. The plunger arm is then released and the lock-up screw is tightened by rotating in a clockwise direction with the screwdriver provided. Check for accuracy of setting by tuning in from each end of the dial with the button.



FRONT WHEEL STATIC COLLECTOR INSTALLATION
SERIES 40-50, 62, 60S, 62, 72

FIGURE - 8



GENERATOR RELAY CONDENSER INSTALLATION

DISTRIBUTOR SUPPRESSOR INSTALLATION

FIGURE-7

Install generator condenser, Part #1849014, on the generator terminal of the relay box.

Install suppressor, Part #1435482, in the center terminal of the

Install static collectors in the front wheels on Series 40-50,62, 62,60S, and 72. See Fig. 8. Bend cotter key over the nut as shown, so that it does not interfere with static collector.

On some cars it may be necessary to bend the oil and throttle line to the dash.

IGNITION SUPPRESSION AND WHEEL STATIC SUPPRESSION

Bond motor to the frame at the two front motor supports, using the bond straps supplied in the antenna package.

Bond exhaust system to the frame, using bond straps supplied with the antenna.

Bond transmission mainshaft housing to center or crossmember.

Bond transmission housing to the floorboard, making the bond as short as possible.

Bond both engine blocks to the dash.

CADILLAC 1940 AUTOMATIC RADIO FOR REAR COMPARTMENT INSTALLATION

SETTING UP STATIONS ON PUSH BUTTONS

There are six push buttons on the remote tuner unit by means of which six stations may be set up for automatic tuning (see B, Fig. 1).

Select the six stations desired and punch out from the set of station call letter tabs supplied the call letters of the stations selected. On the top of each push button a slot is provided for inserting the call letter tabs (See A, Fig. 1). Insert the tabs, then proceed as follows:

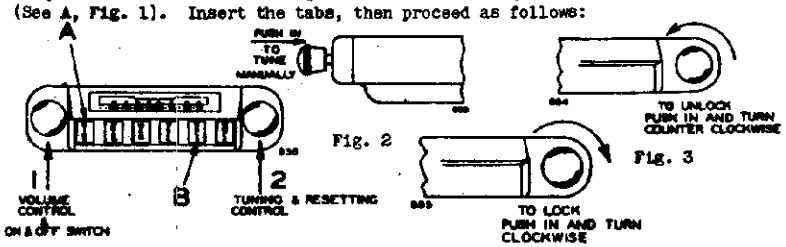


Fig. 1—Front View of Remote Tuner Unit

Fig. 4

Fig. 3

Fig. 2

TO UNLOCK

1. Push on the dial tuning knob hard enough to make it latch in. (See Fig. 2.)

2. Rotate the dial tuning knob to the left (counter-clockwise), until the knob cannot be turned any further without forcing. (See Fig. 3.)

As the knob is rotated it will turn easily until the pointer reaches the end of the dial scale and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point the knob will turn quite easily again until the tuner mechanism is completely unlocked. At this point do not force the knob any further. The tuner mechanism is now unlocked.

(NOTE: Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

SETTING PUSH BUTTONS

1. Push in all the way any one of the push buttons and at the same time hold in firmly the dial tuning knob. Both the dial tuning knob and the push button should be pushed hard enough to make them stay latched in. The reason for holding the dial tuning knob in firmly when the push button is pressed in is due to the latching mechanism in the remote tuner unit which is so constructed as to release the dial tuning knob entirely when a push button is pressed in. When setting up stations for automatic tuning, however, it is necessary that both the dial tuning knob and the push button be latched in together.

2. Press in on the push button which is latched in. Holding it in firmly, tune in by means of the manual tuning knob the station indicated on the station call letter tab on this push button. Turn the dial tuning knob very slowly back and forth (while still pressing in firmly on the push button), until the station is accurately tuned in.

3. Push in all the way another push button, at the same time holding the dial tuning knob in so that both the push button and the dial tuning knob are latched in together. Holding the push button in firmly, tune in the station indicated on the call letter tab on this push button.

4. Follow this procedure until you have tuned in all six selected stations.

5. When the last push button has been properly set up it is necessary to release it from the latched-in position before the tuner mechanism can be locked. To release this push button, slightly depress any other push button, this will trip the latching mechanism and all the push buttons will be released to out position.

TO LOCK

(NOTE: All the push buttons must be in out position when locking the tuner mechanism.)

To lock the tuner mechanism push on the dial tuning knob hard enough to make it stay latched in. Rotate the dial tuning knob to the right (clockwise) until the knob cannot be turned any further with forcing it. (See Fig. 4) This will lock the tuner mechanism and all the stations that have been set up on the buttons will be locked in place for automatic tuning.

ANTENNA

An under car antenna must be used with the rear compartment radio. Instructions for installation are supplied with each antenna.

ALIGNMENT PROCEDURE

Two separate alignment procedures are included in these instructions. The first is to be considered the usual alignment procedure and the second to be used only when a tuning coil has been replaced or when some major change has been made in the tuning apparatus.

CAPACITY ALIGNMENT

I.F. Alignment at 455 KC

(a) Connect an output meter across the voice coil of the speaker leaving speaker connected or connecting a 1.7 ohm load instead of the speaker.

(b) Connect the ground lead of the signal generator to the set chassis and the signal lead to the "G" prong of the 7B6 tube through a .1 mfd. condenser.

(c) With signal generator frequency set at 455 kilocycles adjust the I.F. trimmers A, B, C & D and I.F. core adjustment E in the sequence named until maximum output is obtained. Fig. 5 & 6.

(d) Connect the signal lead of the signal generator to the antenna connection of the set through a 150 mmf. condenser. Adjust the I.F. trap adjustment F for MINIMUM response. (Generator frequency 455 KC) Fig. 5.

Alignment at 1530 KC

(a) Set frequency of the signal generator to 1530 KC.

(b) By means of the manual tuning control adjust the tuning control of the set to its highest frequency position against the high frequency stop.

(c) Adjust the oscillator trimmer ("osc" on tuning unit) for maximum output. See Fig. 7.

Alignment at 600 KC

(a) Set the signal generator frequency to 600 KC.

(b) Tune set to this signal and adjust the RF trimmer ("R.F." on tuning unit) for maximum output, while rocking tuning control back and forth through the signal. See Fig. 7.

(c) Adjust the antenna trimmers ("Ant 1" and "Ant 2") on the tuning unit for maximum output. Fig. 7.

Alignment at 1400 KC

(a) Set signal generator frequency to 1400 kilocycles and tune set to this signal.

(b) Using an insulated three cornered prong tool adjust the core positions for maximum output reading.

Circuit Desc

The circuit used in this receiver is the conve not use any regeneration. The eight tubes empl Oscillator-Modulator Tube, 262.5 kilocycle I which is triple tuned, push-pull output and p A.V.C. voltage to the grids of the 6K7GT R. first audio amplifier. It also serves as second de The bias for the 6K7GT R. F. amplifier and th ohm resistor, item No. 44. The bias for the 6 across a 450 ohm resistor, item No. 52. Bias for across a 2700 ohm resistance, item No. 69. Bia two resistances, item numbers 59-350 ohms and is developed across a 220 ohm resistance, item plate and the 6R7GT ground is the fidelity 6R7GT plate is coupled through a .04 mfd. c audio input choke.

Explanation of Tone C
Automatic Volu

Automatic Volume Control

The 6R7GT diode furnishes A.V.C. voltage resistor, to the 6A8GT through item 57, 1 m filter through a 500,000 ohm isolating resistor from the 1 megohm filter through a 1 megoh of the 6K7GT first audio tube.

Tone Control

The fidelity control and its tone compensating and driver tube. When the switch is in the VO condenser (item 37) then through a .001 con high impedance to low frequencies, limiting high range. From the .001 condenser the sign and a 100,000 ohm (item 68) resistor to gro divider and the signal to the 6R7GT driver gr and 100,000 ohm resistors. Likewise there is a grid to ground, while this is shunted across t on the circuit is negligible and its real purp fidelity switch is in the SOFT position.

The path of the audio with the fidelity swi Through .05 condenser (item 37) a 250,000 resistor (item 67) to ground. Items 66 and junction of these two resistors. This positio rounded with both lows and highs.

For the BASS position, the signal from the denser (item 37) the 250,000 ohm resistor (ite to ground. Item 79, the 500,000 ohm resisto This condenser bypasses the highs so that t The grid of the 6R7GT is fed from the junc

For the SOFT position the a-f is fed throug the 250,000 ohm resistor (item 66) then th 100,000 ohm resistor (item 65) through a .0 6R7GT grid is fed from the junction of item .006 uf. condenser, is to pass highs and midd the .005 uf. condenser is to bypass the high range cutting both the highs and lows. Item grid to ground, is the d.c. grid return.

Setting the Push Buttons

The order in which the stations are set up o the operation of the tuning unit. To set th but an understanding of the operation of th

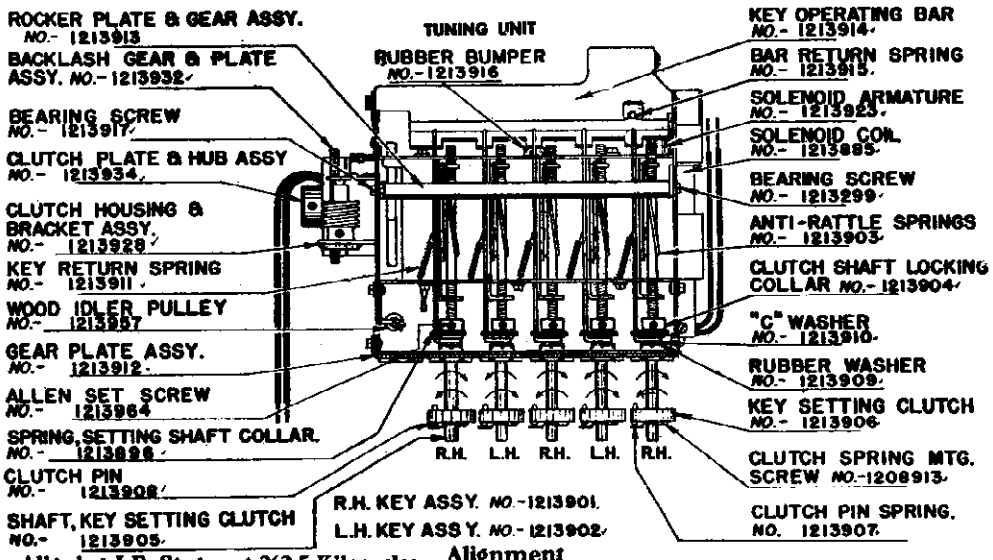
sh buttons will in no way affect
buttons, no tools are required,
utton switch is essential. There

are two definite pressures and movements required to actuate the switch. First, a slight touch and a movement of less than one-quarter inch is all that is required to tune the receiver with a push button after the button has been adjusted. Second, a heavier pressure and a movement of a little more than one-quarter inch is required when the push button is to be set to the station selected. To adjust the button, push the button all the way down and hold it in that position while you tune in as accurately as possible with the manual tuning knob the station selected. Release the button and the station is set. Follow the same procedure in setting the remaining buttons.



Alignment

Aligning I.F. Stages at 262.5 Kilocycles

USE A .02 MFD. DUMMY TO GRID OF 6K7GT TUBE (LEAVE GRID CAP IN PLACE). SET AUDIO FIDELITY TO "MUSIC" POSITION. AT 262.5 KC ADJUST SECOND IF TRIMMERS. THEN APPLY SIGNAL TO GRID OF 6A8GT TUBE (LEAVE GRID CAP IN PLACE) . OPEN MIDDLE TRIMMER OF FIRST IF TRANSFORMER ADJUST TWO OTHER TRIMMERS TO MAXIMUM AND THEN THE MIDDLE TRIMMER FOR MAXIMUM. DO NOT READJUST SECOND IF.

Oscillograph Alignment

(a) Disconnect the conventional signal generator from the receiver.

(b) Connect the vertical plates of the oscillograph to the receiver connecting the (H1) terminal through a .02 mfd. condenser to the grid cap of the 6K7GT audio amplifier tube, leaving the tube's grid clip in place. (Condenser is built into most oscillographs.) Connect the ground terminal to the frame of the receiver chassis.

(c) Connect the output of the R.F. modulated signal generator, also through a .02 mfd. condenser to the grid cap of the 6A8GT tube, leaving the tube's grid clip in place. Connect the ground lead to the frame of the receiver chassis.

(d) Adjust the signal generator to 262.5 kilocycles.

(e) With the modulator switch of the signal generator turned off, a horizontal line will appear on the window of the oscillograph by means of the amplitude control on the oscillograph. Adjust the length of the line so that it is equal to the width of the celluloid scale supplied with the oscillograph.

(f) Turn the frequency modulator switch of the signal generator on.

(g) Adjust the vertical control of the oscillograph so that the image is just within the top and bottom lines of the oscillograph scale. NOTE: Use the lowest signal generator output that will give a stable image on the oscillograph window. If too much signal input is used, the humps desired on the wave form will not be visible even at perfect alignment.

(h) Readjust the middle trimmer on the 1st I.F. transformer for maximum symmetry above the vertical resonance line in the center of the celluloid scale. The hump or shoulder appearing on each side of the wave form will be equal distance from the numbers of the curve when maximum symmetry is reached.

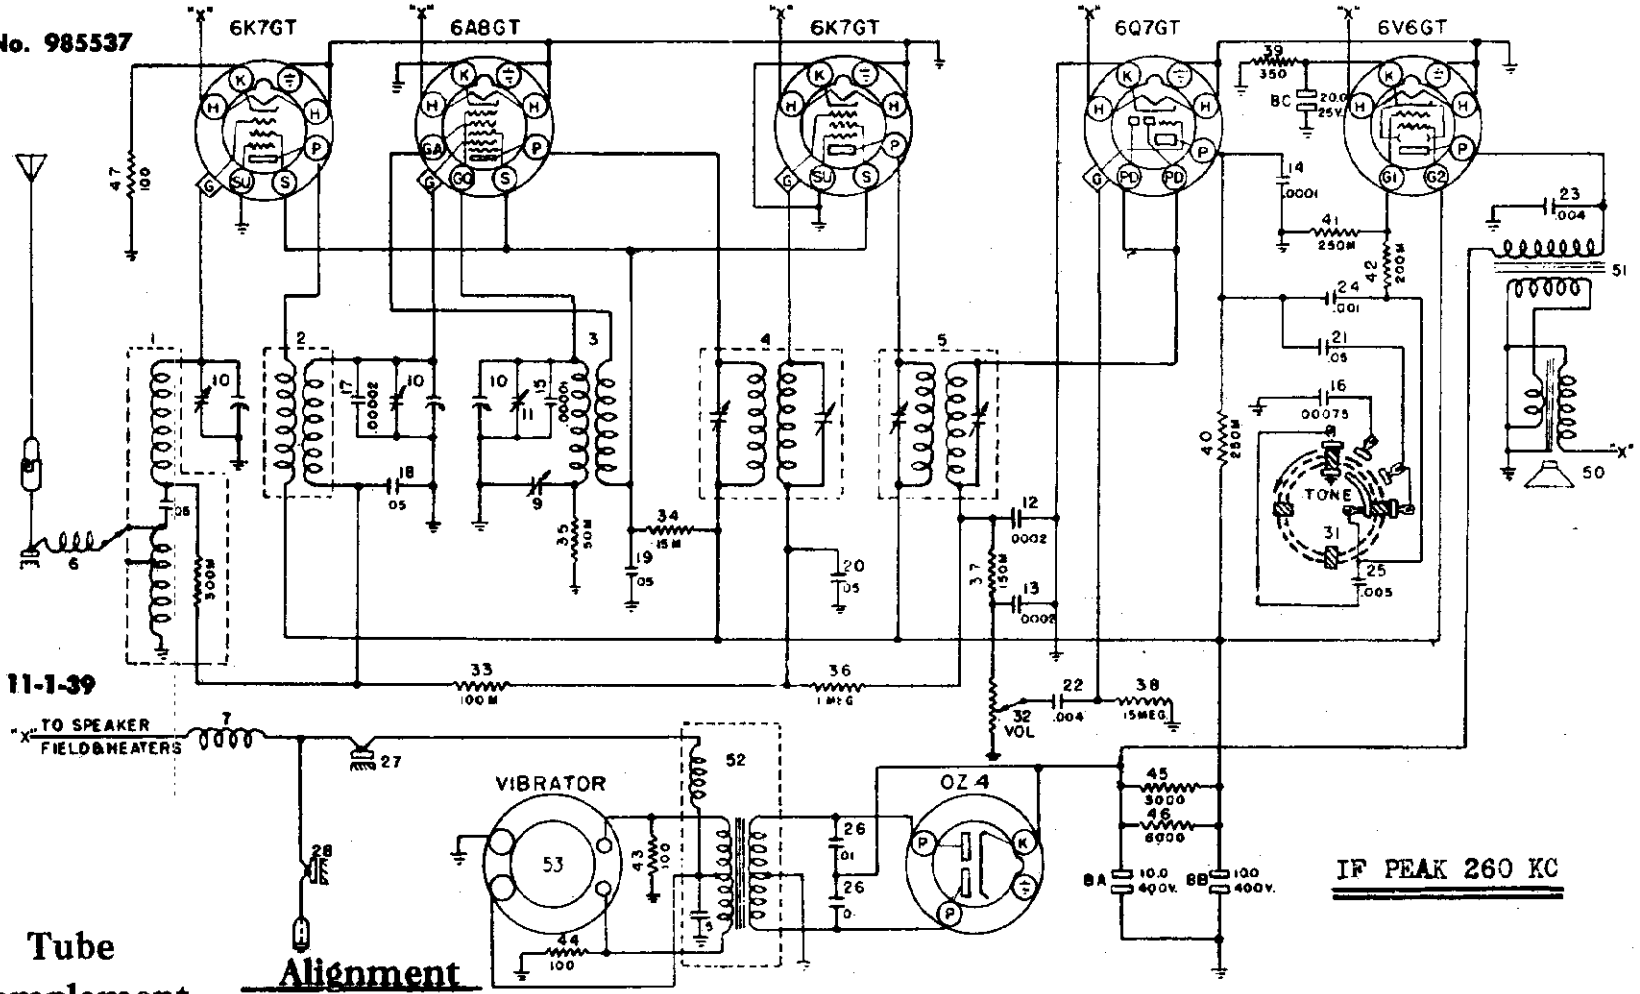
Aligning the R.F. Amplifier

USE A .00016 MFD. DUMMY TO ANTENNA LEAD. AT 1400 KC ADJUST OSCILLATOR TRIMMER FOR MAXIMUM. THEN ADJUST RF AND ANTENNA TRIMMER FOR MAXIMUM. READJUST STATION SELECTOR FOR MAXIMUM. DO NOT READJUST OSCILLATOR TRIMMER.

Adjusting Antenna Compensating Condenser

SET SIGNAL AND DIAL AT 600 KC, ADJUST FOR MAXIMUM. ADJUST ALSO AT 1400 KC. WHEN INSTALLED IN CAR TUNE A WEAK STATION BETWEEN 55 AND 65 ON DIAL AND ADJUST FOR MAXIMUM VOLUME IN SPEAKER.

Part No. 985537



Tube Complement

Type	Function
6K7GT	R.F. Amplifier
6A8GT	Oscillator-Modulator
6K7GT	I.F. Amplifier
6Q7GT	2nd Detector and A.V.C.
6V6GT	Power Output
OZ4	Rectifier

Alignment

At 260 KC :- Use a .1 mfd. condenser as dummy . Signal to 6A8GT grid (LEAVE GRID CAP IN PLACE). Adjust second and then first IF trimmers.

At 1560 KC :- Use a .00007 mfd. condenser as dummy. Signal to antenna post. Adjust oscillator parallel trimmer (e) for maximum output.

At 1400 KC :- Use a .00007 mfd. condenser as dummy. Connections as for 1560 KC. Adjust antenna RF (f) and (g) trimmers for maximum output.

At 600 KC :- With same connections adjust oscillator pad (h) at 600 KC while rocking condenser, for maximum output. Readjust at 1400 KC. With station selector, tune in 1400 KC signal for maximum output. Readjust trimmer on antenna section of gang condenser for maximum output.

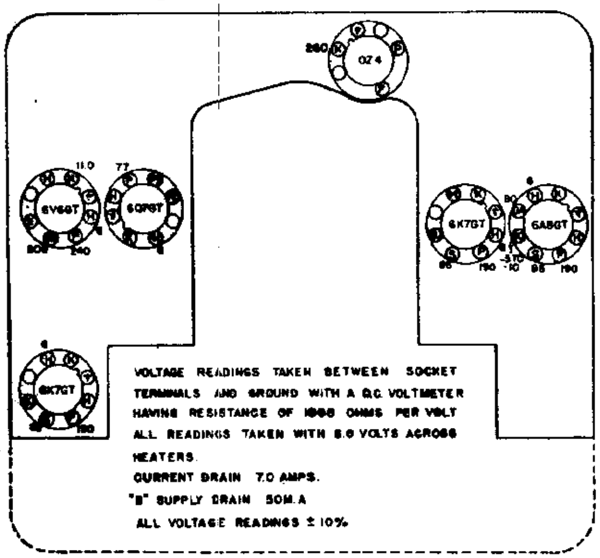
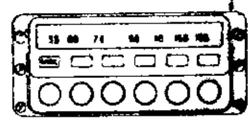
PARTS LOCATING DIAGRAM

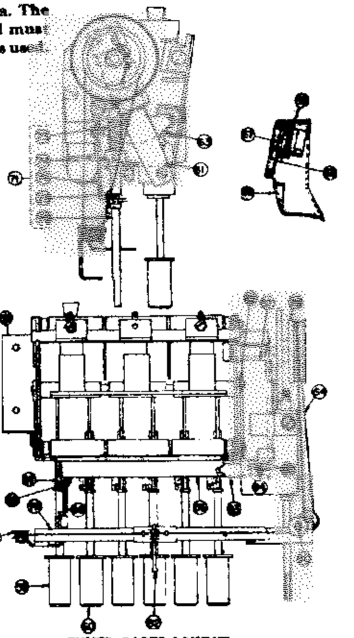
ANTENNA SYSTEM: There are three antenna systems available for use with this receiver; the under car, the turret top, or the telescopic cowl antenna. Any one of these antennas will operate very efficiently when used with this Chevrolet radio.

ANTENNA CIRCUIT: The antenna circuit is directly coupled to the antenna. Two plug-in terminals are provided on the antenna coil; one for use with the under car antenna, and the other for use with the turret top or the cowl antenna. The antenna coil is connected at the factory for cowl antenna operation and must be changed to the under car antenna connection if an under car antenna is used.



SOCKETS AND VOLTAGES





TUNER PARTS LAYOUT

The circuit used in this receiver is the conventional superheterodyne type and does not use any regeneration. A special tone control circuit is employed to give the desired tone with no distortion.

POWER SUPPLY: The power supply uses an OZ4 rectifier tube in conjunction with a full wave primary type vibrator.

READINGS TAKEN FROM TUBE SOCKET CONTACTS TO GROUND WITH A D.C. VOLTMETER HAVING A RESISTANCE OF 1000 OHMS PER VOLT; "A" BATTERY 6.0 VOLTS. CURRENT DRAIN 6.5 AMPERES. "B" SUPPLY DRAIN APPROXIMATELY 50 M.A.

Circuit Alignment

At 455 KC:- Connect signal generator lead to "X" (see fig.1) which is the grid lead of the 6SA7GT tube through a .1 mfd. condenser. Adjust trimmers (a) (b) (c) and (d) for maximum output.

At 1520 KC:- Connections as for 455 KC. Condenser at minimum capacity. Adjust (e) for maximum output.

At 540 KC:- With connections as above, condenser at maximum capacity, adjust oscillator pad (f) for maximum output.

At 1400 KC:- Use a .0002 mfd. condenser (ONLY) as dummy. Connect signal lead to antenna post (Place tap on antenna coil assembly to running board antenna position). Adjust antenna trimmer (g) to maximum output.

At 600 KC:- Readjust oscillator pad (f) at this frequency while rocking condenser.

FOR CONVENTIONAL ALIGNMENT PROCEDURE SEE SPECIAL SECTION VOL. VIII.

ANTENNA SYSTEM: There are three antenna systems available for use with this receiver; the under car, the turret top, or the telescopic cowl antenna. Any one of these antennas will operate very efficiently when used with this Chevrolet radio

GENERAL: This auto radio is a five tube single unit universal receiver with automatic push button tuning. Tuning is accomplished by a mechanical unit of rugged construction assuring accuracy. A special compensating condenser is employed in the oscillator circuit to minimize all receiver drift due to normal variation in car voltages and temperature ranges. The power supply consists of a 6X5GT power rectifier tube used in conjunction with a full wave plug in vibrator. The receiver is designed to mount in 1940 Chevrolet cars, and also in all other cars and trucks.

NOTES FOR VOLTAGE CHART

Voltages measured with 1000 ohm per volt D.C. voltmeter between socket terminals and negative "B" supply.

*-Oscillator voltage measured with R. F. choke in series with voltmeter lead.

NOTE: Voltages as indicated are measured with power switch in AC-DC position and radio connected to 115 volt 60 cycle AC line.

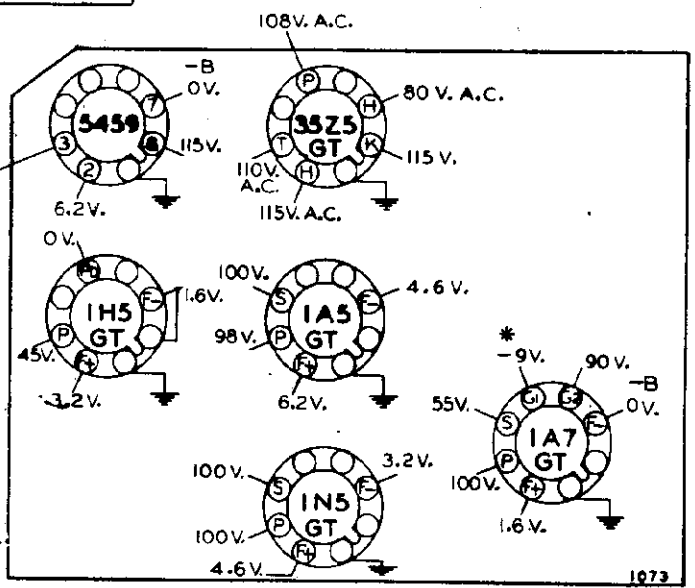

FIG.4 TUBE VOLTAGE CHART

CIRCUIT ALIGNMENT

IMPORTANT: If maximum sensitivity is to be obtained from this receiver, after re-alignment, it is very important that the following procedure be closely observed:

1. Aligning I.F. stages at 465 kilocycles.

   a. Connect the signal lead of the test oscillator to the grid of the 1A7GT tube, through a .1 mfd. condenser.

   b. Connect the ground lead of the test oscillator to the negative "B" lead of the radio (grey wire of the "B" battery lead assembly).

   c. Connect the output meter across primary winding of the output transformer.

   d. Set the test oscillator to exactly 465 kilocycles.

   e. Adjust the trimmers on the 1st and 2nd I.F. transformers (Illus. No. 3 and No. 4, Fig. I) carefully for maximum output.

   These adjustments should be repeated several times and during the alignment the test oscillator output should be kept to as low a value as is consistent with obtaining readable indication on the output meter.

2. Aligning at 1550 kilocycles.

   a. Leave the test oscillator leads connected the same as for aligning the I.F. circuits.

   b. Turn the rotor plates of the gang condenser all the way out and against the high frequency stop.

   c. Set the test oscillator to 1550 kilocycles.

   d. Adjust the trimmer for the oscillator section of the condenser gang (Illus. No. 5B, Fig. I) for maximum output. It is very important that this frequency be set accurately as a slight mis-setting will cause the receiver to be out of track over the entire high frequency end of the dial.

3. Aligning at 1400 kilocycles.

   a. This adjustment should be made with the loop antenna placed alongside the chassis. It is important that the same distance between the loop antenna and the chassis be maintained as when the chassis and loop are installed in the cabinet.

   b. Connect the signal lead of the test oscillator to the external antenna terminal on the loop antenna through a 200 mmfd. dummy.

   c. Connect the ground lead of the test oscillator to the external ground terminal on the loop antenna.

   d. Set the test oscillator to exactly 1400 K.C.

   e. Turn the condenser rotor plates until this frequency is tuned in with maximum output.

   f. Adjust the trimmer on the condenser gang (Illus. No. 5A, Fig. I) for maximum output.

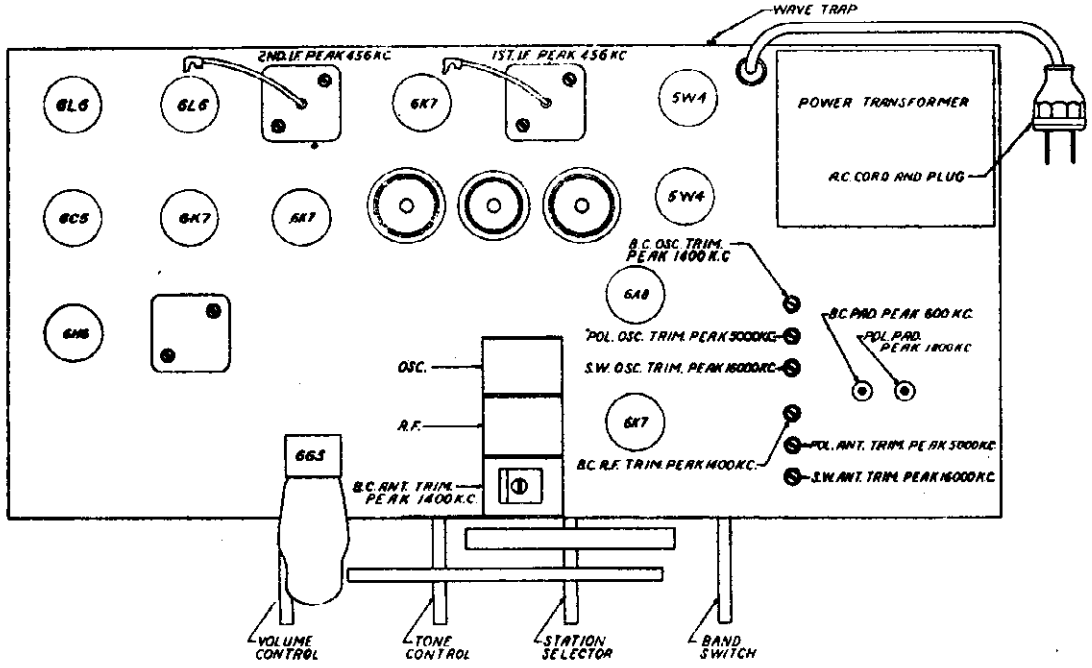
WAVE TRAP ADJUSTMENT

At the rear of the chassis near the Antenna and Ground posts is an adjustment screw connected to a trap circuit for elimination of code interference when operating on the broadcast band. If code interference is encountered adjustment of this screw will filter it out. It is to be used only if such interference is experienced in broadcast reception. It's use prevents code transmitters operating on a frequency around 456 K. C. from being received by the I. F. amplifier which is tuned to 456 K. C.



SERVICE DATA FOR ALL BANDS

If it is suspected that the oscillator has stopped but is doubtful due to the presence of the usual amount of noise level, it is suggested that the oscillator plate voltage be checked. To ascertain whether the tube is oscillating, ground the oscillator grid of the 6A8 (short stator and rotor plates of oscillator section on gang condenser). If oscillating properly, grounding the grid will cause an appreciable drop in oscillator voltage. Grounding or shorting the stator and grid components should be accomplished by grounding the stator mounting nut to the frame of the condenser with a screw-driver or any metallic conductor.

Do not wedge a screw-driver between the plates for this is liable to permanently warp the plates and thus prevent the oscillator section of the gang condenser from tracking probably.

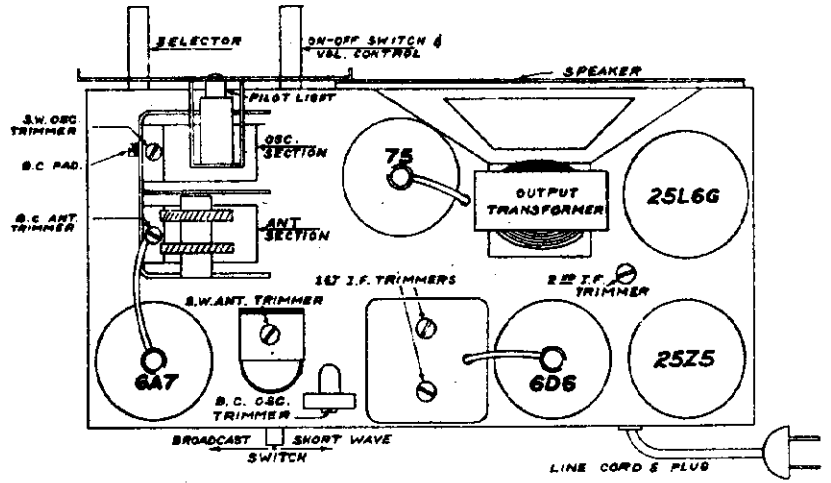
T3	B.C. OSC.	1.6 TO 20
T4	B.C. ANT.	



I.F. ALIGNMENT Adjust the test oscillator to 456 KC and with the band switch in B.C. position connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. Connect ground of test oscillator to chassis ground through a .1 mfd. condenser. Align all three I.F. trimmers to peak or maximum reading on the output meter.

SHORTWAVE ALIGNMENT Adjust the oscillator to 18,100 KC and connect the output to the antenna lead, through a 400 ohm resistance. Set the gang condenser to minimum capacity and adjust the gang condenser trimmer (short wave oscillator) to receive this signal. After this has been carefully done, the next step is to set the generator to 16000 K.C. and after tuning in the signal adjust the shortwave antenna trimmer to peak.

The receiver should now be tuned to the 6 megacycle signal from the generator and the sensitivity checked. No adjustment is required at

BROADCAST BAND ALIGNMENT The broadcast band may now be aligned Using a .0002 dummy antenna, set the generator to 1730 kilocycles. With the gang condenser at minimum capacity, adjust the broadcast oscillator trimmer to receive this signal. Then set the generator to 1400 kilocycles and adjust the broadcast antenna trimmer to peak. The generator is now set to 600 kilocycles

SCHEMATIC DIAGRAM MODEL 7C-PH

I.F. ALIGNMENT

Adjust the signal generator to 455 KC and connect the output to the grid of the first detector tube (6A7) through a .05 or .1 mfd. condenser. Align all I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Adjust the signal generator to 1730 KC and connect the output to the antenna lead (blue) through a .0002 mfd. mica condenser. Set the gang condenser to minimum capacity and adjust the oscillator trimmer to receive this signal. The oscillator and antenna trimmers may be reached by removing the dial escutcheon. (See Fig. 3 for trimmer locations.) The next step is to set the signal generator to 1400 KC and after tuning in the signal adjust the antenna trimmer to peak. Next, re-set the dial pointer on the receiver and the signal generator to 600 KC. Slowly increase or decrease the oscillator padding condenser and at the same time continuously tune back and forth across the signal with the receiver until the maximum reading is obtained on the output meter.

Return to 1400 KC and again go over the adjustments of this frequency to be certain that they were not put slightly out of alignment when adjustment was made at 600 KC.

SPEAKER (Part No. P3390) 12" Dynamic

Field resistance	1500 ohms
D.C. voice coil resistance	1.9 ohms
Voice coil impedance at 400 cycles	2.2 ohms

Voltages—Line 115 volts A.C. Power consumption 90 watts. Volume control maximum. Meter 1000 ohms per volt. (VOLTAGES ARE FROM POINT INDICATED TO GROUND).

FOR TUNER SEE INDEX

SHORT WAVE BAND ALIGNMENT

The short wave band is adjusted by setting the signal generator to 18100 KC and connecting the output to the antenna lead through a 400 ohm resistor. Set the gang at minimum and adjust the "short wave oscillator trimmer" to receive the signal. Set the generator at 16,000 KC, tune in the signal and adjust the "short wave antenna" trimmer to give maximum output. As there is no variable low frequency padding condenser on this band, the sensitivity of the receiver should be checked at 6000 KC to determine whether the circuits are in line at this frequency. Should the receiver lack sensitivity at 6000 KC, the antenna and oscillator coils, as well as the mica padding condenser, should be tested.

CONTINENTAL RADIO & TELEV. CORP.

PROCEDURE FOR SETTING UP PUSH BUTTONS

Loosen one of the push buttons by turning the push button knob counter clockwise a turn or less and push it in; while holding the button in, tune in a desired station by means of the station selector knob. Turn the selector very slowly back and forth until the signal is clearest. Now while holding the push button in, tighten it by turning clockwise. Release the push button and turn the station selector to one end of the dial; push the tuning knob to the right and then check the button by pushing it in and if the station is tuned to the center of the area on the dial covered by the station the adjustment is correct.

Release the push button and loosen another push button and repeat the above procedure, doing this for the remaining buttons.

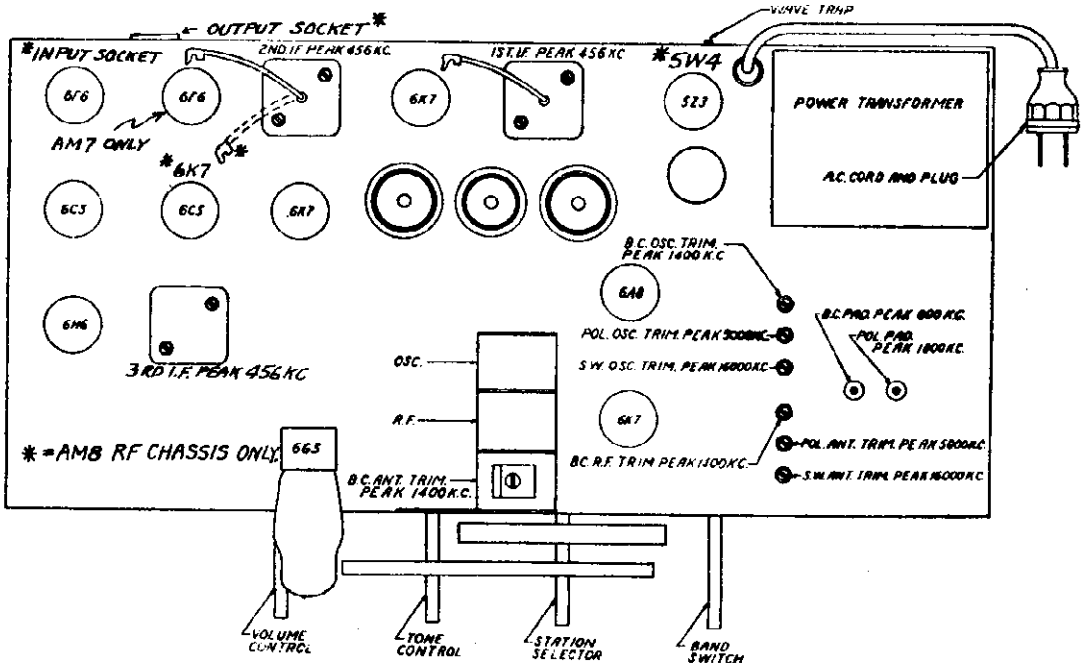
CONVENTIONAL ALIGNMENT SEE SPECIAL SECTION VOLUME VIII.

WAVE TRAP ADJUSTMENT

At the rear of the chassis near the Antenna and Ground posts is an adjustment screw connected to a trap circuit for elimination of code interference when operating on the broadcast band. If code interference is encountered adjustment of this screw will filter it out. It is to be used only if such interference is experienced in broadcast reception. It's use prevents code transmitters operating on a frequency around 456 K. C. from being received by the I. F. amplifier which is tuned to 456 K. C.



SERVICE DATA FOR ALL BANDS

If it is suspected that the oscillator has stopped but is doubtful due to the presence of the usual amount of noise level, it is suggested that the oscillator plate voltage be checked. To ascertain whether the tube is oscillating, ground the oscillator grid of the 6A8 (short stator and rotor plates of oscillator section on gang condenser). If oscillating properly, grounding the grid will cause an appreciable drop in oscillator voltage. Grounding or shorting the stator and grid components should be accomplished by grounding the stator mounting nut to the frame of the condenser with a screw-driver or any metallic conductor.

Do not wedge a screw-driver between the plates for this is liable to permanently warp the plates and thus prevent the oscillator section of the gang condenser from tracking

CONTINENTAL RADIO & TELEV. CORP
MODEL 7C-PH
MODEL 7H-PH
MODEL 11B-PH
Record Changer Del

AUTOMATIC RECORD CHANGER

This **Record Changer** will automatically play a series of eight 10" or seven 12" records of the standard 78 R.P.M. type. Records of the last few years with the standard eccentric or spiral stopping groove on the inside and an eccentric on the outside will operate the automatic mechanism. However, records of any size up to 12" may be played manually.

OPERATION

Before operating the phonograph, either automatically or manually, be sure that the pickup is down and can be moved by hand. If not, a "cycle" must be completed to bring it down. To do this, throw **Turntable Switch** "On". The turntable will begin to revolve and the cycle of motion on the pickup arm will be resumed. When the pickup arm comes down, turn off the **Turntable Switch.**

CAUTIONS

1. Never use force to start or stop the motor or any part of the record-changing mechanism or pickup arm.

2. The use of records which have become warped or damaged through improper care, may cause the mechanism to jam and damage the instrument. Records which have become warped, will slide on one another when playing, resulting in unsatisfactory reproduction.

3. This instrument is not recommended for playing 10" and 12" records in mixed sequence. If this service is desired, all records must be perfectly flat and free from warp. The **index** and **record reject lever** must be set at "10" and after playing the last selection, the pickup will come down in position for a 10" record and repeat the playing of the record on a 10" diameter unless the **turntable switch** is turned off. Any jamming of the mechanism under these conditions indicates that the records used are not perfectly flat or that their edges are not sufficiently smooth to permit normal operation of the separators in dropping each record in sequence onto the turntable.

4. Do not leave records on the record holder posts, as they are liable to warp, particularly so in warmer climates. Keep your records in a record file (album or cabinet) when not in use.

5. The needle must be installed according to directions under "Pickup and Top-Loading Needle Socket" for proper operation of this instrument.

6. The two red mounting bolts which hold the Automatic Record Player solid for shipping must be removed before using the Automatic Record Player so it can "float" on the spring mountings.

7. LEVELING—When a record has been played the pickup moves out, another record is dropped down, and the needle is fed automatically into the starting groove of this record. If the needle fails to enter the starting groove, raise the right-hand side of the cabinet by inserting thin spacers under the feet on that side. If the needle slides over a few grooves, raise the left-hand side of the cabinet in a similar manner.

8. LUBRICATION—A few drops of good quality light machine oil should be applied about once every six months at the base of the spindle below the metal washer under the turntable.

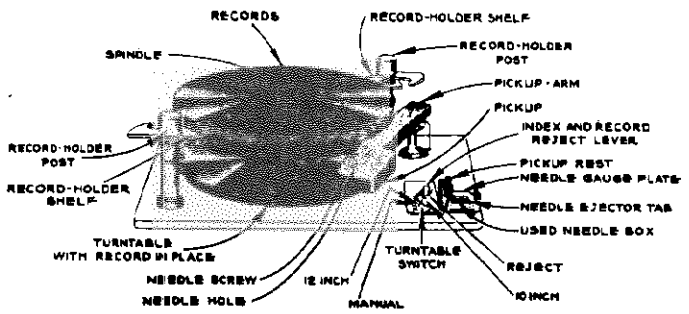


Fig. 2—Top View of Automatic Record Changer

CONTROLS AND MECHANISM

INDEX AND RECORD REJECT LEVER

This lever is located near the right front corner of the motorboard with its index plate marked for four positions—"Manual", "12", "10", and "Reject" When it is desired to change record selections manually, this lever should be set in the "Manual" Position. With the lever in the "12" position, the mechanism is set to play a series of 12" records automatically. To play either a series of 10" records or 10" and 12" records mixed, the lever should be set at the "10" position. To reject a record being played, or to start the record changing cycle in case the record just played does not have the standard eccentric or spiral stopping groove, simply push the lever to the "reject" position and let go. The pickup will rise and swing outwards and the next record will drop down. Upon releasing the lever, it will automatically return to the "10" position. If a series of 12" records is to be played, the lever should be returned to the "12" position after rejecting a record. Keep the lever in its "Manual" position when not actually playing records automatically.

TURNTABLE SWITCH

The Slide Switch located just in front of the **Index** and **Record Reject Lever** controls the current to the turntable motor. To start the turntable, push the switch to the "On" position. To stop the turntable, push the switch to the "Off" position.

NEEDLES

The use of high grade long playing needles is absolutely essential for the proper operation of this instrument, as the regular needles are only good for one or at the most two records. If any needle is used too long, distortion and poor quality will be obtained and also the records will be damaged.

PICKUP AND TOP-LOADING NEEDLE SOCKET

The pickup is the new crystal type, with a hole in the top for insertion of needles. When not playing records, the pickup arm should be moved out to the right beyond the turntable and placed at rest on the support with the edge of the pickup arm in the groove and the pickup over the **needle gauge** plate. The pickup must be in this position to change needles.

To insert a needle initially, loosen the **needle** screw on the front of the pickup, place needle in hole at top so that it drops down against the **needle** plate and then tighten the needle screw.

NEEDLE EJECTOR

The extending tab on the needle gauge plate of the needle box operates the needle ejector. To change a needle, place pickup in rest position, loosen needle screw and press the extending tab on the needle gauge plate to drop the used needle into the box below. Release tab allowing the needle gauge plate to swing back, and then insert a new needle in the pickup as described above.

RECORD HOLDER SHELVES

To place a record on the turntable or to remove records, raise the record holder shelves by lifting with the fingers under the shelf, and swing clear of the outer edge of record. Also push back vertical lever adjacent to the rear record holder post. The turntable is now accessible. Before loading the magazine for **automatic operation**, swing the record holder shelves back into position.

AUTOMATIC OPERATION

1. See that the pickup is over the needle gauge plate with the needle properly in place. If not, complete a "cycle" as explained in the first paragraph under "Operation".

2. With the **Index** and **Record Reject Lever** at **"Manual"**, place the first of the series of records on the turntable and the remainder of the series (up to seven 10" or six 12" records) on the record holder posts (as shown in Fig. 2). The records should be arranged in the desired order with the **desired selection** face up and the last selection on top.

3. Set the **Index** and **Record Reject Lever** to the proper position. (See **Controls: Index and Record Reject Lever.**)

4. Push the turntable switch to the left—**"On"** turntable should commence to revolve.

5. When the turntable has attained speed, lift pickup and lower gently on to the record so that the needle point enters the outside groove.

6. Adjust volume control to the desired intensity and tone control to the preferred setting.

7. Close the lid of the cabinet to eliminate mechanical reproduction of sound by the needle.

The whole series of records will now play without further attention, and the last record will repeat until the **Turntable Switch** is turned off. Allow the record-changing mechanism to complete its cycle before the turntable is stopped. Then lift the pickup, swing the arm to the right beyond the edge of the record and lower it onto the pickup rest with the pickup over the needle gauge plate. The record player is then ready for reloading, or for manual operation.

PROCEDURE FOR SETTING UP PUSH BUTTONS

Loosen one of the push buttons by turning the push button knob counter clockwise a turn or less and push it in; while holding the button in, tune in a desired station by means of the station selector knob. Turn the selector very slowly back and forth until the signal is clearest. Now while holding the push button in, tighten it by turning clockwise. Release the push button and turn the station selector to one end of the dial; push the tuning knob to the right and then check the button by pushing it in and if the station is tuned to the center of the area on the dial covered by the station the adjustment is correct.

MODEL A-169 SPECIFICATIONS

This model Crosley is a six tube single unit automobile receiver. It incorporates an unusual electric push button tuning system of simple, rugged mechanical and electrical construction. The tubes used and their functions are as follows: one 6SK7 as resistance coupled R-F amplifier, one 6SA7 as oscillator-modulator, one 6SK7 as I-F amplifier, one 6SQ7 as detector, A.V.C., 1st audio, one 6K6GT as power output and one 6X5GT as rectifier.

Improvements to be noted in the circuit are, the resistance coupled R-F stage and the method of connecting oscillator coil and variable level bass compensation. Bias voltage for the 6SK7 R-F amplifier and the 6SK7 I-F amplifier is developed across item 38, a 450 ohm resistor. Bias voltage for the 6K6GT is developed across item 43, a 600 ohm resistor. The 6SQ7 is operated at zero bias. A.V.C. is applied to 6SK7 (R-F) and the 6SA7. The volume control serves as the A.V.C. load and items 29 and 36, ½ and 1 megohms respectively, act as filters. Item 16 is a chemical condenser which automatically compensates for temperature differences, preventing station drift. The filter circuit is similar to that of Model A-259 using a resistive circuit.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary, such as when an I-F assembly has been changed and etc., the circuit can best be properly aligned with the use of a MODULATED SIGNAL GENERATOR and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to the plate and screen of the 6K6GT output tube. Be sure the meter is protected from D.C. by connecting a condenser (0.1 mf. or larger—not electrolytic) in series with one of the meter leads.

1. Aligning the I-F to 455 Kilocycles

(a) Connect the ground lead from the signal generator to the chassis frame. Connect the high side of generator through an .02 mf. condenser to the grid (pin No. 8) of the 6SA7 oscillator-modulator. Care should be exercised to keep signal generator leads as far as possible from the other grid leads.

(b) Open gang condenser all the way (minimum) turn volume control to maximum and then set signal generator to 455 kilocycles.

(c) Adjust both 2nd I-F trimmers for maximum output. Trimmers are accessible from bottom of the chassis between the 6SQ7 and 6SK7 sockets.

(d) Adjust both 1st I-F trimmers for maximum output. Trimmers accessible from bottom of the chassis.

(e) Repeat (c) and (d) with as low an output as gives a reasonable indication on output meter for more accurate adjustment.

2. Aligning the R-F

(a) If the receiver is to be used with a whip or streamlined antenna, the output lead from the signal generator should be connected through a .0001 mf. condenser to the "ANT" connection of the receiver. If a large antenna such as a running board type or built-in top antenna is to be used, a .0002 mf. condenser should be used in place of the .0001 mf. condenser.

(b) Set the signal generator to 1400 kilocycles.

(c) Adjust the station selector to 140 on the dial.

(d) Adjust the trimmer on the "OSC" section of the tuning condenser for maximum output.

(e) Adjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

(f) Readjust the station selector for maximum output.

(g) Repeat operation (e) for more accurate adjustment.

3. Adjusting Antenna Compensating Condenser on Model A-169 only.

(a) Set the signal generator to 600 kilocycles.

(b) Tune in the 600 kilocycle signal with the station selector for maximum output.

(c) Adjust the antenna compensating condenser, located near antenna receptacle, for maximum output.

(d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.

(e) Set the signal generator to 1400 kilocycles again.

(f) Tune in the 1400 kilocycle signal with the station selector for maximum output.

(g) Readjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

(a) After the installation is complete, tune in a WEAK station between 55 and 65 on the dial.

(b) Adjust the antenna compensating condenser for maximum volume in the speaker.

4. Setting the Push Buttons

The push buttons are easily and accurately set from the front of the case without removing any panels, etc.

To set push buttons, lift up on push button and the setting screw is easily accessible. Loosen the screws of the buttons to be set, two or three turns to the left. It is not necessary that all the buttons be set at the same time.

Determine the five favorite stations whose call letters are to be placed in the call letter holder (holder enclosed in the instruction envelope). Place the call letters in the holder in the order of their frequency (kilocycles), that is, the station that is tuned-in nearest the 150 marking on the dial, should be placed in the right-hand opening, etc. After call letters have been placed in the holder, break off the celluloid strip five pieces to insert in front of the call letters to protect and hold them in place.

With the special screws provided (two, enclosed in the instruction envelope) mount the call letter holder in place above the push buttons.

By means of the manual tuning knob tune-in AS ACCURATELY AS POSSIBLE, the station whose call letter has been placed in the right-hand opening. REMEMBER: the accuracy of the push buttons depends upon how accurate YOU tune-in the station when setting them.

Lift up the right-hand push button and with a small screw driver push the key all the way down. While holding the key down, securely tighten the setting screw. It is essential that you apply pressure while tightening the setting screw, in order to keep mechanism lined up with station tuned-in.

Remove screw driver and the first button is set, follow through with the same procedure to set the rest of the push buttons.

MODEL A-259 SPECIFICATIONS

This model Crosley Roamio is a single unit five tube superheterodyne receiver. It incorporates an unusual electric push button tuning system of simple, rugged mechanical and electrical construction. The tubes used and their functions are as follows: one 6SA7 as oscillator-modulator, one 6SK7 I-F amplifier, one 6SQ7 as diode detector, A.V.C., and 1st audio, one 6K6GT as pentode output and one 6X5GT as rectifier. The 6SA7 oscillator circuit is unusual in that the cathode is tied to a tap on the oscillator coil which is several turns above ground. Bias for the 6SK7 is obtained from the drop across item 30, a 450 ohm resistor and bias for the 6K6GT is obtained from the drop across item 39, a 600 ohm resistor. The 6SQ7 is operated at zero bias. A.V.C. is supplied to the 6SA7 and 6SK7 through item 29, a 500,000 ohm filter and item 34, a 1 megohm filter respectively. The B circuit is filtered by means of item 37, a 1,400 ohm resistor, and the two 10 mf. sections of item 25, a three section electrolytic condenser. Item 14 is a chemical temperature compensating condenser used in the oscillator circuit to prevent station drift.

SPECIFICATIONS

The Crosley Model 449 and 459 radio is a four-tube superheterodyne receiver designed for operation from batteries. The method of connecting the battery cable to the batteries is shown on the Wiring Diagram. The batteries required are: one Crosley A & B Battery Pack No. CR28 or one 1.5 volt "A" (EVEREADY NO. 740 or equivalent) and two plug-in type 45 volt "B" batteries.

TUBES AND VOLTAGE LIMITS

The following table gives the function of the tubes used, together with the voltage reading between the tube socket contacts and the chassis. Voltage readings should be taken with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with receiver in operating condition and the volume control full on and no signal input. The filament voltages should be measured with an accurate low range DC voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	G	Ga	Go
1A7-G	Oscillator-Modulator	1.5	72	30	—	72	—
1N5-G	I-F Amplifier	1.5	82	82	—	—	—
1H5-G	Detector & 1st A-F Amp.	1.5	10	—	—	—	—
1C5-G	Output	1.5	80	82	8*	—	—

Power Output approximately .5 Watt.
"A" Battery Drain approximately .25 Ampere at 1.5 Volts.
"B" Battery Drain approximately 9 Milliamperes at 90 Volts.
*Measured at No. 8 Socket Lug and Chassis.

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary, the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter across the "P" and "S" terminals of the 1C5G output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning I-F Amplifier To 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 1A7G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the GREEN lead of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely in mesh and turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I-F trimmers for maximum reading on the output meter. (Fig. 2).

(e) Adjust both trimmers on the 1st I-F transformer for maximum output. (Fig. 2).

(f) Check operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator should be connected through a .0002 mfd. condenser to the RED lead of the receiver.

(a) Set the signal generator to 1725 kilocycles.

(b) Open the condenser gang all the way.

(c) Adjust the "OSC" trimmer condenser on gang for maximum output.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune the receiver to the generator signal for maximum output (approximately 140 on the dial).

(f) Adjust the "ANT" trimmer condenser on gang for maximum output. DO NOT READJUST THE "OSC" TRIMMER AT 1400 KILOCYCLES.

(g) Repeat operations (e) and (f) alternately until no further improvement in output can be obtained.

If any of the circuits have been re re-adjusted it may be necessary to reset the push buttons.

SETTING THE PUSH BUTTONS

Remove push buttons by pulling straight up. With a small screw driver loosen the set screw a turn or two. With the manual tuning knob tune-in as ACCURATELY AS POSSIBLE the station for which the button is to be set. Then push the button key all the way down and while you hold it in that position SECURELY TIGHTEN the set screw. Replace the push button. Use same procedure in resetting or adjusting the rest of the push buttons.

PARTS LIST — MODEL 449 & 459

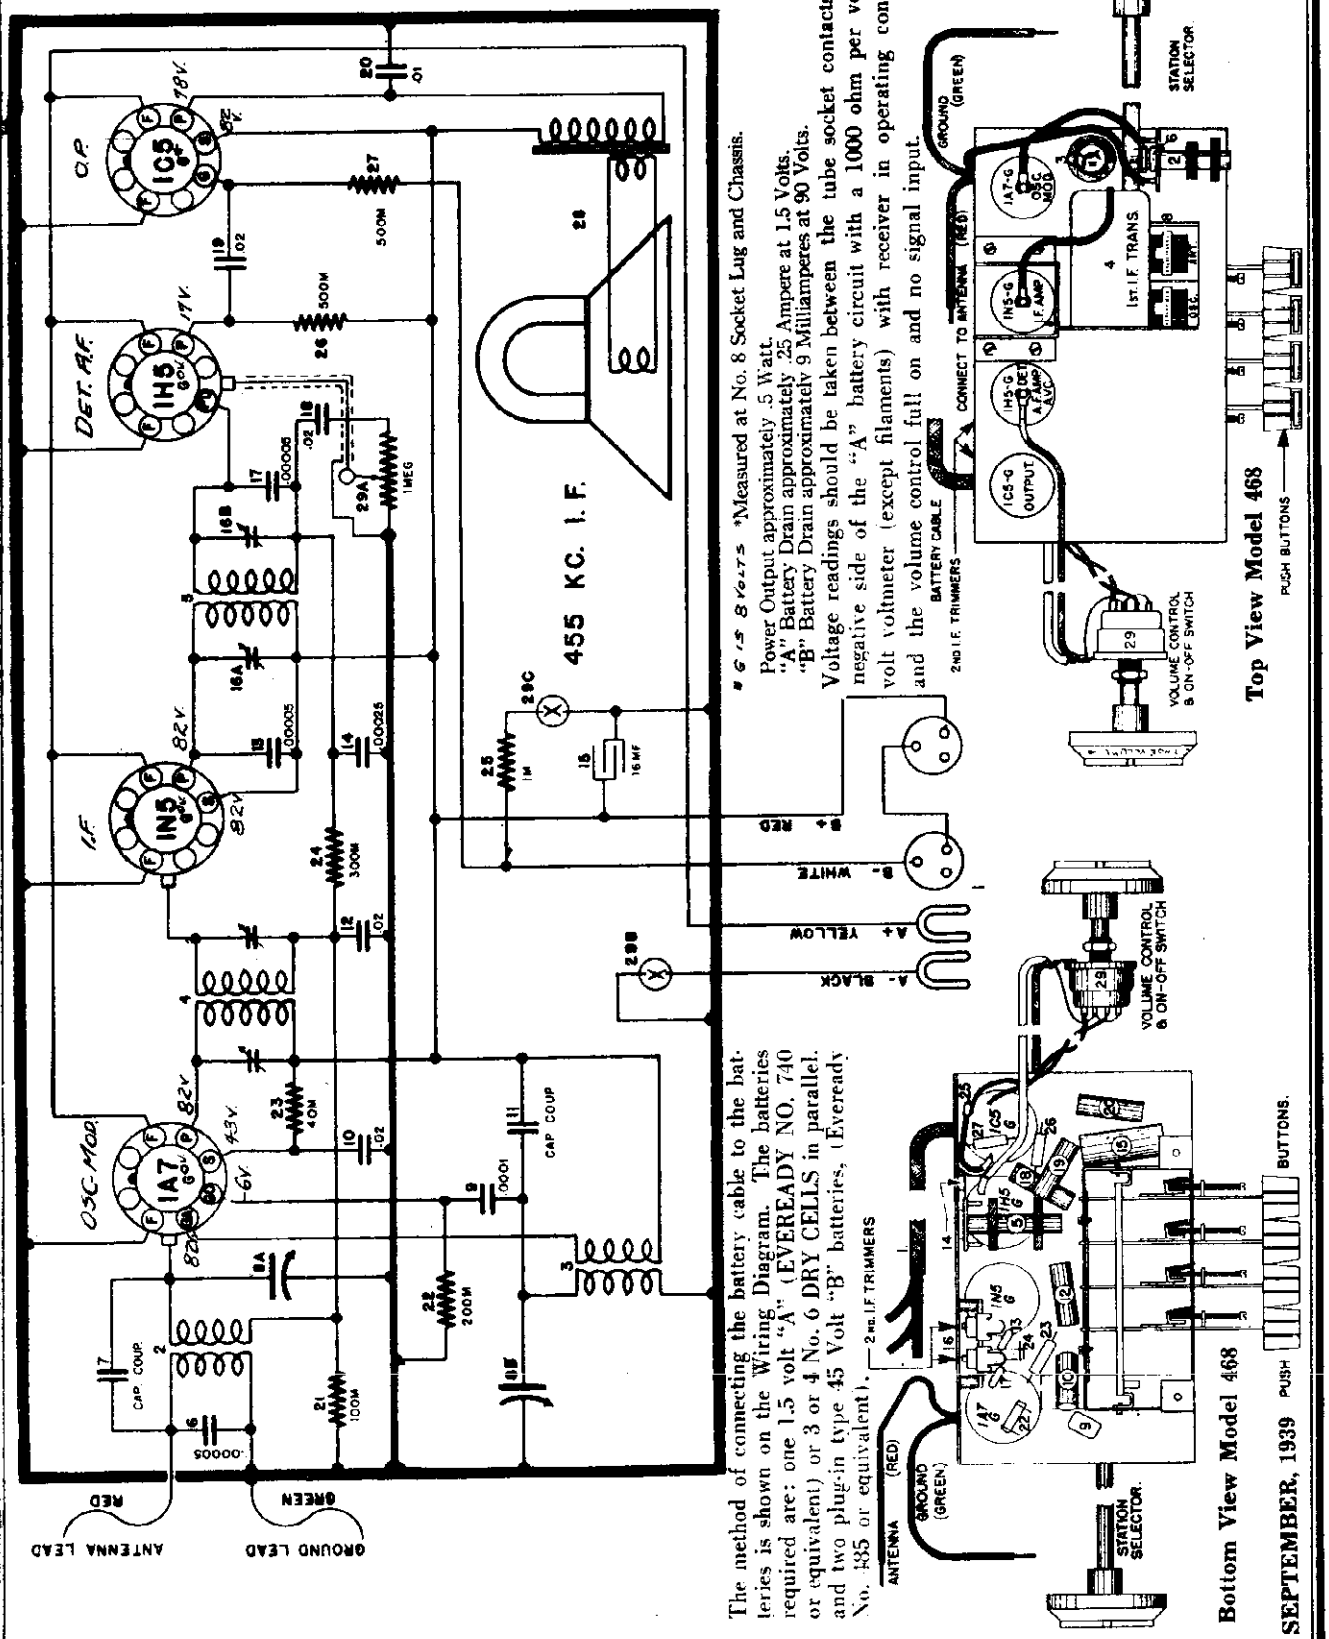
MODEL 468
Schematic, Socket
Trimmers, Chassis
Notes

THE CROSLEY CORP.



* 67.5 Volts *Measured at No. 8 Socket Lug and Chassis.

Power Output approximately .5 Watt.
"A" Battery Drain approximately .25 Ampere at 1.5 Volts.
"B" Battery Drain approximately 9 Milliamperes at 90 Volts.
Voltage readings should be taken between the tube socket contacts and the negative side of the "A" battery circuit with a 1000 ohm per volt, 250 volt voltmeter (except filaments) with receiver in operating condition and the volume control full on and no signal input.

The method of connecting the battery cable to the batteries is shown on the Wiring Diagram. The batteries required are: one 1.5 volt "A" (EVEREADY NO. 740 or equivalent) or 3 or 4 No. 6 DRY CELLS in parallel, and two plug-in type 45 Volt "B" batteries, (Eveready No. 485 or equivalent).

Alignment, Rear Vi
MODELS 518, 6518
Voltage, Alignment

CHASSIS MODEL 468

ALIGNMENT PROCEDURE
CONNECTING OUTPUT METER

Connect the output meter across the "P" and "S" terminals of the 1C5G output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning the I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 1A7G tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely in mesh and turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I-F trimmers (located through rear of chassis flange) for maximum reading on the output meter. (Fig. 3).

(e) Adjust both trimmers located on the 1st I-F transformer (right end) for maximum output. (Fig. 2).

(f) Check operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

2. Aligning the R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator should be connected through a .0002 mfd. condenser to the "ANT" terminal of the receiver.

(a) Set the signal generator to 1725 kilocycles.

(b) Open the condenser gang all the way.

(c) Adjust the "OSC" trimmer condenser on gang for maximum output.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune the receiver to the generator signal for maximum output (approximately 140 on the dial).

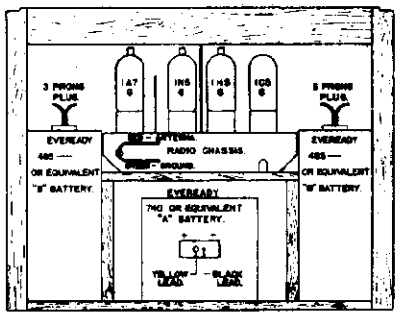
(f) Adjust the "ANT" trimmer condenser on gang for maximum output. DO NOT READJUST THE "OSC" TRIMMER AT 1400 KILOCYCLES.

(g) Repeat operations (e) and (f) alternately until no further improvement in output can be obtained.

If any of the circuits have been adjusted it may be necessary to reset the push buttons.

SETTING THE PUSH BUTTONS

With a small screw driver or pen knife remove celluloid cover and the call letters. Insert screw driver in the hole in the front of the button and loosen the set screw a turn or two. With the manual tuning knob tune-in as ACCURATELY AS POSSIBLE the station for which the button is to be set. Then push the button all the way down and while you hold it in that position SECURELY TIGHTEN the set screw. Replace the call letter and call letter cover. Use same procedure in resetting or adjusting the rest of the push buttons.



Rear View Model 468

CHASSIS MODELS 518 & 6518 (FOREIGN)

SPECIFICATIONS

These models are five-tube superheterodyne receivers designed for operation on A.C. circuits as specified on the Model Label. The 518 and 6518 chassis are identical electrically but differ slightly in mechanical parts due to various cabinet combinations.

CIRCUIT DESCRIPTION

Five glass (octal) tubes are used and their functions are as follows: one 6A8G as oscillator-modulator, one 6U7G as I-F amplifier, one 6Q7G as diode detector, A. V. C., and first audio amplifier, one 6K6G as power output and one 5Y3G as a half-wave rectifier. The bias for the 6K6G is obtained from the drop across item 29 a 375 ohm resistor which is in series with the speaker field (700 ohms) that is in the negative leg of the power supply.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given

MODELS 518 & 6518

ALIGNMENT PROCEDURE
CONNECTING OUTPUT METER

Connect the output meter to the plate and screen of the 6K6G Output tube. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON).

(c) Turn the band selector switch to the Broadcast Band.

(d) Set the signal generator to 455 kilocycles.

(e) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. (Item 5, Fig. 2).

(f) Adjust both trimmers located on top of the 1st I-F transformer for maximum output. (Item 4, Fig. 2).

(g) Check operations (e) and (f) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna (A) terminal of the receiver. For both bands a 100 mmf. condenser should be connected in series with the output lead of the signal generator.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh and the band selector switch set for the band being aligned, adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL (C) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

NOTE: When shunt aligning the Short Wave Band care should be exercised so that the circuits will be aligned on the correct frequency rather than on the image frequency which is approximately 910 kilocycles less than the fundamental. To check on this, increase the output of the signal generator 10 times, or more, and try to tune-in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. If the circuits have been properly aligned the signal can be tuned-in at both positions but much stronger at the correct frequency.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 42).

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 100 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	K	G	Ga	Ge
6A8G	Oscillator-Modulator	6.3	165	95	—	—	165	—

ALIGNMENT PROCEDURE CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 50L6GT output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier To 455 Kilocycles.

(a) Disconnect the antenna coil from the receiver and connect the output of the signal generator through a 50 mmf. condenser to the antenna connection on the receiver. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condenser, Item 14, located on top of coil (Fig. 2) for maximum reading on the output meter.

(e) Adjust the 1st I-F trimmer condensers located on the rear of chassis for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the signal generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

MODELS 519 & 529, 668.

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil, a fixed condenser and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram.

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 100 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser open and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

CHASSIS MODEL 668

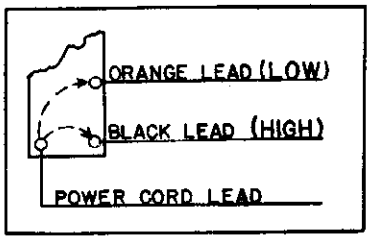
This model is a six-tube superheterodyne, phono combination receiver. The tuning range is from 540 to 1725 kilocycles. The Phono Assembly consists of a sensitive crystal pickup, a small efficient self-starting motor and a separate switch for changing from radio to phono operation.

For adapting the phono-motor to 50 cycle operation it is only necessary to change the rubber drive bushing on the motor shaft, using pulley No. 46991.

50 CYCLE POWER TRANSFORMER ADJUSTMENT

Receivers equipped with a 50 cycle power transformer have a "high" and "low" voltage tap on the under side of the chassis. The "high" voltage lead (BLACK) and the "low" voltage lead (ORANGE) are connected to a terminal strip near the transformer.

The voltage range of the "low" tap of the 95-130 volt



transformer is from 95 to 112½ volts and of the "high" tap is from 112½ to 130 volts.

The accompanying illustration shows the connections for changing from high to low or low to high line voltage. Note the "jumper" wire which is attached to the terminal at which one side of the power cord is attached. The other end of this jumper wire should be connected to the ORANGE or BLACK lead of the transformer primary, according to the line voltage the receiver is to be used on.

NOTE: Any change made in the power supply circuit of the receiver should be plainly stamped or otherwise permanently recorded on the rear of the chassis.

SETTING THE PUSH BUTTONS

With a small screw driver or pen knife remove celluloid cover and the call letters. Insert screw driver in the hole in the front of the button and loosen the set screw a turn or two. With the manual tuning knob, tune-in as ACCURATELY AS POSSIBLE the station whose call letters were in the button or that station for which the button is to be set. Then push the button all the way down and while you hold it in that position SECURELY TIGHTEN the set screw. Replace the call letters and call letter cover. Use same procedure in resetting or adjusting the rest of the push buttons.

MODELS 548 & 5548, 558.

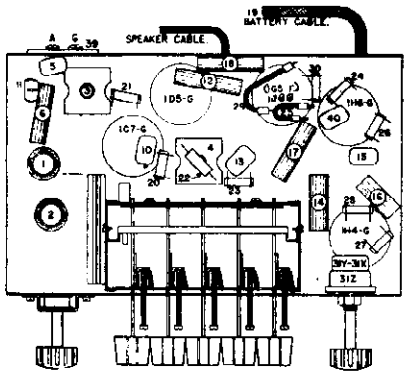
ALIGNMENT PROCEDURE CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 1G5G Output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning the I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger condenser to the top cap of the 1C7G Osc-Mod tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the "GND" terminal of the receiver.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON).



Bottom View

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. Fig. 2.

(e) Adjust both trimmers located on top of the 1st I-F transformer for maximum output.

(f) Check operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

2. Aligning the R-F Amplifier.

(a) Connect the output lead from the signal generator through a .0001 mfd. condenser to the "ANT." terminal of the receiver. Connect generator ground lead to the chassis.

(b) Set signal generator to 1725 kilocycles.

(c) Open condenser gang all the way.

(d) Adjust "OSC." trimmer on gang to 1725 kc. signal, the gang does not have to tune through this signal.

(e) Set signal generator to 1400 kilocycles.

(f) Tune-in 1400 kc. signal with station selector, should be approximately 140 on dial.

(g) Adjust "ANT." trimmer on gang for maximum output. Do not readjust "OSC" trimmer. Repeat above operations for more accurate adjustments.

SETTING THE PUSH BUTTONS

If any of the circuits have been readjusted it may be necessary to reset the push button tuning system.

Remove the call letters from the buttons or remove the complete button. Loosen set screws a turn or two by turning to the left. Then tune-in as accurately as possible the station to which the button is to be set. With the screw driver inserted in adjustment screw slot push the key all the way down and while holding in that position securely tighten the adjusting screw. It should be remembered that when tightening the adjusting screw in this manner, to all apply a steady pressure when tightening the screw in order to keep the key aligned with the station tuned-in.

Repeat the above procedure for resetting the rest of the buttons.

NOTE:
The schematic,socket layout, and parts list of Models 548 and 5548 will be found on Crosley page 9-58 in Volume IX.

MODELS 548 — 3 & 558

TUBE SOCKET VOLTAGE READINGS

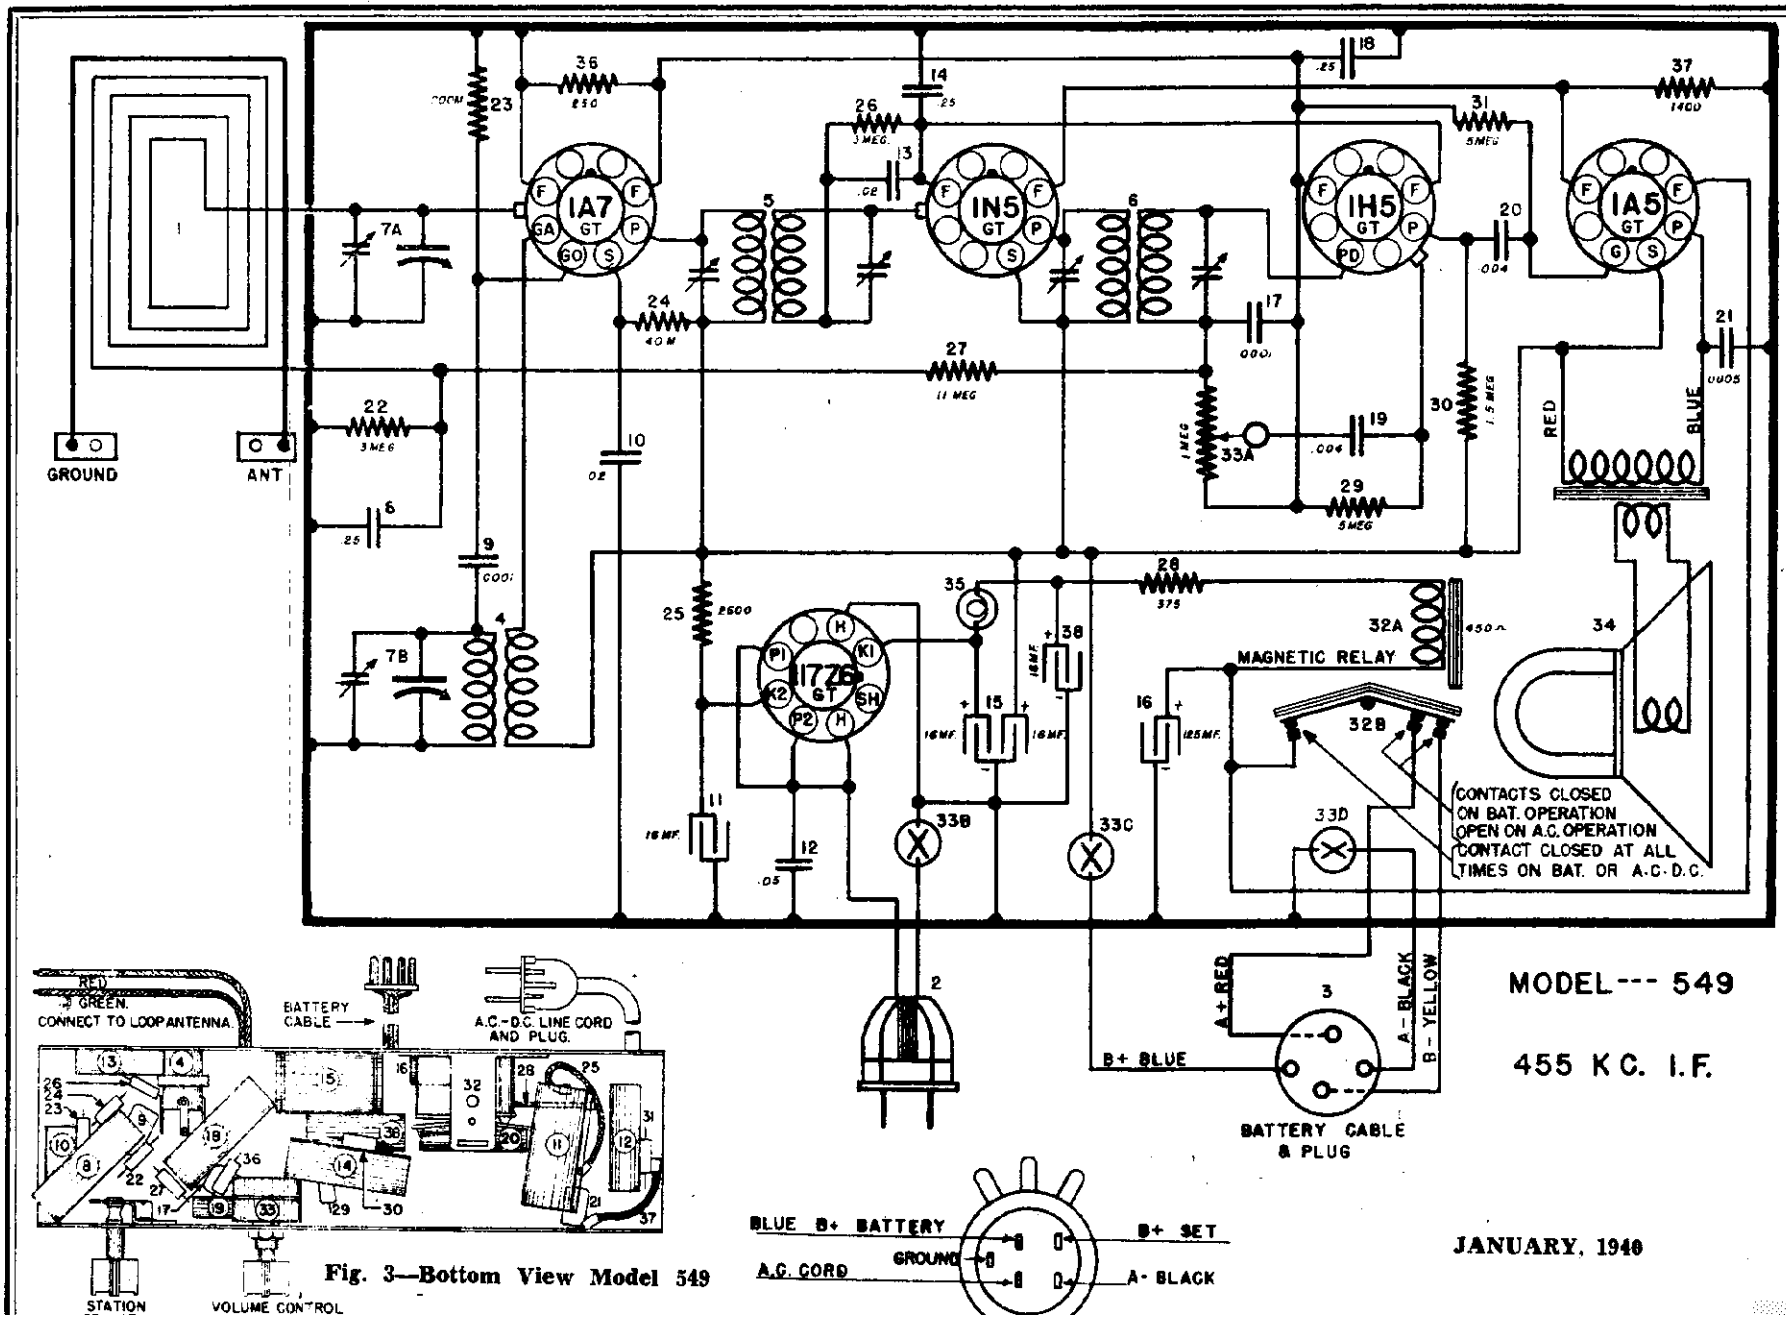

Fig. 3—Bottom View Model 549

JANUARY, 1940

MODEL 549
Voltage, Socket
Trimmers, Alignment

THE CROSLEY CORP.

The circuit is a conventional superheterodyne with a tuned loop antenna stage. Four 1.4 volt tubes and one 117Z6GT tube are employed as follows: one 1A7GT as oscillator-modulator, one 1N5GT as 455 kc. I-F amplifier, one 1H5GT as diode detector, A.V.C. and first audio, one 1A5GT as power output and the 117Z6GT as rectifier (used only when plugged into 110 volt power circuits).

The filaments of the 1.4 volt tubes are connected in series and have plate current compensating resistors one, item 36, a 250 ohm resistor across the 1A7GT filament and the other, item 37, a 1,400 ohm resistor from the negative leg of the 1A5GT to chassis.

When used on 110 volt power circuits one half the 117Z6GT supplies the filament voltage and the other half the B voltage. The rectified voltage for the filament string is well filtered by the following, item 35, which is a 7½ watt 110 volt miniature lamp and does triple duty—, 1, regulates the voltage—2, acts as a filter –3, as an ON-OFF indicator; item 28 a 375 ohm resistor and item 32A, the relay coil which serves as a choke and their associated electrolytic condensers, i.e., item 15, 16 mf.—item 38, 16 mf. and item 16, 125 mf. The above mentioned miniature lamp (item 35) should always be replaced with an exact duplicate should replacement become necessary.

The "b" voltage is filtered by means of item 25, a 2,600 ohm resistor and item 11—a 16 mf. electrolytic and one section of item 15 (twin electrolytic) 16 mf. condenser.

The relay automatically disconnects the batteries from the circuit when the receiver is operated on 110 volt circuits.

1A5GT	Output	0	6.0	98	102	—	28	4.5	1.5
117Z6GT	Rectifier	58 5 A.C.	117.5 A.C.	117.5 A.C.	142	117.5 A.C.	0	0	126

Power Output approximately 200 M. W.

Watts @ 117.5 volts 20 watts.
Above readings will be approximately 10% less when checked on D.C. power circuit.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 1A5GT output tube. Be certain that the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier to 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mf. condenser to the grid cap of the 1A7GT oscillator-modulator tube leaving th. tubes' grid cap in place. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

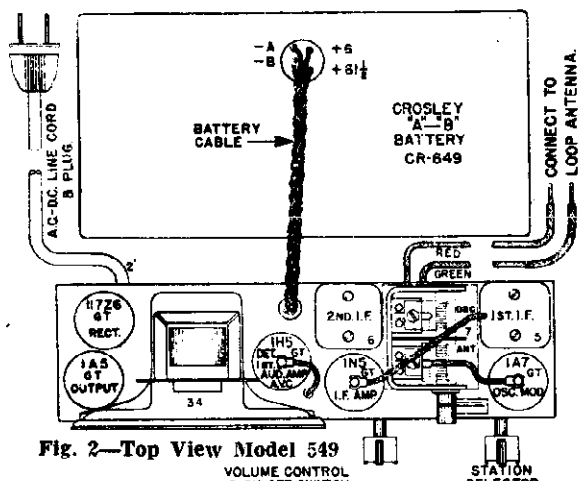

Fig. 2—Top View Model 549

VOLUME CONTROL & ON-OFF SWITCH

STATION SELECTOR

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condensers for maximum reading on the output meter.

(e) Adjust the trimmer condensers located on the 1st I-F transformer for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier

When aligning the R-F amplifier the output lead from the signal generator should be connected through a .0001 mf. condenser to "A" terminal and the ground lead to the "G" terminal on the back of the cabinet.

It is essential that the following alignment be made with the receiver in the cabinet and the battery and back in position. Trimmer adjustments may be made on the two luggage type carrying cases through the two holes in the top, beneath the carrying handle. On the walnut cabinet model the oscillator will have to be aligned before placing chassis in the cabinet and then adjust the antenna trimmer provided on the back.

Before aligning receiver check the position of the pointer by opening gang all the way, the pointer should then split the 1600 kilocycle calibration point.

(a) Set signal generator to 1400 kilocycles.

(b) Tune gang to 140 on the dial, then adjust oscillator trimmer (rear section of gang) for maximum output.

(c) Adjust antenna trimmer (front section of gang) for maximum output.

RELAY

The receiver, when plugged into 110 volt circuit, will operate on the batteries until rectifier warms up and trips the relay. When relay trips there should be no decrease or dead spot in output as rectifier should be warmed up sufficiently to carry load and give a slight increase in output due to higher plate voltage available.

The relay is insulated from the chassis and care should be exercised when probing so as not to short it.

In earlier models the relays have three sets of contacts and the single side must make contact at all times. The double side must make contact when batteries are used and both contacts (double contact side) must break when operated on 110 volt circuits. Later models the single contact side was omitted and a flexible braid connection used instead.

THE CROSLEY CORP

MODEL 558
Schematic, Socke
Trimmers, Notes

FOR ALIGNMENT
SEE INDEX

MODEL 558

This model receiver is similar to model 548. The main difference is in the output system. The output tube is a 1J6G, dual triode, impedance coupled. Bias for the 1J6G is obtained from drop across item 27 a 60 ohm resistor. The use of the 1J6G will increase the total "A" drain as listed in the 548 voltage chart by 120 M. A. Likewise the maximum power output is increased to approximately 2 watts.

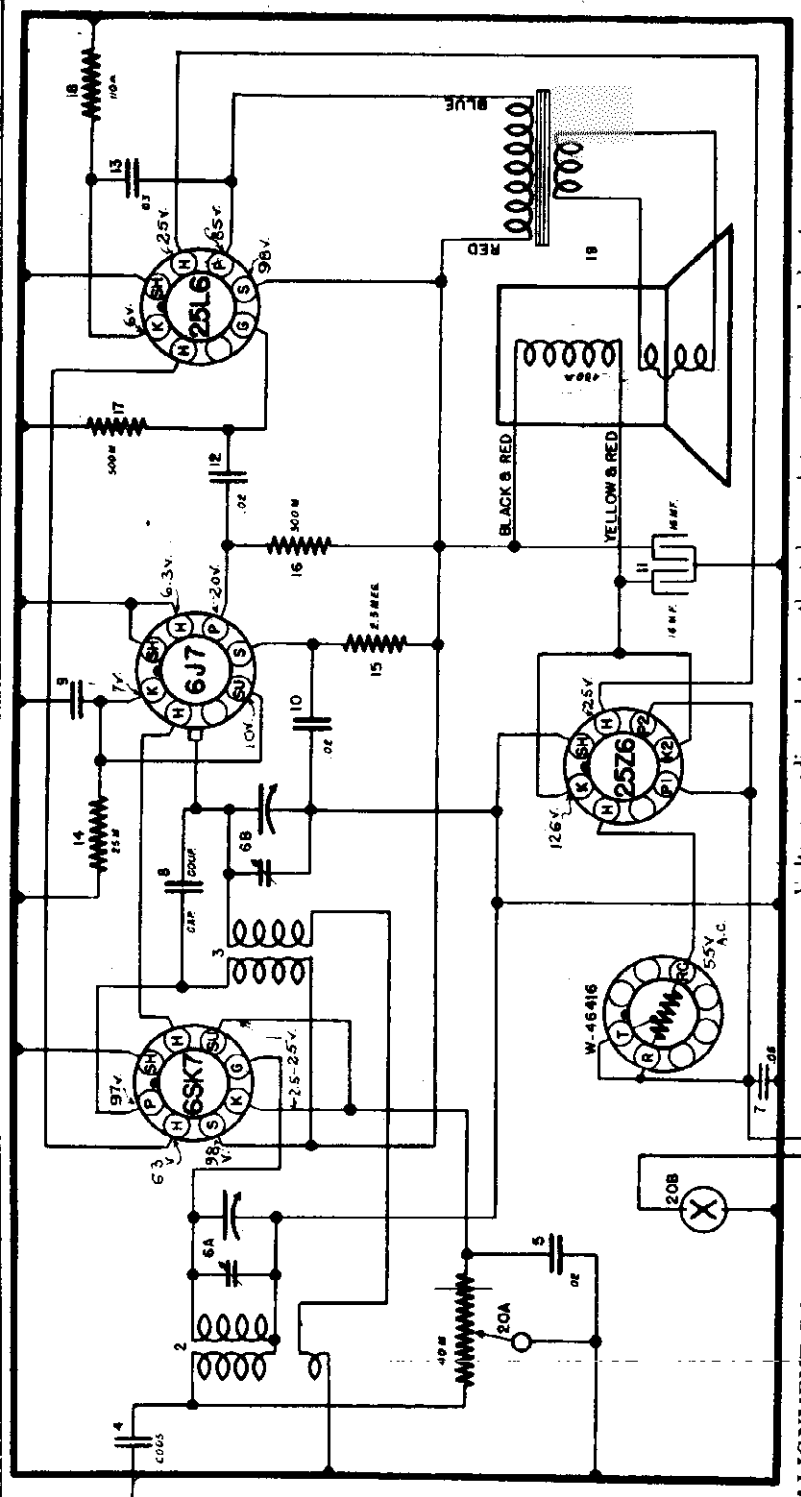
The R-F and I-F adjustment procedure is the same

MODEL 599
Schematic, Socket

THE CROSLEY CORP.

Trimmers, Chassis
Alignment, Voltage

Power output approximately 2 watts. Drop across field 28 volts.
Power consumption at 117.5 volts line 45 watts (A.C.).
All readings except filaments will be approximately 10% lower on 117.5 D. C.



Voltage readings between the tube socket contacts and chassis.

ALIGNMENT PROCEDURE

(a) Connect the output lead of the signal generator through a .0001 mf. condenser to the antenna lead on the receiver. The ground lead of the generator should be connected through a .001 mf. condenser to the chassis.

(b) Open the gang condenser all the way.

(c) Set the generator to 1725 kilocycles.

(d) Adjust the trimmer condensers on the gang until the 1725 kc. signal is heard. The gang does not have to tune through this signal.

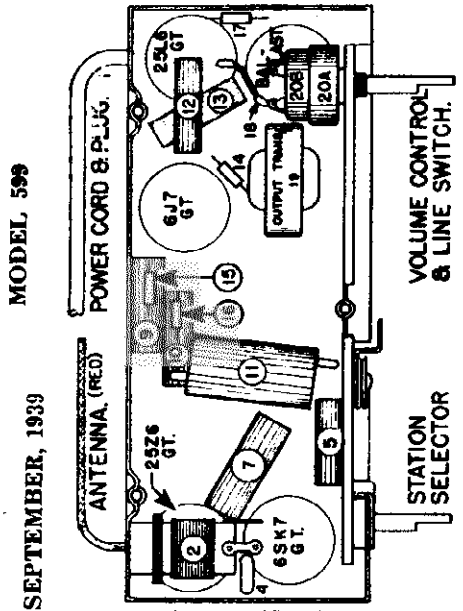
(e) Set the generator to 1400 kc.

(f) Tune the set to the 1400 kc. signal, then alternately adjust the trimmers on the gang until no further improvement can be noticed on the output meter.

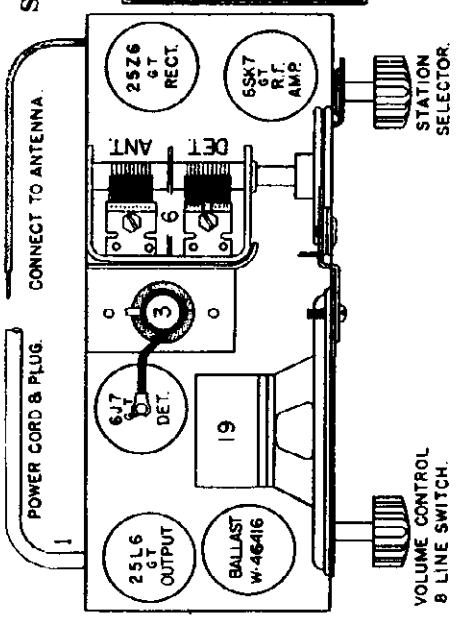
NOTE: Always use the lowest signal generator output that will give a reasonable indication on the output meter.

Keep the two grid leads as far as possible from each other.

MODEL 599
SEPTEMBER, 1939



Bottom View Model 599



Top View Model 599

THE CROSLEY CORP.

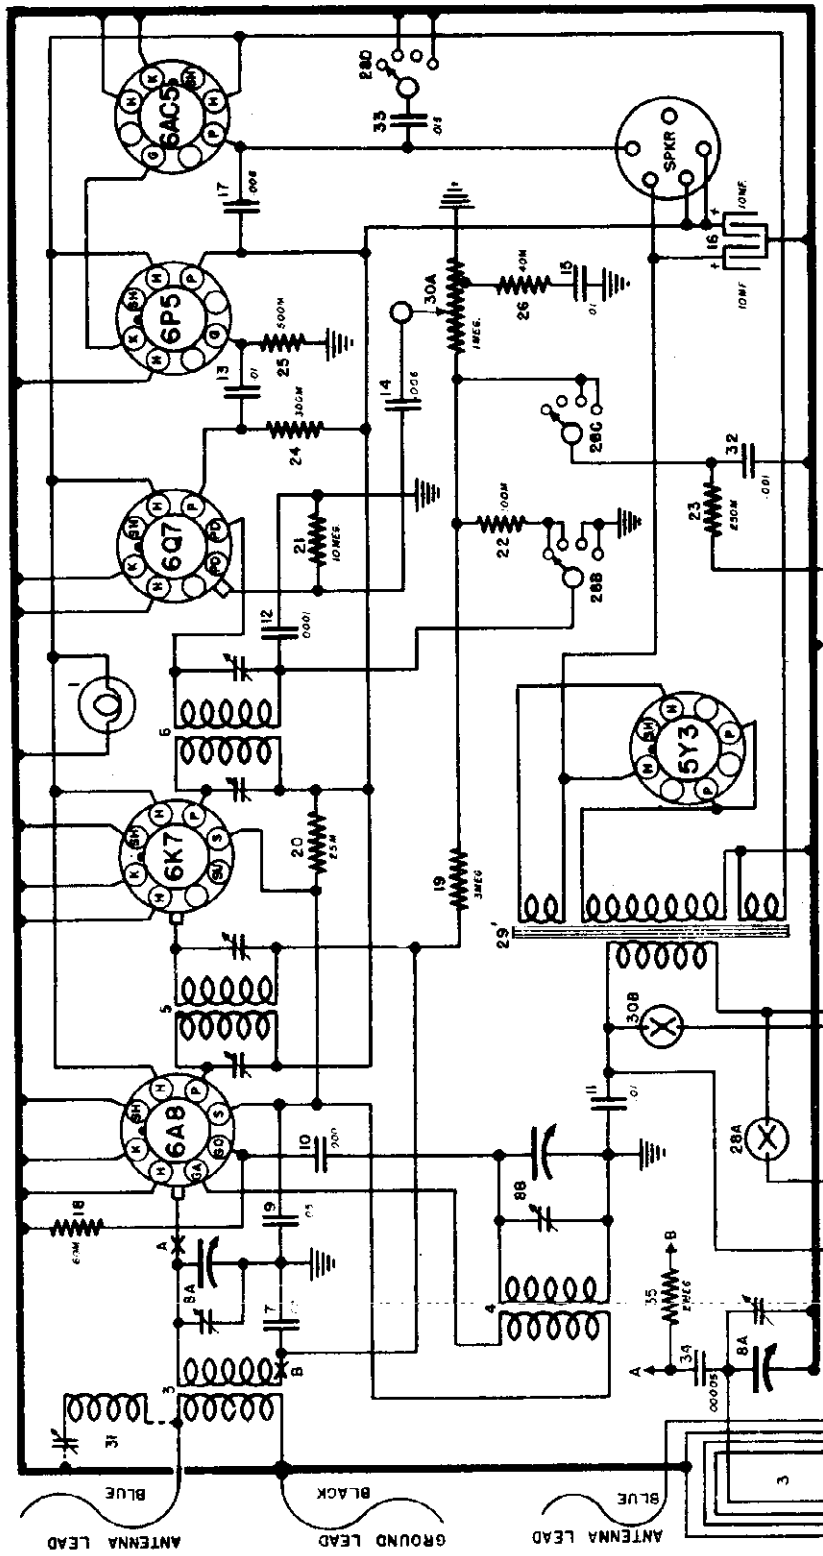
MODEL 639
Schematic, Voltage

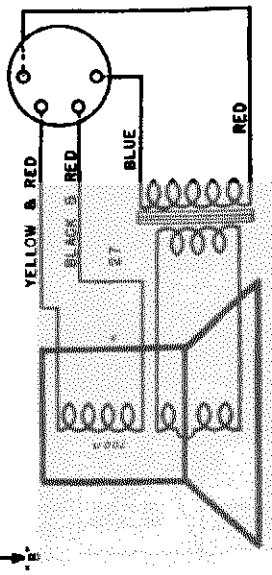
CIRCUIT DESCRIPTION

Six glass (octal) tubes are used and their functions are as follows: one 6A8G as oscillator-modulator, one 6K7G as I-F amplifier, one 6Q7G as diode detector and A. V. C., and 1st audio, one 6P5G as 2nd audio amplifier, one 6AC5G dynamic coupled power output and one 5Y3G as a half-wave rectifier.

This model is a six-tube superheterodyne, phono combination receiver with Automatic Record Changer. The tuning range is from 540 to 1725 kilocycles.

For adapting the phono-motor to 50 cycle operation it is only necessary to change the drive pulley on the motor shaft, using pulley No. 48536.





NOVEMBER, 1939

Voltage drop across speaker field 44 volts.
Maximum power output approximately 5 watts.
Power consumption at 117.5 volts approximately 85 watts with phono operating.

TUBES MAY BE EITHER "M", "G", OR "GT" TYPES

ALIGNMENT PROCEDURE

Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6ABG tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. (Item 6, Fig. 2).

(e) Adjust both trimmers located on top of the 1st I-F transformer for maximum output. (Item 5, Fig. 2).

(f) Check operations (d) and (e) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning R. F. Amplifier.

When aligning the R. F. amplifier the output lead from the signal generator is connected to the antenna lead of the receiver: a 100 mmf. condenser should be connected in series with the output lead of the signal generator.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL ¶ (C) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

If any of the circuits have been re-adjusted it may be necessary to reset the push buttons.

SETTING THE PUSH BUTTONS

Remove push buttons and with a small screw driver loosen the set screws a turn or two. With the manual tuning knob, tune-in as ACCURATELY AS POSSIBLE the station whose call letters were in the button or that station for which the button is to be set. Then push the key all the way down and while you hold it in that position SECURELY TIGHTEN the set screw.

(C) SIGNAL INPUT FREQUENCIES

Minimum Capacity Signal
1,725 Kilocycles

I-F Alignment Signal	Shunt Alignment Signal
455 Kilocycles	1,400 Kilocycles

WAVE TRAP

Some chassis of this model are equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the underneath side of the chassis and consists of a coil and a trimmer condenser as illustrated by dotted lines in the Wiring Diagram (item 31).

The wave trap should not be adjusted until all other adjustments have been made. To make the adjustment, feed a 455 kilocycle signal from the signal generator through a 100 mmf. condenser into the antenna terminal of the receiver. With the band selector switch turned to the Broadcast Band position, the gang condenser closed and the volume control full on, adjust the trimmer condenser on the wave trap for MINIMUM output.

Should the interfering station be operating on a frequency of slightly more or less than 455 kilocycles, the exact frequency should be determined with the aid of the signal generator. Then, instead of feeding a 455 kilocycle signal into the receiver the exact frequency of the interfering signal should be used. If it is not possible to determine the exact frequency of the interfering signal the antenna may be attached to the receiver and the receiver tuned to the position where the interfering signal is most noticeable. Then adjust the wave trap for minimum interference.

AUTOMATIC RECORD CHANGER

This record changer is mounted on a heavy metal base which is rubber mounted to the cabinet. The turntable is rim driven and in turn drives the automatic changing mechanism. Each changer is thoroughly tested before it leaves the factory and should not need any further adjustments. It is possible that due to wide variations in types of records used, minor adjustments in settings may have to be made. Under the following headings are listed effects, possible cause and method of correcting.

A word of caution when checking for quality.

1. Make sure that all the packing has been removed, around motor, turntable, etc.

2. See that the changer unit does not touch the cabinet, it must float on the four rubber mountings. The four screws which mount base to cabinet should be removed (AFTER RECEIVER IS IN POSITION).

3. ALWAYS USE A GOOD NEEDLE AND SEE THAT IT IS SEATED AND THAT THE NEEDLE SCREW IS TIGHT.

1. Motor Will Not Start.

1. Plug not in receptacle, house fuse blown, defective outlet.

2. Defective switch (Phono-Radio), open motor winding or leads.

3. Motor stopped in an overload position, i. e., record drop cam and cam roller at point where roller is just about to LOWER shelf. Turn the turntable (clockwise) two or three revolutions by hand.

NOTE: The turntable screws down on the record spindle. To remove, turn in clockwise direction by hand until the carve on the spindle is toward the loading rack, then lock small drive pinion in that position. Spindle must NOT turn. Unscrew turntable (counter clockwise).

4. Friction drive pulley stuck, friction drive pulley not touching turntable rim or bushing on motor shaft not touching friction drive pulley. Oil on friction drive pulley.

5. Center pinion shaft stuck or tight. Free and oil. When replacing be very careful so as not to bend or spring the friction drive pulley which will have to be pushed under the edge while screwing the turntable in position.

2. Tone Arm Does Not Drop In Correct Position.

1. 10 inch or 12 inch lever not in correct position for record being played. Check setting of lever.

2. Tone arm drop not set correctly to meet record variations. Records may vary as much as ½-inch in diameter. Adjust for average conditions.

To adjust tone arm drop, place gauge on turntable, large hole (A) over spindle, place needle in tone arm and then place tone arm so the needle sets in small hole marked "NEEDLE SET FOR 10". Throw 10" record lever in correct position. The tone arm adjusting lever, see Fig. 7, must have its stud in contact with the tone arm travel lever, this lever must be in contact with die cast cam and gear. Loosen screw in adjusting lever and adjust lever, then tighten. Check operation and repeat until tone arm drops in correct position.

To adjust for 12-inch records, throw lever to left for 12-inch records. With gauge in place on turntable place tone arm in position marked "NEEDLE SET FOR 12". Loosen lock nut on tone arm travel lever and adjust screw to stop. Tighten lock nut and check. Repeat until needle drops in correct position.

For the above adjustments use a small cotter pin instead of a needle. This prevents any scratching or marring of records or turntable surface.

3. Trips Before Record Is Finished.

This condition invariably is caused by the clutch being too tight. This clutch is the friction type and when the pickup moves at an increased speed toward the center of the record, sufficient torque is developed to cause the tripping arm to act. To remedy it is necessary to have a No. 6 Bristol wrench to loosen the special set screw in the collar nearest the base of changer, see Fig. 1. Loosen set screw and turn collar a fraction of an inch to the left (counter clockwise) tighten set screw. Check and repeat until record plays to end.

4. Does Not Trip After Record Is Finished.

1. Center groove on record does not have sufficient pitch to develop enough torque to actuate clutch. This may result from improperly cut trip groove in record or loose clutch setting.

2. It may be possible that the trip arm may have jumped to the wrong side of the rocker bar trip arm, see Fig. 7. It should be on the same side as reject arm.

3. To check the trip action adjustment, place the gauge (hole marked B) on the lower spindle and set needle or cotter pin in hole marked TONE ARM TRIP (1⅞" centers). When in this position the cam on the center pinion shaft should be pointing toward tone arm. With cam as stated, the starting lever should be touching cam when cam and starting lever are in this position. The tone arm tripping lever should be in contact with the starting lever. Likewise the rocker bar (Fig. 3) ,bar which engages pin in pinion gear shaft causing large cam gear to engage pinion gear) must be in contact (beneath) the end of the starting lever (Fig. 3) The end of starting lever may be bent sufficiently to make contact. The end of starting lever must not be bent any more than that which is necessary to center the other end of the rocker bar between the cam and the pin on the small pinion gear (Fig. 3) (running position).

After the above has been checked and adjusted the trip arm (while unit is running) should come in contact with the starting lever when the needle is about 3½ inches from the center line of the spindle. This may be adjusted by loosening the Bristol set screw in tripping lever stop collar (Fig. 1) and turning collar a fraction of an inch to the left. Check operation after tightening set screw.

4. The clutch may be too loose, thereby not developing sufficient torque. To adjust loosen Bristol set screw in clutch collar, rotate collar (Fig. 1) to the right a fraction of an inch. Tighten set screw. Check operation.

5. Records Do Not Drop.

1. Record hole tight or record warped.
2. Shelf height not correct. To adjust see Fig. 4 for correct height; adjust for 10" records first.
3. Spindles may not be in correct relation. See Fig. 4, for correct alignment. Top spindle adjustable.
4. Record drop cam roller out of adjustment. Set correct shelf height (10" shelf) by loosening lock nut and turning screw; tighten locknut.

6. Drops More Than One Record.

1. Warped record.
2. Spindle alignment and etc. Same procedure as listed under 5.

7. Tone Arm Drags On Record.

1. Too many records on the turntable.
2. Records may be thicker than average or warped.
3. Needle too long or not properly seated.
4. Tone arm lift adjusting screw loose or out of adjustment.

To check the tone arm for correct lift, rotate turntable (clockwise) by hand and push reject button in order to actuate trip. Turn slowly until tone arm reaches maximum height and starts to travel toward tone arm rest, then stop when the arm is approximately one inch from edge of turntable. Check the height of the tone arm from the surface of the turntable as indicated in Figure 5. From the lower edge of the tone arm to the top of the turntable the distance should be between 1 7/16" and 1 17/32". To adjust the tone arm lift screw (Fig. 2-A) loosen locknut and adjust screw until arm is within above tolerance, then tighten locknut.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

ALIGNMENT PROCEDURE

CONNECTING OUTPUT METER

Connect the output meter to the plate and screen of the 6V6G Output tube. Be certain that the meter is protected from D. C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd. condenser to the top cap of the 6A8G tube, leaving the tube's grid lead in place. Connect the ground lead from the signal generator to the ground terminal of the receiver. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the tuning condenser plates are completely out of mesh. Turn the volume control knob to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both trimmers located on top of the 2nd I-F transformer for maximum output. (Item 6, Fig. 2).

(e) Adjust both trimmers located on top of the 1st I-F transformer for maximum output. (Item 5, Fig. 2).

(f) Check operations (d) and (e) for more accurate adjustment.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier.

When aligning the R-F amplifier the output lead from the signal generator is connected to the antenna lead of the receiver, a 100 mmf. condenser should be connected in series with the output lead of the signal generator.

(a) With the station selector adjusted so that the tuning condenser plates are completely out of mesh adjust the "OSC" shunt trimmer so that the MINIMUM CAPACITY SIGNAL (C) is heard (it is not necessary that the receiver tune through this signal).

(b) Adjust the station selector so that the SHUNT ALIGNMENT signal is tuned-in with maximum output. Then adjust the "ANT" shunt trimmer for maximum output. Readjust the station selector slightly so that the generator signal is tuned-in with maximum output and check the adjustment of the "ANT" trimmer. DO NOT READJUST THE OSCILLATOR TRIMMER.

If any of the circuits have been re-adjusted it may be necessary to reset the push buttons.

SOCKET VOLTAGES

The tube socket voltages are measured from the tube socket contacts to the chassis with a 1000 ohm per volt, 500-volt D. C. voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range A. C. voltmeter (approximately 0-10 volts). Readings may vary plus or minus 10% of values given.

MODELS---5648 & 649

455 KC. I. F.

JANUARY, 1940

SPECIFICATIONS

Crosley radios, Models 5648 and 649, are designed for operation on 100-125 volts A.C. (50-60 cycles) or D.C. electric circuits. The tuning range of Model 5648 is from 1550 to 540 kilocycles. The tuning range of Model 649 is from 1725 to 540 kilocycles.

The difference between Models 5648 and 649 lies in the design and mounting of the built in loop antenna. Model 5648 has the rectangular loop mounted on the back of the receiver and includes an electrostatic shield. Model 649 loop antenna is a newly developed spider form which mounts on the end of the chassis, making for a more compact design.

CIRCUIT DESCRIPTION

Five G or GT tubes and one metal Ballast tube are employed in a superheterodyne circuit which consists of a combination oscillator-modulator tube, 455 kilocycle I-F amplifier, Beam Power output and power supply. The 6Q7 tube serves as the detector and 1st A-F amplifier and supplies A.V.C. voltage to the grid of the 6A8-G and 6U7-G tubes. The bias for the 25L6-G tube is obtained from item 25 a 140 ohm resistor. A Ballast tube is used to provide the proper heater voltage to the tubes. The filaments of the tubes are wired in series. A .05 mfd. condenser, item 11, is connected across the power supply leads to reduce electrical interference from that source.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1,000 ohm per volt, 250 volt voltmeter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. When measured on a 117.5 volt A.C. line voltage limits may vary plus or minus 10% of the values given.

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	Su	K	Go	Ga
6A8GT	Oscillator-Modulator	6.3	105	70	—	—	-10	105
6U7G	I-F Amplifier	6.3	105	70	—	—	—	—
6Q7G	Det, AVC, A-F Amplifier	6.3	35	—	—	—	—	—
25L6G	Output	25.1	100	105	—	6	—	—
25Z6G	Rectifier	25.1	117.5 A.C.		—	132	—	—
W-46773	Ballast Tube	Approx. 48.4 A.C. Drop						

Power output approximately 2 watts.
Power consumption approximately 48 watts.
Voltage drop across speaker field 27 volts.
All voltages except filaments will be approximately 10% lower if measured on 117.5 volts DC power supply.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25L6G output tube. Be certain that the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier to 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mf. condenser to the grid cap of 6A8GT, leaving grid cap in place. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condensers, Fig. 2, located on chassis between Push Button Assembly and speaker field, for maximum reading on the output meter.

(e) Adjust the 1st I-F trimmer condensers for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier Model 5648

Connect output lead of signal generator through a .0001 mf. condenser to the antenna lead of the receiver.

(a) Set signal generator to 1550 kilocycles.

(b) With the condenser gang open all the way, adjust the "OSC" section of the gang for maximum signal.

(c) Set the signal generator to 1400 kilocycles.

(d) Tune in the 1400 kc. signal with the manual tuning knob.

(e) Adjust the trimmer condenser on the "ANT" section of the gang for maximum signal.

NOTE: Do not readjust the "OSC" section at this time. Repeat (b) and (e) for more accurate adjustments.

Aligning the R-F Amplifier Model 649

Connect output of signal generator through a .0001 mf. condenser to the antenna lead of receiver.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

If any of the circuits have been re-aligned, check push buttons to see if they need resetting.

SETTING THE PUSH BUTTONS

The push buttons are easily and accurately set from the top of the receiver. It is not necessary that all the buttons be set at the same time. Remove the push buttons to be set by grasping the button between the forefinger and thumb and pulling straight up. Loosen the set screws on the keys but do not remove them.

Determine the favorite broadcasting stations whose call letters are to be placed in the buttons. By means of the manual tuning knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency—that is the station that is tuned-in nearest the 1500 Kc. end of the dial. Then push the front key all the way down, and while you hold it in that position SECURELY TIGHTEN THE SET SCREW. Replace push button on key.

The push button tuning system is now correctly set for the first station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles). Detach the call letters of the favorite stations from the list supplied with your receiver and press them into the openings in the front of the push buttons. Thin pieces of clear celluloid are supplied in a small envelope and should be snapped in place over the call letters to protect and hold them in place.

25Z6GT	Rectifier	25.1	117.5 A.C.	—	—	132	—	—
W-46773	Ballast Tube	Approx. 48.4 A.C. Drop						

Power output approximately 2 watts.
Power consumption approximately 48 watts.
Voltage drop across speaker field 27 volts.
All voltages except filaments will be approximately 10% lower if measured on 117.5 volts DC power supply.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25L6GT output tube. Be certain that the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier to 455 Kilocycles

(a) Connect the output of the signal generator through a .02 mf. condenser to the grid cap of 6A8GT, leaving grid cap in place. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh, turn the volume control to the right (ON), and turn the band switch to the right (B.C.).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condensers, Fig. 2, located between Push Button Assembly and speaker field, for maximum reading on the output meter.

(e) Adjust the 1st I-F trimmer condensers for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier

When aligning the R-F amplifier the output lead of the signal generator should be connected, through a dummy antenna, to the BLUE lead extending from the rear of the chassis. For the standard Broadcast Band and special police band use a .0001 mf. condenser and for the short wave band a 250 ohm carbon resistor instead of the condenser.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position and band switch turned to B.C. position, adjust the B.C. "OSC" trimmer condenser of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser B.C. "ANT" for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

(g) Set signal generator to 2.5 megacycles and turn band switch to special police band (middle position).

(h) Tune in 2.5 signal on receiver and then adjust POL. "ANT" trimmer condenser (Fig. 2) for maximum output. There is no "OSC" adjustment for this band.

(i) Set signal generator to 18.3 megacycles, turn band switch to S.W. position (left) and open gang all the way.

(j) Adjust S.W. "OSC" trimmer condenser for maximum output.

(k) Set signal generator to 18 megacycles.

(l) Tune in 18 mc. signal on receiver, then adjust the S.W. "ANT" trimmer condenser for maximum output.

(m) Repeat (i) to (l) for more accurate adjustments.

NOTE: When shunt aligning the short wave band care should be exercised so that the circuits will be aligned on the correct frequency (fundamental) rather than on the image frequency which is approximately 910 kilocycles more than the fundamental. To check on this, increase the signal generator output approximately 10 times or more, and try to tune in the signal both at the generator frequency as indicated on the station selector dial and at approximately 910 kilocycles less than the correct frequency. (18.0 mc. fundamental 17.09 mc. image). If circuits have been properly aligned the signal can be tuned in at both positions but with a much stronger signal on the fundamental.

A few of the earlier releases of this model used a 6Q7GT in place of the 6SQ7GT. This change was made to improve performance especially on the short wave band.

If any of the circuits have been re-aligned, check push buttons to see if they need resetting.

SETTING THE PUSH BUTTONS

The push buttons are easily and accurately set from the top of the receiver. It is not necessary that all the buttons be set at the same time. Remove the push buttons to be set by grasping the button between the forefinger and thumb and pulling straight up. Loosen the set screws on the keys but do not remove them.

Determine the favorite broadcasting stations whose call letters are to be placed in the buttons. By means of the manual tuning knob, tune-in AS ACCURATELY AS POSSIBLE the station having the highest frequency—that is the station that is tuned-in nearest the 1500 Kc. end of the dial. Then push the front key all the way down, and while you hold it in that position SECURELY TIGHTEN THE SET SCREW. Replace push button on key.

The push button tuning system is now correctly set for the first station. Follow through with this same procedure, setting the other stations in the order of their frequency (kilocycles). Detach the call letters of the favorite stations from the list supplied with your receiver and press them into the openings in the front of the push buttons. Thin pieces of clear celluloid are supplied in a small envelope and should be snapped in place over the call letters to protect and hold them in place.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1,000 ohm per volt, 250 volt volt-meter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. When measured on a 117.5 volt A.C. line voltage limits may vary plus or minus 10% of the values given.

SPECIFICATIONS

This model Crosley receiver is a three band superheterodyne receiver designed for operation on 110 volt A.C. (50-60 cycles) or D.C. power circuits.

The receiver incorporates an improved mechanical push button tuning system, built in loop antenna, A.V.C., terminals for phono or television sound and many improved circuit developments.

THE CROSLEY CORP.

SPECIFICATIONS

This model Crosley is a seven tube superheterodyne receiver designed for operation on 110 volt—50 or 60 cycle power circuits. It may be adapted for 25 cycle operation by the addition of another filter condenser as indicated in wiring diagram.

CIRCUIT DESCRIPTION

There are three versions of this model in the field namely: one version with an improved mechanical push button tuning system; one version with mechanical push button tuning and loop antenna, and one version has the Magnetune electric push button tuning system.

The circuit is a conventional super with no regeneration. Item 23, a 60,000 ohm resistor in series with the volume control form the A.V.C. load. Item 22, a 3 megohm resistor acts as a filter for the A.V.C. voltage applied to the 6A8GT and the 6SK7. Bias for the 25L6GT is obtained from the voltage drop across item 28, a 140 ohm resistor. The two 25Z6GT rectifiers are in parallel and connected for voltage doubling

The B voltage is filtered with the 900 ohm resistor, item 24, the speaker field (450 ohms) item 15, a twin 30 mf. electrolytic, and item 14, a single 30 mf. electrolytic.

The filaments of the tubes are wired in series. A .05 mfd. condenser, item 11, is connected across the power supply leads to reduce electrical interference from that source.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and chassis. Voltage readings should be taken with a 1,000 ohm per volt, 250 volt volt-meter (except filaments) with the volume control full "ON" and no signal input. The filament voltages should be measured with an accurate low range voltmeter. When measured on a 117.5 volt A.C. line voltage limits may vary plus or minus 10% of the values given.

TUBE SOCKET VOLTAGE READING

Tube	Function	PIN NUMBER No. 1	No. 2	No. 3	No. 4	No. 5	No. 6	No. 7	No. 8
6A8GT	Oscillator-Modulator	—	H	130	70	-17	130	H	—
6SK7	I-F Amplifier	—	H	—	—	—	70	H	130
6P5	Det. AVC Diode	—	H	—	J.B.	—	J.B.	H	—
6SF5	1st Audio	—	—	—	—	68	—	H	H
25L6	Output	—	H	121	128	—	J.B.	H	6
2-25Z6	Rectifier	—	H	A.C.	232	—	—	H	130

Maximum power output 2.5 watts.
Drop across speaker field 40 volts.
Power consumption @ 117.5 volt line = 65 watts. Those with "Magnetune" coil 40 watts additional.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver.

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 25L6GT output tube. Be certain that the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning The I-F Amplifier to 455 Kilocycles

(a) Connect the output of the signal generator through a 100 mmf. condenser to the antenna lead on the receiver. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condensers, item 6, for maximum reading on the output meter.

(e) Adjust the 1st I-F trimmer condensers, item 5, for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the signal generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

The special police band has no provisions for alignment.

WAVE TRAP

Some chassis of this model may be equipped with a wave trap for the purpose of eliminating interference from code stations which operate on a frequency of approximately 455 kilocycles. This assembly is located on the top side of the chassis and consists of a coil and a condenser as illustrated by dotted lines in the Wiring Diagram, Fig. 1A.

H = heater.

JANUARY, 1940

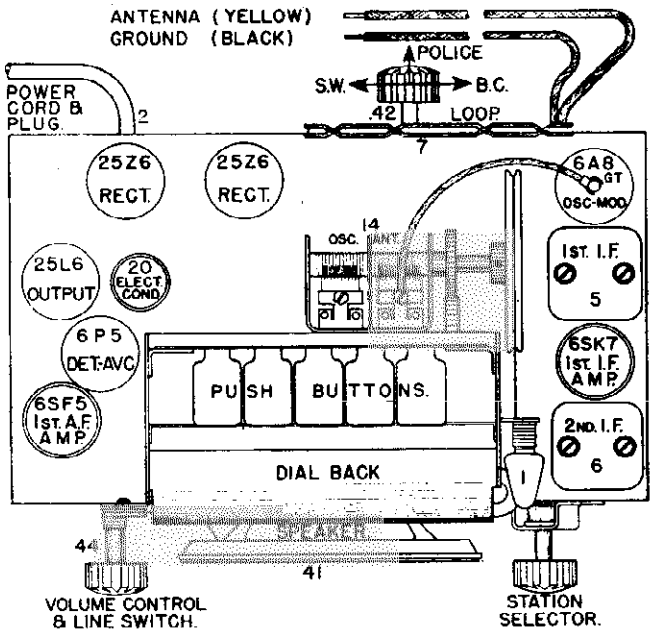

Fig. 1—Top View Model 729

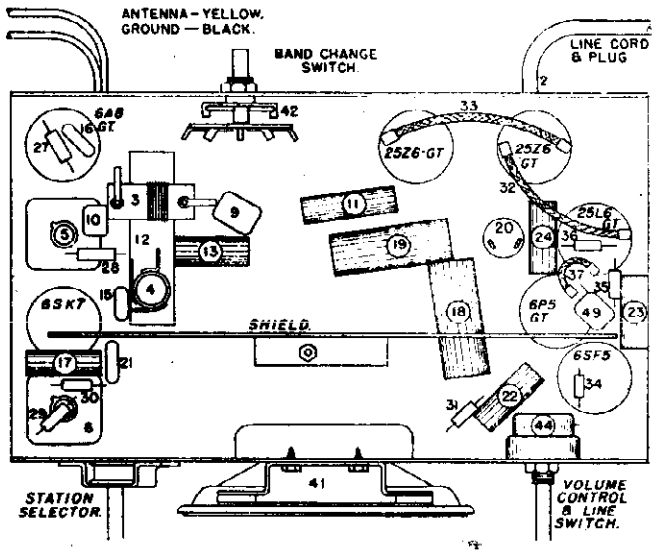

Fig. 3—Bottom View Model 729

THE CROSLEY CORP.

MODEL NO. 729

This model Crosley receiver is designed for operation on 110 volt, 50 or 60 cycle electric circuits. There are three versions of this model in the field which include; one version which is a two band super with a mechanical push button tuning system; one version which is a two band super with the "Magnetune" electric push button tuning system; one version which is a three band super with a loop antenna and a mechanical push button tuning system.

The circuit is a conventional superheterodyne with the exception of the three band series which is novel in the method in which the special police band is covered. This special band makes use of the image frequency (2 x I-F frequency more than fundamental) and the tap on the loop which is resonated at 2.4 megacycles.

The 6A8GT, 6SK7, and 6SF5 are operated at zero bias and the 25L6 bias is obtained from voltage drop across item 37, a 140 ohm ½ watt resistor. A.V.C. voltage is applied to the 6A8GT and the 6SK7 through filter resistor item 30 (3 megohms). Item 31, a 60,000 ohm resistor and item 45A, a 1 megohm volume control, serve as the A.V.C. load. The two 25Z6 rectifiers are hooked in parallel and connected voltage doubling. The speaker field (450 ohms) and item 33, a 900 ohm 7 watt resistor with condensers items 18 and 19 filter the B supply.

ALIGNMENT PROCEDURE

All circuits have been accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

NOTE: The circuit of this receiver is such that if the signal generator has one side of the line connected to the case or ground side and the generator and receiver are plugged into the same line, serious damage may result to either or both instruments. ALWAYS ISOLATE SIGNAL GENERATOR GROUND LEAD BY INSERTING A .01 mf. OR SMALLER CONDENSER IN SERIES WITH THE LEAD BEFORE CONNECTING TO THE CHASSIS.

CONNECTING OUTPUT METER

One terminal of the output meter should be connected to the plate (No. 3 pin) and the other terminal to the screen (No. 4 pin) of the 25L6GT output tube. Be sure the meter is protected from D.C. by connecting a .25 mf. condenser in series with one of the leads.

(1) I-F Amplifier Alignment

(a) Connect the output lead of the signal generator through a .02 mf. condenser to the top (GRID) cap of the 6A8GT tube (leaving the tubes grid connector in place).

(b) Connect the ground lead of the signal generator through a .01 mf. (or smaller .001 mf.) condenser to the chassis.

(c) Adjust station selector so that the rotor plates of the gang are completely disengaged, turn band to B.C. position and turn the volume control to maximum.

(d) Set the signal generator to 455 kc.

(e) Adjust the trimmer condensers on the 2nd I-F transformer for maximum output.

(f) Adjust the trimmer condensers on the 1st I-F transformer for maximum output.

(g) Repeat (e) and (f) for more accurate adjustments. IN ORDER TO PREVENT A.V.C. ACTION, ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

(2) Aligning R-F Amplifier

(a) Connect the signal generator output lead through a .0001 mf. condenser to the antenna lead (YELLOW) and the generator ground lead to the Black lead of the receiver. Turn band switch to B.C. band, open gang all the way and turn volume control on full.

(b) Set signal generator to 1725 kilocycles.

(c) Adjust B.C. oscillator trimmer for maximum output (receiver does not have to tune through this signal).

(d) Set signal generator to 1400 kilocycles.

(e) Tune in generator signal on receiver by means of manual tuning knob.

(f) Adjust B.C. antenna trimmer for maximum output. DO NOT readjust oscillator trimmer.

(g) Repeat above procedure for more accurate adjustments.

(h) Connect the signal generator output lead through a 250 ohm carbon resistor to the antenna lead of the receiver. Turn band switch to S.W. position, open gang condenser all the way, and turn volume on full.

(i) Set signal generator to 18.3 megacycles.

(j) Adjust S.W. oscillator trimmer for maximum output.

(k) Set signal generator to 18 megacycles.

(l) Tune in 18 mc. signal with manual control, then adjust the S.W. antenna trimmer condenser for maximum output.

Check to see that receiver is aligned on the fundamental and not the image frequency. Increase signal generator output approximately 10 times and tune in image frequency (2 x 455 kc. + fundamental) which will be approximately 910 kilocycles less than 18 mc. as indicated by the dial calibrations (17.1 mc.). If correctly aligned, the image will come in as stated but will be much weaker than the fundamental.

The special police band in some models covering 2.3 to 2.5 mc. has no adjustments but can be checked by using a .0001 mf. condenser in series with the signal generator output lead, turning band switch to POL. position, set signal generator to 2.5 mc. and then tune in generator signal, which should come in with the dial pointer near the end of that band.

SOCKET VOLTAGE READINGS AT 117.5 VOLT LINE

Tube	Function	PIN NUMBER No. 1	No. 2	No. 3	No. 4	No. 5	No. 6	No. 7	No. 8
6A8GT	Oscillator-Modulator	—	H	123	80	−11	123	H	—
6SK7	I-F. Amplifier	—	H	—	Grid	—	80	H	123
6P5	Diode	—	H	—	—	Grid	—	H	—
6SF5	1st Audio	—	—	Grid	V.C.	68	—	H	H
25L6	Output	—	H	115	123	Grid	—	H	+6
2-25Z6	Rectifier	—	H	117.5 A.C.	220	—	—	H	115

Drop across speaker field 35 volts, 739—65 volts on 7739.
Drop across Item 33—72 volts.
Maximum power output 4.3 watts @ 125 volts line.
Power consumption @ 117.5 volts line—63 watts.
H = heater.

ALIGNMENT PROCEDURE

All circuits have been accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

NOTE: The circuit of this receiver is such that if the signal generator has one side of the line connected to the case or ground side and the generator and receiver are plugged into the same line, serious damage may result to either or both instruments. ALWAYS ISOLATE SIGNAL GENERATOR GROUND LEAD BY INSERTING A .01 mf. OR SMALLER CONDENSER IN SERIES WITH THE LEAD BEFORE CONNECTING TO THE CHASSIS.

CONNECTING OUTPUT METER

One terminal of the output meter should be connected to the plate (No. 3 pin) and the other terminal to the screen (No. 4 pin) of the 25L6GT output tube. Be sure the meter is protected from D. C. by connecting a .25 mf. condenser in series with one of the leads.

1.—I-F Amplifier Alignment

(a) Connect the output lead of the signal generator through a .02 mf. condenser to the top (GRID) cap of the 6A8GT tube (leaving the tubes grid connector in place) or to the antenna lead.

(b) Connect the ground lead of the signal generator through a .01 mf. (or smaller, .001 mf.) condenser to the chassis.

(c) Adjust station selector so that the rotor plates of the gang are completely disengaged, turn band to B. C. position and turn the volume control to maximum.

(d) Set the signal generator to 455 kc.

(e) Adjust the trimmer condensers on the 2nd I-F transformer for maximum output.

(f) Adjust the trimmer condensers on the 1st I-F transformer for maximum output.

(g) Repeat (e) and (f) for more accurate adjustments. IN ORDER TO PREVENT A. V. C. ACTION, ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2.—Aligning R-F Amplifier

(a) Connect the signal generator output lead through a .0001 mf. condenser to the antenna lead (YELLOW OR BLUE) and the generator ground lead to the Black lead of the receiver. Turn band switch to B. C. band, open gang all the way and turn volume control on full and tone control to treble position.

(b) Set signal generator to 1725 kilocycles. (Generator should be set to 1620 kilocycles for Model 7739).

(c) Adjust B. C. oscillator trimmer for maximum output (receiver does not have to tune through this signal).

(d) Set signal generator to 1400 kilocycles.

(e) Tune in generator signal on receiver by means of manual tuning knob.

(f) Adjust B. C. antenna trimmer for maximum output. DO NOT readjust oscillator trimmer.

(g) Repeat above procedure for more accurate adjustments.

(h) Set signal generator to 600 kilocycles.

(i) Tune in 600 kilocycle signal on receiver. While rocking the gang back and forth adjust the B. C. oscillator series condenser for maximum output.

(j) Repeat operations (d), (e) and (f) to correct any change caused by series alignment.

(k) Connect the signal generator output lead through a 250 ohm carbon resistor to the antenna lead of the receiver. Turn band switch to S. W. position, open gang condenser all the way, and turn volume on full, etc.

(l) Set signal generator to 18.3 megacycles.

(m) Adjust S. W. oscillator trimmer for maximum output.

(n) Set signal generator to 18 megacycles.

(o) Tune in 18 mc. signal with manual control, then adjust the S. W. antenna trimmer condenser for maximum output.

Check to see that receiver is aligned on the fundamental and not the image frequency. Increase signal generator output approximately 10 times and tune in image frequency (2 x 455 kc. + fundamental) which will be approximately 910 kilocycles less than 18 mc. as indicated by the dial calibrations (17.1 mc.). If correctly aligned, the image will come in as stated but will be much weaker than the fundamental.

Chassis, Notes

THE CROSLEY CORP.

MODELS J739,J7739
Socket,Trimmers

The circuit used is a conventional superheterodyne without regeneration using a 6A8GT as Oscillator-Modulator (biased 6K8GT in some of the earlier models), a 6SK7 as I-F amplifier, a 6P5GT as diode detector, A. V. C., a 6SF5 as first audio amplifier, a 25L6GT as beam power output and two 25Z6GT rectifiers (connected for voltage doubling). A. V. C. is applied to the oscillator-modulator and I-F tubes. All tubes are operated at zero bias except the 25L6GT which obtains its bias from the voltage drop across a 140 ohm resistor between cathode and chassis.

Model 7739 uses a tapped volume control for variable level bass compensation. Models of either chassis in the later series are equipped with terminals for connecting a phonograph attachment.

Models J-739 and J-7739 are the same as models 739 and 7739 except for the following:

Model J-739 differs from Model 739 in that the negative or ground return is isolated from the chassis by a .2 mf.—160 volt condenser. For alignment procedure use same as outlined for Model 739. The voltage readings are the same as given for Model 739 except the MEASUREMENTS SHOULD BE TAKEN BETWEEN SOCKET CONTACTS AND THE LOW SIDE OF THE VOLUME CONTROL.

Model J-7739 is the same as Model 7739 except that Model J-7739 has a 1 to 1 isolating power transformer. For alignment procedure and socket voltages use same as given for the Model 739 etc.

THE CROSLEY CORP. MODELS 819,1019(Loop Type
Schematic

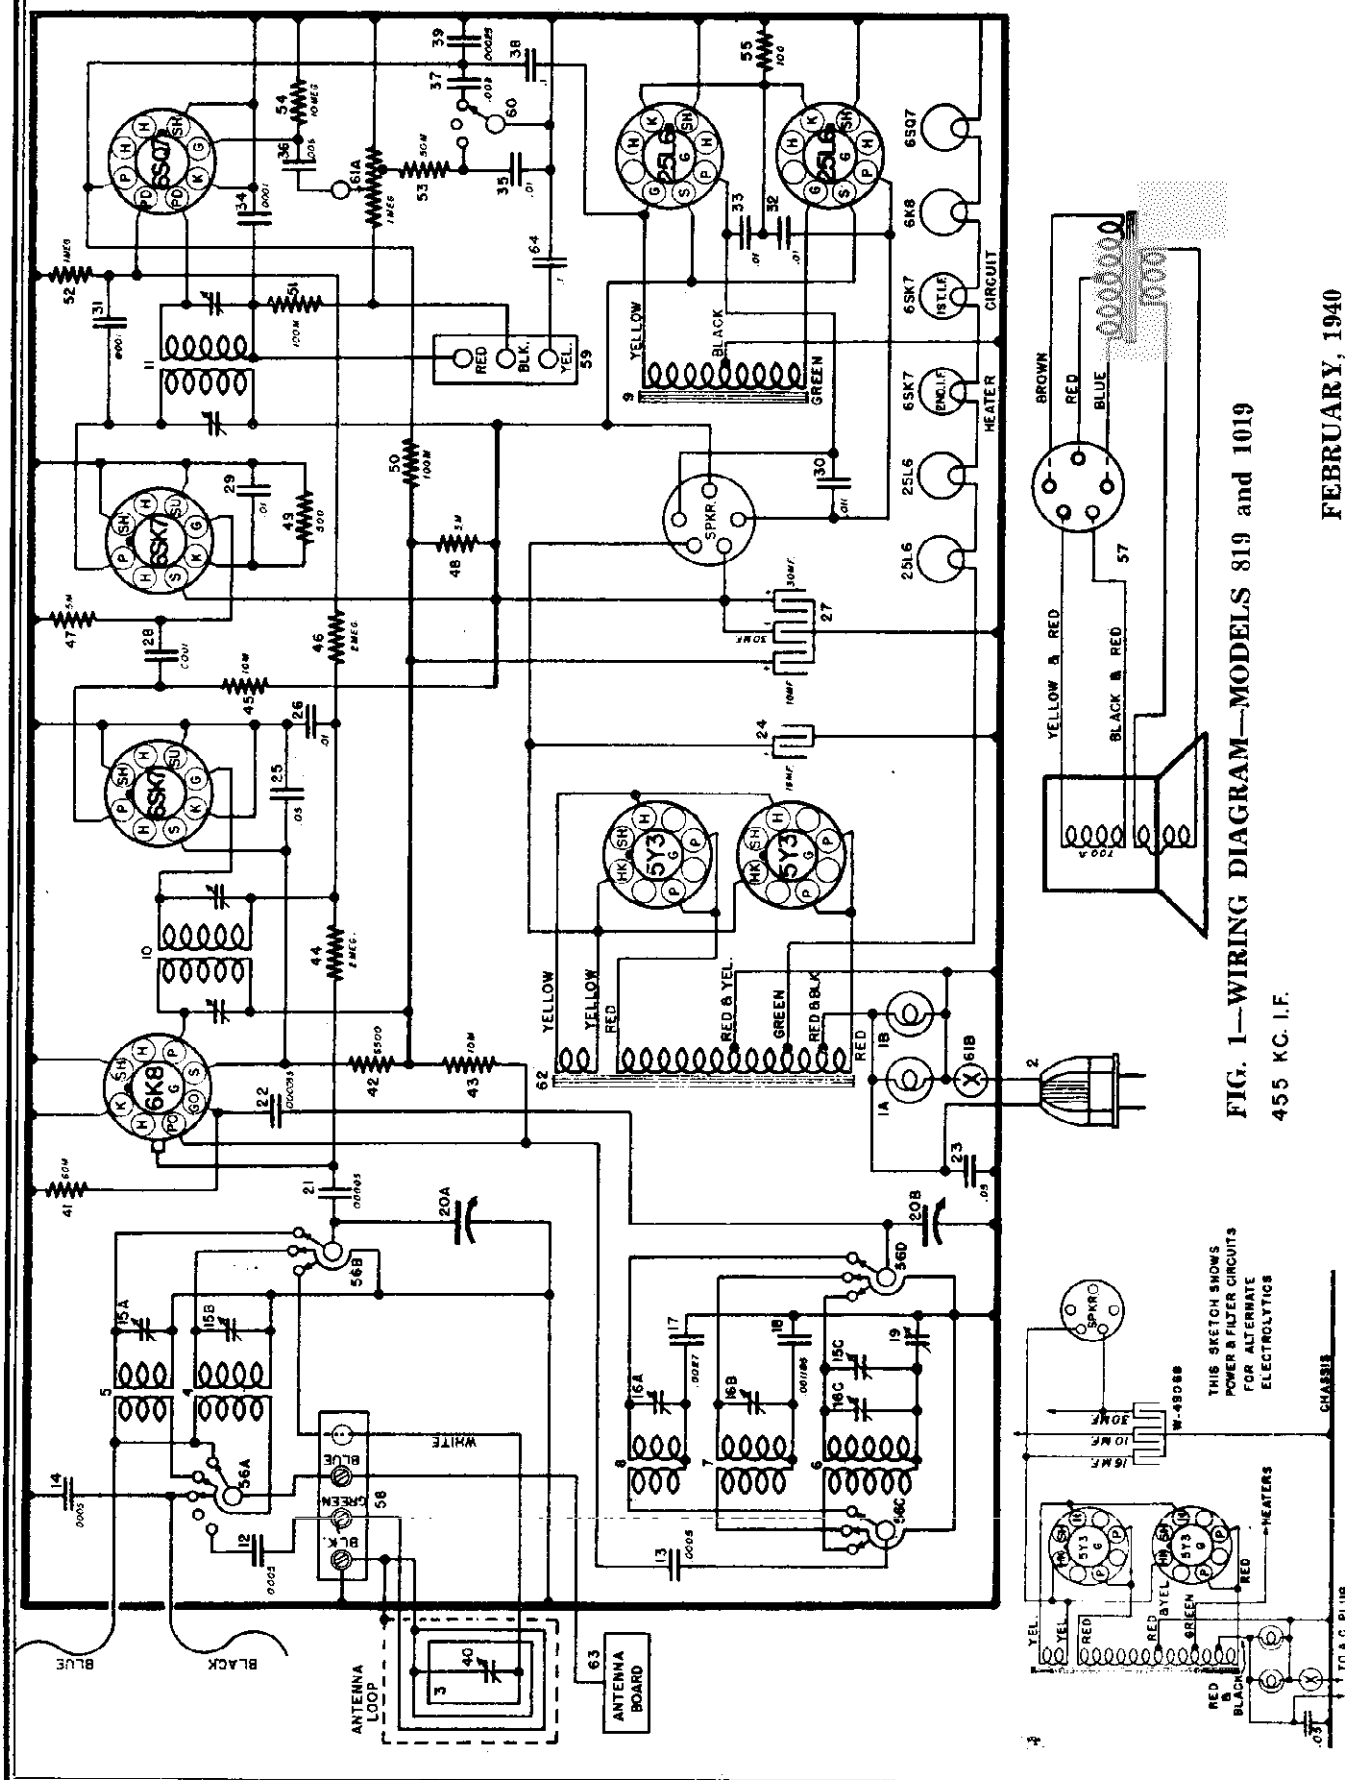

FIG. 1—WIRING DIAGRAM—MODELS 819 and 1019

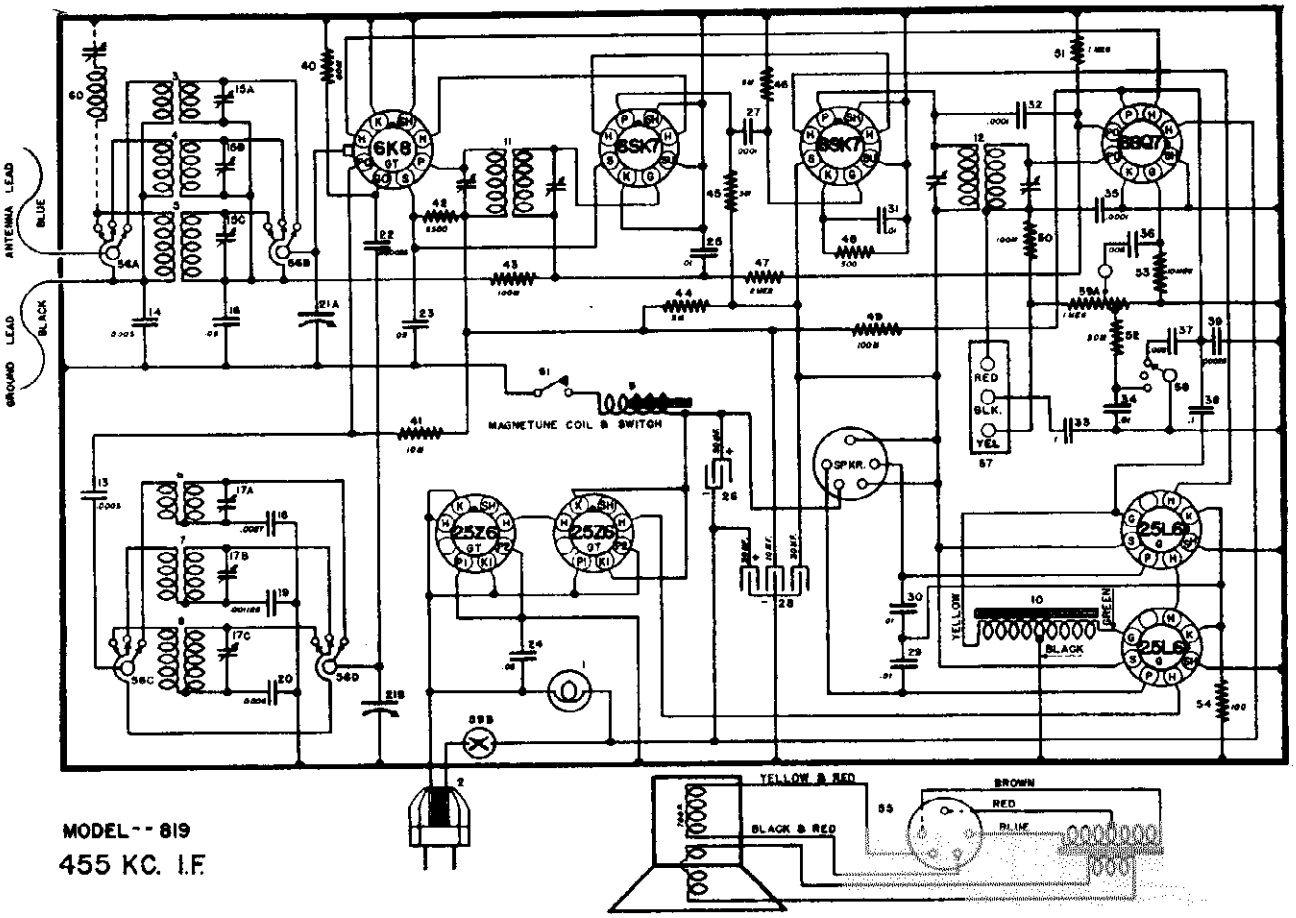
455 KC. I.F.

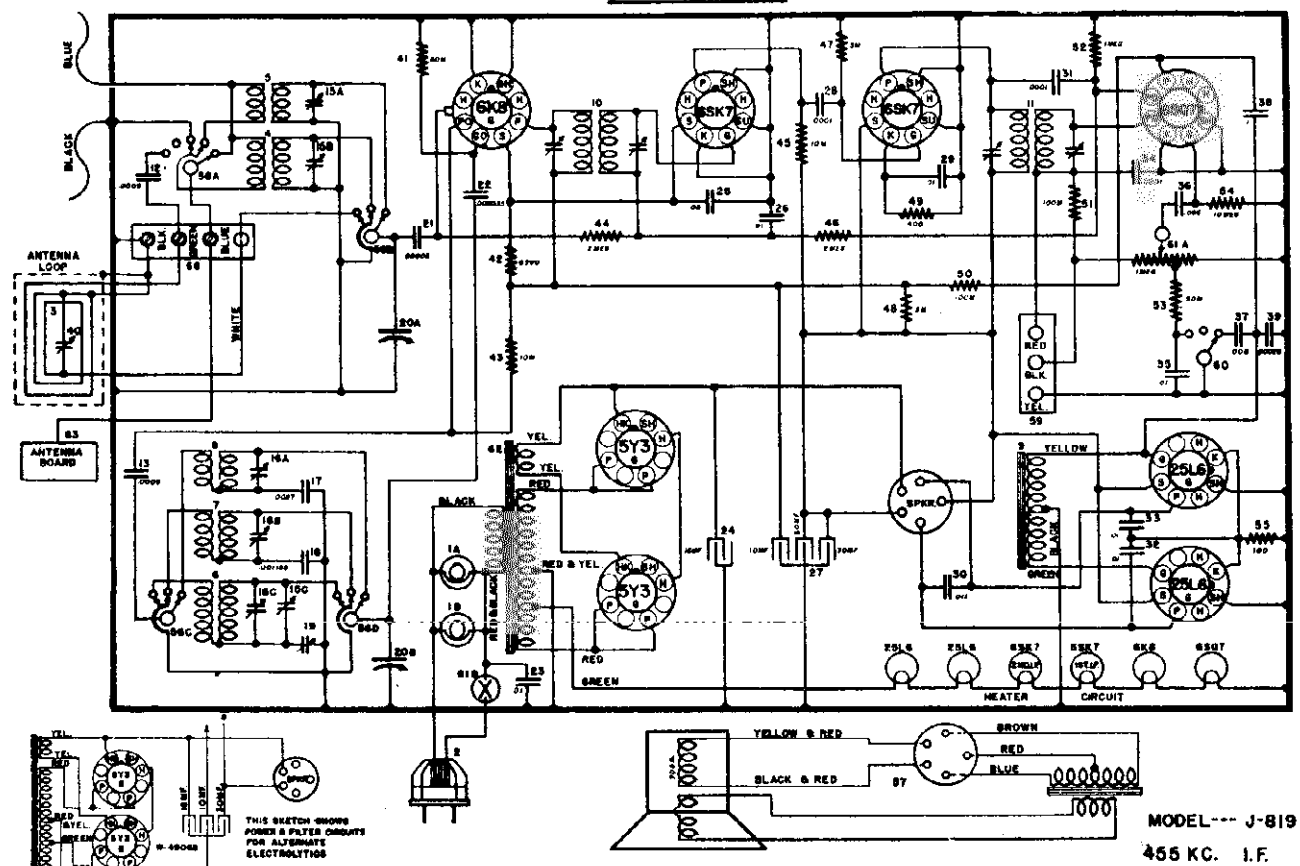
FEBRUARY, 1940

MODELS 819, J819
Schematics

THE CROSLEY CORP.



MODEL--819
455 KC. I.F.



MODEL--- J-819
455 KC. I.F.

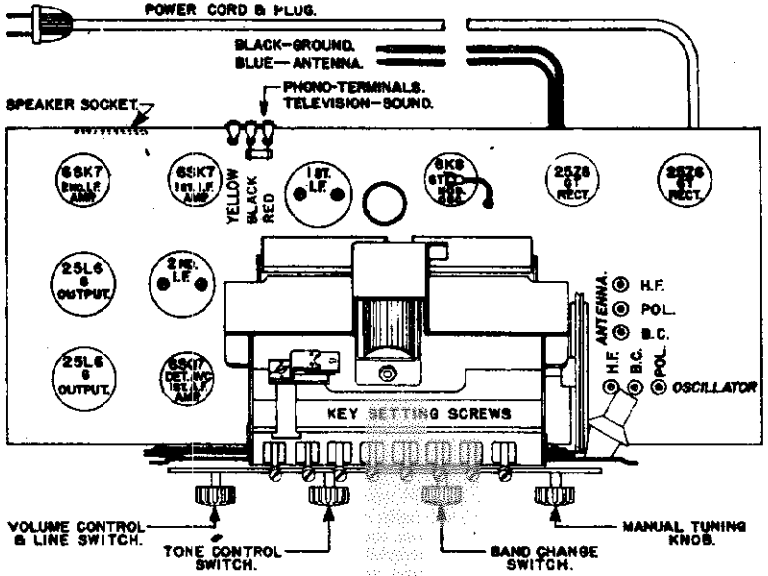


Fig. 3-A—Top View Model 819 (No Loop)

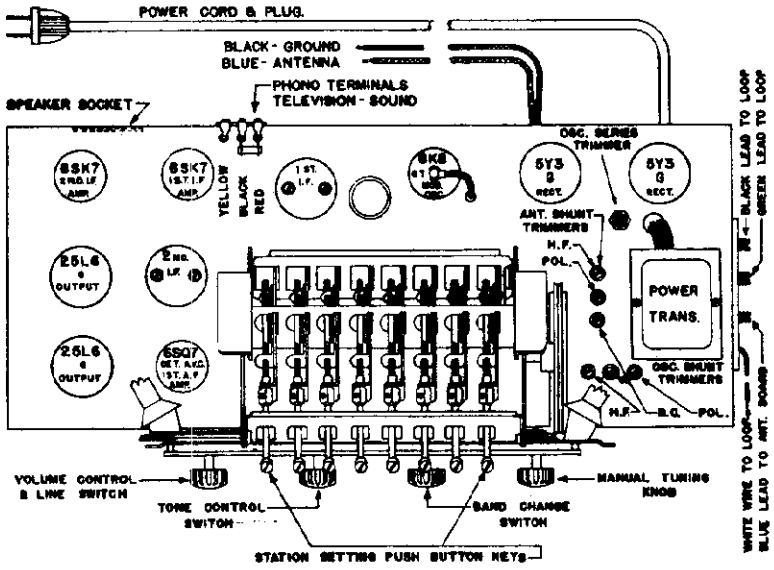

Fig. 2-B—Top View Models 819 and 1019

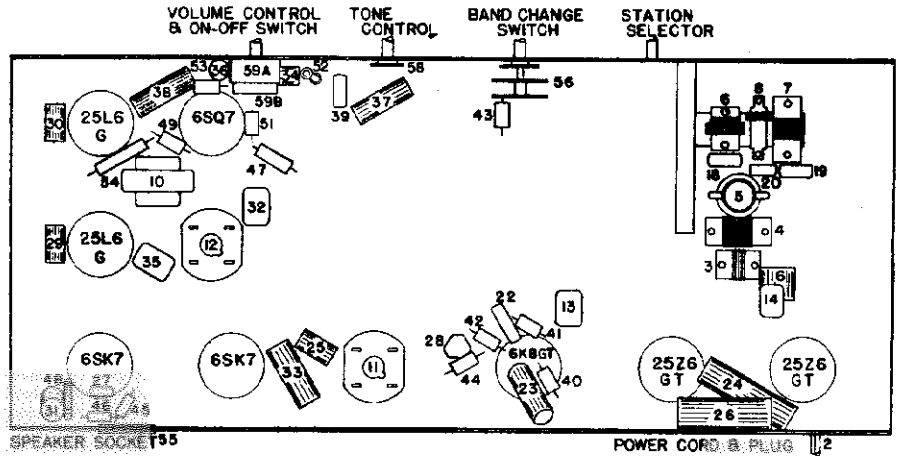

Fig. 3-A—Bottom View Model 819 (No Loop)

The circuit is a conventional superheterodyne with no regeneration, having two stages of I-F amplification, the first of which is resistance coupled, variable level bass compensation, a three position tone control and impedance coupled push pull beam power output. No power transformers were used on those chassis which used two 25Z6GT Rectifiers. The power transformer used on the later versions having two 5Y3G Rectifiers is quite different from the regular type power transformer used in Model J-819, and care should be exercised when checking its voltages.

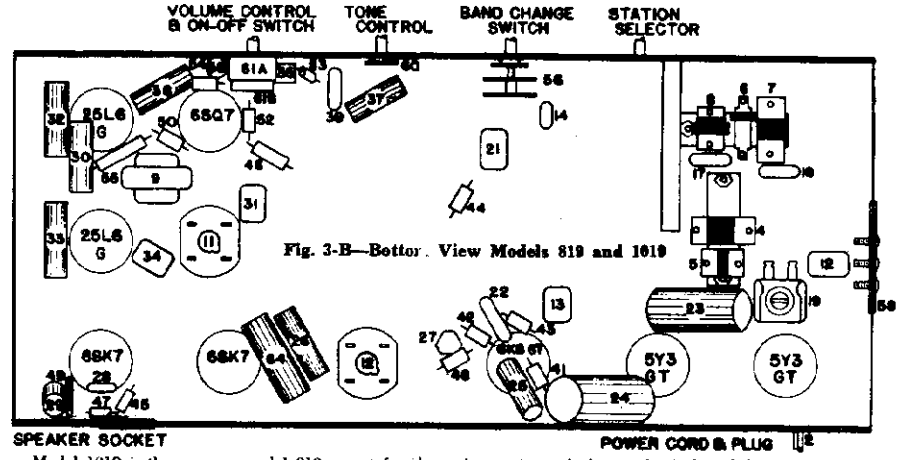

Fig. 3-B—Bottom View Models 819 and 1019

Model 1019 is the same as model 819 except for the cabinet, dial, escutcheon and knobs used. There are two versions of the model 819 in the field. The first few releases had an electrical (magnetune) push button tuning system and two 2526GT Rectifier tubes. The later releases had a mechanical push button tuning system, loop antenna, two 5Y3G Rectifier tubes and a power transformer. Models J-819 and 1019 falls in this group.

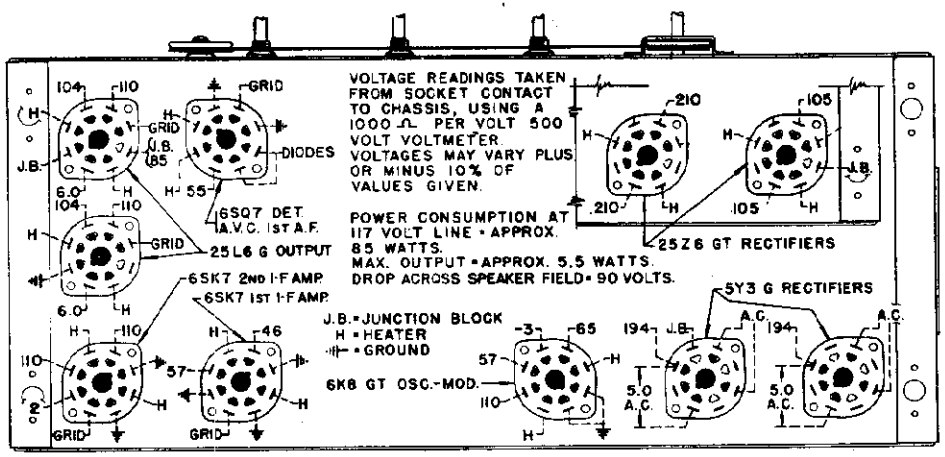

Fig. 4—Socket Voltages Models 819, J-819, 1019

Aligning The I-F Amplifier To 455 Kilocycles.

(a) Connect the output lead of the signal generator through a .0002 mf. condenser to the receiver antenna lead (Blue). Connect the signal generator ground lead through a .01 mf. or smaller condenser to the receiver ground lead (Black).

(b) Set the signal generator to 455 kilocycles. Turn the receiver band switch to the Broadcast band (left), the tone control switch to the speech position (left) open the gang condenser all the way then turn the volume control on full (all the way to the right).

(c) Adjust the two trimmer condensers on the second I-F assembly for maximum output (Fig. 2).

(d) Adjust the two trimmer condensers on the first I-F assembly for maximum output. (Fig. 2).

(e) Repeat (c) and (d) for more accurate adjustments.

Aligning The R-F Amplifier.

(a) For aligning the broadcast band the setup remains the same. Using a .0002 mf. condenser for a dummy antenna and etc.

(b) For models without loop antenna set the signal generator to 1725 kilocycles. For models with a loop antenna set the signal generator to 1550 kilocycles. Open condenser gang all the way, turn band switch to left (B. C.), tone control to left (speech) and the volume control on full.

(c) For models without the loop antenna adjust B. C. oscillator shunt trimmer condenser (Fig. 2) for maximum output (gang does not have to tune through this signal). For models with a loop antenna there are two oscillator shunt trimmer condensers as will be noted in figure 2. Close the front oscillator shunt trimmer all the way, then open about ½ turn. Proceed to tune in with the other (rear) trimmer the 1550 kilocycle signal for maximum output.

(d) Set the signal generator to 1400 kilocycles.

(e) Tune the receiver to generator signal for maximum output (approximately 140 on the dial).

(f) On models without the loop adjust the B. C. antenna shunt trimmer for maximum output, see (Fig. 2). On models with a loop a B. C. antenna shunt trimmer is located on top the loop antenna; adjust for maximum output.

Models equipped with a loop antenna have provisions for series aligning the oscillator circuit:

(1) Set signal generator to 600 kilocycles.

(2) Tune in generator signal on receiver.

(3) While rocking tuning condenser back and forth adjust oscillator series trimmer (Fig. 2) for maximum output. Then repeat (d) and (f) for more accurate alignment.

(g) Change dummy antenna from a .0002 mf. condenser to a 250 carbon resistor.

(h) For models without loop antenna set the signal generator to 5.8 megacycles. Open gang condenser, turn band switch to center position, T. C. to left (speech) and volume on full. For models with a loop antenna set signal generator to 5.0 megacycles.

(i) Adjust "Pol." oscillator shunt trimmer condenser (Fig. 2) for maximum output.

(j) For models without loop antenna set signal generator to 5.5 megacycles. For models with a loop antenna set signal generator to 4.0 megacycles.

(k) Tune in generator signal with manual control for maximum output (approximate 5.5 or 4.0 megacycles on the dial). Adjust the "Pol." antenna shunt trimmer condenser for maximum output.

(l) Set signal generator to 18.3 megacycles.

(m) With gang open and band switch turned to the right (H. F.), adjust the H. F. (high frequency) oscillator trimmer (Fig. 2) for maximum output. Care should be taken to align the oscillator on the fundamental and not the image frequency. When correctly aligned the image should be heard approximately 17.4 on the dial but will be comparatively weak compared to the fundamental signal.

(n) Set signal generator to 18.0 megacycles.

(o) Tune in the signal generator signal for maximum output; then adjust the H. F. antenna shunt trimmers for maximum output. When aligning the R-F circuits always use the lowest signal input, which will give a reasonable indication on the output meter, to prevent A.V.C. acton.

REPLACING DRIVE CORD

(1) Remove the broken drive cord, saving the small metal cord clamp, the tension spring and pointer.

(2) Carefully remove the dial glass.

(3) Cut a piece of drive cord about 85 inches long. Fasten the tension spring approximately one inch from one end.

(4) Open the condenser gang all the way. The eyelet in the large drive pulley should be near the top with the gang in this position.

(5) Hook the loose end of the tension spring on small ear formed in pulley and thread the drive cord through the eyelet in pulley rim from the inside.

(6) Bring cord forward over pulley then down to small pulley on manual drive shaft, make one complete turn around small pulley in a clockwise direction.

(7) Continue cord from the under side of drive shaft pulley over the lower left hand idler pulley, then making a half turn over left hand idler continue over to the top of pulley on drive shaft.

(8) Continue around pulley in a clockwise direction over to lower left hand idler, over lower left hand idler and up to upper left hand idler pulley, continue cord over upper left hand idler to upper right hand idler pulley.

(9) Bring cord over right hand idler pulley and down and under and around large drive pulley to eyelet.

(10) Insert end through the eyelet. Tie securely to tension spring. The cord should be so tied that the tension spring when hooked on ear formed in pulley, will be stretched to approximately 1¼ inches in length.

(11) Hook the pointer on drive cord, the solid end pointer to the drive cord between the upper left hand and right hand idler pulleys. The cutout end of pointer is fastened to the top cord between the lower left hand and the pulley on the drive shaft. Replace dial glass.

Before clamping pointer or cementing it to the drive cord, open gang all the way. The pointer should then split the last graduation on the dial. Check travel from end to end then fasten pointer securely.

(12) Replace the cord clamp on drive cord inside the large drive pulley. The position of clamp should be no more than 1/16" from inside end of eyelet.

THE CROSLEY CORP.

Models 5519, J-5519, 6519 **Fig. 2—Top View** **Models 5529, J-5529**

TUBE SOCKET VOLTAGE READINGS

Tube	Function	H	P	S	Su	K	Go	Ga
12A8GT	Oscillator-Modulator	12	90	48	—	3	-4	90
12SK7GT	I-F. Amplifier	12	90	90	—	—	—	—
12SQ7GT	Det, AVC, A-F Amplifier	12	40	—	—	—	—	—
50L6GT	Output	50	84	90	—	6	—	—
35Z5GT	Rectifier	35	117 5	—	—	117	—	—

Power output approximately 2 watts.
Power consumption approximately 27 watts.
Voltage drop across speaker field 25 volts.
All voltages except filaments will be approximately 10% lower if measured on 117.5 volts DC power supply.

ALIGNMENT PROCEDURE

The chassis of this receiver is connected to one side of the power supply and for this reason all test equipment should be thoroughly insulated in order that the power supply will not become short circuited while aligning the receiver. (J Models have a .25 mf. condenser isolating line from chassis).

CONNECTING OUTPUT METER

Connect one terminal of the output meter to the plate and the other terminal to the screen of the 50L6GT output tube. Be certain that the meter is protected from DC by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

Tuning the I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a 50 mmf. condenser to the antenna connection on the receiver. Do not use a ground return from the signal generator unless it is found to be absolutely necessary. If it is found to be necessary, a small condenser (approximately .001 mfd.) should be connected in series with the ground terminal of the signal generator and the receiver chassis. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Set the station selector so that the plates of the condenser gang are completely out of mesh and turn the volume control to the right (ON).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust the 2nd I-F trimmer condenser, Item 14, located on top of coil (Fig. 2) for maximum reading on the output meter.

(e) Adjust the 1st I-F trimmer condensers located on the rear of chassis for maximum output.

(f) Repeat operations (d) and (e) for more accurate adjustments.

ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE READING ON THE OUTPUT METER.

Aligning the R-F Amplifier.

(a) Set the signal generator to 1725 kilocycles.

(b) With the condenser gang turned to the minimum capacity position, adjust the trimmer condenser on the "OSC" section of the gang so that the 1725 kilocycle signal is heard. It is not necessary that the receiver tune through this signal.

(c) Set the signal generator to 1400 kilocycles.

(d) Tune-in the 1400 kilocycle signal in the region of 140 on the dial for maximum output.

(e) Adjust the trimmer condenser located on the "ANT" section of the gang for maximum output.

NOTE: Do not readjust the "OSC" trimmer.

(f) Repeat operations (d) and (e) for more accurate adjustments.

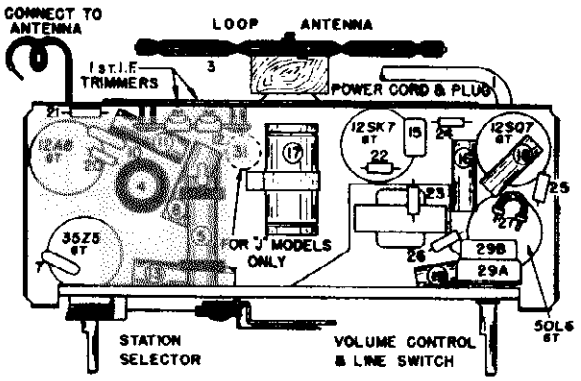

Fig. 3—Bottom View Models 5519, J-5519, 6519, 5529, J-5529

MODEL 6519—Same electrically as model 5519. Has special spider loop mounted to a bracket on right side of chassis and is housed in a wood cabinet.

MODEL 5529—Same electrically as model 5519. Has a four station mechanical push button tuning system. There are two series of this model in the field, one series has a spider form loop antenna mounted on the BACK of the receiver and the other series has the pancake type loop mounted in the cabinet between chassis and right end of the cabinet.

MODEL 5519—Five tube superheterodyne with a pancake type loop antenna mounted between chassis and right side of the cabinet. Has a handle on top for carrying.

ANTENNA-GROUND CONNECTIONS

The antenna and ground leads to the receiver are attached to a terminal strip at the rear of the chassis. The terminals on this strip are marked "A," "D," and "G," which are the abbreviations for "Antenna," "Doublet" and "Ground" respectively.

The receiver is normally shipped from the factory with a wire connecting terminal "D" to terminal "G." In such a condition the receiver is ready for a normal antenna and a ground wire to be attached to the terminals "A" and "G" respectively. If a doublet is used, the wire connecting terminal "D" to terminal "G" should be removed and the two leads from the doublet antenna connected to terminals "A" and "D." For best operation with the doublet, a normal ground lead should be connected to the "G" terminal.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. An all W. Signal Generator which will provide an accurately calibrated signal at the frequencies listed.
2. An Output Meter.
3. A non-metallic screwdriver.
4. Dummy Antenna—.1 mfd., 200 mmf., 400 ohms.

Set the volume control near the maximum position, connect the signal generator ground to the receiver chassis, connect the proper value of dummy antenna between the high side of the generator output and the point in the receiver indicated in the table below. Connect the output meter either across the primary of the output transformer or across the speaker voice coil. Allow the signal generator and the chassis to heat for several minutes.

BAND	SIGNAL FREQUENCY SETTING	GENERATOR CONNECTED TO	DUMMY ANTENNA	BAND SWITCH POSITION	VARIABLE CONDENSER SETTING	TRIMMER FUNCTION	ADJUSTMENT
I.F.	455 kc.	Grid of 6K7G(I.F.)	.1 mmfd.	Short wave	Minimum capacity	2nd I.F.	Adjust to maximum output
I.F.	455 kc.	Grid of 6K8G	.1 mmfd.	Short wave	Minimum capacity	1st I.F.	Adjust to maximum output
BROAD-CAST BAND	1400 kc. exact	Antenna terminal	200 mmf.	Broadcast	Set pointer to indicate 1400 kc.	Broadcast oscillator	Adjust to maximum output
BROAD-CAST BAND	1400 kc. exact	Antenna terminal	200 mmf.	Broadcast	As above	Broadcast RF amplifier	Adjust to maximum output
BROAD-CAST BAND	1400 kc.	Antenna terminal	200 mmf.	Broadcast	As above	Broadcast antenna	Adjust to maximum output
BROAD-CAST BAND	600 kc. approx.	Antenna terminal	200 mmf.	Broadcast	Tune in signal	Broadcast padder	Adjust to maximum output while rocking gang condenser

REPEAT ABOVE BROADCAST ALIGNING PROCEDURE AT LEAST ONCE MORE

MIDDLE WAVE BAND	5,000 exact	Antenna Terminal	400 ohms	Middle	Set pointer to indicate 5000 kc.	Middle wave oscillator	Adjust to maximum output.
MIDDLE WAVE BAND	5,000 kc. exact	Antenna Terminal	400 ohms	Middle	As above	Middle wave RF.	Adjust to maximum output.
MIDDLE WAVE BAND	5,000 kc. exact	Ant. Terminal	400 ohms	Middle	As above	Middle wave Ant.	Adjust to maximum output.
SHORT WAVE BAND	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	Set pointer to indicate 16,000 kc.	Short wave oscillator	Adjust to maximum output. *See note 1
SHORT WAVE BAND	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	As above	Short wave RF. amplifier	Adjust to maximum output while rocking the tuning-condenser slightly.
SHORT WAVE BAND	16,000 kc. exact	Ant. Terminal	400 ohms	Short wave	As above	Short wave Antenna	Adjust to maximum output while rocking the tuning-condenser slightly.

REPEAT ABOVE PROCEDURE AS FINAL CHECK

NOTE 1.—Exercise care to see that the oscillator is tuned to a frequency higher than the signal since it is very easy to mistakenly set the oscillator on the wrong side of the signal at this high frequency.

1—80 Rectifier.
1—6U5 Tuning Indicator.

POWER TRANSFORMERS

Power transformer are available and receivers are sometimes equipped with them for operation on 25 or 40 cycles.

SERVICE SUGGESTIONS

Be *sure* that antenna and ground connections are made according to instructions.

See that all tubes are in the proper sockets, that they are in good operating condition, and that clips are attached to the small caps on tops of those tubes requiring them. Make sure that the tube shields are not shorting the clips to the chassis.

Be sure that the Band Selector Switch and "Ant-Loop" Switch is in the proper position for the type of reception desired.

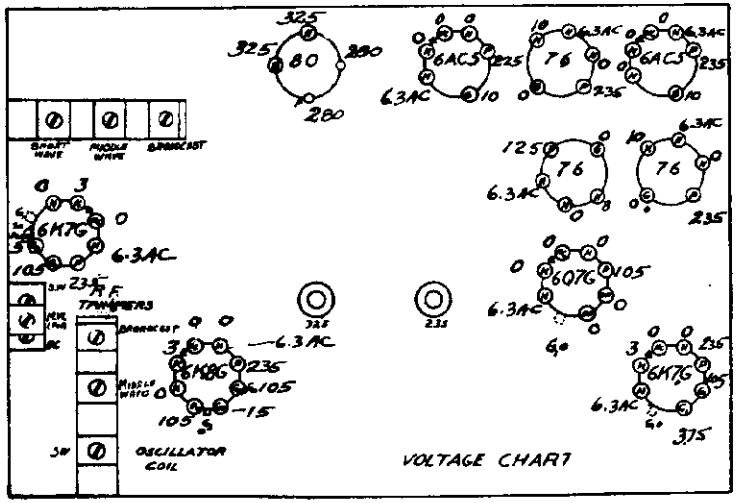
See that all plugs are making proper contact.

If the receiver remains inoperative after the above suggestions have been tried, *turn the Power Switch "Off."* Never leave the switch turned on when signs of abnormal heating are present. A minor circuit trouble may cause an expensive repair bill if the set is allowed to run for any length of time after the trouble develops.

Occasionally a loud hum will be heard as stations are tuned in. Reverse the power supply plug. If the hum persists, remove the cause by properly grounding other sets or appliances in the house.

The receiver is perfectly conventional in all respects, therefore servicing should not present any particular problems to the professional service man. The normal methods of locating trouble applies in this set as in any other.

1. Suspected open condensers may most easily be checked by shunting each suspected unit with another condenser of the same capacity known to be good.
2. Suspected shorted condensers can usually be most easily detected by resistance checks. The condensers usually bypass a resistance of some finite value. A resistance check without disconnecting any wires will show a lower resistance than the color code of the resistance would indicate if the condenser is leaking or shorted. It must be remembered that some resistances vary 25% above or below the value indicated by the color code.
3. Leaky condensers in grid circuits can be checked by voltage measurement across the grid leak at no signal. If a measurable positive voltage exists at the grid end of the grid leak when measured to ground, a leaky coupling condenser probably exists. The condenser should then be disconnected and checked for resistance.



DETROLA CORP.
MODEL 326
Voltage Alignment
DETROLA PAGE 11

MODEL 3231

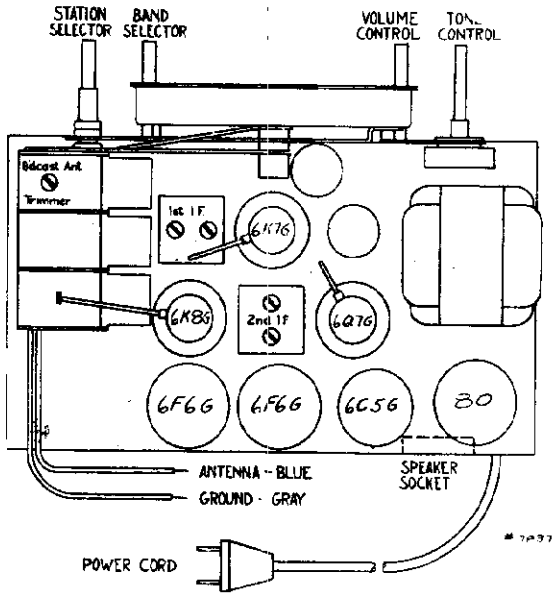
ALINEMENT PROCEDURE

Connect a high impedance AC voltmeter across the loudspeaker terminals. Volume control should be set a few degrees back of maximum volume position. Use a weak signal from the generator, strong signals tend to cause improper adjustments.

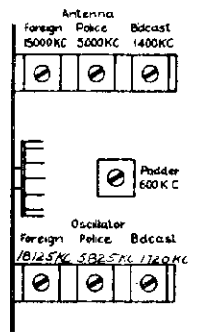
IF. Connect the generator ground to receiver chassis. Using .1 mfd. condenser in series with high side of the generator, apply 455 kc. signal to the grid of the 6K7G IF amplifier tube and aline second IF transformer trimmers. Repeat for first IF transformer, applying signal to grid of the 6K8G tube.

RF. (See diagram for location of trimmers.) Using a 200 mmf. condenser in series with the high side of the generator, turn band selector switch to position "B," tuning condenser to minimum capacity. Feed 1720 kc. signal to antenna terminal and adjust broadcast oscillator trimmer for top frequency. Set generator frequency at some point around 1400-1500 kc., and adjust broadcast antenna and RF trimmers. Set generator for 600 kc., tune receiver to signal and adjust the padder. The tuning condenser should be rocked back and forth through the signal while varying the padder in order to assure perfect alinement.

A 400 ohm resistor must be used in series with the generator as a "dummy" antenna for proper alignment of the two short wave bands. Set the band selector switch in the "P" position, adjust the oscillator top frequency for 5825 kc., then aline the antenna trimmer at about 5000 kc. With the band selector in the extreme right position, adjust the top frequency of the high frequency band to 18,125 kc., and aline the antenna trimmer at about 15,000 kc. In order to make sure that the top end of the lst band is set properly, it is best to screw the oscillator trimmer tight, then unscrew to the second peak. The antenna trimmer should be screwed down tight, then unscrewed to the first peak. This procedure must be followed in order that the oscillator and RF circuits will be set in the correct relation to each other, otherwise a "dead" spot at a lower frequency will result, and the dial calibration will not be correct. Usually, it is best to rock the tuning condenser back and forth slightly while making these adjustments at high frequencies.



MODEL 3231



TRIMMER ADJUSTMENT

MODELS 333 - 3281

ALINEMENT PROCEDURE

Turn the band switch to the Broadcast position.

Connect an output meter across the speaker voice coil. The volume control should be set a few degrees from the maximum volume position. Use a weak signal from the generator, strong signals tend to cause improper adjustments.

IF alignment: Connect the signal generator ground to the receiver chassis through a .1 mfd. condenser. Using a .1 mfd. condenser in series with the high side of the generator, apply a 455 kc. signal to the grid of the 6K7GT tube and align the 2nd IF transformer. Connect to the grid of the 6K8 tube and align the 1st IF transformer. (See Tube Layout Diagram for location of these adjustments.) From this postion re-check both transformers again.

Broadcast Band Alignment: Turn the band switch to the Broadcast position, turn the tuning condenser all the way to the right, (minimum capacity), apply a 1720 kc. signal to the grid of the 6K8 tube and adjust the broadcast oscillator trimmer. The oscillator coil is under the right hand end of the chassis and this trimmer is the one nearest the front of the chassis. To align the loop antenna, connect a single turn loop across the terminals of the generator, place the receiver about one foot in front of the single turn loop, set the generator at about 1400 kc., tune in the signal and adjust the trimmer on the loop antenna assembly for maximum response.

Short Wave Alignment: Using a 400 ohm resistor between the high side of the generator and the antenna terminal (on the LOOP frame), turn the tuning condenser to minimum capacity, set the generator at 18,500 kc., and adjust the short wave oscillator trimmer. This trimmer is immediately in back of the broadcast oscillator trimmer. Set the generator at about 17,000 kc., tune in the signal and adjust the short wave antenna trimmer for maximum response. This trimmer is mounted on the loop antenna.

NOTE: If considerable hum appears when the generator is connected as described above use smaller condensers between the generator and the receiver. The best way is to use a 1:1 transformer to isolate either the receiver or the generator from the line. The adjustments of this receiver are very stable and no aligning should be attempted unless absolutely necessary.

MODEL 326

PROCEDURE FOR SETTING THE STATION BUTTONS

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning. Make a list of your favorite stations, those which you tune in regularly.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next and so on.

Any buton may be used for any station you can receive, although it will be better to set the stations so that the kilocycle numbers increase from left to right.

SETTING A STATION BUTTON

Pull the button at the extreme left off the shaft. When this is done, the locking screw under the shaft will be exposed.

Loosen this screw with a small screwdriver by turning several turns in a counter-clockwise direction. Continue to press in firmly on the screwdriver, thus holding the station button shaft depressed. Select the first station button shaft depressed. Select the first station from the list you have prepared and carefully tune in this station by means of the manual tuning knob.

Continue to press in firmly on the screwdriver and lock the mechanism by turning the locking screw in a clockwise direction until it is tight. The station is now set on this button.

Proceed in the same manner to set any additional stations on your list on the remaining station buttons.

Select the proper station call letter tab from the sheet provided and place it in the recess in the proper push button. Cover the call letter tab with one of the heavy celluloid retainers provided. Replace the button on the shaft. Follow the same procedure for inserting the station call letters in any other buttons.

After the stations are set and the mechanism is locked, tune in each of them by depressing the proper button. If any of them does not appear to be properly tuned in after the button has been depressed, reset the station for that button following the procedure as outlined above. If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of the others.

WARNING !

The clock with which this receiver is equipped will operate on 60 cycle alternating current only. A switch is provided on the back of the cabinet to disconnect the clock when the receiver is operated on direct current. Failure to throw the switch to the proper position as indicated on the back of the cabinet will result in serious damage to the clock.

These models are superheterodyne receivers, with full automatic volume control on all bands. They have been designed to operate on 110-125 volts, 40-60 cycles AC or DC unless otherwise specified. A slide rule instrument type dial which simplifies tuning is featured in these receivers.

TO CALIBRATE RECEIVER

I.F. ALIGNMENT Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 456 K.C. and peak I.F. trimmers for maximum signal.

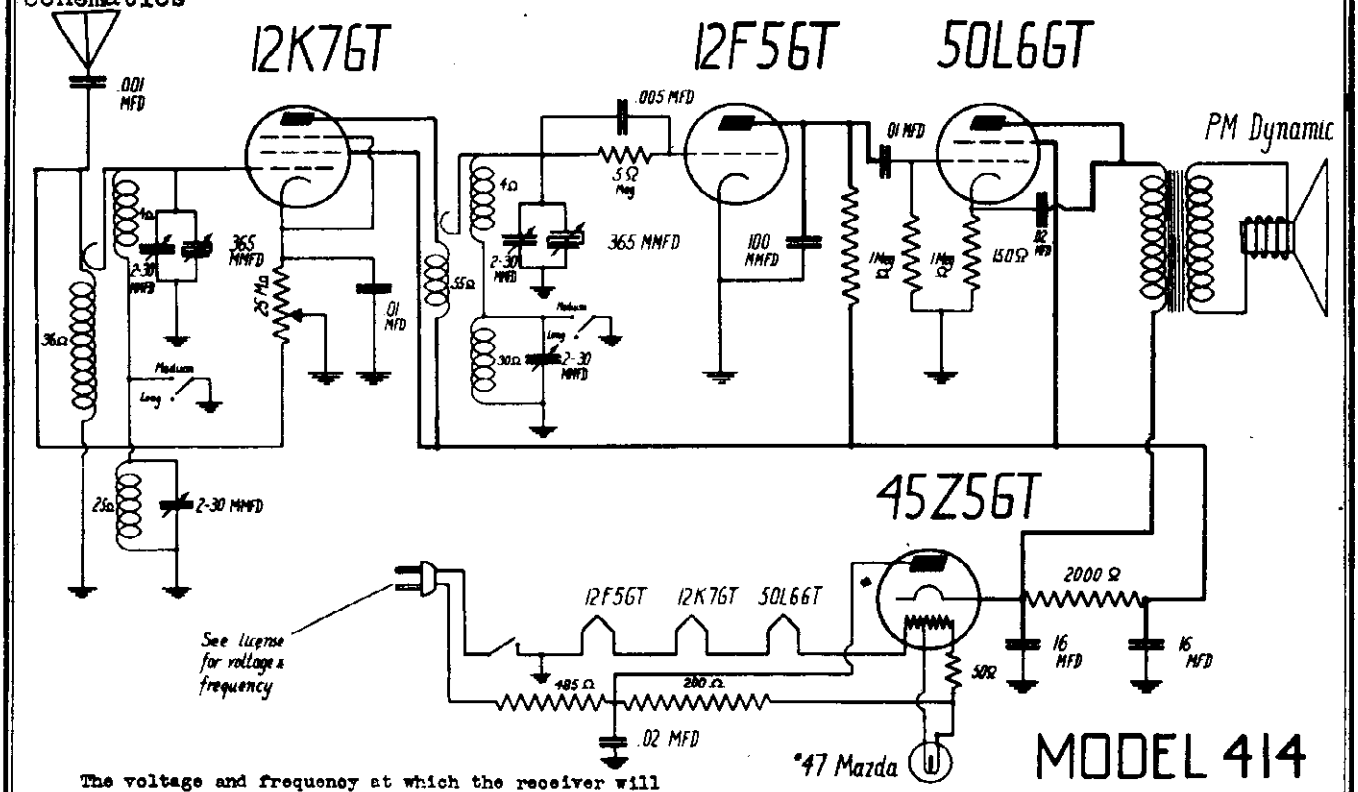
BROADCAST ALIGNMENT Remove short from variable condenser. Have wave band switch on broadcast position. Adjust generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C., peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

SHORT WAVE ALIGNMENT Turn wave band switch to the short wave band. Adjust generator and receiver to 16.0 M.C. Peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

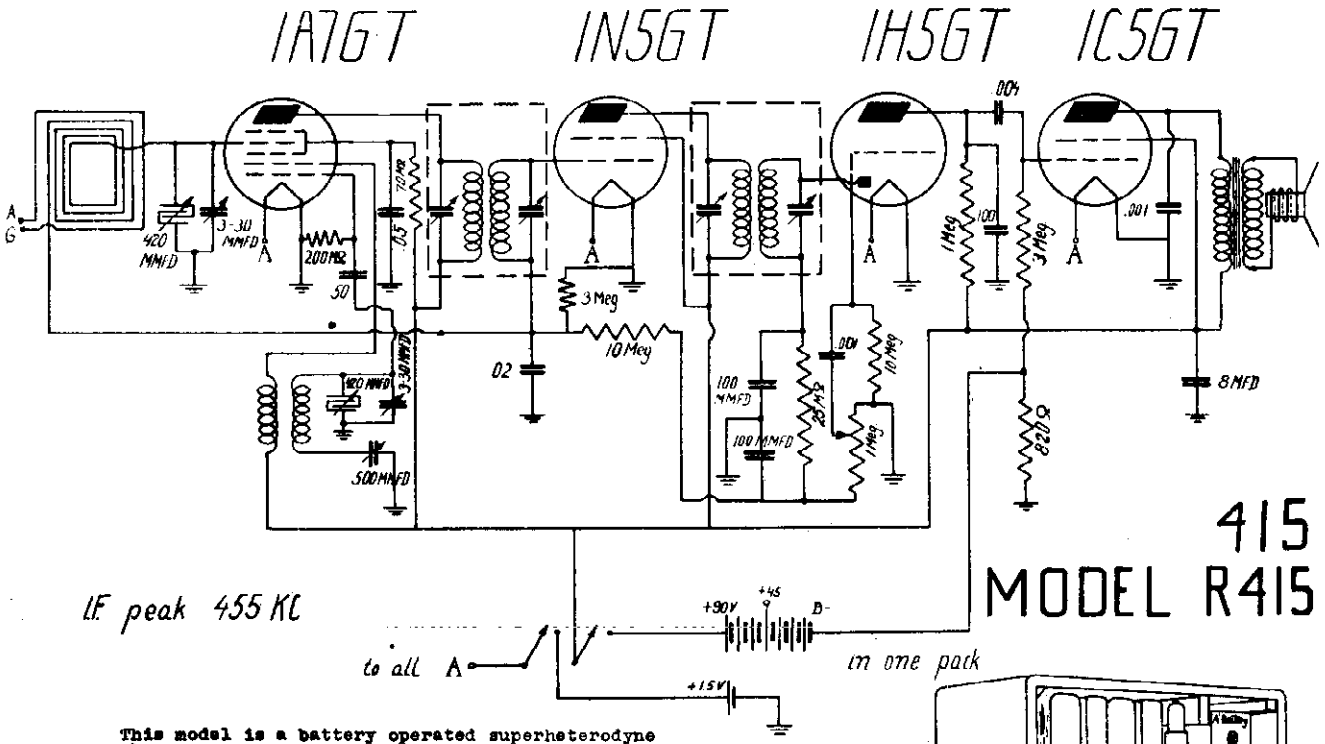
LONG WAVE ALIGNMENT Turn wave band switch to Long Wave band. Adjust the generator and receiver to 300 K.C. and peak trimmers for maximum signal. Adjust generator and receiver to 175 K.C. and peak Long Wave padder for maximum signal. The variable condenser should be "rocked" during this operation. Recheck 300 K.C.

MODEL 414
MODELS 415,R415
Schematics

DEWALD RADIO MFG. CORP.



The voltage and frequency at which the receiver will operate is specified on the back of the cabinet. The broadcast range coverage is 180-560 meters. The long wave range coverage is 850-2040 meters.



This model is a battery operated superheterodyne receiver with full automatic volume control. A self-contained loop is incorporated which makes the use of an antenna unnecessary. It is designed to operate with an "A" supply of 1.5 volts and a "B" supply of 90 volts. The broadcast range coverage is 540 - 1600 kilocycles. For the "A" supply one Eveready #743, Burgess #6F or the equivalent may be used. For the "B" supply two Eveready #727, Burgess #A30X or the equivalent batteries may be used.

TO CALIBRATE RECEIVER

I.F. ALIGNMENT: Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 456 K.C. and peak I.F. trimmers for maximum signal.

BROADCAST ALIGNMENT: Remove short from variable condenser. Have wave band switch on broadcast position. Adjust generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K. C.; peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

SHORT WAVE ALIGNMENT: For 6.0-18.5 M.C. (Model 542) Turn wave band switch to this band. Adjust the generator and receiver to 16.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

LONG WAVE ALIGNMENT: (Model 542 L.W.) Turn wave band switch to long wave band. Adjust the generator and receiver to 300 K.C. and peak trimmers for Maximum signal. Adjust generator and receiver to 175 K.C, and peak Long Wave padder for maximum signal. The variable condenser should be "rocked" during this operation. Recheck 300 K.C.

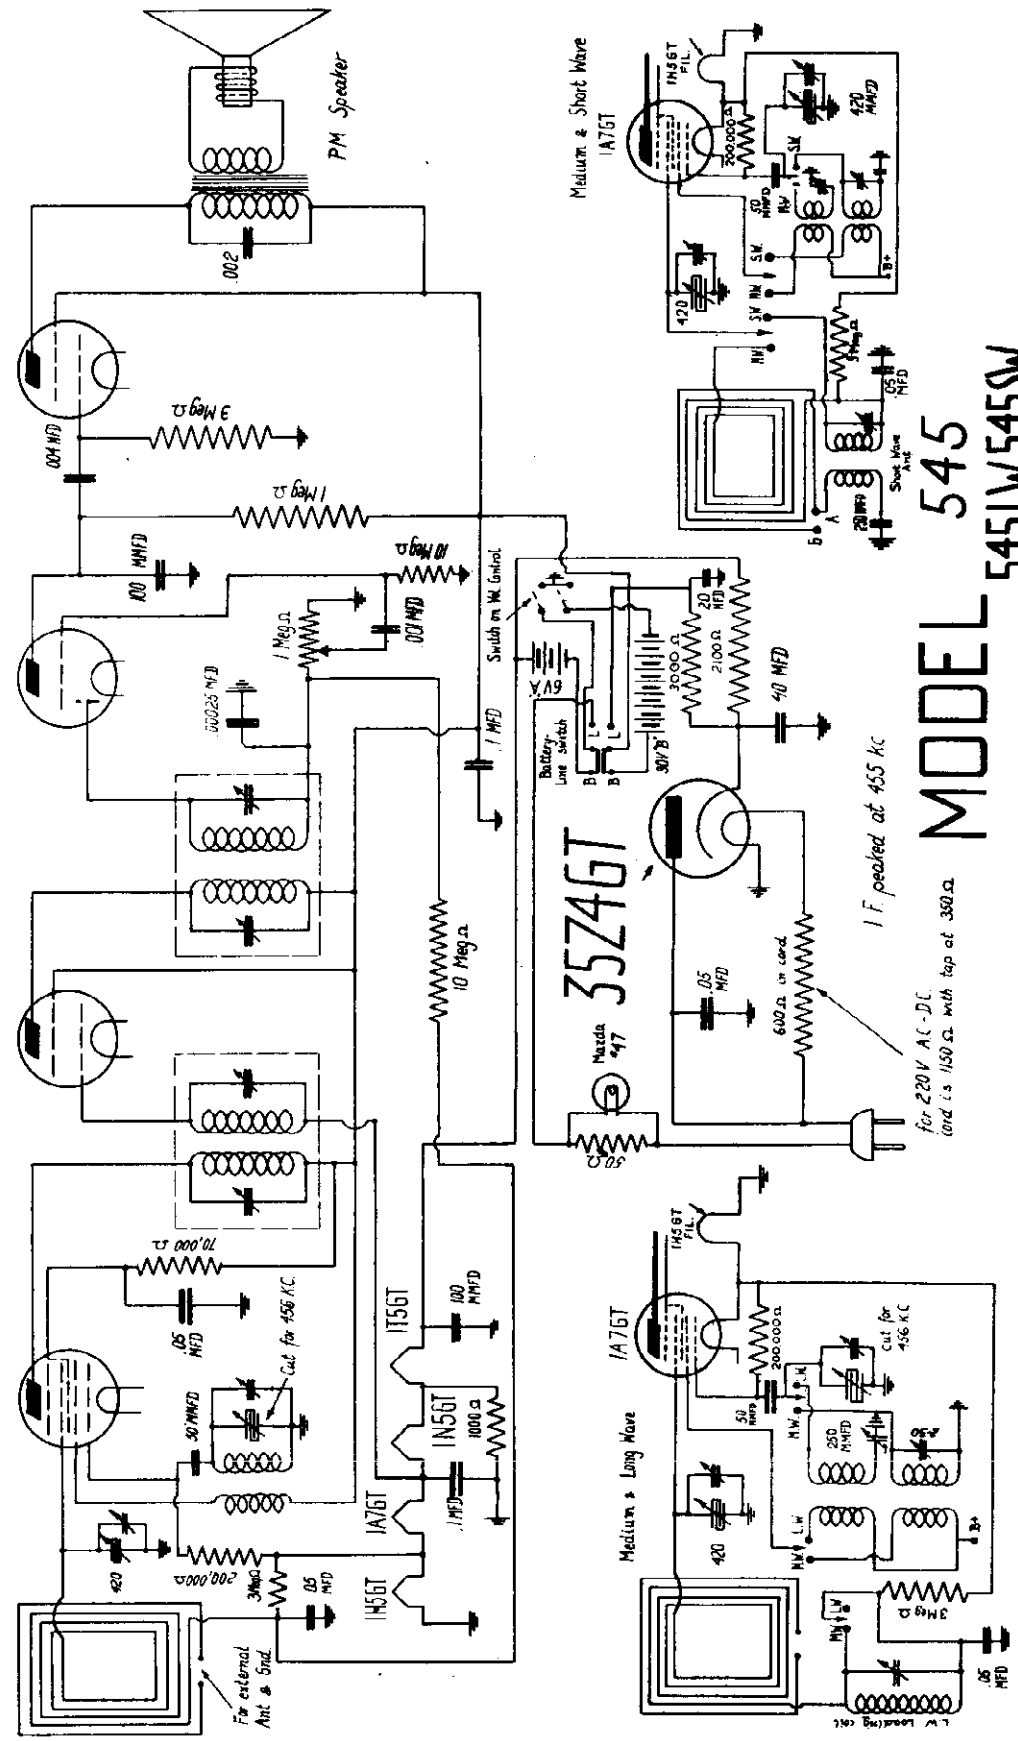
Schematics, Notes

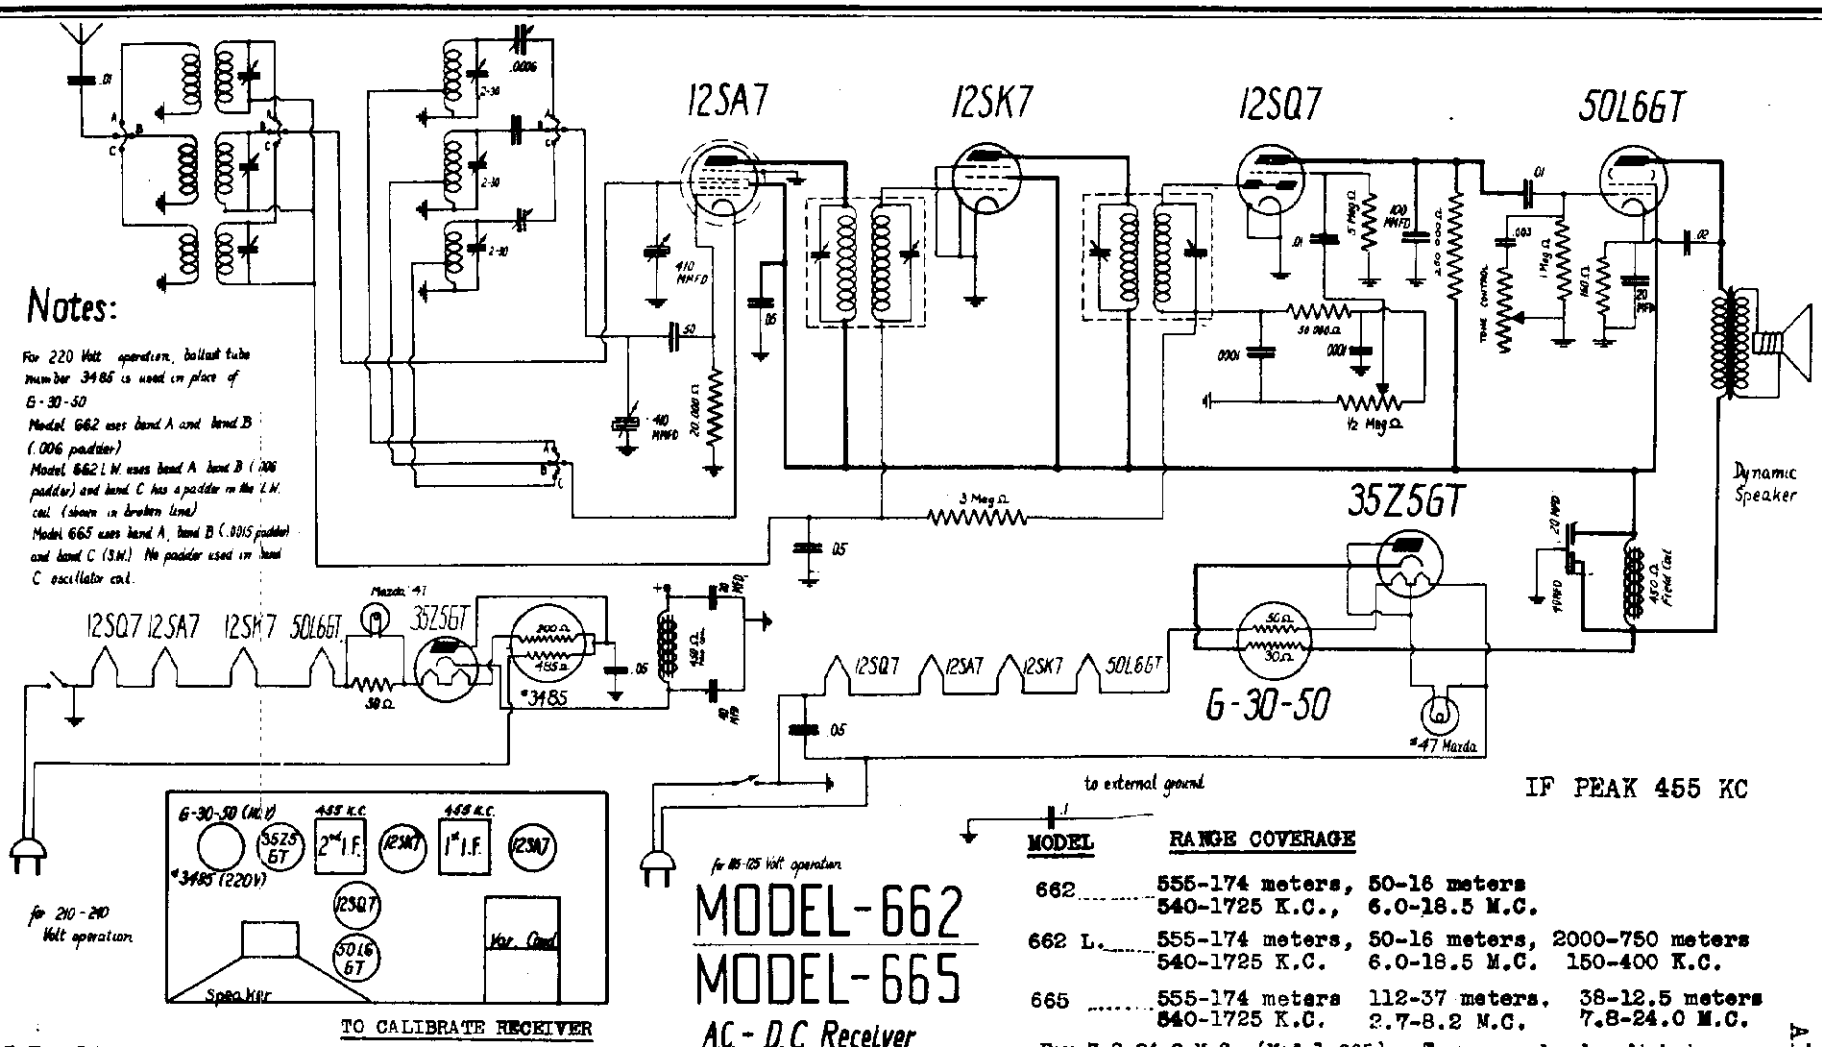
DEWALD RADIO MFG. CORP.



These models are portable combination battery and electric operated superheterodyne receivers with full automatic volume control. A self-contained loop is incorporated which makes the use of an outside aerial unnecessary for broadcast reception. The receivers will operate with an "A" supply of 6 volts and a "B" supply of 90 volts. They will also operate on 105-125 volts, 40-60 cycles A.C. or D.C. unless otherwise specified.

The range coverage is as follows:

MODEL 545	1700 - 540 KC.
MODEL 545 L.W.	1700 - 540 KC. & 350 - 145 KC.
MODEL 545 S.W.	1700 - 540 KC. & 17 - 5.5 MC.



TO CALIBRATE RECEIVER

for 105-125 Volt operation

MODEL-662
MODEL-665

A.C.-D.C. Receiver

MODEL	RANGE COVERAGE		
662	555-174 meters, 540-1725 K.C.,	50-16 meters 6.0-18.5 M.C.	
662 L.	555-174 meters, 540-1725 K.C.	50-16 meters, 6.0-18.5 M.C.	2000-750 meters 150-400 K.C.
665	555-174 meters 540-1725 K.C.	112-37 meters. 2.7-8.2 M.C.	38-12.5 meters 7.8-24.0 M.C.

I.F. ALIGNMENT Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 455 K.C. and peak I.F. trimmers for maximum signal.

BROADCAST ALIGNMENT Remove short from variable condenser. Have wave band switch on broadcast position. Adjust generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C., peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

SHORT WAVE ALIGNMENT For 2.7-8.2 M.C. (Model 665). Turn wave band switch to this band. Adjust the generator and receiver to 7.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

For 7.8-24.0 M.C. (Model 665) Turn wave band switch to this band. Adjust the generator and receiver to 22.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

For 6.0-18.5 M.C. (Model 662). Turn wave band switch to this band. Adjust the generator and receiver to 16.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

LONG WAVE ALIGNMENT (Model 662 L.W.) Turn wave band switch to Long Wave band. Adjust the generator and receiver to 300 K.C. and peak trimmers for maximum signal. Adjust generator and receiver to 175 K.C. and peak Long Wave padder for maximum signal. The variable condenser should be "rocked" during this operation. Recheck 300 K.C.

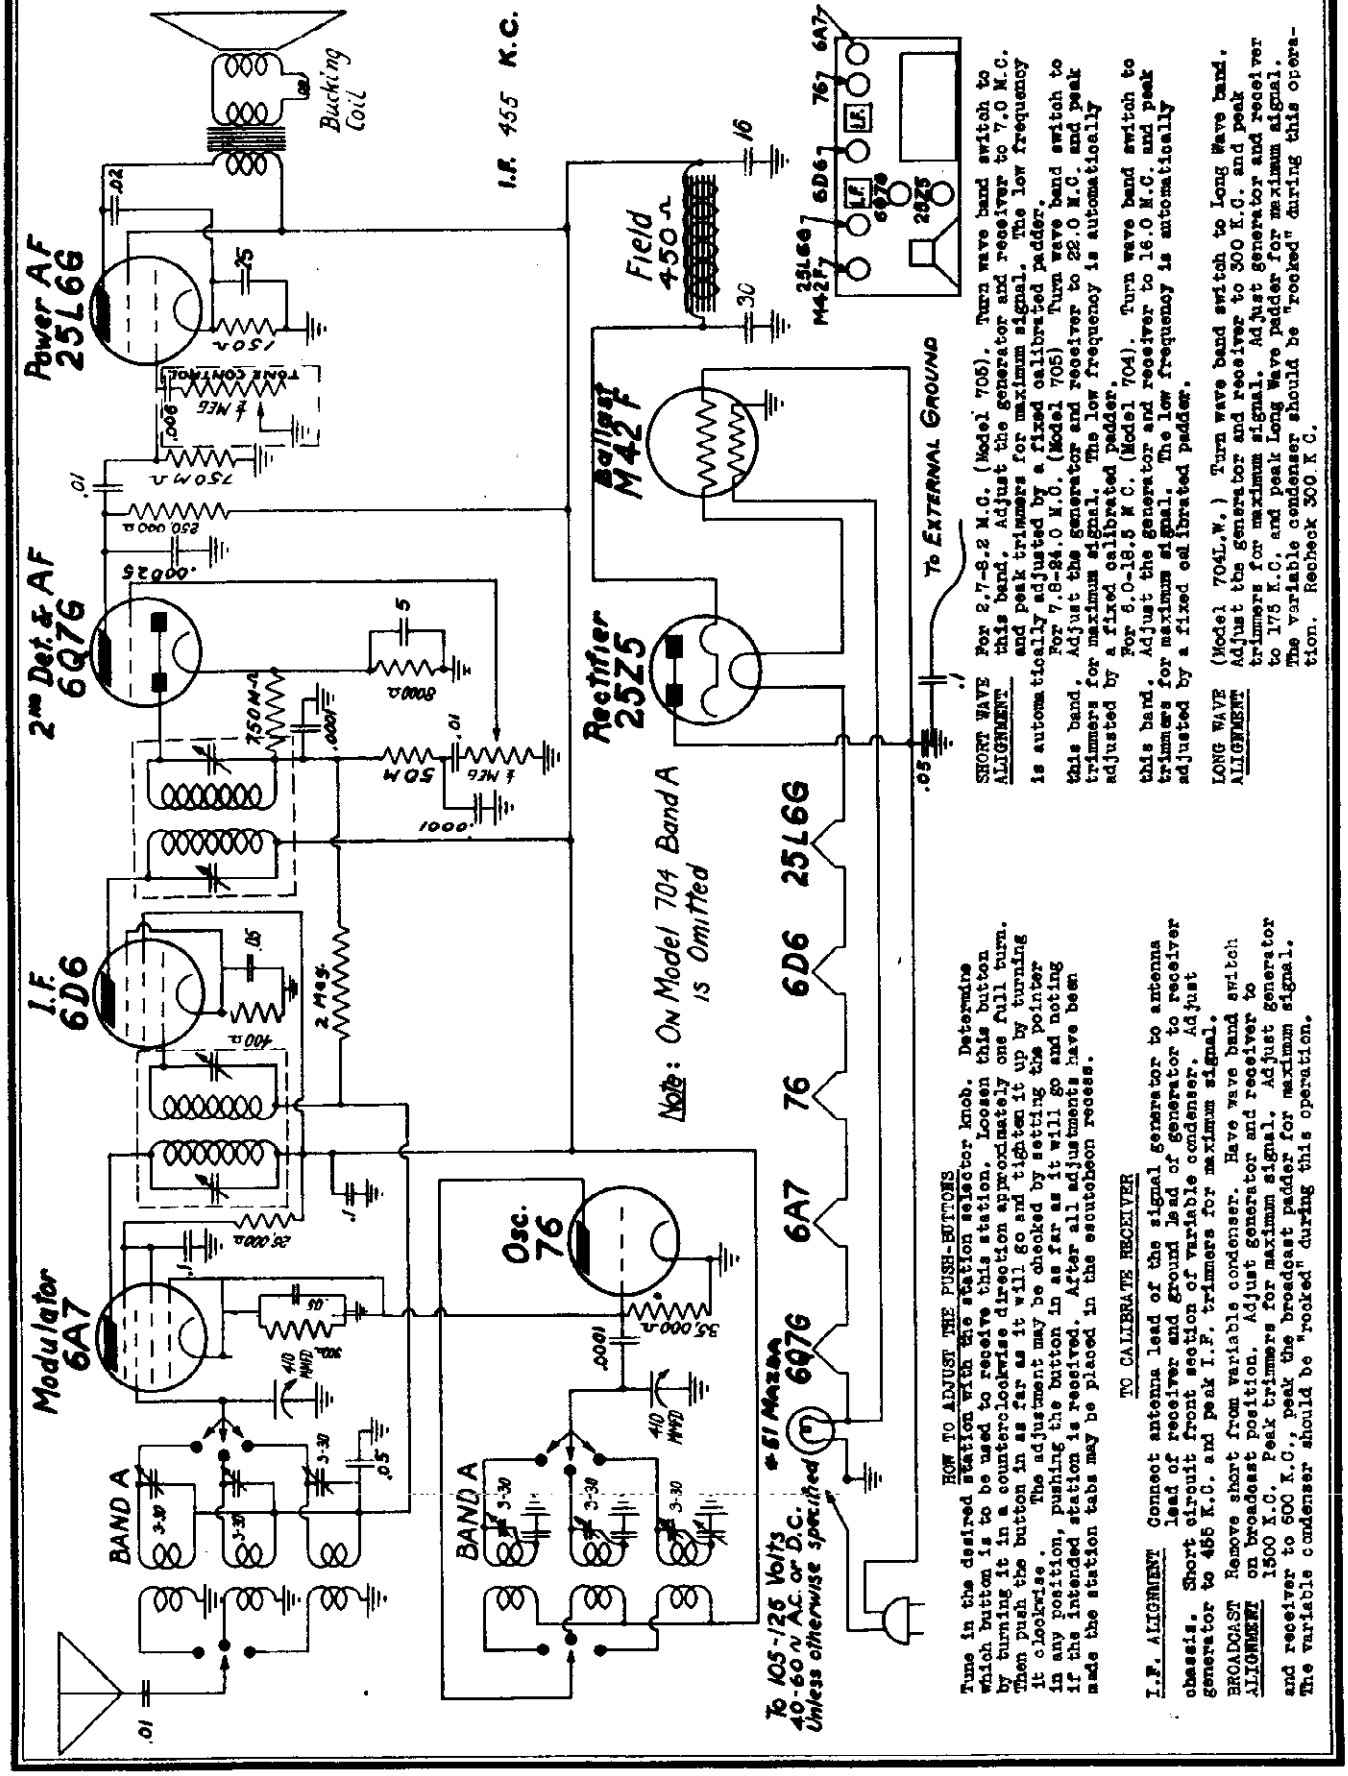
Tuner, Alignment

DEWALD RADIO MFG. CORP.



HOW TO ADJUST THE PUSH-BUTTONS

Tune in the desired station with the station selector knob. Determine which button is to be used to receive this station. Loosen this button by turning it in a counterclockwise direction approximately one full turn. Then push the button in as far as it will go and tighten it up by turning it clockwise. The adjustment may be checked by setting the pointer in any position, pushing the button in as far as it will go and noting if the intended station is received. After all adjustments have been made the station tabs may be placed in the escutcheon recess.

TO CALIBRATE RECEIVER

I.F. ALIGNMENT. Connect antenna lead of the signal generator to antenna lead of receiver and ground lead of generator to receiver chassis. Short circuit front section of variable condenser. Adjust generator to 455 K.C. and peak I.F. trimmers for maximum signal.

BROADCAST ALIGNMENT. Remove short from variable condenser. Have wave band switch on broadcast position. Adjust generator and receiver to 1500 K.C. Peak trimmers for maximum signal. Adjust generator and receiver to 600 K.C., peak the broadcast padder for maximum signal. The variable condenser should be "rocked" during this operation.

SHORT WAVE ALIGNMENT. For 2.7-6.2 M.C. (Model 705). Turn wave band switch to this band. Adjust the generator and receiver to 7.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.
For 7.8-24.0 M.C. (Model 705) Turn wave band switch to this band. Adjust the generator and receiver to 22.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.
For 6.0-18.5 M.C. (Model 704). Turn wave band switch to this band. Adjust the generator and receiver to 16.0 M.C. and peak trimmers for maximum signal. The low frequency is automatically adjusted by a fixed calibrated padder.

LONG WAVE ALIGNMENT. (Model 704LW.) Turn wave band switch to Long Wave band. Adjust the generator and receiver to 300 K.C. and peak trimmers for maximum signal. Adjust generator and receiver to 175 K.C. and peak Long Wave padder for maximum signal. The variable condenser should be "rocked" during this operation. Recheck 300 K.C.

*Item number locates the article on the schematic diagram.
†Not supplied separately.

PRODUCTION CHANGES

1. In CJ chassis bearing serial numbers below 2,700,250; R7, the 12Q7G plate resistor, is 250,000 ohms.
2. CJ chassis also use oscillator coil 4XT-458 or 6JT-467. For correct lug connections to any of these coils see illustration.
3. R9, R10 is not used on CJ chassis above serial number 2,700,250.
4. CJ-221 chassis uses dotted portion R8, R14, and C25.
   CJ-232 chassis uses dotted portion R18, C26, and C27.

Tube Data

For serial numbers below 2,700,250:			For serial numbers above 2,700,250
1—12A8 or 12A8GT		pentagrid oscillator modulator	1—12A8 or 12A8GT
1—12K7 or 12K7GT		first i-f amplifier	1—12K7 or 12K7GT
1—12Q7 or 12Q7GT		diode detector, a-f amplifier, a.v.c.	1—12SQ7 or 12SQ7GT
1—35L6 or 35L6GT		beam power output	1—50L6 or 50L6GT
1—35Z4 or 35Z4GT		half-wave rectifier	1—35Z5 or 35Z5GT

All tubes are replaceable with either metal or equivalent bantam glass tubes. The letters "GT" at the end of the tube number indicate that the tube has a bantam size glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

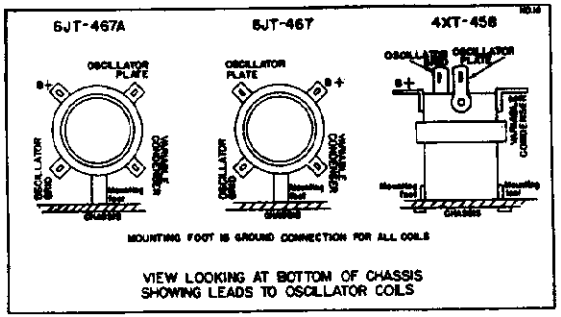
Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
12A8GT	65	40	0	65	12
12K7GT	65	65	0	—	12
12SQ7GT	40	—	0	—	12
50L6GT	100	65	5.7	—	50

Voltage at 35Z5 cathode—110 volts.

Voltage across pilot light—6.5 volts.

† In chassis using 35Z4GT and 35L6GT plate and screen voltage readings will be slightly higher.

CHASSIS MODEL CJ
Voltage rating ..... 105-125 volts
Power consumption 50 watts for receiver
20 watts for 221 a.c. or 232 a.c. motor
30 watts for 221 and 232 a.c.-d.c. motors
Frequency range ..... 540-1730 kc.



MOUNTING FOOT IS GROUND CONNECTION FOR ALL COILS

VIEW LOOKING AT BOTTOM OF CHASSIS SHOWING LEADS TO OSCILLATOR COILS

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the left of the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil between the 12K7 and 35Z5 tubes. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis. The oscillator coil is located underneath the chassis, beneath the first i-f transformer.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 12A8 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 4.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
12A8GT—pentagrid oscillator modulator	88	45	0	88	12
12K7GT—first i-f amplifier	88	88	0	—	12
12SQ7GT—diode detector, a-f amplifier, a.v.c.	40	—	0	—	12
50L6GT—beam power output	82	88	5.7	—	50

Voltage at 35Z5 cathode—115 volts.

Voltage across speaker field—27 volts.

Voltage across pilot light—4.5 volts.

Voltage rating	105 to 125 volts, a.c. or d.c.
Power consumption	30 watts
Frequency ranges	538 to 1650 kc (558 to 182 meters) 157 to 375 kc (1905 to 804 meters)

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the right of the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The two-band antenna coil is located to the left of the speaker. The trimmer for the broadcast antenna coil is located on the front section of the variable condenser. The trimmer for the long-wave antenna coil is mounted on the top of the antenna coil form. The two-band oscillator coil is located underneath the chassis below the antenna coil. The trimmer for the broadcast oscillator coil is located on the rear section of the variable condenser. The trimmer and series padder (condensers C25 and C26 resp.) for the long-wave oscillator coil are located beneath the chassis and can be reached from the bottom only. The section toward the rear of the chassis is C25, the shunt trimmer. The section toward the front of the chassis is C26, the series padding condenser.

Alignment

I.F. Turn the band switch clockwise to broadcast position and swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 12A8GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

B.C.-With the band switch in broadcast position set the dial pointer at 200 meters. Feed 1500 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

L.W. Turn the band switch counter-clockwise to the long-wave position. With the dial pointer set at 850 meters, feed 350 kc through a .0001 mf condenser to the antenna and adjust first the oscillator trimmer (rear trimmer beneath the chassis), then the antenna trimmer (on antenna coil) for maximum response. Move the pointer to 1750 meters, feed 172 kc, and adjust the series padder (front trimmer beneath the chassis), rocking the variable condenser back and forth while adjusting for maximum response. Return to 350 kc and repeat alignment.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	*Plate*	*Screen*	*Cathode*	*Heater*
12J5GT, first r-f amplifier	85	—	2.3	12
12K7GT, second r-f amplifier	85	85	1.6	12
12SF5GT, grid leak detector	25	—	0	12
50L6GT, beam power output	110	85	6	50

Voltage at rectifier cathode—120 volts. Power consumption ..... 30 watts.

ALIGNMENT PROCEDURE

An oscillator with frequencies of 1500 kc and 350 kc is required.

Use as weak a test signal as possible. An output meter should be used across the voice coil or output transformer for observing maximum response.

Rotate variable condenser to the maximum capacity position and set the pointer at the next calibration mark beyond 550. Rotate band-switch clockwise to broadcast (medium-wave) position. Then rotate the variable condenser until the pointer is at 200 meters, feed 1500 kc to the antenna through a .0001 mf mica condenser and adjust both trimmer condensers on the variable condenser for maximum response.

Turn wave-band switch counter-clockwise to long-wave position. Rotate variable condenser until pointer is at 850 meters and feed 350 kc to antenna. Adjust the two long-wave interstage coil trimmers for maximum output. The first long-wave interstage coil trimmer is located on the speaker frame. The second (detector coil) long-wave trimmer is located beneath the chassis and is reached from the right end of the chassis.

Type Battery	No. Req.	Eveready Part No.	Raycovac Part No.	Burgess Part No.
1½ volt "A"	1	741 (plug-in type)	P-96A (plug-in type)	8F (plug-in type)
45 volt "B"	2	782 (plug-in type)	P-5308 (plug-in type)	B30-P1 (plug-in type)

FOR MODEL CX-285

"A" and "B" Pack	1	748 (plug-in type)	AB82 (plug-in type)	17G-D60 (plug-in type)

2. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red

3. The color coding of the battery cable is as follows:
   Red—B plus, 90 volts — Yellow—A plus, 1.5 volts
   Blue—B minus — Black—A minus

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	Plate	Screen	Osc. Plate	Fil.
1A7GT oscillator-modulator	82	52	82	1.5
1N6GT 1st i-f amplifier	70	32	—	1.5
1N5GT 2nd i-f amplifier	82	32	—	1.5
1H5GT 2nd detector, a.v.c., a-f amplifier	25	—	—	1.5
1Q5GT beam power output	77	82	—	1.5

Bias for the 1Q5GT tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.0 volts.

C24	6XC-458A	0.00014 mf mica condenser
C25	3VC-324	0.003 mf, 600 volt tubular condenser
	3GM-251	Phonograph needle cup
	6XPM-48	Spring-driven phonograph motor
	4XS-432	Phono-radio switch
	3GS-202R	Tone control switch

* Item number locates the article on the schematic diagram.

† Not supplied separately.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maxium response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the rear section of the variable condenser.

On Model CX-285 the antenna coil is located between the two i-f transformers. On all other CX Models the loop antenna acts as the antenna coil. The trimmer for the loop C4 is on the loop frame for Models CX-263, 284 and 305. On Models CX-283, 285 and 292, C4 is on the front section of the variable condenser.

The i-f transformers are located in cans mounted on top of the chassis. The first i-f transformer is at the extreme left end of the chassis. The diode i-f transformer is just to the left of the variable condenser. The trimming condensers for both transformers can be reached through holes in the tops of the cans.

I-f Alignment

Swing variable condenser to minimum capacity position. Feed 456 kc to the grid of the 1A7GT tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance. Align at 140. Set the dial at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may then be swung to either side of the center to give maximum response. Realign at 140.

Battery Installation for Models CX-263, CX-283, CX-284, CX-292 and CX-305

The portable cabinets contain a shelf under the receiver for housing the batteries. To install and connect the batteries observe the following procedure:

1. Remove the back panel of the cabinet by taking out the wood screws.
2. Locate the battery cable on the bottom shelf of the cabinet.
3. With the batteries out of the cabinet insert the three-prong plug on the battery cable into the two "B" batteries and the small two prong plug into the "A" battery.
4. Place the batteries in the cabinet as indicated in the illustration Note that the plug end of the battery is up against the front panel of the cabinet.
5. Replace the back panel of the cabinet and fasten it in place with the wood screws.

Battery Installation for Model CX-285: The cabinet for this model is designed to house completely the combined "A" and "B" pack. Place the battery pack in the cabinet at the rear of the receiver and insert the four-prong plug of the battery cable into the socket on the top of the battery.

TUBE DATA

THE TUBE COMPLEMENT IS AS FOLLOWS:

One 12SA7GT—pentagrid oscillator modulator
One 12K7GT—first i-f amplifier
One 12SQ7GT—diode detector, a-f amplifier, a.v.c.
One 50L6GT—beam power output
One 35Z5GT—half-wave rectifier

(NOTE: Chassis bearing serial numbers below 2920685 use 12A8GT instead of 12SA7GT)

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Fil.*
†12SA7GT	88	88	0	12
12K7GT	88	88	0	12
12SQ7GT	40	—	0	12
50L6GT	82	88	5.7	50

Voltage at 35Z5 cathode—115 volts.
Voltage across speaker field—27 volts.
Voltage across pilot light—4.5 volts.
†Chassis using 12A8GT measures 88 volts at oscillator plate and 45 volts at screen.

4YZ-772	Drive cord
6JH-24B	Drive shaft
6RW-162	Drive cord spring
6RF-52	Dial pointer
	6RE-20 Dial crystal

PRODUCTION CHANGES

1. (a) Used only in chassis using 12A8GT.
   (b) Used only in chassis using 12SA7GT.
2. (a) Chassis bearing serial numbers below 2764502 use oscillator coil 6RT-476
   (b) Chassis bearing serial numbers between 2764502 and 2920685 use oscillator coil 7GT-511
3. Chassis bearing serial numbers below 2920685 use
   (a) First i-f transformer 6RT-479A.
   (b) Second i-f transformer 7BT-489A.
   (c) Condenser C19—.03 mf—400 volt.
4. Chassis bearing serial numbers below 2764502 use
   (a) Dial face 6VD-82.
   (b) Loop antenna 6VW-172.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the left of the speaker. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis to the right of the speaker. The trimmers are accessible through holes in the top of the can.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil (loop). The oscillator coil is located directly beneath the speaker.

Alignment

I.F.—Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. The grid of the 12SA7GT tube may be reached by clipping the input lead to the stator loop of the antenna (front) section.

R.F.—Set the dial pointer at 140. Feed 1400 kc from the signal generator into a loop of wire about one foot in diameter. Hold this radiating loop about 12 inches away from and parallel to the receiver loop antenna. Advance the input to the loop until a satisfactory deflection is obtained on the output meter. Adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response. If the loop antenna has been replaced it may be necessary to retrack the loop inductance. With the dial set at 60 feed 600 kc to the antenna lead. A portion of the outside may be swung to either side of the center to give maximum response. Repeat the trimmer alignment at 140.

C15, C17	4XC-394A	0.00022 mf mica condenser
C16, C19	KC-58	0.01 mf, 400 volt tubular condenser
C20	6EC-432	8 mf, 100 volt dry electrolytic condenser

Current drain: "A" battery—0.3 amps. "B" battery—0.010 amps. with no signal

Frequency range 530 to 1730 kc

Alignment

IF—Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 1A7GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for *minimum* response.

RF—Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the left of the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted underneath the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis directly beneath the variable condenser.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The 455 kc wave-trap is mounted on the same form as the antenna coil to the left of the speaker. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the left side of the chassis. The oscillator coil is located underneath the chassis, beneath the antenna coil.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	*Plate*	*Screen*	*Osc. Plate*	*Fil.*
1A7GT	82	52	82	1.5
1N5GT 1st i-f	48	82	—	1.5
1N5GT 2nd i-f	82	82	—	1.5
1H5GT	25	—	—	1.5
1Q5GT	77	82	—	1.5

Bias for the 1Q5GT tube is obtained across the resistor R11. The voltage drop across this resistor should be 7.0 volts.

The tube complement is as follows:

1—12J5GT, first r-f amplifier
1—12K7GT, second r-f amplifier
1—12SF5GT, grid leak detector
1—50L6GT, beam power output
1—35Z5GT, single half-wave rectifier

Voltage rating ..... **105 to 125 volts, a.c. or d.c.**
Power consumption ..... **30 watts.**
Frequency range ..... **540 to 1730 kc.**

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with volume control turned on full and no signal. The line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	*Plate*	*Screen*	*Cathode*	*Heater*
12J5GT	85	—	2.3	12
12K7GT	85	85	1.6	12
12SF5GT	25	—	0	12
50L6GT	110	85	6	50

Voltage at rectifier cathode—120 volts.

ALIGNMENT PROCEDURE

Use as weak a test signal as possible. An output meter should be connected across the voice coil or output transformer for observing maximum output.

With the pointer set at 150 feed 1500 kc to the antenna lead through a .0001 mf condenser, and adjust the trimmers, located on the variable condenser, for maximum response.

Octal-base tubes in this receiver may be replaced with either metal or bantam-type octal-base glass tubes. The letters "GT" at the end of the tube number indicates that the tube has a bantam glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.

The filament dropping resistor (L-49B on schematic) is located at the rear of the chassis. This resistor will become quite hot under normal operating conditions. For voltage drop specifications, see below.

When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.

The first i-f transformer is held to the chassis by snap-on fasteners. To remove it, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.

The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1500 kc and 6000 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the oscillator.

The 455 kc wave-trap is part of the antenna coil assembly directly behind the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 6.)

Short-Wave Alignment

With the wave-band switch in the short-wave position, counter-clockwise, set the dial pointer at 6 mc. and feed 6000 kc through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) to the antenna lead.

MODEL CG: Adjust first the oscillator trimmer (on front section of the variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

MODEL CY: Adjust first the oscillator trimmer (on left-hand section of variable condenser) then the antenna trimmer (on right-hand section of variable condenser) for maximum response.

Broadcast Alignment

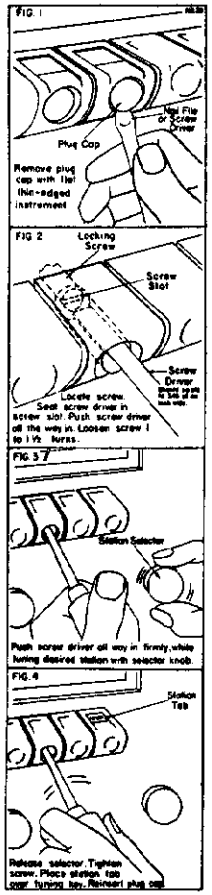
MODEL CG: Rotate the wave-band switch clockwise to the broadcast position, set the pointer at 150 and feed 1500 kc through a standard dummy antenna to the antenna lead. Adjust first the broadcast oscillator trimmer (lower of dual trimmer assembly located underneath the variable condenser) and then the antenna trimmer (upper trimmer of dual assembly) for maximum response.

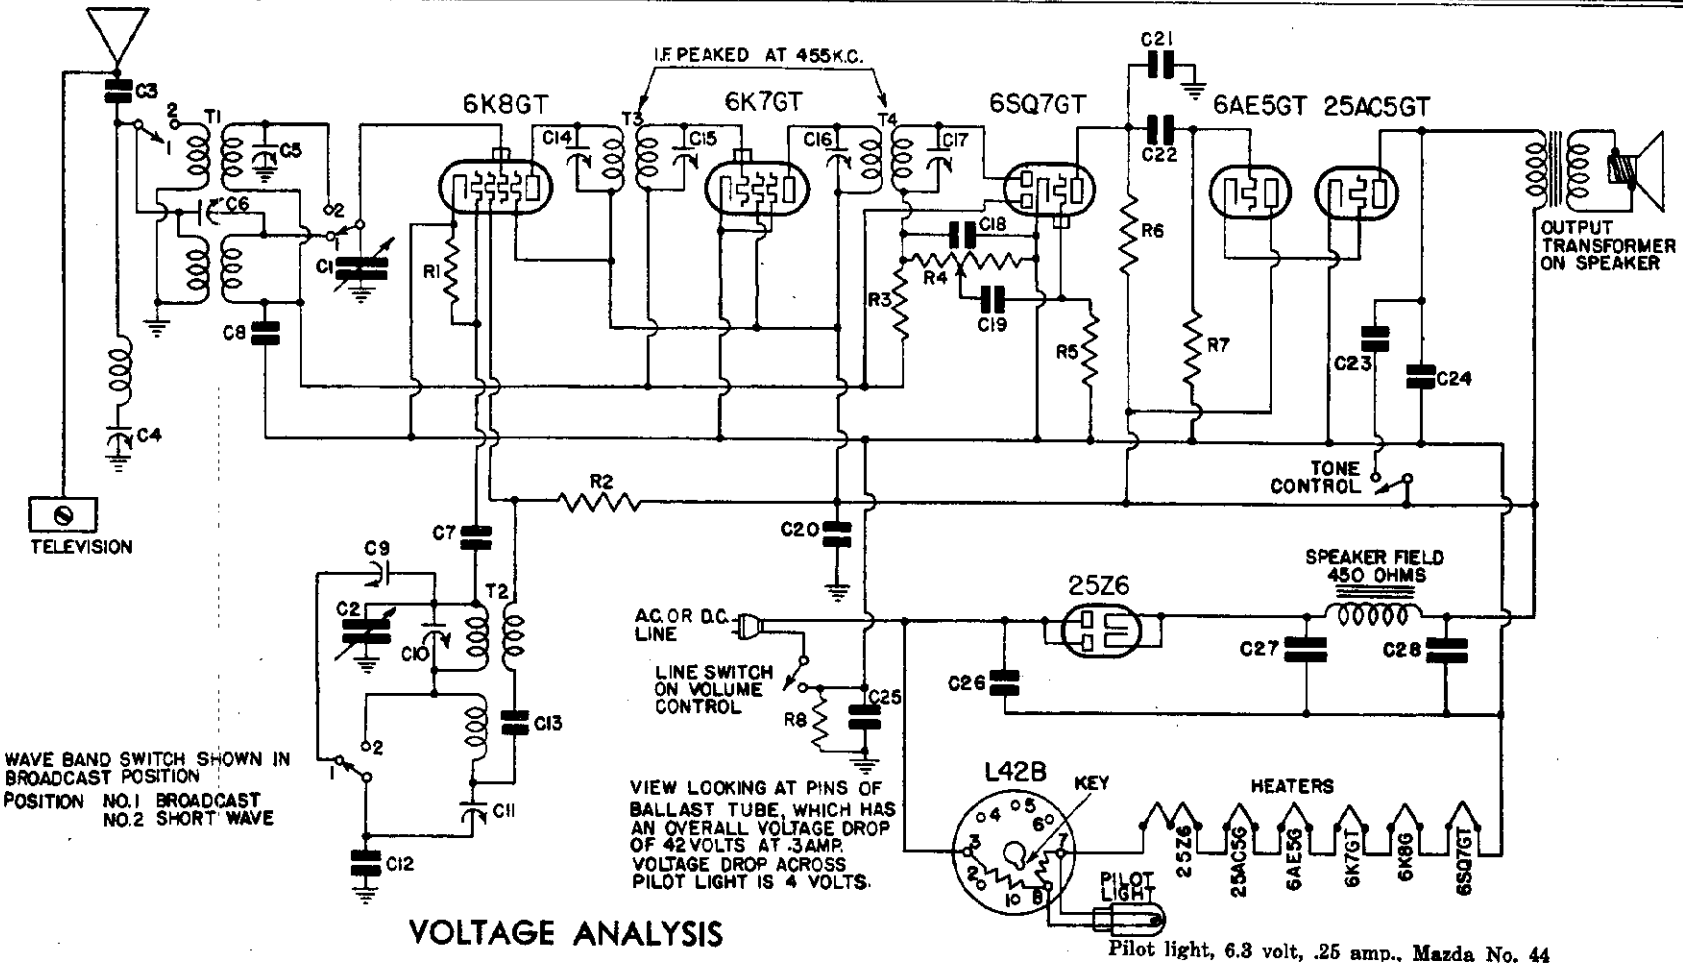
MODEL CY: Follow identical procedure as outlined above for CG. Then feed 600 kc and adjust the variable padding condenser (reached through hole in rear wall) while rocking the variable condenser for maximum response. Return to 1500 and retrim if necessary.

PREADJUSTMENT OF AUTOMATIC TUNING KEYS

Select four nearby stations desired for automatic tuning. Choose one of these stations and any button to be adjusted for it. Follow the procedure outlined below:

1. Remove the small plug cap in the front of the tuning key by prying at its lower edge with a flat thin-edged tool such as a nail file or screw-driver. *See Fig. 1 at right.*
2. Insert a screw-driver into the hole in the tuning key. The locking screw is accessible through the tuning key hole. Seat the screw-driver in the slot of the locking screw and push in the screw-driver as far as it will go. Loosen the screw about 1 to 1½ turns. *See Fig. 2.*
   It is important to use a screw-driver in which the flat portion is not wider than ⅛". A larger screw-driver cannot be inserted.
3. With the screw-driver seated in the screw slot, press the screw in as far as possible and holding it in firmly with one hand, tune in the desired station with the other hand, using the selector knob. *See Fig. 3.*
4. Release the selector knob and tighten screw firmly.
5. Check the adjustment by turning well past the station, using the selector knob, and then pushing down the key. The station should come back in again clearly and with maximum volume.
   After the adjustment is tested, check to see that the locking screw is tightened firmly.
6. Replace the plug cap in the front of the key. Remove the tab bearing the station call letters from one of the cards supplied in a separate envelope with the receiver. Moisten the tab and place it on the top of the tuning key as indicated in Fig. 4.





Pilot light, 6.3 volt, .25 amp., Mazda No. 44

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6K8GT	95	95	0	70	6.3

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear.

The trimmers for the antenna coil are mounted on the antenna coil assembly behind and to the right of the variable condenser. The trimmer in the center is for the broadcast band and the trimmer at the bottom for the short-wave band.

The trimmers for the oscillator coil are mounted on the oscillator coil assembly, located on the rear wall underneath the chassis. The trimmer farthest from the end is for the broadcast band. The center trimmer is the broadcast series padding condenser, and the trimmer closest to the end is for the short-wave band.

The 455 kc wave-trap is part of the antenna coil assembly. The trimmer for the trap is the uppermost trimmer of the assembly.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6K8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for *minimum* response. (See General Note No. 6.)

Short-Wave Alignment

With the wave-band switch in the short-wave position, counter-clockwise, set the dial pointer at 16 mc. Feed 16,000 kc through a standard short-wave dummy antenna (a 400 ohm resistor may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer, then the antenna trimmer for maximum response.

Broadcast Alignment

Rotate the wave-band switch clockwise and set the pointer at 160. Feed 1600 kc through a standard broadcast dummy antenna to the antenna lead (a .0002 mf condenser may be used as a substitute) and adjust first the broadcast oscillator trimmer and then the antenna trimmer for maximum response.

The color coding of the i-f transformer leads is as follows:

Grid—green
Grid return—black
Plate—blue
B plus—red

The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

Six-Tube, A.C., Three-Band Superheterodyne

MODEL DA-287

CHASSIS MODEL DA

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1600, 1800, 6000 and 20,000 kc should be used.

An output meter should be used across the voice coil or speaker output transformer for observing maximum response.

Use a dummy antenna for aligning any of the three bands. A .0002 mf condenser may be used for broadcast band dummy antenna, a .0001 mf condenser for the police band dummy antenna and a 400 ohm non-inductive resistor for the short-wave band dummy antenna.

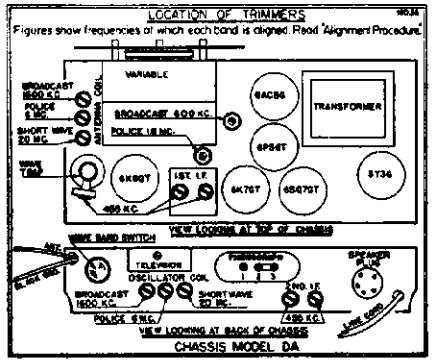
Always use as weak a test signal as possible during alignment.

The set's oscillator is higher in frequency than the signal on *all three bands*, so images should be observed on the low frequency side of the signals.

Always choose the minimum capacity peak on oscillator trimmers and maximum capacity peaks on antenna trimmers. The last motion in adjusting trimmers should always be a tightening one, not a loosening one.

Never leave the trimmer with the outside plate so loose that there is no tension on the screw. Either bend the plate up or remove the screw entirely. Loose screws are a sure source of noise, drifting, and microphonism.

In aligning antenna trimmers on the high-frequency signals there is always a tendency for the oscillator to drift, due to interlocking. To compensate for this always keep tuning the variable condenser as the trimmers are being adjusted.



I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6K8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna (using a standard dummy antenna) and adjust the 455 kc wave trap for minimum response. (See General Notes No. 6.)

Broadcast Alignment

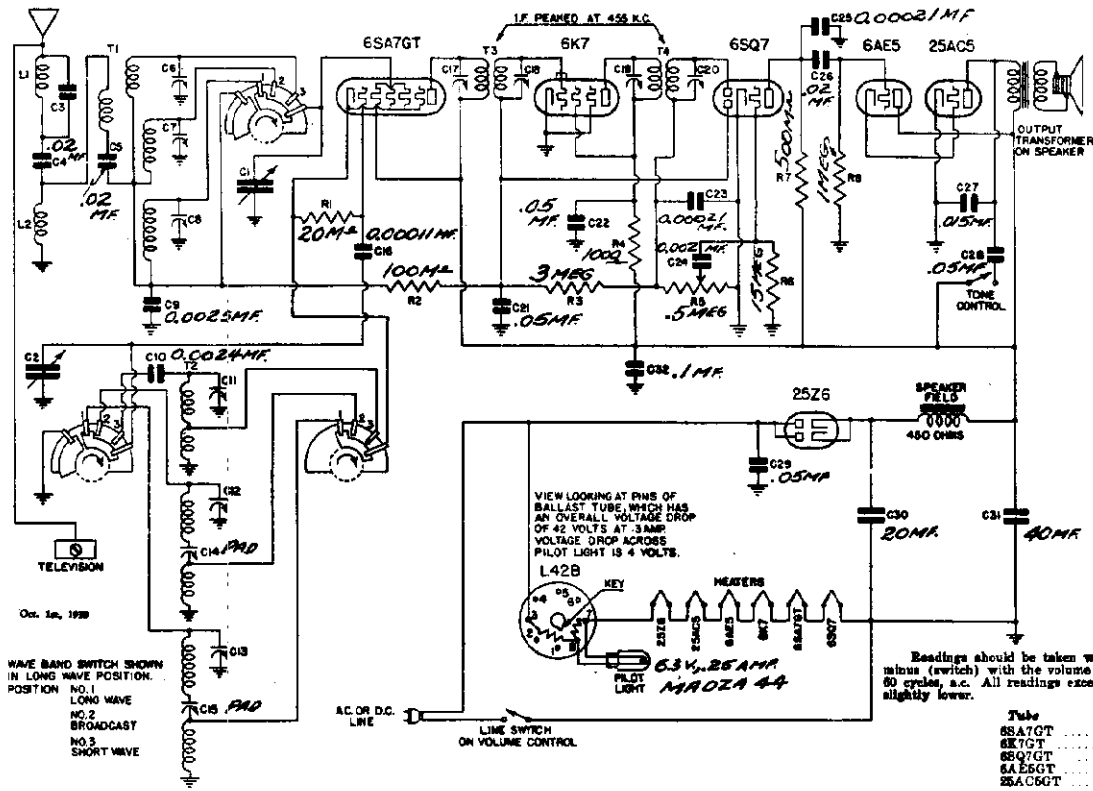
Set the wave-band switch at the broadcast (clockwise) position, and the pointer at 60. Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the pointer to 160, feed 1600 kc and adjust the oscillator coil trimmer for maximum response, then adjust the antenna coil trimmer for maximum response. Reset the pointer at 60, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 1600 and check alignment. If readjustment is necessary return to 600 and repeat entire procedure. (The broadcast padder is located beneath the chassis to the left of the variable condenser.)

Police Alignment

Set the wave-band switch at the police-band (central) position and the pointer at 1.8. Feed 1800 kc to the antenna (using a .0001 mf dummy antenna) and adjust the police-band series padder for maximum response. Move the pointer to 6.0, feed 6000 kc and adjust the oscillator trimmer for maximum response. Then adjust the antenna trimmer for maximum response. Return the pointer to 1.8, feed 1800 kc to the antenna and rock the variable condensers while readjusting the series padder for maximum response. Return to 6000 kc and check alignment. If readjustment is necessary return to 1800 kc and repeat entire procedure. (The police-band padder is located beneath the chassis behind the variable condenser.)

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the pointer to 20 and feed 20,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the antenna coil trimmer for maximum response. If two peaks are obtained choose the maximum capacity peak.



Three-Band, Six-Tube Superheterodyne Receiver

MODELS DD-268, DD-270, DD-272 and DD-276

CHASSIS MODEL DD

Voltage rating	105 to 125 volts, a.c. or d.c.
Power consumption	43 watts
Frequency ranges	141 to 353 kc (2130 to 850 meters) 535 to 1600 kc (560 to 187 meters) 5.6 to 18.3 mc (53.6 to 16.4 meters)

Tube Data

The tube complement is as follows:

1—6SA7GT pentagrid oscillator-modulator.
1—6K7GT first i-f amplifier.
1—6SQ7GT diode detector, a-f amplifier, a.v.c.
1—6AE5GT audio amplifier.
1—25AC5GT dynamic coupled output.
1—25Z6GT dual half-wave rectifier.

GENERAL NOTE

The color coding of the i-f transformer leads is as follows:

Grid—green	Plate—blue
Grid return—black	B plus—red

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

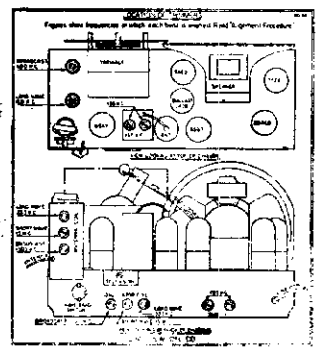
Tube	Plate	Screen	Cathode	Pil.
6SA7GT	95	95	0	4.3
6K7GT	95	95	0	4.3
6SQ7GT	35	—	0	4.3
6AE5GT	95	—	14	4.3
25AC5GT	90		0	25.0

Voltage at 25Z6—130 volts.

Voltage across speaker field—85 volts.

Voltage drop across ballast resistor (pins nos. 3, 7)—42 volts.

Voltage drop across pilot light section of ballast resistor (pins nos. 8 and 7) —4 volts.



Television

The outlet marked "Television" at the rear of the chassis may be used in conjunction with "Television Attachments" which are designed to feed *sound intermediate frequency* to an additional receiver for amplification. This outlet is not suitable for use with Television Attachments which feed *audio* to a separate amplifier.

I-f Alignment

Rotate the wave-band switch to the broadcast (central) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid of the 6SA7GT tube (clip signal input to stator of front variabe condenser section). Adjust the four i-f trimmers for maximum response.

Long-Wave Alignment

Set the wave-bond switch at the long-wave (clockwise) position and the pointer at 2000 (meters). Feed 150 kc to the antenna (using standard dummy antenna or .0002 mf condenser) and adjust the long-wave series padder for maximum response. Move the pointer to 900 (meters), feed 333 kc to the antenna, and adjust first the oscillator trimmer then the antenna trimmer for maximum response. Return to 2000 meters, feed 150 kc, and rock the variable condenser while adjusting the series padder for maximum response. Return to 900 (meters) and check alignment.

ADJUSTMENTS

Broadcast Alignment

Set the wave-band switch at the broadcast (central) position, and the pointer at 500 (meters). Feed 600 kc to the antenna (using a standard dummy antenna) and adjust the broadcast-band series padder for maximum response. Move the pointer to 200 (meters), feed 1500 kc and adjust the oscillator coil trimmer for maximum response, then adjust the antenna coil trimmer for maximum response. Reset the pointer at 500, feed 600 kc and rock the variable condenser while adjusting the series padder for maximum response. Return to 200 meters and check alignment. If readjustment is necessary return to 500 meters and repeat entire procedure.

Short-Wave Alignment

Set the wave-band switch at the short-wave (counter-clockwise) position. Move the pointer to 20 (meters) and feed 15,000 kc to the antenna (using a 400 ohm dummy antenna) and adjust the short-wave oscillator trimmer for maximum response. If two peaks are obtained choose the minimum capacity peak. Then adjust the antenna coil trimmer for maximum response. If two peaks are obtained choose the maximum capacity peak.

	4XPM-20A	117 volt a.c. phono motor	12.00
	or		
	3GPM-1	117 volt a.c.-d.c. phono motor (not used on CV-289)	43.20
	6VS-414	Phono-radio switch	.75
	4XC-418A	Crystal pick-up	8.10

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully re-aligned.
2. In operating the a.c.-d.c. combinations on d.c. it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:
   Grid—green . Plate—blue
   Grid return—black B plus—red
4. The receiver has a self-contained antenna and normally does not require additional antenna connection. For permanent home installations of this model, however, in a location far removed from broadcasting stations, an additional outside antenna should be used. The outside antenna connection should be made to the flexible wire lead at the rear of the cabinet.
5. The self-contained loop antenna operates at maximum efficiency when its position is at right angles to the broadcasting source. *It is important, therefore, once the station is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.*
6. The receivers in these combinations are of the a.c.-d.c. type. The motors, however, in models CV-289, CV-290 and CV-291 are of the A.C. *only* type and will be damaged if the combination is used on direct current.

PRODUCTION CHANGES

1. On CV-289 resistor R9 is .5 megohm.
2. On CV-291 and CV1-291 resistor R11 is .2 megohm.
3. CV chassis bearing serial numbers below 2,764,502 use:

T4	6RT-476	Oscillator coil	.35
	6VD-82	Dial face	.30
T1	6MW-171A	Loop antenna (for CV-289, CV-291 and CV1-291)	.90
T1	6VW-188	Loop antenna (for CV-290 and CV1-290)	.85

THE TUBE COMPLEMENT IS AS FOLLOWS:

One 12A8GT—pentagrid oscillator-modulator
One 12K7GT—first i-f amplifier
One 12SQ7GT—diode detector, a-f amplifier, a.v.c.
One 50L6GT—beam power output
One 35Z5GT—half-wave rectifier

Voltage rating . . . 105-125 volts
Power consumption . . . (30 watts for receiver; 120 watts for A.C. motor; 130 watts for A.C.-D.C. motor)
Frequency range . . . 540 to 1600 kc

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
12A8GT	*88	*45	0	*88	12
12K7GT	*88	*88	0	—	12
12SQ7GT	*40	—	0	—	12
50L6GT	†82	*88	5.7	—	50

Voltage at 35Z5 cathode—116 volts.
Voltage across speaker field—27 volts.
Voltage across pilot light—4.5 volts.

* These readings are approximately 10% lower on CV-291 and CV1-291.
† This reading is approximately 20% higher on CV-291 and CV1-291.

ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located at the extreme left end of the chassis. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is located just to the left of the variable condenser. The trimmers are accessible through holes in the top of the can.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil (loop). The oscillator coil is located beneath the first i-f transformer.

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid-cap of the 12A8GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

R-f Alignment

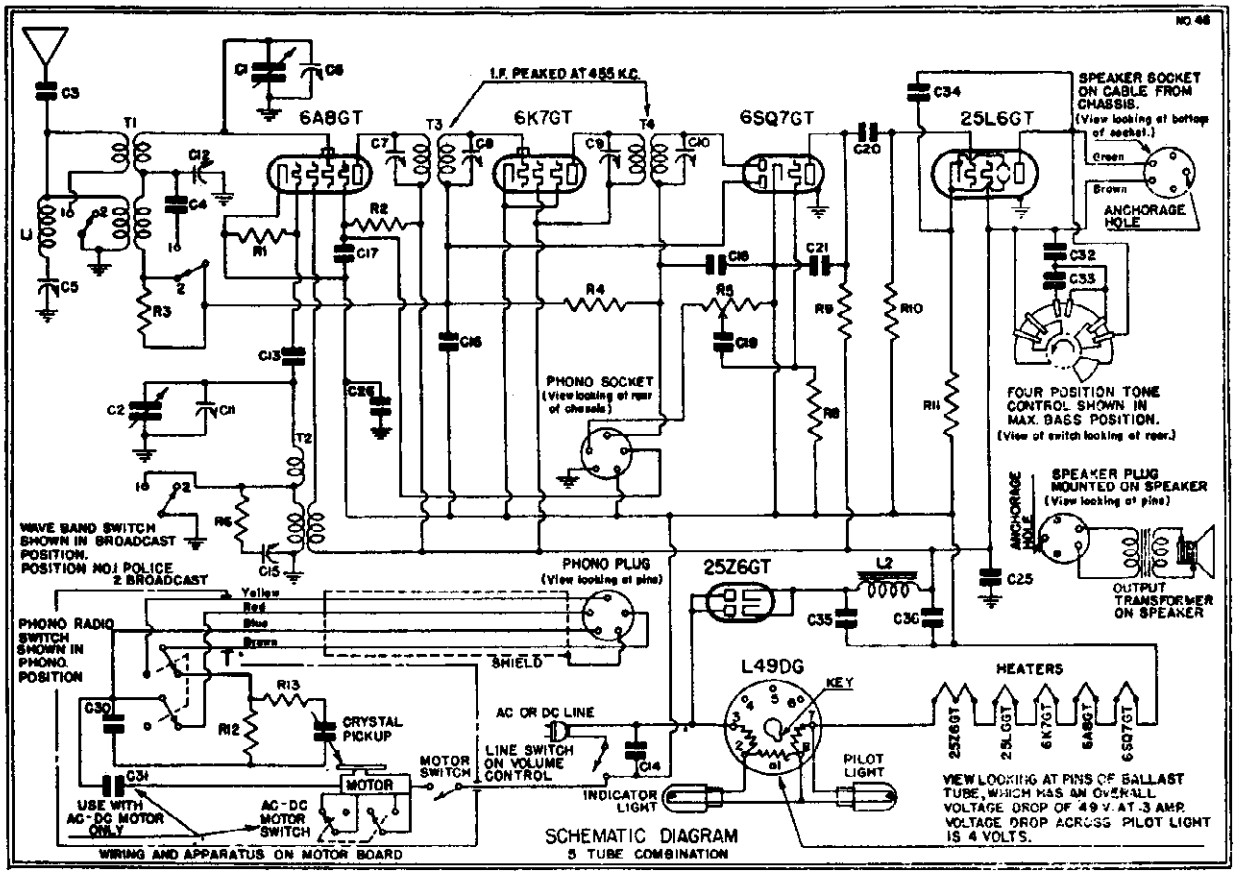
Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response. The antenna trimmer should be adjusted when the chassis is in place in the cabinet. It can be reached through a hole near the front of the motor board.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance. Align at 140. Set the dial at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may then be swung to either side of the center to give maximum response. Realign at 140.

CHASSIS CR,CR1 EMERSON RADIO & PHONOGRAPH CORP. MODELS CG293,CG294,CG1-293 CG1-294,Chassis CG,CG1

Record Changer Data

Schematic,Record Changer



AUTOMATIC RECORD CHANGER

(A)—Record Removing Lever.

A locknut provides adjustment for raising or lowering the record finger to engage the next to last record on the turntable. No adjustment is required unless the motor mounting screws should loosen and allow motor and turntable to shift upward or downward, or should record finger become bent.

Raising the record removing lever to the vertical position will repeat the top record on the turntable, either 10-inch or 12-inch for as long as desired.

(B)—Latch Mechanism.

The latch should engage one-half the depth of the notch. This may be adjusted by turning the eccentric washer.

(C)—Speed Regulator.

The motor speed can be regulated for "fast" or "slow" by moving lever to either side.

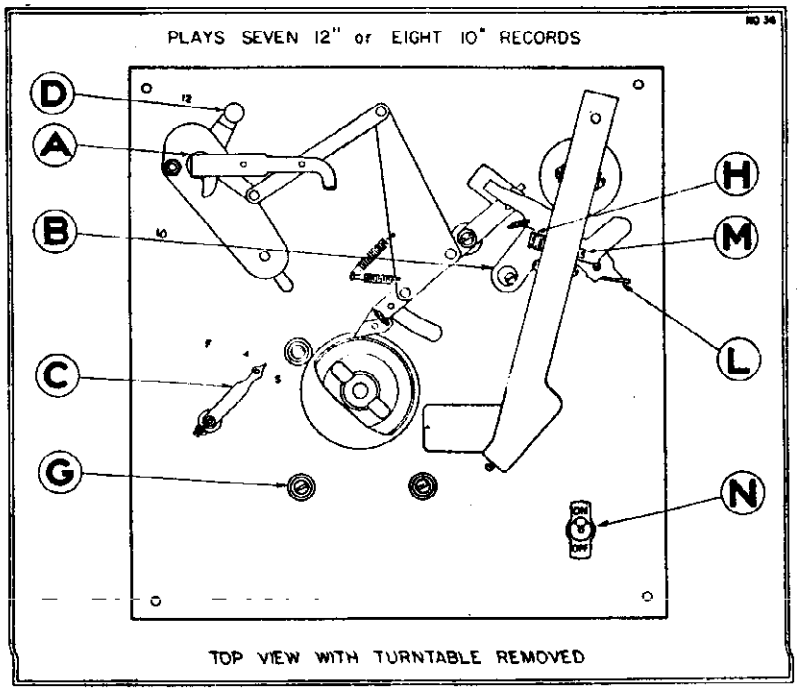
(D)—Adjustment for 10-inch and 12-inch Records.

The motor panel is stamped "10" and "12." Set the change lever opposite the size of record to be played.

(G)—Motor Mounting Screws.

(H)—Trip Mechanism.

All records having either the spiral or oscillating type trip groove are handled automatically by this trip mechanism. No adjustment required.



(L)—Record Reject Lever.

Pull the reject lever forward if removal of a record is desired before it is completely played.

(M)—Pick-up and Tone Arm.

Turn screw in or out to place the needle properly on the edge of the record.

(N)—On-off Switch.

On-off switch for motor.

9/39

	6JPM-46 or 4XPM-20B or 8GPM-1	117 volt a.c. rim-drive phonograph motor (for CG-293) 9.00 117 volt a.c. phonograph motor (for CG-293) 12.25 117 volt a.c.-d.c. phonograph motor (for CG1-293) 43.20
	4XC-418A	Crystal pick-up 8.10
	4RS-301	Automatic stop switch 2.50

ADJUSTMENTS

An oscillator with frequencies of 455, 600, 1500 kc and 6000 kc is required.
An output meter should be used across the voice coil or output transformer for observing maximum response.
Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear.

The trimmers for the antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the oscillator.

The 455 kc wave-trap is part of the antenna coil assembly directly behind the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis.

I-f and Wave-trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 6.)

Short-Wave Alignment

With the wave-band switch in the short-wave position, counter-clockwise, set the dial pointer at 6 mc. and feed 6000 kc through a 400 ohm resistor to the antenna lead.

Adjust first the oscillator trimmer (on front section of the variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

Broadcast Alignment

Rotate the wave-band switch clockwise to the broadcast position, set the pointer at 150 and feed 1500 kc through a standard dummy antenna (a .0092 mf condenser may be used as a substitute) to the antenna lead. Adjust first the broadcast oscillator trimmer (lower of dual trimmer assembly located underneath the variable condenser) and then the antenna trimmer (upper trimmer of dual assembly) for maximum response.

Voltage rating	105 to 125 volts, a.c. or d.c.
Power consumption	43 watts for radio 20 watts for a.c. motor 30 watts for a.c.-d.c. motor
Frequency ranges	540 to 1700 kc and 2200 to 6600 kc

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. The filament dropping resistor (L49DG on schematic) is located at the rear of the chassis. This resistor will become quite hot under normal operating conditions. For voltage drop specifications, see below.
3. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
4. The first i-f transformer is held to the chassis by snap-on fasteners. To remove it, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red
6. The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.
7. The receivers in these combinations are of the a.c.-d.c. type. The motors, however, used in Models CG-293 and 294 are of the *a.c. only* type and will be damaged if operated on direct current.
8. Any series of records to be played automatically should be of one size. The changer will not play intermixed sizes. Select seven 12-inch records or eight 10-inch records and place them on the turntable with the selection to be played facing upwards.
9. Adjust the lever "D" for the size of records to be played. (See illustration.) Lower the pick-up carefully so that the needle rides on the smooth surface on the outside edge of the record.
10. *On the Model* CG1-293 *and* CG1-294 *only, before turning the motor on check the a.c.-d.c. switch underneath the turntable on the motor board, making sure that it is in a position corresponding to the power supply.* To reach this switch simply remove the turntable by pulling it directly upward. If the power supply is d.c. the switch should be thrown to d.c. position and for an a.c. supply to the a.c. position. When replacing the turntable be sure it is seated all the way down over its shaft.

Tube Data

The tube complement is as follows:

1—6A8GT pentagrid oscillator-modulator.
1—6K7GT first i-f amplifier.
†1—6SQ7GT diode detector, a-f amplifier, a.v.c. (*see note*).
1—25L6GT beam power output.
1—25Z6GT dual half-wave rectifier.

Octal-base tubes in this receiver may be replaced with either metal or bantam-type octal-base glass tubes. The letters "GT" at the end of the tube number indicates that the tube has a bantam glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

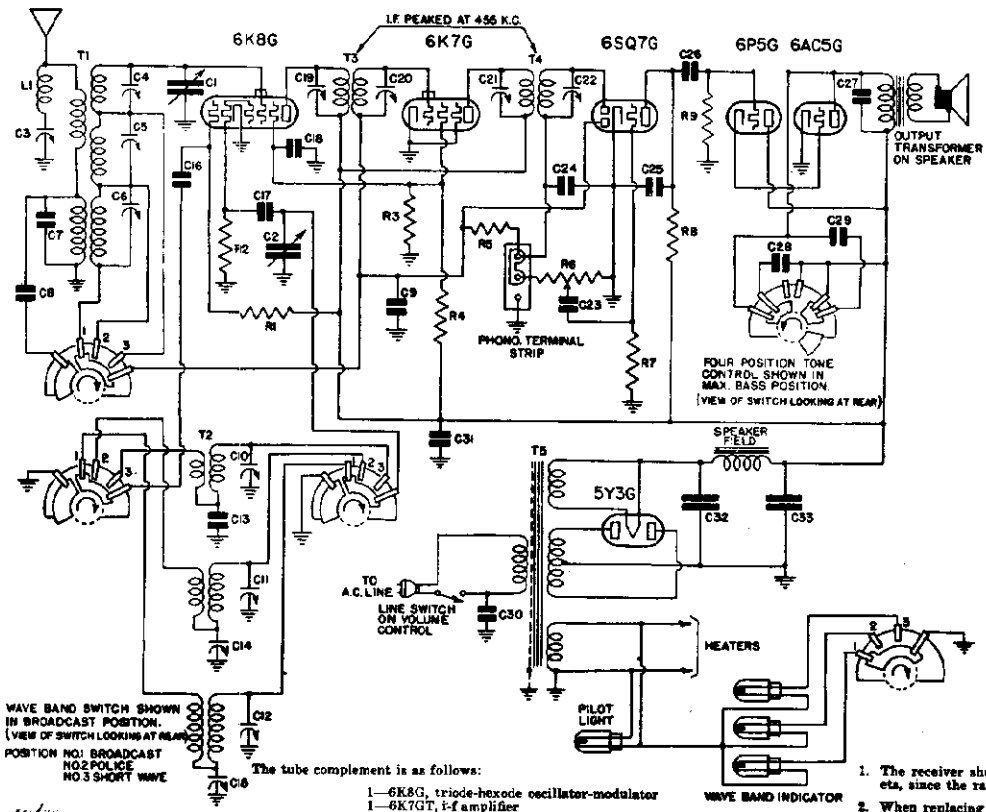
VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6A8GT	113	46	0	113	6.3
6K7GT	113	113	0	—	6.3
†6SQ7GT	98	—	0	—	6.3
25L6GT	125	113	6.5	—	25.0

Voltage at 25Z6 cathode—125 volts.
Voltage across filter choke—12 volts.
Voltage drop across ballast resistor (pins nos. 3, 7)—49 volts.
Voltage drop across pilot light sections of ballast resistor (pins nos. 8 and 7, 2 and 8)—4 volts.

†*Note*: CG chassis bearing serial numbers below 2,616,849 use 6Q7GT.



10/39

The tube complement is as follows:

1—6K8G, triode-hexode oscillator-modulator
1—6K7GT, i-f amplifier
1—6SQ7GT, diode detector, audio amplifier and a.v.c.
1—6P5GT, audio amplifier
1—6AC5G, power output
1—5Y3G, full-wave rectifier.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to ground (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 110 volts, 60 cycles, A.C. All readings except B plus at rectifier, heaters, and cathode voltages were taken on 250 volt scale.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
6K8G	220	95	0	100	6.3 a.c.
6K7GT	220	95	0	—	6.3 a.c.
6SQ7GT	65	—	0	—	6.3 a.c.
6P5GT	220	—	12	—	6.3 a.c.
6AC5G	205	—	0	—	6.3 a.c.

Voltage at 5Y3G filament to ground—300 volts.
Voltage across speaker field—80 volts.

Voltage rating	105-125 volts, 60 cycle, a.c. (unless otherwise specified)
Power consumption	55 watts
Frequency ranges	540 to 1800 kc, 1800 to 6250 kc and 5.8 to 22 megacycles

REPLACEMENT PARTS LIST

*Item	Part No.	DESCRIPTION

C18, C31	EEC-132	0.1 mf, 400 volt tubular condenser
†C19, C20, C21, C22		Trimmers, part of first i-f transformer Trimmer, part of second i-f transformer
C23	3HC-274	0.002 mf, 600 volt tubular condenser
C24, C25	4XC-394A	0.00022 mf mica condenser
C26	LC-65	0.02 mf, 400 volt tubular condenser
C27	NNC-199	0.001 mf, 600 volt tubular condenser
C28	EC-23	0.03 mf, 400 volt tubular condenser
C29	3XC-331	0.15 mf, 400 volt tubular condenser
C30	3LC-297A	0.01 mf, 400 volt molded condenser
C32	7AC-443	16 mf, 450 volt dry electrolytic condenser
C33	7AC-444	16 mf, 400 volt dry electrolytic condenser

GENERAL NOTES

1. The receiver should never be turned on with either the speaker plug or the 6AC5G tube out of their respective sockets, since the rapid rise in rectifier voltage will damage the electrolytic condenser.
2. When replacing the chassis in the cabinet take precautions to keep any part of the dial and condenser assembly from touching the cabinet, otherwise microphonism will result.
3. The color coding of the i-f transformers is as follows:
   Grid—green Plate—blue.
   B plus—red Grid return—black
4. The color coding of the power transformer is as follows:
   Primary—two black leads
   High-voltage secondary—two red leads
   High-voltage secondary center tap—red and yellow lead
   6.3 volt secondary—two green leads
   5 volt secondary—two yellow leads.
5. The adjustable padding condensers for the broadcast and police bands are mounted on the top of the chassis with the screw adjustment accessible through holes in the top of the chassis. The short-wave band has a fixed padder, C13 on schematic. When replacing this fixed padder be careful to use a condenser which has a capacity within 2% of the specified value, otherwise the short-wave coils may not track.
6. The wave trap in the receiver has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave trap trimmer until the response from the interfering station is at a minimum.
7. The outlet marked "Television" at rear of the chassis may be used with any "Television Attachment" which is designed to feed the sound intermediate or audio frequency to a separate amplifier.
   Detailed instruction for such a connection is given with any "Television Attachment."

Voltage rating ..... 101-125 volts, a.c. or d.c.
Power consumption ..... 30 watts.
Frequency range ..... 540 to 1600 kc.

TUBE DATA

THE TUBE COMPLEMENT IS AS FOLLOWS:

1—12SA7 or 12SA7GT ..... pentagrid oscillator modulator
1—12K7 or 12K7GT ..... first i-f amplifier
1—12SQ7 or 12SQ7GT ..... diode detector, a-f amplifier, a.v.c.
1—50L6 or 50L6GT ..... beam power output
1—35Z5 or 35Z5GT ..... half-wave rectifier

All tubes are replaceable with either metal or equivalent bantam glass tubes. The letters "GT" at the end of the tube number indicate that the tube has a bantam size glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (chassis) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	Plate	Screen	Cathode	Pin
12SA7	88	88	0	12
12K7	88	88	0	12
12SQ7	80	—	0	12
50L6	82	88	5.6	20

Voltage at 35Z5 cathode—120 volts. Voltage across speaker field—33 volts.
Voltage across pilot light—4.5 volts.

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the right of the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted on top of the chassis between the variable condenser and the speaker. The trimmers are accessible through holes in the top of the can.

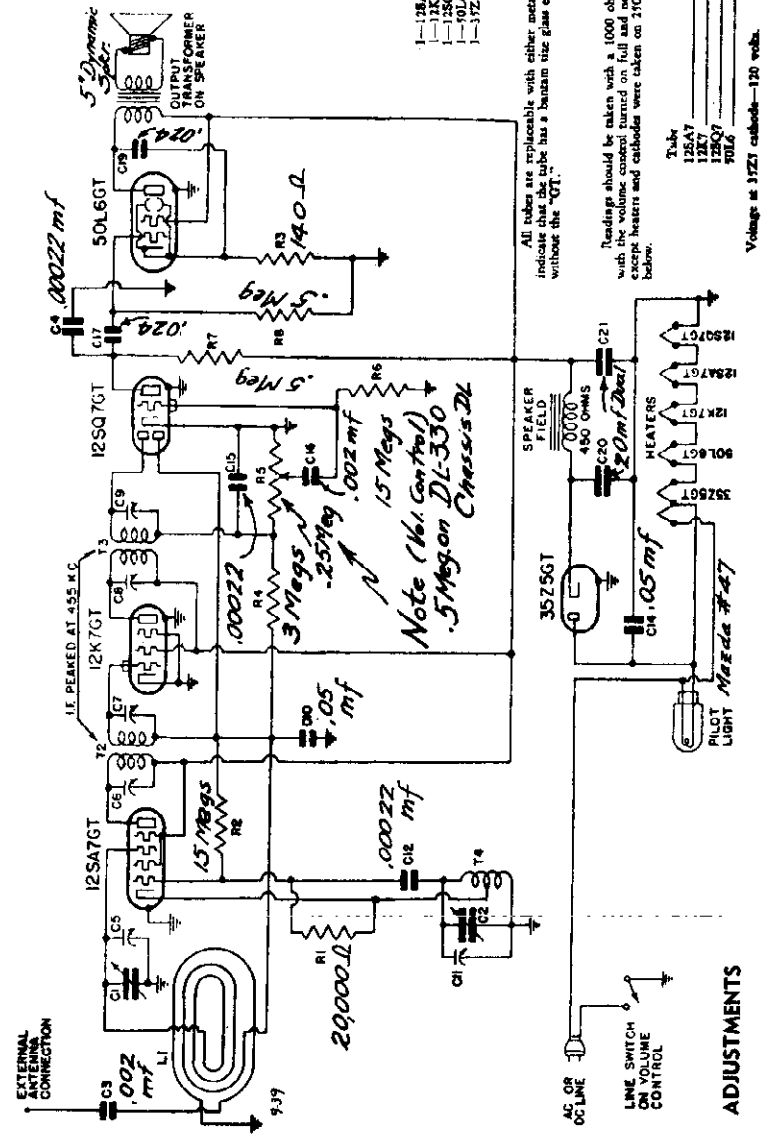
The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the oscillator coil.

The oscillator coil is located underneath the chassis. The loop antenna acts as the antenna coil.

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully re-aligned.
2. In operating the receiver on d.c. it may be necessary to reverse the line plug for correct polarity.
3. The color coding of the i-f transformer leads is as follows:

	Plate—blue B plus—red
Grid—green Grid return—black	

4. Models DB-296 and 301 have self-contained antennas and do not require additional antenna connections. For permanent home installations of either model, however, if it is desired to improve reception of weak stations, an additional outdoor antenna should be used. For this purpose a lead has been brought out of the rear near the line cord.
5. The self-contained loop antenna operates at maximum efficiency when in position is at right angles to the broadcasting source. It is important, therefore, once the receiver is tuned in, to rotate the cabinet back and forth through a quarter of a circle (90 degrees), leaving it at the position where the station is received with maximum volume.



ADJUSTMENTS

An oscillator with frequencies of 455 and 1400 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

I-f Alignment

Swing the variable condenser to the minimum capacity position. Feed 455 kc to the grid of the 12SA7 tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response.

Note: The grid of the 12SA7 tube is connected to the lower stator lug of the rear variable condenser section. Connection may be made with a tear clip to the upper stator lug. This lug is easily indentified by the connection of the green lead to the loop.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance as follows. Align at 140. Set the pointer at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Realign at 140.

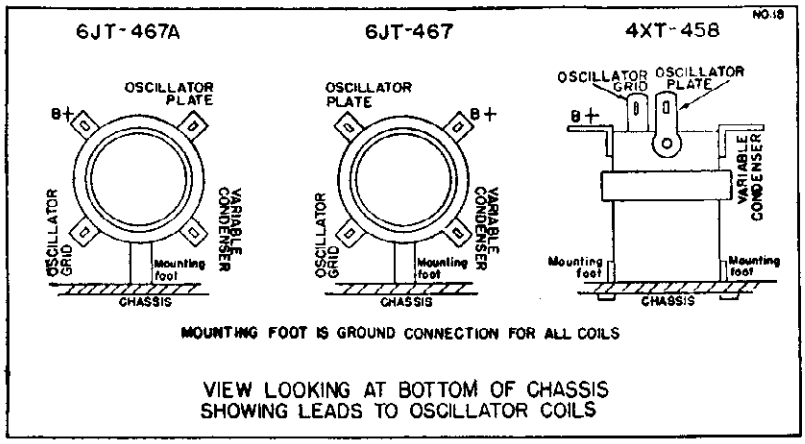
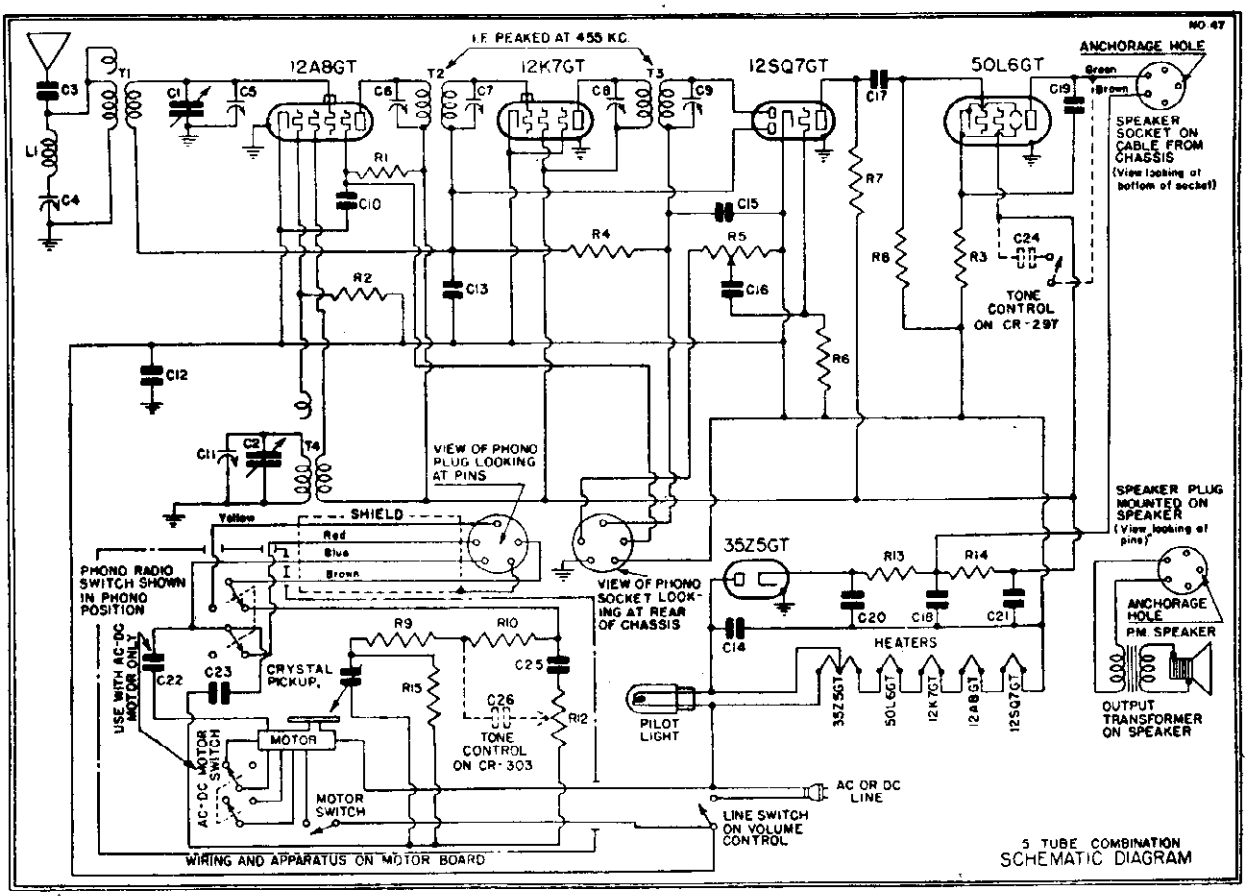
EMERSON RADIO & PHONOGRAPH CORP.





VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

Tube	*Plate*	*Screen*	*Cathode*	*Osc. Plate*	*Fil.*
12A8GT	65	40	0	65	12
12K7GT	65	65	0	—	12
12SQ7GT	40	—	0	—	12
50L6GT	100	65	5.7	—	50

Voltage at 35Z5 cathode—110 volts.

Voltage across pilot light—4.5 volts.

Voltage rating ..... 105-125 volts

Power consumption ..... 30 watts for receiver; 20 watts for a.c. motor; 30 watts for a.c.-d.c. motor

Frequency range ..... 540 to 1730 kc

10-39

The tube complement is as follows:

One 12A8GT—pentagrid oscillator modulator
One 12K7GT—first i-f amplifier
One 12SQ7GT—diode detector, a-f amplifier, a.v.c.
One 50L6GT—beam power output
One 35Z5GT—half-wave rectifier

Location of Coils and Trimmer Adjustments

The first i-f transformer is mounted on top of the chassis deck to the left of the variable condenser. The trimmers are accessible through holes in the top of the can.

The second i-f transformer is mounted under the chassis beneath the variable condenser. The trimmers are accessible through holes in the top of the chassis.

The trimmers for the antenna and oscillator coils are located on the variable condenser. The trimmer on the front section is for the antenna coil.

The oscillator coil is located underneath the chassis, beneath the speaker and the antenna coil and wave-trap assembly is mounted at the left side of the chassis.

I-f and Wave-Trap Alignment

Swing the variable condenser to the maximum capacity position. Feed 455 kc to the grid-cap of the 12A8GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap for minimum response. (See General Notes, paragraph No. 4.)

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on front section of variable condenser) for maximum response.

PRODUCTION CHANGES

1. CR chassis also uses oscillator coil 6JT-467A or 6RT-476. For correct lug connections to either of these coils see illustration on previous page.

MODEL CW-279 and MODEL CZ-282

CHASSIS MODEL CW — CHASSIS MODEL CZ

Location of Coils and Trimmer Adjustments

MODEL CW

The first i-f transformer is located between the variable condenser and the speaker. The trimmers are accessible through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are accessible through holes in the rear of the chassis.

The antenna coil is located to the left of the speaker and the oscillator coil underneath the chassis below the speaker.

Trimmers for the antenna and oscillator coils are located on the variable condenser, the trimmer on the section adjacent to the 50L6GT tube being for the oscillator.

The 455 kc wave trap is wound on the same form as the antenna coil and may be adjusted from the left side of the chassis.

MODEL CZ

The first i-f transformer is located to the left of the speaker and the second i-f transformer, to the right of the speaker. Trimmers for both coils are accessible through holes in the tops of the cans.

The oscillator coil is located directly beneath the speaker. The loop antenna acts as the antenna coil. Trimmers for both oscillator and antenna coil are located on the variable condenser, the trimmer on the section adjacent to the 50L6GT tube being for the oscillator.

I-f and Wave-Trap Alignment

MODEL CW

Rotate the variable condenser to the minimum capacity position. Feed 455 kc to the grid-cap of the 12A8GT tube through a .01 mf condenser and adjust the four i-f trimmers for maximum response. Feed 455 kc through a .0001 mf condenser to the antenna lead and adjust the wave-trap trimmer for maximum response. (See General Notes, paragraph No. 4.)

MODEL CZ

Repeat the same procedure as for Model CW except for trap alignment. Model CZ does not use a wave trap.

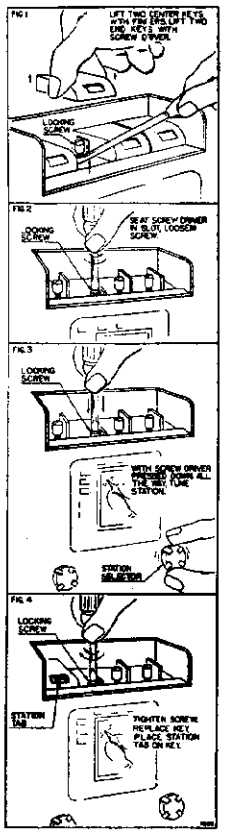
R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna lead and adjust first the oscillator trimmer (on section of variable condenser near 50L6) then the antenna trimmer (on section of variable condenser near 12K7) for maximum response.

Preadjustment of Automatic Tuning Keys

Select four nearby stations desired for automatic tuning. Choose one of these stations and any key to be adjusted for it. Follow the procedure outlined below.

1. Remove all four keys. The two center keys should be taken out first. Grasp the key firmly on each side with the fingers and pull directly up. Remove the two end keys by prying them up with a screw-driver; the screw-driver should be inserted in the slot at the side of the key. See Fig. 1.
2. Seat the screw-driver in the slot of the locking screw to be adjusted. Press down the screw-driver firmly and loosen the screw about 1 to 1½ turns. See Fig. 2.
3. With the screw-driver seated in the locking-screw, press it down firmly with the left hand while tuning in the desired station with the right hand, using the station selector. See Fig. 3.
4. Release the station selector knob and tighten the locking screw as much as possible. See Fig. 4.
5. Replace the key on its shaft. The vertical piece of metal alongside the locking screw slides into the slot in the key which contains a flat spring. Remove the tab bearing the station call letters from one of the cards supplied in a separate envelope with the receiver. Moisten the tab and place it in the depression provided for it in the key. See Fig. 4.
6. Check the adjustment by turning well past the station, using the selector knob, and then pushing down the key. The station should come back in again clearly and with maximum volume.



VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except heaters and cathodes were taken on 250 volt scale. Measurements made with 117.5 volts d.c. will be lower than those given below.

PRODUCTION CHANGES

1. Chassis using certain speakers use output condenser C23, part no. KC-58—.01 mf.—400 volt.
2. Chassis bearing serial numbers between 3000651 and 3001051 and between 3325600 and 3326599 use 117L7GT in place of 70L7GT and do not use resistor R13.
3. The schematic diagram of chassis using 70L7GT does not show resistors R16 and R17. These resistors occupy the same position in this chassis as they are shown in the schematic of chassis using 117L7GT.

Some chassis do not contain resistors R16 and R17. These resistors should be added to increase tube life.

On chassis bearing serial numbers between 2,888,350 and 2,963,000 use only bakelite base tubes when replacing the 1N5GT's.

To permit the use of *metal base* 1N5GT's in the above chassis, the following change must be made in the chassis:

1. Unsolder and remove the three leads from the #1 pin soldering lug of the 1N5GT socket at the rear of the chassis. (Three leads are condenser C26, resistor R15, and one wire.)
2. Solder these three leads to the #8 pin soldering lug of the 1A7GT socket. (This lug is a blank.)

The tube complement is as follows:

1—1A7GT oscillator-modulator.
1—1N5GT 1st i-f amplifier.
1—1N5GT 2nd i-f amplifier.
1—1H5GT 2nd detector, a.v.c., a-f amplifier.
1—3Q5GT beam power output (battery operation only).
1—7OL7GT beam power output and half wave rectifier (line operation only).
or
1—117L7GT beam power output and half wave rectifier (see Production Change No. 2)

See Note above.

Range ..... 540—1600 kc.
Voltage Rating (Line Operation) ..... 105-125 volts a.c. or d.c.
Power Consumption (Line Operation) ..... 30 watts
Current Drain (Battery Operation) ..... "A" Battery 0.05 amps.
"B" Battery 0.01 amps.

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the rear section of the variable condenser.

The loop antenna acts as the antenna coil. The trimmer for the loop is on the loop frame.

The i-f transformers are located in cans mounted on top of the chassis. The first i-f transformer is the one at the left end of the chassis. The diode i-f transformer is located between the 1N5GT first i-f tube and the variable condenser. The trimming condensers for both transformers can be reached through holes in the tops of the cans.

Alignment

LF-Swing variable condenser to minimum capacity position.

Feed 455 kc to the grid of the 1A7GT tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

RF-Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmer (on rear section of variable condenser) then the antenna trimmer (on loop frame) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance. Align at 140. Set the dial at 60 and feed 600 kc to the antenna lead. A portion of the outside turn of the loop may then be swung to either side of the center to give maximum response. Realign at 140.

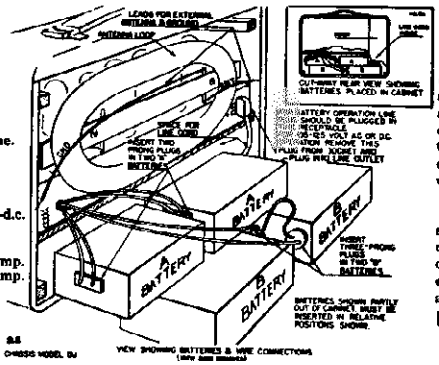
BATTERY COMPLEMENT

The cabinet is designed to house the complete set of batteries. The battery complement should be as follows:

Type Battery	*No. Req.*	*Eveready Part No.*	*Raytheon Part No.*	*Burgess Part No.*
4½ volt "A"	2	746 (plug-in type)	P83A or EM-83 (plug-in type)	3G (plug-in type)
45 volt "B"	2	482 Minimax (plug-in type)	——	——



VIEW SHOWING BATTERIES & WIRE CONNECTIONS

DESCRIPTION

Type: Universal (Battery, A.C.-D.C.) Superheterodyne.

Frequency Range: 540-1600 kc.

Power Supply: Battery, A.C. or D.C.

Voltage Rating: (Line operation) 105-125 volts, a.c.-d.c.

Power Consumption: (Line operation) 30 watts.

Current Drain: (Battery operation) "A" battery 0.05 amp. "B" battery 0.01 amp.

GENERAL NOTES

1. The color coding of the i-f transformer leads is as follows:
   Grid—green Plate—blue
   Grid return—black B plus—red

2. The color coding of the battery cable is as follows:
   Red—B plus, 90 volts Yellow—A plus, 9 volts
   Blue—B minus Black—A minus

3. If replacements are made in the r-f section of the circuit, the receiver should be carefully re-aligned.

4. A.C.-D.C. Operation: Open the small door at the back of the cabinet. *It is important that this small door be left open while operating the receiver on either a.c. or d.c. power.* Take out the line cord, removing the plug from its receptacle at the rear of the chassis. Insert the plug in the wall outlet. If the power supply is d.c. and the receiver does not operate at first, remove the plug from the wall outlet, turn it half way around and re-insert it in the outlet, thus obtaining the proper polarity.

5. Battery Operation: Important: Remove the line plug from the electrical outlet. Insert the plug into the receptacle at the rear of the receiver. This is important since the receiver will not operate from batteries with the plug out of the receptacle. The loose portion of the cord can then be coiled and placed in the cabinet underneath the shelf.

6. The receiver has a self-contained antenna and normally does not require additional antenna or ground connection. For permanent home installations of this model, however, in a location far removed from broadcasting stations, an additional outside antenna should be used. The outside antenna and ground connections should be made to the two leads at the rear of the cabinet. See the illustration

7. The self-contained loop antenna has directional properties. *It is important, therefore, once the station is tuned in, that the cabinet be rotated on its base back and forth through a quarter of a circle (90 degrees), and left at the position where the station is received with maximum volume.*

ADJUSTMENTS

Location of Coils and Trimmer Adjustments

The oscillator coil is located beneath the chassis. The trimmer for the oscillator is on the front section of the variable condenser.

The loop antenna acts as the antenna coil. The trimmer for the loop is on the rear section of the variable condenser.

The i-f transformers are located in cans mounted on top of the chassis. The first i-f transformer is at the right of the variable condenser and the diode i-f transformer is to the left of the variable condenser. The trimming condensers for both transformers can be reached through holes in the tops of the cans.

I-f Alignment

Swing variable condenser to minimum capacity position. Feed 455 kc to the grid of the 1A7GT tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc from the signal generator into a loop of wire about one foot in diameter. Hold this radiating loop approximately one foot away from and parallel to the receiver loop antenna and advance the output of the signal generator until a suitable deflection is obtained on the output meter. Adjust first the oscillator trimmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance. Align at 140. Set the dial at 60 and feed 600 kc to the radiating loop. A portion of the outside turn of the loop may then be swung to either side of the center to give maximum response. Re-align at 140.

Battery Installation

To install and connect the batteries in this cabinet observe the following procedure:

1. Remove the back panel of the cabinet by taking out the screws.

2. Locate the battery cable coming from the receiver and identify the plugs on the cable ends.

3. Insert the three-prong plug on the battery cable into the two "B" batteries. Place the two batteries in the bottom of the cabinet with the plug-ends of the batteries facing each other. Push the batteries up against the front of the cabinet. The wood blocks at the rear corners and rear center of the cabinet serve to hold the "B" batteries in place.

4. Insert the two-prong plug on the battery cable into the two "A" batteries. Place the "A" batteries, one at a time, above the "B" batteries in the cabinet. The plug-ends of the "A" batteries should be facing to the left, as indicated in the illustration. Push the "A" batteries to the left, when placing them in the cabinet, in order to clear the small wood block in the front right-hand corner of the cabinet.

5. Replace the back panel of the cabinet and fasten it in place with the screws.

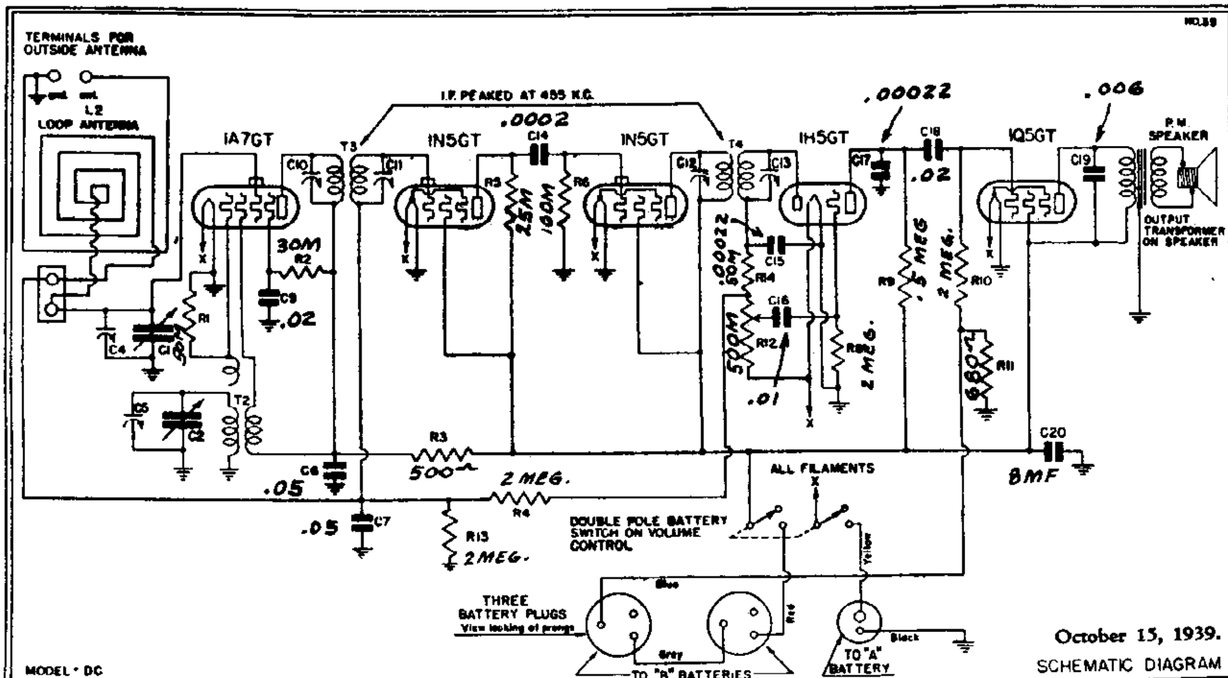
EMERSON RADIO & PHONOGRAPH CORP.

MODEL DC308
Chassis DC
Schematic, Voltage, Changes
Alignment, Trimmers



PRODUCTION CHANGES

1. **Chassis bearing serial numbers below 2,936,285 use .5 megohm at R10.**
2. **Chassis bearing serial numbers below 2,939,151 use diode i-f transformer**

The tube complement is as follows:

1—1A7GT oscillator-modulator
1—1N5GT 1st i-f amplifier
1—1N5GT 2nd i-f amplifier
1—1H5GT 2nd detector, a.v.c., a-f amplifier
1—1Q5GT pentode output

Current drain .... "A" battery—0.3 amps.
"B" battery—0.010 amps. with no signal

Frequency range .... 530 to 1600 kc.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed are from point indicated to chassis with volume control turned on full and no signal. The battery voltages for these readings were: "A" 1.5 volts, "B" 90 volts.

Tube	*Plate*	*Screen*	*Osc. Plate*	*Fil.*
1A7GT	82	52	82	1.5
1N5GT 1st i-f	70	82	—	1.5
1N5GT 2nd i-f	82	82	—	1.5
1H5GT	25	—	—	1.5
1Q5GT	77	82	—	1.5

Bias for the 1Q5GT tube is obtained across the resistor R11. The voltage drop across this resistor should be 6.8 volts.

Location of Coils and Trimmer Adjustments

The first i f transformer is located to the right of the variable condenser and the diode i-f transformer to the left of the variable condenser. Trimmers for both transformers are accessible through holes in the tops of the cans.

The oscillator coil is located under the chassis, beneath the variable condenser. Trimmer for the oscillator is located on the front section of the variable condenser.

The loop antenna acts as the antenna coil. Trimmer for the loop is located on the rear section of the variable condenser.

I-f Alignment

Swing variable condenser to minimum capacity position.

Feed 455 kc to the grid of the 1A7GT tube through a 0.01 mf condenser. Adjust the four i-f trimmers for maximum response.

R-f Alignment

Set the dial pointer at 140. Feed 1400 kc through a .0001 mf condenser to the antenna connection and adjust first the oscillator trimmmer (on front section of variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

If the loop antenna has been replaced it may be necessary to adjust the loop inductance, align at 140. With the pointer set at 60 feed 600 kc to the antenna lead. A portion of the outside turn of the loop may be swung to either side of the center to give maximum response. Repeat the alignment at 140.

SCHEMATIC DIAGRAM
5 TUBE A.C. D.C. RECEIVER
*CHASSIS MODELS DM & DM-1

December 15, 1939.

MODEL: DM-331 MODEL: DM1-331

CHASSIS MODEL: DM CHASSIS MODEL: DM1

DESCRIPTION

Type: Two-band superheterodyne.

Frequency ranges: 540 -1700 kc
2300-6600 kc

Number of Tubes: Five.

Type of tubes:

1—6A8GT, pentagrid oscillator-modulator
1—6K7GT, first i-f amplifier
1—6SQ7GT, diode detector, a-f amplifier, a.v.c.
1—25L6GT, beam power output
1—25Z6GT, dual half-wave rectifier.

Octal-base tubes in this receiver may be replaced with either metal or bantam-type octal-base glass tubes. The letters "GT" at the end of the tube number indicates that the tube has a bantam glass envelope. In all other respects it is the same as the metal tube bearing the same number without the "GT."

Power supply: A.C. or D.C.

Voltage rating: 105-125 volts.

Power consumption: 45 watts.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f portion of the circuit, the receiver should be carefully re-aligned.
2. The filament dropping resistor (L49BG on schematic) is located at the rear of the chassis. This resistor will become quite hot under normal operating conditions. For voltage drop specifications, see below.
3. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
4. The first i-f transformer is held to the chassis by snap-on fasteners. To remove it, unsolder all its leads under the chassis, pinch together the prongs of the snap-on fastener and lift the i-f can from the chassis.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red
6. The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

VOLTAGE ANALYSIS

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on 250 volt scale. Readings taken on d.c. will be slightly lower.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6A8GT	95	45	0	95	6.3
6K7GT	95	95	0	—	6.3
†6SQ7GT	38	—	0	—	6.3
°25L6GT	90	95	6.5	—	25.0

Voltage at 25Z6 cathode—125 volts. Voltage drop across ballast resistor (pins nos. 3, 7)—49 volts.
Voltage across speaker field—28 volts. Voltage drop across pilot light section of ballast resistor (pins nos. 8 and 7)—4 volts.

ADJUSTMENTS

An oscillator with frequencies of 455, 1500 and 6000 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear.

The trimmers for the short-wave antenna and oscillator are located on the variable condenser. The trimmer on the front section is for the oscillator.

The trimmers for the broadcast oscillator and antenna coil are mounted on a dual assembly just below the variable condenser underneath the chassis.

The 455 kc wave-trap is part of the antenna coil assembly directly behind the variable condenser. The trimmer for the 455 kc wave-trap is mounted on the coil and is accessible from the rear of the chassis.

I-f and Wave-Trap Alignment

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 6.)

Short-Wave Alignment

(Short-wave alignment should precede broadcast alignment.)

With the wave-band switch in the short-wave position, counter-clockwise, set the dial pointer at 6 mc. and feed 6000 kc through a standard dummy antenna to the antenna lead. If an I.R.E. standard dummy antenna is not available, a 0.0002 mf mica condenser in series with 400 ohm non-inductive resistor may be used as a substitute.

Adjust first the oscillator trimmer (on front section of the variable condenser) then the antenna trimmer (on rear section of variable condenser) for maximum response.

Broadcast Alignment

Rotate the wave-band switch clockwise to the broadcast position, set the pointer at 150 and feed 1500 kc through a standard dummy antenna to the antenna lead. A .0002 mf mica condenser may be used as a substitute. Adjust first the broadcast oscillator trimmer (lower of dual trimmer assembly located underneath the variable condenser) and then the antenna trimmer (upper trimmer of dual assembly) for maximum response.

VOLTAGE ANALYSIS

December 15, 1939.

Readings should be taken with a 1000 ohms-per-volt meter. Voltages listed below are from point indicated to B minus (switch) with the volume control turned on full and no signal. Line voltage for these readings was 117.5 volts, 60 cycles, a.c. All readings except cathodes and heaters were taken on d.c. will be slightly lower.

Tube	Plate	Screen	Cathode	Osc. Plate	Fil.
6K8GT	90	90	0	70	6.3
6K7GT	90	90	0	—	6.3
6SQ7GT	30	—	0	—	6.3
6AB5GT	90	—	14	—	6.3
25A6SGT	110	—	0	—	25.0

Voltage at 2526—125 volts. Voltage drop across ballast resistor (pins nos. 3, 7)—42 volts.
Voltage drop across pilot light section of ballast resistor (pins nos. 6 and 7)—4 volts.

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the i-f portion of the circuit, the receiver should be carefully realigned.
2. The filament dropping resistor (L42B on schematic) is located at the rear of the chassis. This resistor will become quite hot under normal operating conditions. For voltage drop specifications, see below.
3. When operating the receiver on d.c. it may be necessary to reverse the line plug to obtain the correct polarity.
4. The first i-f transformer is held to the chassis by means of a screw. To remove it, unsolder all its leads under the chassis, pinch together the prongs of the snap-in fastener and lift the i-f can from the chassis.
5. The color coding of the i-f transformer leads is as follows:
   Grid—green — Plate—blue
   Grid return—black — B plus—red
6. The wave-trap has been adjusted for maximum signal rejection at 455 kc. If, however, persistent interference is experienced from some particular telegraphic station, readjust the wave-trap trimmer until the response from the interfering station is at a minimum.

DESCRIPTION

Type: Two-band superheterodyne.

Type of tube:
1—6K8GT, pentagrid oscillator-modulator
1—6K7GT, first i-f amplifier
1—6SQ7GT, diode detector, a-f amplifier, a.v.c.
1—6AB5GT, audio amplifier
1—25A6SGT, dynamic coupled output
1—25Z6GT, dual half-wave rectifier.

Frequency ranges: 540-1730 kc
5.6-18 mc.

Number of tubes: Six.

ADJUSTMENTS

An oscillator with frequencies of 455, 1600 and 16,000 kc is required.

An output meter should be used across the voice coil or output transformer for observing maximum response.

Always use as weak a test signal as possible when aligning the receiver.

Location of Coils and Trimmer Adjustments

The first i-f transformer is located on top of the chassis deck. The trimmers are available through holes in the top of the can. The second i-f transformer is located on the rear wall underneath the chassis. The trimmers are available through holes in the rear.

The trimmers for the antenna coil are mounted on the antenna coil assembly behind and to the right of the variable condenser. The trimmer in the center is for the broadcast band and the trimmer at the bottom for the short-wave band.

The trimmers for the oscillator coil are mounted on the oscillator coil assembly, located on the rear wall underneath the chassis. The trimmer farthest from the end is for the broadcast band. The center trimmer is the broadcast series padding condenser, and the trimmer closest to the end is for the short-wave band.

I-f and Wave-Trap Alignment

The 455 kc wave-trap is part of the antenna coil assembly. The trimmer for the trap is the uppermost trimmer of the assembly.

Rotate the wave-band switch to the broadcast (clockwise) position. Set the variable condenser at the minimum capacity position and feed 455 kc, through a 0.02 mf paper condenser, to the grid cap of the 6A8 tube (do not remove the grid clip from the tube). Adjust the four i-f trimmers for maximum response. Feed 455 kc to the antenna through a standard dummy antenna (a .0002 mf condenser may be used as a substitute) and adjust the wave-trap trimmer for minimum response. (See General Note No. 6.)

Short-Wave Alignment

With the wave-band switch in the short-wave position, counter-clockwise, set the dial pointer at 16 mc. Feed 16,000 kc through a standard short-wave dummy antenna (a 400 ohm resistor may be used as a substitute) to the antenna lead and adjust first the oscillator trimmer for maximum response. Move pointer to 60, feed 600 kc and adjust series padder (while rocking the variable) for maximum response.

Broadcast Alignment

Rotate the wave-band switch clockwise and set the pointer at 160. Feed 1600 kc through a standard broadcast dummy antenna to the antenna lead (a .0002 mf condenser may be used as a substitute) and adjust first the broadcast oscillator trimmer and then the antenna trimmer for maximum response. Move pointer to 60, feed 600 kc and adjust series padder (while rocking the variable) for maximum response.

ELECTROLYTIC CONDENSER COLOR CODE

(All Other Color Codes Standard R. M. A.)

With the positive (+) or center solder lug toward you, read the colored markings as follows from left to right:

LEFT HAND OR CAPACITY COLOR		SECOND FROM LEFT OR MAXIMUM VOLTAGE COLOR	
Black	0 to 9 mfd.	Black	0 to 99 volts
Brown	9 to 19 mfd.	Brown	99 to 199 volts
Red	19 to 29 mfd.	Red	199 to 299 volts
Orange	29 to 39 mfd.	Orange	299 to 399 volts
Yellow	39 to 49 mfd.	Yellow	399 to 499 volts
		Green	499 to 599 volts

If a third (blue) stripe is shown, the condenser is a regulator and should be in the position furthest from the rectifier tube in the filter circuit.

PUSH BUTTON SET UP

At the right hand end of the top of the cabinet four buttons project. These buttons are set for stations by—

1. Loosen button to be set by unscrewing it about one full turn.
2. Depress button which is to be set up.
3. While holding button down, carefully tune in the station to be set up.
4. Tighten button—detune set and check button by depressing it.

The other three buttons are set up in the same manner.

ALIGNMENT PROCEDURE

To properly align this set an output meter and a signal generator are required. The generator must be calibrated at the following points: 455 Kc., 600 Kc., 1400 Kc., 1600 Kc., 6 Mc., 10 Mc., 15 Mc., and 18.3 Mc.

Always run the output of the signal generator as low as possible and still have accurate readings of the output meter. Connect high side of generator to antenna lead and low side to chassis through .01 condenser.

STEPS	In Series With Antenna	Set Generator at	Set Gang at	Adjust	Located	To obtain

ALIGNMENT

To properly align this receiver, a signal generator calibrated at 455 Kc., 1400 Kc., and 1730 Kc., is required. After aligning the I. F. stages, replace receiver in cabinet and FASTEN LOOP IN NORMAL POSITION before aligning the R. F. end through the openings in the end of the cabinet. These openings are closed by snap fasteners. The oscillator trimmer is nearest the front panel and the loop trimmer is directly behind it.

STEPS	Use in Series With Generator	Set Generator at	Set Gang at	Adjust	Located	To obtain
1.	.02 mfd. to Chassis Connect high side of Generator to grid cap of 1A7G tube.	455 Kc.	Quiet Point	2nd I. F. Trimmers 1st I. F. Trimmers	Top of I. F. Trans.	MAXIMUM OUTPUT

WHEN INSTALLING BATTERIES

1. Remove corner brackets. These lift out readily.
2. Put "B" battery against left wall of cabinet. Push against front panel, then slide as far to right as possible against wooden block. Insert other "B" battery in space just vacated.
3. If batteries stick, opening bottom door will facilitate installation.

ALIGNMENT

A signal generator calibrated at 455 Kc., 1400 Kc., and 1730 Kc., is necessary to properly align this receiver. After aligning the I. F. stages, replace receiver in cabinet and fasten loop in normal position before aligning the R. F. end through the openings in the end of the cabinet. These openings are closed by snap fasteners. The oscillator trimmer is nearest the front panel and the loop trimmer is directly behind it.

STEPS	Use in Series with Generator	Set Generator at	Set Gang at	Adjust	Located	To obtain
1.	.02MFD in each lead Connect high side of generator to grid cap of 1A7G tube	455 Kc.	Quiet Point	2nd I. F. Trimmers 1st I. F. Trimmers	Top of I. F. Trans.	MAXIMUM OUTPUT
2.	Loop**	1730 Kc.	Minimum	Oscillator Trimmer*	See Note Below	
3.	Loop**	1400 Kc.	1400 Kc. & Rock Gang	Loop Trimmer*		

*See preceeding paragraph for location of trimmers.

**Loop to consist of five to ten turns of insulated wire wound on a three to four inch form to be closely coupled to the loop antenna in the receiver.

				5654-1	Dial Indicator
				3121-1	Dial Crystal

This set is designed to be used with an outdoor antenna which should be placed as high as possible and as far as possible from sources of interference. A good ground connection should be used.

ALIGNMENT

To properly align this receiver, an output meter and a signal generator are required. The generator must be calibrated at the following frequencies: 455 Kc., 600 Kc., 1400 Kc., and 1700 Kc. The volume control must bet set at maximum and the signal generator at the lowest value that will give an accurate reading on the output meter. The high side of the generator is connected to the blue antenna lead and the low side is connected to the black lead.

STEPS	In Series With Antenna	Set Generator at	Set Gang at	Adjust	Located	To obtain
1.	SET VOLUME CONTROL AT MAXIMUM.					
2.	250 mmf.	455 Kc.	Minimum	2nd I. F. Trimmers	Top of I. F.	MAXIMUM OUTPUT

CHASSIS REMOVAL

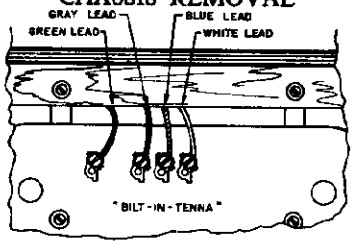

Fig. 2

When removing the chassis from the cabinet for service, first remove the loop antenna in table models. Second—disconnect the pointer from the drive cable by bending tongue toward the rear of the chassis to release drive cord, before loosening chassis hold down bolts. In consoles the loop is mounted below the chassis shelf, so it is not necessary to remove the loop assembly. However, the four leads from the chassis to the four screw type terminals on the loop shield should be removed by loosening the screws. See Fig. 2 for color code, when replacing chassis.

ALIGNMENT

Before re-aligning the set be sure all adjusting screws for the iron core oscillator coils are flush with or inside the chassis base.

Connect the low side of the signal generator to the black (ground) lead of the set and the high side of the generator to the green (antenna) lead.

PUSH BUTTON SET UP

At the rear of the chassis between the television jack and the antenna and ground leads are five pairs of holes. The lower hole is for the adjustment of the iron cores for the oscillator coils. The upper hole is for the R.F. stage adjustment. It is suggested that a signal generator be used for alignment. Tune in by means of the tuning knob, one of the stations that is to be set up. Select the button in the range covering the station selected, as shown by the label on the back of the chassis and Fig. 1 below. Before pushing the button adjust the signal generator to zero beat with the desired station, then push button. Adjust the oscillator (lower screw) first, then the R.F. stage (upper screw) turn off the signal generator, check against manual tuning by the manual tuning button. When the screws are turned to the right (clockwise) the frequency of the associated circuit is lowered.

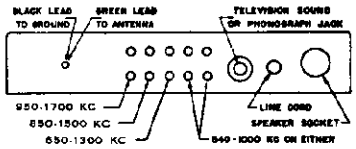

Fig. 1

CAUTION—Often two peaks are found at 18Mc. Use the one found at the minimum setting of the oscillator trimmer.

STEPS	Use in series with antenna	Set Generator at	Set Gang at	Adjust	Located	To obtain

8.	400 Ohms	18.1 Mc.	Minimum	S.W. Osc. Trimmer		
9.		16 Mc.	Strongest Signal and Rock Gang	S.W.R.F. Trimmer		
10.	Check Signal at 6 Mc. and 10 Mc.					

MODELS AC-70,AC-71 (Ch.C3-1),AK-78 (Ch.C3-2) AC-90,AC-91 (Ch.C4-1),and AK-95, AK-96 (Ch.C4-2).

TO REMOVE CHASSIS

Before removing the chassis it is necessary to remove the loop antenna, this is done as follows: First remove the 3 prong plug from top of loop frame. Loosen the bolt which goes through the wooden member at the bottom of the speaker enclosure. This will allow the bottom pivot (wood) to drop—allowing the top pivot of the loop to be removed from its bearing. Caution should be used so that the heavy rubber washer is not lost, also when the loop is removed from the top bearing, a lead which plugs into the top of the loop axis, must be disconnected, if the loop is dropped this lead may break. After the loop is free the set should be manually tuned to 900 K. C. and the pointer disconnected from the drive cord by bending the center tab toward the back of the cabinet and releasing the cord.

The chassis bolts may be removed and the chassis lifted out taking care that the two sets of leads to the loop do not catch on the chassis shelf.

When replacing the loop after the chassis, chassis pointer and the single lead to the center of the loop have been reinstated, before replacing the loop make sure the lower bearing support has the dowel pointing away from the loud speaker so that an angle of approximately 10° or 15° is made with a line parallel with the front panel. When the loop is installed be sure the label faces the back of the cabinet and that the loop is raised by the lower support so the rubber washer is slightly compressed so the loop will not rotate by itself. Then plug in the three prong plug making certain the leads are dressed so no strain is on them when the loop is rotated.

When replacing chassis adjust signal generator, to 900 Kc—then manually tune in the signal, set the pointer so its center line coincides with the center line of the 900 Kc marker, then clamp pointer to drive cord. If set is correctly aligned the calibration will check at 600 Kc and 1500 Kc within the pointer's width.

ALIGNMENT Connect the high side of the generator to the antenna terminal and the low side of it to the ground terminal making certain jumper on terminal strip is disconnected. Before aligning tighten wave trap-trimmer screw.

STEPS	In Series With Antenna	Set Generator at	Set Gang at	Adjust	Located	To Obtain
1	SET VOLUME AND TONE CONTROLS AT MAXIMUM					
2	250 mmfd.	455 Kc.	Minimum	2nd I. F. Trimmers	Top of I. F. Trans.	Maximum Output

ALIGNMENT

Be sure to follow procedure carefully and in the order given—otherwise the receiver will be insensitive and the dial calibration incorrect. For alignment procedure read tabulations from left to right. If more than one adjustment is required on any one band, make the adjustment marked (1) first, (2) next, (3) third.

Before starting alignment:

(a) Check tuning dial adjustment by turning gang condenser until plates touch maximum capacity stop (completely in mesh) at which point the dial needle must be exactly even with the last line at the low frequency end of the dial calibration. If dial needle does not point exactly to the last line move to correct position.

(b) Use an accurately calibrated test oscillator with some type of output measuring device.

(c) Have ground lead of test oscillator attached to chassis.

Set receiver dial to:	TEST OSCILLATOR: Adjust test oscillator frequency to:	TEST OSCILLATOR: Use dummy antenna in series with output of test oscillator consisting of:	TEST OSCILLATOR: Attach output of test oscillator to:	Refer to parts layout diagram for location of trimmers mentioned below:
I.F. Any point where no interfering signal is received	455 K. C.	.02 MFD condenser	High side to grid terminal of 6SA7 tube DO NOT REMOVE CAP.	Adjust each of the second I. F. transformer trimmers for maximum output—then adjust each of the first I. F. trimmers for maximum output.
(1) Exactly 1730 K. C.	Exactly 1730 K. C.	.00025 MFD condenser	Receiver "A" antenna post.	Adjust 1730 K. C. oscillator trimmer for maximum output.
(2) Approx. 1400 K. C.	Exactly 1400 K. C.	.00025 MFD condenser	Receiver "A" antenna post.	While rocking gang condenser adjust 1400 K. C. antenna trimmer for maximum output.

ALIGNMENT PROCEDURE

MODEL S-7402-3

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12A8GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove chassis from cabinet and set it up on the bench. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench.

Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL S-7403-4

I. F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (12A8GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Remove chassis, shield, and loop antenna from cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set up on a metal bench.

Connect the test oscillator to the antenna of the set through a 200 mmfd. (.0002) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL S7403-8
Alignment, Socket Trimmers

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT EQUIPMENT & PROCEDURE

ALIGNMENT: An output meter and an accurately calibrated signal generator are required.
Connect the output meter across the voice coil or between the plate of the 6F6G output tube and ground in series with a .1 mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
Connect the ground lead of the signal generator to the chassis.
Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.
Be sure the loop is properly connected and in the same relative position it occupies when in the cabinet.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output To Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment
.1 MFD. Condenser	Rear Lug of Gang Condenser	455 KC	Broadcast	Any Point Where It Does Not Affect The Signal	1-2 3-4	2nd I. F. 1st I. F.	Adjust for maximum output. Then repeat adjustment.
400 OHM Carbon Resistor	External Antenna Terminal	6 MC	Foreign	6 MC	5	Foreign Oscillator (Shunt)	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 5.1 MC. If image does not appear realign at 6 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	External Antenna Terminal	6 MC	Foreign	Tune to 6 MC. Generator Signal.	6*	Foreign Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
200 MMFD. Mica Condenser	External Antenna Terminal	1500 KC	Broadcast	1500 KC	7	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Terminal	1500 KC	Broadcast	Tune To 1500 KC Generator Signal	8*	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Terminal	600 KC	Broadcast	Tune To 600 KC Generator Signal	9	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

*NOTE: Trimmers must be aligned in order shown. After set is in cabinet realign No. 6 at 6MC. Then No. 8 at 1500 KC. on weak signals. Signal generator should be disconnected.

200 MMFD. Mica Condenser	"A" Terminal	1500 KC	Broadcast	Tune To 1500 KC Generator Signal	7	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	"A" Terminal	600 KC	Broadcast	Tune To 600 KC Generator Signal	8	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"A" Terminal	14 MC	Foreign	14 MC	9	Foreign Oscillator (Shunt)	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 13.1 MC. If image does not appear realign at 14 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	"A" Terminal	14 MC	Foreign	14 MC	10	Foreign Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

TO SET UP THE BUTTONS FOR AUTOMATIC TUNING:

1. Turn the set on and allow it to operate at least fifteen minutes before attempting to set up the buttons.
2. Make a list of the frequencies of six nearby stations to which you wish to set up the buttons. Be sure to select the most powerful nearby stations, since weak signals will not give as satisfactory results. Also be sure to select stations that fall within the frequency range of the buttons.
3. Be sure the antenna is connected before proceeding further.
   It will be impossible to set up buttons properly without an antenna.
4. With the range switch in the Broadcast (Manual) position (position B) tune in the station to be set up. Then turn the range switch to Automatic Position (Position A) and push in the button to be set up, being sure to select a button with the proper frequency range (see Fig. 1). ALWAYS TRY TO SELECT THE BUTTON WHICH CAN BE SET UP TO A STATION WHOSE FREQUENCY IS WELL WITHIN THE BUTTON'S OPERATING RANGE.
5. At the back of the chassis will be found 6 holes numbered to correspond to the numbers of the buttons. See Fig. 1. Adjust the large screw with the number corresponding to the number of the button you have pushed in, until the same station is again heard. Tune accurately, adjusting for deepest tone.

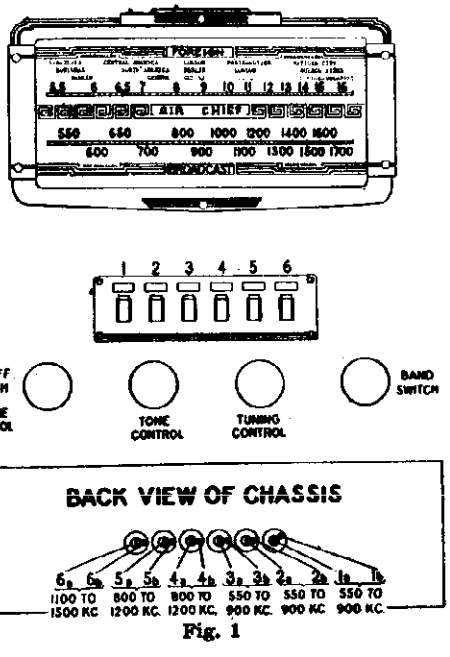

Fig. 1

6. Now adjust the small screw (located adjacent to the large screw just adjusted) until maximum output is obtained. Make a final adjustment on the large screw, always tuning for deepest tone.
7. The set-up is now complete for this button. The remaining buttons may be set up in the same way.
8. Call letter tabs which may be used to label the buttons are supplied with this radio.

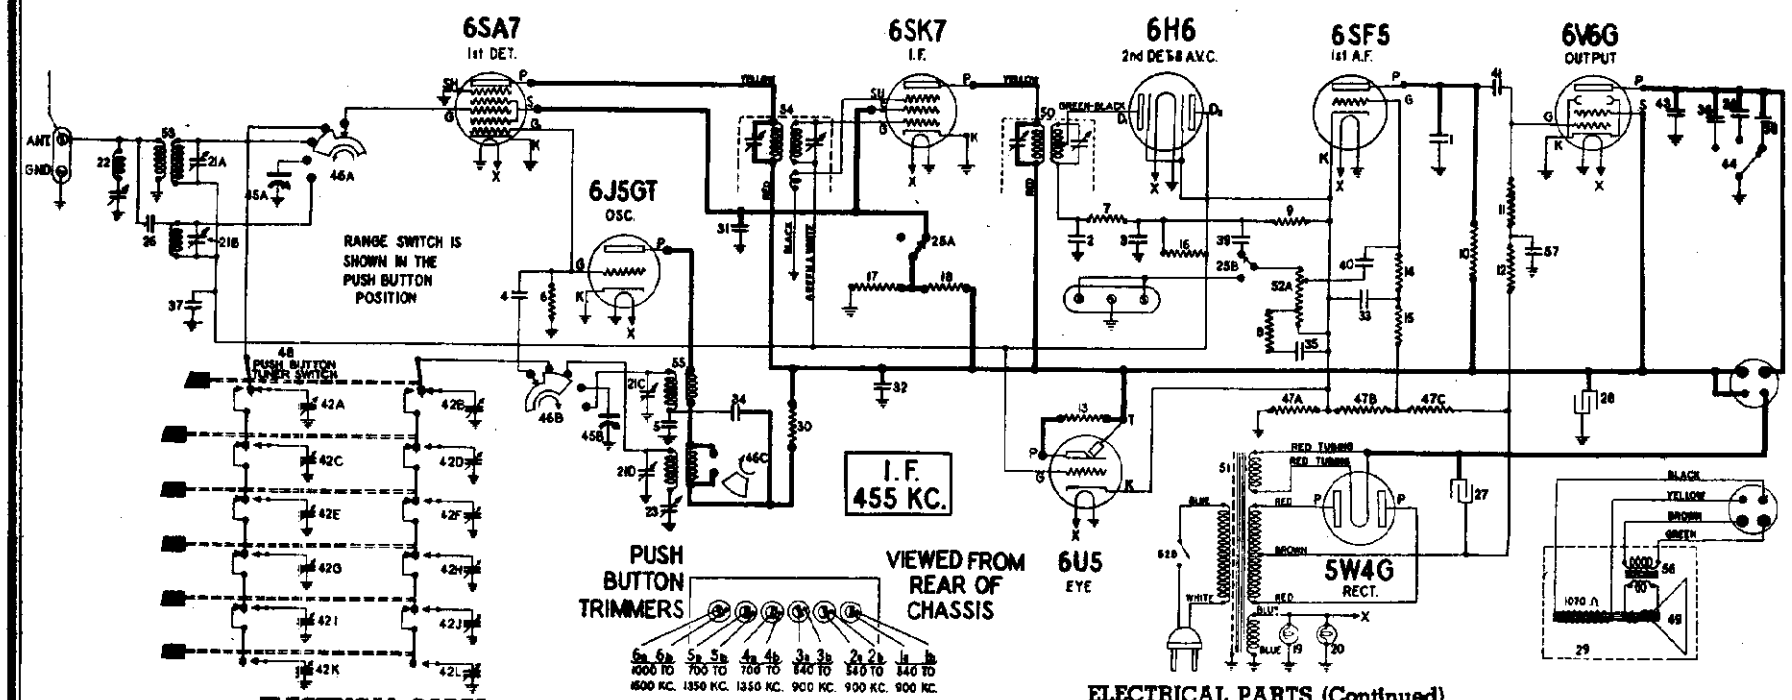

Fig. 1

PHONOGRAPH CONNECTIONS: Connect the wires from a phonograph record player to the left hand and middle terminals on the terminal strip nearest the middle of the chassis on the back of the chassis. Push the black sliding button on the back of the chassis to the right for phonograph or television reception. This switch must be pushed to the left for radio reception. Turn the volume knob on the record player to the maximum volume position and control volume by means of the volume control on the radio.

TELEVISION CONNECTIONS: Connect the wires from a television picture receiver to the right hand and middle terminals on the terminal strip. Operation will now be the same as for phonograph operation.

Manual B.C.	600 kc	600 kc	.0002 mfd.	Ant. Term.	C13	Padder
Manual S.W.	15 mc (rock)	15 mc	400 ohms	Ant. Term.	C5	Translator

IMPORTANT ALIGNMENT NOTES

* The generator should be adjusted for high output. The trimmer should be adjusted for minimum output meter reading instead of the usual maximum reading. If the frequency of an interfering station around 455 kc is known, the generator should be adjusted to the frequency of that station instead of to 455 kc.

** Mounted under the chassis.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

IMPORTANT ALIGNMENT NOTES

* Mounted on loop.

Where indicated by the word, "Rock", the variable should be rocked back and forth a degree or two while making the adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

With the signal generator disconnected, tune in a weak broadcast station at about 1400 kc and readjust C1 for the final adjustment.

The alignment procedure should be repeated stage by stage, in the original order, for greatest accuracy. Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

PUSH BUTTON TUNING

Each of the buttons will be set up in the following manner:

1. Turn the BAND knob to the MANUAL BROADCAST position and tune in the desired station.
2. Turn the BAND knob to PUSH BUTTON. Push in the button that is to be set to the desired station.
3. Turn the large screw of the corresponding adjustment until the station is tuned in; then the small screw for finer tuning. Repeat with the large screw for final adjustment. Use the Tuning Eye to secure exact tuning. The BAND knob can be turned back to MANUAL BROADCAST in order to check if the station is the desired one.
4. Fasten the proper call letters in the escutcheon.

Proceed in the same manner for the remaining buttons.

MODEL S7405-5
Alignment, Trimmers
Socket

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

FOR ALIGNMENT an output meter and an accurately calibrated signal generator are required.

Connect the output meter across the voice coil or between the plate of the 1A5G output tube and ground through a 0.1 Mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)

Connect the ground lead of the signal generator to the black ground wire or the chassis.

Turn the volume control to the maximum volume position and keep it in this position while aligning.

With the gang condenser in full mesh, set the dial pointer to the low frequency edge of the dial scale.

Dummy Ant. in Series with Sig. Gen.	Connection of Sig. Generator Output To Receiver	Signal Generator Frequency	Band Switch Position	Receiver Dial Setting	Trimmer Number	Trimmer Description	Type of Adjustment

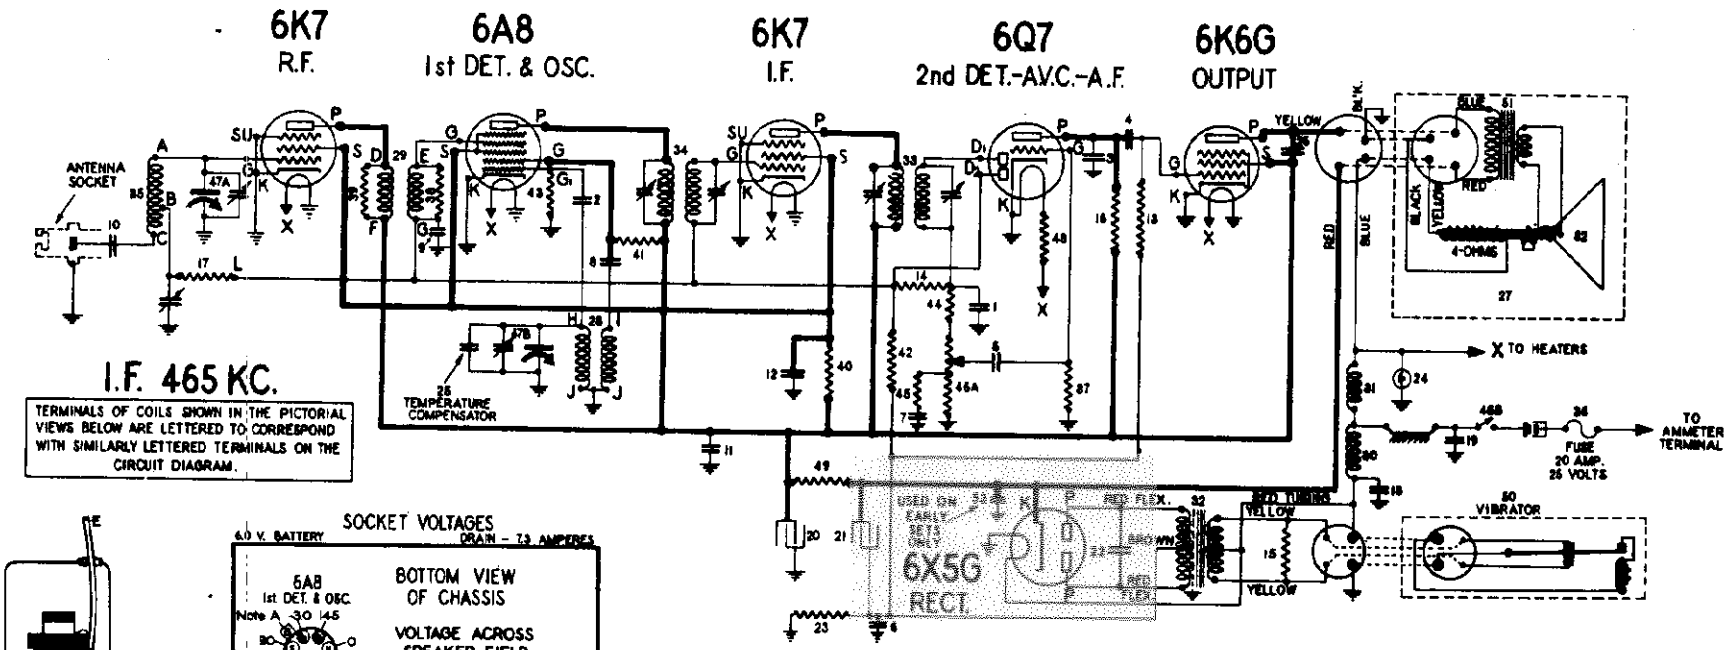
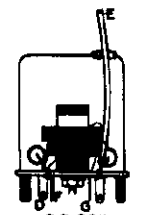
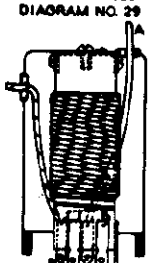
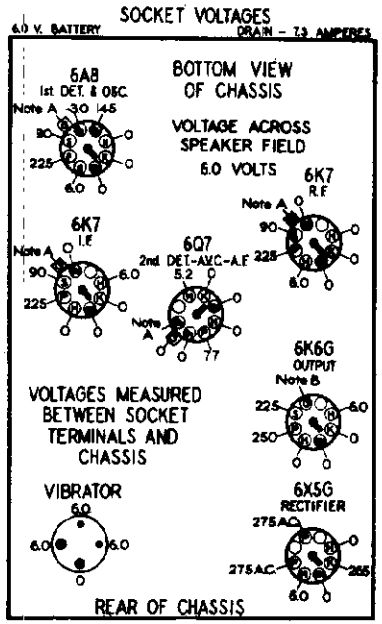
MODEL S7407-6
Schematic, Voltag
Socket, Coils, Par









USE A HIGH RESISTANCE VOLTMETER OR A 1000 OHMS PER VOLT.

NOTE A:- THE ACTUAL BIAS ON THESE GRIDS AND DIODE PLATE (Dp) IS -3 VOLTS. DUE TO THE HIGH RESISTANCE IN THIS BIAS SUPPLY CIRCUIT IT IS NOT POSSIBLE TO MEASURE THE ACTUAL VOLTAGE UNLESS A VACUUM TUBE VOLTMETER IS AVAILABLE.

NOTE B:- THE BIAS ON THIS GRID IS -18 VOLTS MEASURED ACROSS RESISTOR NO. 23.

Alignment, Trimmers
Parts

FIRESTONE TIRE & RUBBER CO.

ALIGNMENT PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator with a tuning range from 465 KC. to 1400 KC. are required.

1— Connect the output meter across the speaker voice coil or between the plate of the 6K6G output tube and ground through a .1 mfd. condenser. The more sensitive type meter should be connected across the voice coil.

2— Connect the ground lead of the signal generator to the receiver chassis and leave it connected in this manner throughout the entire alignment procedure.

3— Turn the volume control to the maximum volume position.

4— With the gang condenser in full mesh, set the pointer to the last division on the low frequency end of the dial scale. This can be done by releasing the clip holding the pointer to the dial cord and slide the pointer to the correct position. Then retighten the pointer clip on the dial cord.

ALIGNMENT PROCEDURE

POSITION OF VARIABLE	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	TRIMMER ADJUSTMENTS (IN ORDER SHOWN) S-7407-5	S-7407-8	TRIMMER FUNCTION
Closed	455 kc	.1 mfd.	RF Grid	T2, T1	T_2 T_1	IF
Closed	455 kc	.1 mfd.	RF Grid	C16*	C8*	IF Wave Trap
Open	1530 kc	.00008 mfd.	Ant. Conn.	C11	C7	Oscillator
Open	3430 kc	.00008 mfd.	Ant. Conn.	C15*	C6*	Image Rejector
Closed	540 kc	.00008 mfd.	Ant. Conn.	C12	C9	Padder
Open	1530 kc	.00008 mfd.	Ant. Conn.	C11	C7	Oscillator
1400 kc	1400 kc	.00008 mfd.	Ant. Conn.	C1	C1	Antenna
600 kc(rock)	600 kc	.00008 mfd.	Ant. Conn.	C12	C9	Padder

The receiver must be in its case during alignment.

* The signal generator should be adjusted for high output and the trimmer should be adjusted for minimum response.

The alignment procedure should be repeated in the original order, step by step, to insure greater accuracy.

MODEL S7425-3
Alignment, Tuner
Dial Data, Parts

FIRESTONE TIRE & RUBBER CO.

SPECIFICATIONS

This model is a single unit five-tube superheterodyne receiver. It incorporates an unusual push button tuning system of rugged mechanical design that is positive, accurate, and easy to adjust and operate. A highly efficient superheterodyne circuit employs five tubes to the utmost advantage as follows: one 6A8G as an oscillator and mixer or modulator, one 6U7G as an intermediate frequency amplifier, one 6Q7G as detector, A. V. C. and 1st A. F. amplifier, one 6K6G as power output amplifier and a 6X5G as a rectifier. A full wave vibrator is used. Bias for the 6A8G and 6U7G tubes is obtained across item 27 (60 ohm resistor), for the 6Q7G tube across item 28 (40 ohm resistor) and for the 6K6G across the "B" Filter choke, item 7, and items 27 and 28.

TUBES AND VOLTAGE LIMITS

The following table gives the functions of the tubes used, together with the voltage readings between the tube socket contacts and the receiver chassis. Voltage readings taken with a 1000 ohm per volt, 500 volt voltmeter (except filaments) with receiver in operating condition and no signal input. The filament voltages should be measured with an accurate low range D.C voltmeter (approximately 0 to 10 volts). Voltage limits may vary plus or minus 10% of values given.

SOCKET VOLTAGE LAYOUT

The socket layout in the illustration Fig. 5, shows the voltage readings taken between the tube prongs and receiver chassis. It will be noted that certain unused terminals are used as junction blocks while others are not used at all. All readings are taken with the receiver in operating condition and no signal input.

SETTING PUSH BUTTONS

Should it become necessary to realign the circuits of the receiver, it may also be necessary to reset the push buttons. The push buttons may be quickly and accurately set, either with the receiver in the case or with the case removed.

Insert a small screw driver in the hole through each push button and loosen (do not remove) the set screw in the bottom of the hole. By means of the conventional tuning knob, tune-in AS ACCURATELY AS POSSIBLE the favorite station having the highest frequency —that is, the station nearest the left-hand end of the dial. Completely depress and hold the No. 1 push button on the left and tighten the set screw SECURELY.

The push button tuning system is now correctly set for the 1st station. Follow through with this same procedure, setting the other four stations in the order of their frequency (kilocycles).

ALIGNMENT PROCEDURE

All the circuits in this receiver are very accurately adjusted at the factory and normally should need no further adjustment. However, if it is definitely known that an adjustment is necessary the circuits can best be properly aligned with the use of a modulated signal generator and an output meter.

CONNECTING OUTPUT METER

Connect the output meter to P and S of the 6K6G Output tube. Be sure the meter is protected from D.C. by connecting a condenser (.1 mfd. or larger—not electrolytic) in series with one of the leads.

1. Tuning I-F Amplifier To 455 Kilocycles.

(a) Connect the output of the signal generator through a .02 mfd., or larger, condenser to the top cap of the 6U7G I. F. tube, leaving the tube's grid clip in place. Connect the ground lead from the signal generator to the receiver chassis frame. KEEP THE GENERATOR LEADS AS FAR AS POSSIBLE FROM THE GRID LEADS OF THE OTHER SCREEN GRID TUBES.

(b) Adjust the station selector so that the rotor plates of the tuning condenser are completely disengaged and turn Vol. Cont. to maximum position (RIGHT).

(c) Set the signal generator to 455 kilocycles.

(d) Adjust both 2nd I. F. trimmer condensers for maximum output. Fig. 3.

(e) Transfer generator lead to top of 6A8G Osc.-Mod. tube, leaving the tube's grid clip in place.

(f) Adjust both trimmers located on the 1st I-F transformer for maximum output.

(g) Repeat operations (d) and (f) for more accurate adjustments.

IN ORDER TO PREVENT A. V. C. ACTION ALWAYS USE THE LOWEST SIGNAL GENERATOR OUTPUT THAT WILL GIVE A REASONABLE OUTPUT METER READING.

2. Aligning R-F Amplifier.

To obtain the greatest gain from the R. F. amplifier, the capacity of the dummy antenna should be equal to the capacity of the antenna with which the receiver is to be used. The capacities of auto radio antennas range from 65 mmf. (.000065 mf.) to 250 mmf. (.00025 mf.), depending upon the size and type. If the receiver is adjusted for maximum efficiency when used with an antenna havinig a high capacity, it will not operate at its maximum efficiency on an antenna having a much lower capacity and vice versa.

(a) If the receiver is to be used with a whip or streamlined antenna, the output lead from the signal generator should be connected through a .0001 mf. condenser to the "Ant" connection of the receiver. If a large antenna such as a running board type or built-in top antenna is to be used, a .0002 mf. condenser should be used in place of the .0001 mf. condenser.

(b) Set the signal generator to 1400 kilocycles.

(c) Adjust the station selector to 140 on the dial.

(d) Adjust the trimmer on the "OSC" section of the tuning condenser for maximum output.

(e) Adjust the trimmer on the "ANT" section of the tuning condenser for maximum output.

(f) Readjust the station selector for maximum output. DO NOT READJUST THE OSC. TRIMMER.

(g) Repeat operation (e) for more accurate adjustment.

3. Adjusting Antenna Compensating Condenser.

(a) Set the signal generator to 600 kilocycles.

(b) Tune in the 600 kilocycle signal with the station selector for maximum output.

(c) Adjust the antenna compensating condenser, located between the control knobs on the front of the chassis, for maxiumum output.

(d) Repeat operations (b) and (c) alternately until no further improvement can be obtained.

(e) Set the signal generator to 1400 kilocycles again.

(f) Tune-in the 1400 kilocycle signal with the station selector for maximum output.

(g) Readjust the trimmer on the "Ant" section of the tuning condenser for maximum output.

It will be necessary to adjust the antenna compensating condenser to the car antenna after the receiver has been installed in the car.

(a) After the installation is complete, tune-in a WEAK station between 55 and 65 on the dial.

(b) Adjust the antenna compensating condenser for maximum volume in the speaker.

REPLACING DIAL DRIVE CORDS

Two dial drive cords are used and should the innermost cord break, it will be necessary to remove the outer cord and large pulley before the inner cord can be replaced.

To replace the inner cord:

(1) After removing the broken cord, place the chassis on end with the push buttons "up" and the speaker toward you.

(2) Thread an 18" length of drive cord through the hook on one end of the tension spring which was removed from the pulley on the end of the push button rocker plate.

(3) Insert both ends of this cord through the eyelet in the rocker plate pulley from the inside. Pull the cord through until the tension spring is pulled into the pulley, then hook the free end of the spring over the catch in the pulley in the side opposite the eyelet.

(4) Open the condenser gang all the way.

(5) Pull all but approximately 4½" of the cord through the eyelet. Loop the 4½" end of the cord around the lower half of the pulley.

(6) Loop the long end of the cord over the top of the pulley and back over the brass idler pulley to the drive shaft. Continue the cord around the drive shaft, threading from the inside and over the top. Wrap four complete turns of the cord around the drive shaft and continue the cord over the top of the rocker plate pulley.

(7) Pull on the short end of the cord until the tension spring in the pulley is stretched to within ⅛" of the eyelet. Maintain this tension and tie a knot in the two ends of the cord over the catch which holds the spring. Loop the cord over the spring catch so that the knot is turned in. (A drop of bees' wax on the knot would be an added protection against coming untied.)

To replace the outer cord:

(1) Place the chassis in a horizontal position with the push buttons to the left and the speaker toward you.

(2) Close the condenser gang and mount the large drive pulley on the shaft. Place the pulley on the condenser shaft so that the shaft is flush with the outside of the pulley bushing and the eyelet in the pulley is horizontal with the shaft and toward the dial.

(3) Cut a 22" length of drive cord and tie a knot ½" from the two ends.

(4) Hook one end of the tension spring over the catch provided in the pulley and hook the other end over the drive cord at the knot.

(5) Thread the cord through the eyelet in the pulley and extend one side up and over the vertical brass pulley. Loop this lead around the horizontal idler pulley at the left-hand side of the dial and then around the idler pulley at the right-hand side of the dial and then over the top of the large drive pulley. The tension on the spring should be sufficient to stretch it to within approximately ½" of the eyelet.

(6) With the gang closed, move the pointer to the extreme right-hand end of the dial. Press the cord into the slots in the back of the pointer and check to see that the pointer travels from one end of the dial to the other as the gang is opened and closed. It may be advisable to place some Aratex or other liquid adhesive on the cord where it fits into the pointer.

REPLACING THE DRIVE CORD

1.—Remove the broken cord and the cord tension spring.

2.—Cut a 30 inch length of drive cord and tie the tension spring approximately 4 inches from one end. Thread both ends through the eyelet in the large pulley from the inside. Hook the other end of the spring to the catch in the pulley and bend catch to secure spring.

3.—Close the condenser gang and see that the eyelet in pulley is on top and that the end of the condenser shaft is flush with the inside of the pulley.

4.—Take the long end of cord and place on small brass idler pulley on the right side of the dial bracket. Loop around pulley in a clockwise direction and then around idler pulley on the left side of the dial bracket, continue on over the top of the large pulley and down to the drive shaft. From the under side of drive shaft wrap 2 turns around shaft in a counter-clockwise direction, bringing cord up on the left side of large pulley. Be sure the cord is on all the pulleys then tie a knot, pulling with sufficient force to stretch the tension spring to within ½ inch of the edge of pulley.

5.—Close gang and place the pointer on the cord at the extreme left end of the dial. Check to see that pointer travels full length of the dial. It may be advisable to place some "ARATEX" or other liquid adhesive on cord where it fits into the pointer.

When referring to manually tuned model disregard all parts listed between Items 7 and 11 and all parts listed under the heading Miscellaneous Mechanical Parts.

PARTS — The following are parts to fill the deletions to complete Parts List

Item No.	Part No.	Description

ALIGNMENT EQUIPMENT & PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator with a tuning range from 465 KC to 1500 KC are required.

1. Connect the output meter across the voice coil or between the plate of the 25L6-G output tube and ground through a .1 mfd. condenser, depending upon the type of meter. The more sensitive type should be connected across the voice coil.

2. Connect the ground lead of the signal generator to the chassis of the receiver through a .25 mfd. condenser and keep it connected in this manner throughout the entire alignment procedure. Failure to do this may have serious results as the signal generator may be connected to one side of the power line, or it may be grounded externally.

3. Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.

4. TO CALIBRATE THE DIAL:- Remove the chassis from the cabinet and set it on a flat surface (insulated from ground). Release the set screw in the collar which connects the gang condenser shaft with the tuning unit. Holding the gang in full mesh turn the dial until the last dial division (just below 55) on the low frequency end is exactly 4 3/8 inch above the table surface. Now retighten the set screw in the coupler collar. The 4 3/8 inch division on the ruler (when measured vertically from table surface) is to be used as the dial indicator for all calibrations and alignment.

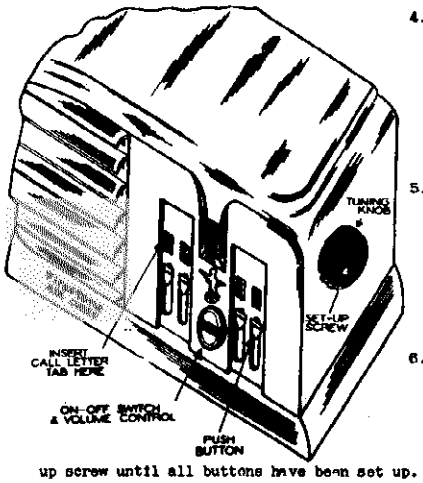
DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. MICA CONDENSER	CONTROL GRID OF 6A8-G TUBE	465 KC	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1-2	1ST I. F.	ADJUST FOR MAXIMUM OUTPUT THEN REPEAT ADJUSTMENT
				3-4	2ND I. F.	
200 MMFD. MICA CONDENSER	ANTENNA LEAD (Blue Wire)	1500 KC	1500 KC	5	BROADCAST OSCILLATOR (Shunt)	ADJUST TRIMMER TO BRING IN SIGNAL.
200 MMFD. MICA CONDENSER	ANTENNA LEAD (Blue Wire)	1500 KC	TUNE TO 1500 KC GENERATOR SIGNAL	6	BROADCAST ANTENNA (Shunt)	ADJUST FOR MAXIMUM OUTPUT.

HOW TO SET UP THE PUSH BUTTONS.

1. Be sure that the antenna wire furnished with the set is extended to its full length and placed under the carpet or around the floor molding. In most instances the 20 feet of brown insulated wire included with the radio will make a satisfactory antenna. However in localities remote from powerful broadcast stations, it may be found necessary to use an outside antenna.

2. Turn the set on and allow it to operate at least one quarter hour before setting up the push buttons.

3. Select the four nearby stations to which you wish to set up the buttons. Be sure to select nearby, powerful stations, since weak signals generally give poor results.



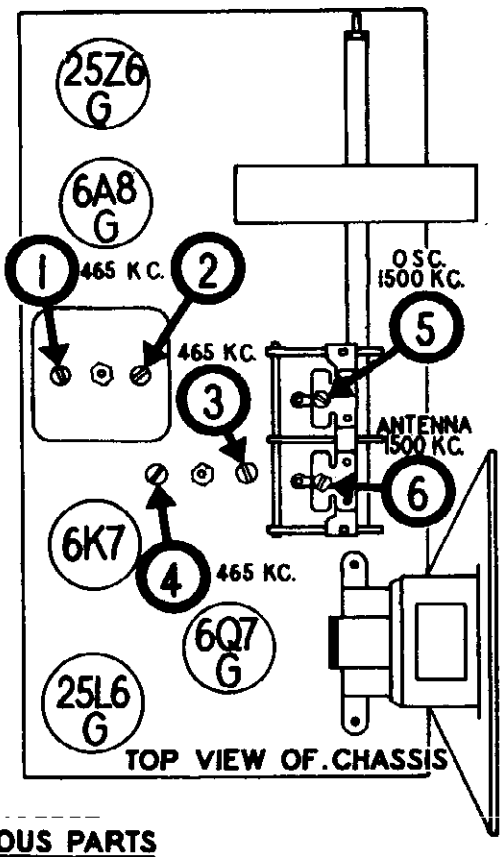
4. The large tuning knob at the side of your set has a set screw located in the center. Grasp this tuning knob firmly and then using a screw driver or a coin, turn the screw counter-clockwise not more than two whole turns.

5. Push down any one of the four buttons and holding it down tune in the desired station using the tuning knob. The push button must be held down firmly while the station is being tuned in otherwise the setting will be incorrect.

6. Release the button that you have just set up. WARNING:- Do not attempt to use any button until you have completed the set-up of all four buttons. Do not retighten the set-up screw until all buttons have been set up.

7. Proceed to set up the next button by pushing down on the button firmly and tuning in the desired station, using the tuning knob. The rest of the buttons should be set-up in a similar manner.

8. After all of the buttons have been set-up YOU MUST RE-TIGHTEN THE SCREW IN THE TUNING KNOB: OTHERWISE ALL SETTINGS OF THE BUTTONS WILL BE DESTROYED. GRASP THE KNOB FIRMLY AND USE A SMALL SCREW DRIVER OR A COIN TO TIGHTEN THE SCREW SECURELY.



DIAL & MISCELLANEOUS PARTS

PART NUMBER	DESCRIPTION	LIST PRICE
112745	Clip - coil mounting (osc. & ant.)	.01

The Firestone Air Chief Stock No. 7425-8UA and 7425-9 (317 chassis) are identical in operation, performance and circuit wiring to the Firestone Air Chief Stock No. 7426-1 (311 chassis) except for the following differences:

The 317 chassis is designed for operation from a 117 volt 60 cycle power supply while the 311 chassis will operate on either 117 volt A.C. or D.C. power system. The only difference between the two models is that a one-to-one power transformer which also has a 25 volt and a 6 volt filament winding, has been substituted for the ballast resistor tube. A partial schematic diagram for the 317 chassis, showing only the power supply wiring, tube filament wiring and associated parts list is shown below. ALL OTHER CIRCUIT WIRING IS IDENTICAL TO THE 311 CHASSIS.

Use a high resistance voltmeter of at least 1000 ohms per volt.

MODEL S7426-8
Alignment, Socket Trimmers

FIRESTONE TIRE & RUBBER CO.

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil or between the plate of the 6F6-G output tube and chassis, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)
2. Connect the ground lead of the signal generator to the "G" terminal or the chassis.
3. Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.
4. Remove the connector from between the "A" and "X" terminals.
5. Push in the "MANUAL" button, and keep it depressed during the entire alignment procedure.

Alignment,Trimmers
Socket,Notes

FIRESTONE TIRE & RUBBER CO.

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator are required.

1. **Connect the output meter across the voice coil or between the plate of the 6F6G output tube and ground in series with a .1 mfd. condenser, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)**
2. **Connect the ground lead of the signal generator to the chassis.**
3. **Turn the volume control to the maximum volume position and keep it in this position throughout the entire alignment procedure.**
4. **Remove the blue wire from the extreme left hand screw at the rear of the chassis and allow it to float free.**

PHONOGRAPH & TELEVISION CONNECTIONS

PHONOGRAPH CONNECTIONS: Connect the wires from a phonograph record player to the left hand and middle terminals on the terminal strip nearest the middle of the chassis on the back of the chassis. Push the black sliding button on the back of the chassis to the right ("TELE. PHONO" position) for phonograph or television operation. This switch must be in the "RADIO" position for radio reception.

Turn the volume knob on the record player to the maximum volume position and control volume by means of the volume control on the radio.

TELEVISION CONNECTIONS: Connect the wires from a television attachment unit to the right hand and middle terminals on the terminal strip. Operation will now be the same as for phonograph operation.

MODEL S7427-3, Chassis R316
Alignment, Socket, Trimmers
Coils, Tuner, Dial Drive

FIRESTONE

ALIGNMENT EQUIPMENT & PROCEDURE

FOR ALIGNMENT: An output meter and an accurately calibrated signal generator with a tuning range from 465 KC to 20 MC. are required.

1 Connect the output meter across the voice coil or, in series with .1 mfd. condenser, from the plate of the 6L6-G output tube to ground, depending on the type of meter. (The more sensitive type should be connected across the voice coil.)

2 Connect the ground lead of the signal generator to the "G" post on the antenna terminal strip at the rear of the chassis, or to the metal chassis.

The ground and doublet terminals on the antenna terminal strip must be connected together throughout the alignment procedure.

3 With the gang condenser in full mesh set the pointer to the last mark on the left end of the dial scale. If the pointer is incorrectly set, it is only necessary to loosen the set screw on the dial cord drive drum and push the gang condenser to full mesh with the pointer properly set, then retighten the set screw.

4 Turn the volume control to the MAXIMUM volume position and keep it in this position throughout the entire alignment procedure. IMPORTANT:- If the remote control unit is plugged in, be sure that its volume control is also in the maximum volume position.

-IMPORTANT-

THE FIRST PUSH-BUTTON ON THE LEFT, LABELLED "MANUAL", MUST BE PUSHED IN WHEN ALIGNING. FAILURE TO PUSH IN THIS BUTTON WILL MAKE CORRECT ALIGNMENT IMPOSSIBLE.

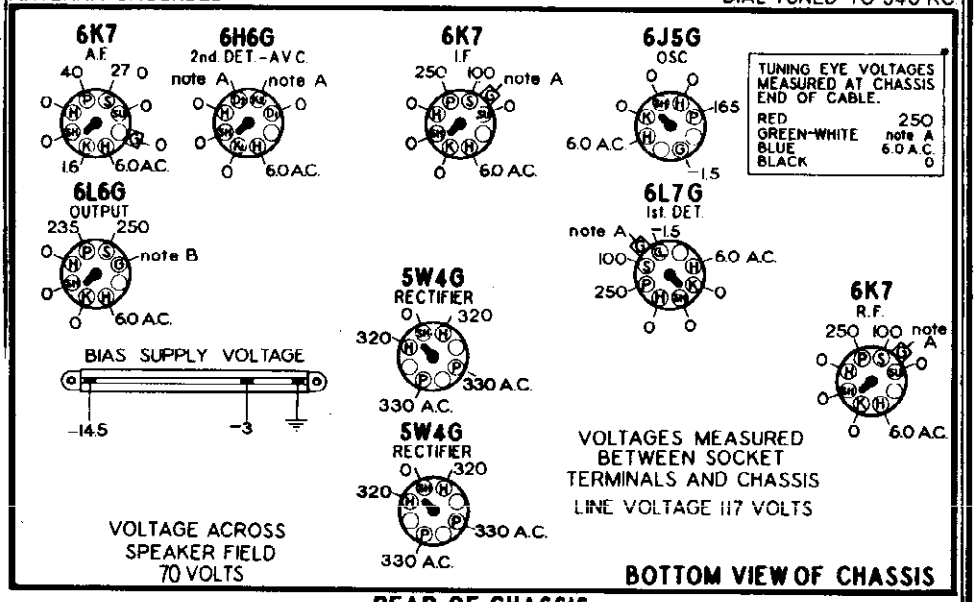
ANTENNA GROUNDED — DIAL TUNED TO 540 KC



REAR OF CHASSIS

DESCRIPTION	LIST PRICE
Condenser - mica 1650 mmfd.(3%)	.30
Condenser - mica 4050 mmfd.(3%)	.40
Coil - wave trap (with trimmer)	.50
Condenser - elect. 10 mfd. 25 V.	.80
Condenser - variable gang	6.80
Transformer - 2nd I.F.	1.64
Push Button Switch Assembly	3.75
Condenser - 30 mfd. 450 volt	1.40
Coil - antenna (B.C.)	1.20
Coil - R.F. (B.C.)	1.30
Coil - antenna (police)	.50
Coil - antenna (S.W.)	.52
Condenser - trimmer - 3 section	.54
Condenser - trimmer - 3 section	.54
Condenser - padding	.38
Transformer - 1st I.F.	1.90
Transformer - 117 volt 60 cycle	9.00
Bias Resistor - Section A-23 ohm, Section B-90 ohm	.38
Coil - oscillator (B.C.)	.50
Coil - oscillator (police)	1.20
Resistor - candohm 90 ohms	.26
Motor - for electric tuner	8.00
Cone - voice coil assembly	2.40
Connector Link - for remote control plug	.01
Switch - range	2.10
Coil - oscillator (S.W.)	.52
Coil - R. F. (S.W.)	.60
Coil - R.F. (Police)	.50
Speaker (dynamic) (12 inch)	9.25
Remote control unit	
Switch - two section (in remote control unit)	4.20
Volume control (35,000 ohms) on remote control unit	.75
Case for remote control unit	1.20
Push Button - for remote control unit	.08

Use a high resistance voltmeter of at least 1000 ohms per volt.

NOTE A: The bias for the control grids of the 6L7-G, 6K7-R.F., 6K7-I.F. and the diode plate (D_2) and cathode (K_2) of the 6H6-G tubes is -3.0 volts measured across resistor 81A.

NOTE B: The bias for the control grid of the 6V6-G output tube is -14.5 volts measured across resistors 81A and 81B.

CHASSIS DESCRIPTION

The R-316 chassis is a 10 tube, Electric Push-Button Tuning Superheterodyne receiver. The tuning ranges are 535 to 1730 KC, 2.2 to 7.0 MC, and 3.8 to 22.5 MC.

Incorporated in each chassis is a ruggedly constructed Electric Push-Button Tuner Unit, which was primarily designed to give long-life and consistent accuracy of tuning. Aside from the automatic tuning system this receiver incorporates several features described in the following paragraph which the service man should carefully read as they may aid him in rapidly locating the source of trouble.

CIRCUIT FEATURES

VARIABLE SELECTIVITY: Two degrees of selectivity can be obtained by proper use of the first push-button labelled "Manual". When the button is in the "out" position the tuning of the receiver will be broad. With this button in the "in" position the tuning will be sharp. Broadening is accomplished by inserting a resistor and coil in series with the secondary of the first I. F. transformer. The series coil is mutually coupled into the primary of the same I.F. transformer thereby causing a flattening of the overall selectivity.

AUDIO SYSTEM: The audio voltage developed across the diode load resistor is fed to the volume control which in turn couples, the desired amount of this audio voltage to the control grid of the 6K7 1st audio tube. The output of this stage is coupled to the 6L6-G output tube. A mute switch connected across the control grid load resistor of the 6L6-G output tube is utilized to silence the receiver while the automatic tuning unit is in operation. This is accomplished by placing the mute switch on the back of the tuner motor. When the motor starts to operate the rotor pulls into the magnetic field of the stator, which causes the end of the motor shaft to push against the mute switch and close its contacts.

TUNER MOTOR

Failure of the Tuner Motor to operate will generally be found due to the following causes:

1. The small black set-up switch on the rear of the tuner must be in the left hand position. If this switch is in the right hand position, the set-up lamp is connected in series with the motor, and the motor cannot operate.

2. The overload thermostat on the motor will open when the temperature of the motor reaches a dangerous value (approximately 95° C.) The thermostat will close automatically when the motor cools down.

HOW TO SET UP THE PUSH BUTTONS

1. Be sure that your set is first connected to a good antenna system.
2. Turn on the set and allow it to operate at least one-quarter hour before setting up the push buttons.
3. Make a list of eight nearby stations which you wish to tune in with automatic tuning buttons. Be sure to select nearby powerful stations, since weak stations will generally give better results when tuned manually. Arrange the list so that the lowest frequency station appears first, then the next lowest frequency continuing in this manner until the eight stations are arranged in the numerical order of their frequency. The frequency of your local stations may be obtained from your newspaper or radio call magazine.

Only buttons No. 2 to No. 9 are used for automatic tuning. IT IS IMPERATIVE THAT THESE BUTTONS BE SET-UP IN THE FOLLOWING ORDER: Button No. 2 must be set to tune in the station whose frequency is lowest in your list of eight stations. Button No. 3 must be set to tune in the station next higher in frequency. Continue to follow this procedure until Button No. 9 will be set to tune in the station whose frequency is highest in your list.

The actual setting up of the buttons is done as follows:

4. Push in the "MANUAL" button and use the tuning knob to tune in the station (lowest frequency on your list) that you have selected for Button No. 2. Be sure to tune in the station correctly using the "Tuning Eye". The correct tuning point is indicated when the two open ends of the inverted "V" shaped shadow in the "Tuning Eye" are closest together.
5. Place the small black "set-up switch" button which appears on the back of the chassis in the right hand position. (See label on back of chassis.) LEAVE THIS SWITCH BUTTON IN THIS POSITION UNTIL ALL BUTTONS HAVE BEEN SET-UP.
6. PUSH IN BUTTON No. 2. The lamp mounted on the back of the chassis just to the right of the selector drum will be illuminated when the button is depressed. (See Fig. 1)

NOTE: If the lamp does not light up when the switch is in this position it indicates that Button No. 2 is already correctly set to the desired station and further adjustment need not be made for this button.

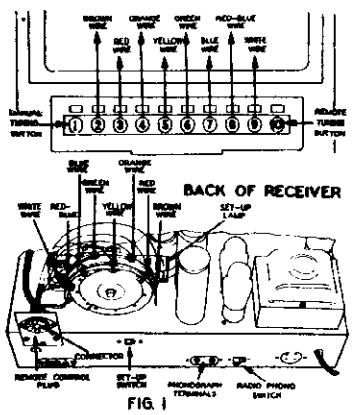


FIG. 1

7. Locate the contactor corresponding to Button No. 2. This contactor has a BROWN lead attached to it (see Fig. 1 or label on back of chassis for the color of the wire associated with each button), and is the extreme right hand contact on the inner circle of the semi-circular bridge, when viewed from rear of chassis. Loosen the knurled nut on this contactor (not more than one-half turn), THEN SLIDE THIS CONTACTOR ALONG THE BRIDGE TO THE POINT INDICATED BY THE WHITE ARROWHEAD ON THE SIDE OF THE ROUND DRUM. When this point is reached, the lamp will go out. If the contactor is moved farther than the point at which the lamp extinguishes, the lamp will again be illuminated. Move the contactor back and forth between the two points at which the lamp extinguishes, and set the contactor midway between these two points. Then tighten the knurled nut as tightly as possible, with the fingers. The lamp should still be out after tightening the contactor. If it is not, the contactor must be reset.
8. Set up for Button No. 2 is now complete.
9. Set up the remaining seven buttons in a similar manner. The contactors for the remaining buttons can be identified as follows: (See Fig. 1 or label on back of chassis.)

Button No. 2 - Brown Lead.
Button No. 3 - Red Lead.
Button No. 4 - Orange Lead.
Button No. 5 - Yellow Lead.
Button No. 6 - Green Lead.
Button No. 7 - Blue Lead.
Button No. 8 - Red-Blue Lead.
Button No. 9 - White Lead.

10. AFTER ALL THE BUTTONS HAVE BEEN SET-UP YOU MUST PLACE THE SMALL BLACK SET-UP SWITCH BUTTON IN THE LEFT HAND POSITION (white dot showing). OTHERWISE THE ELECTRIC TUNER MOTOR WILL NOT OPERATE. (See label on back of chassis just below this switch.) This re-connects the motor and enables you to tune to any of the eight selected stations by pushing the proper button.
11. To use the Push Button Tuner it is only necessary to push the button for the station you desire.
12. The Push Button Tuner buttons may also be used on the Foreign or Intermediate bands. However, on these bands we recommend that rather than setting a button to a station, you set the buttons to some particular location on the dial where foreign, police, aircraft or amateur stations are frequently received. Attempts to set buttons to short-wave stations are not recommended due to the extreme sharpness of tuning on these bands.
13. Label each button with the call letters of the stations you have selected, using the call letter tabs packed with your receiver. These tabs are to be moistened on their gummed side and inserted in the recesses in the escutcheon, directly above the push buttons.

REMOTE CONTROL UNIT

This Air-Chief radio is designed to permit tuning from a remote point such as your armchair or any point within 20 ft. of the receiver cabinet. A special "Remote Tuner Kit" part No. 114200 is available to adapt your receiver for remote control. It can be purchased from any Firestone Store or Dealer. This accessory kit consists of a remote control unit incorporating eight push buttons and a remote volume control. The unit is connected by a flat flexible cable to an eleven prong plug, which fits into a corresponding socket at the left rear of the receiver chassis. Following are the instructions for installation of the remote control unit:

1. Turn off the radio set.
2. Remove the wire connector which joins the two holes adjoining the white dot on the eleven hole socket. IMPORTANT: If at any time you decide to discontinue the use of the remote control unit, remove the plug and reinsert this wire connector in the two holes adjoining the white dot. Failure to replace the connector will make the set inoperative.
3. Insert the remote control plug in its socket and locate the remote control unit at some convenient point within 20 ft. of the set. The connecting cable may be placed beneath the rug, or along the floor.
4. PRESS IN THE "REMOTE" BUTTON (#10) on the Push Button Tuner and the unit is now ready for operation.

REPLACING THE POINTER DRIVE CORD.

1. Tie one end of 53" of special dial cord (part No.111302) to the spring, which is attached to Lug H.

2. Thread the free end of the cord through hole A in drum C (threading from the inside of the drum out) See Fig. 2.

3. After pulling the cord through hole A, make one half turn around the drum C in a clockwise direction (viewed from the front) using the front groove in the drum.

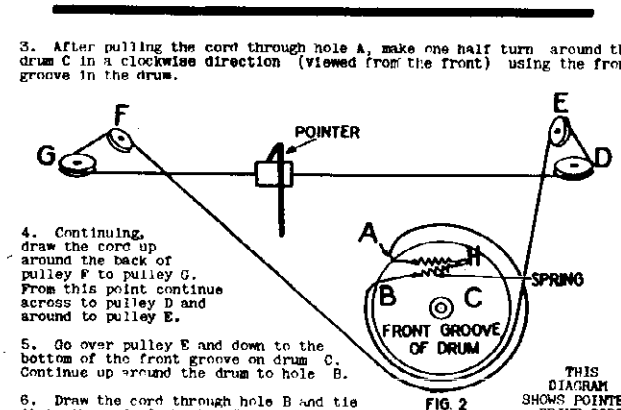

FIG. 2

4. Continuing, draw the cord up around the back of pulley F to pulley G. From this point continue across to pulley D and around to pulley E.

5. Go over pulley E and down to the bottom of the front groove on drum C. Continue up around the drum to hole B.

6. Draw the cord through hole B and tie it to the end of the tension spring in such a manner that when the spring is clipped on to lug H it will be extended to about 1⅜" long.

THIS DIAGRAM SHOWS POINTER DRIVE CORD ONLY

FIRESTONE TIRE & RUBBER CO.

HOW TO SET UP THE PUSH BUTTON TUNER

1. Be sure that your set is connected to a good antenna system.

2. Turn on the set and allow it to operate at least one-quarter hour before setting up the push buttons.

3. Make a list of the frequencies of six nearby stations to which you wish to set up the buttons. Be sure to select nearby, powerful stations, since weak stations will generally give better results when tuned manually. Also BE SURE TO SELECT STATIONS FALLING WITHIN THE TUNING RANGE OF THE INDIVIDUAL BUTTONS, AS INDICATED IN Fig. 1.

Each of the buttons on your Push-Button Tuner has a definite range of frequencies to which it can be tuned as shown in Fig. 1. It is imperative that in setting up the buttons, you select stations whose frequency is in the indicated tuning range of that button. FAILURE TO SELECT THE PROPER BUTTON WILL RESULT IN THE INCORRECT SETTING OF THE TRIMMER ADJUSTING SCREW AND WILL ALSO CAUSE "DRIFTING". The correct frequencies of your local stations may be obtained from your newspaper of radio call magazine. For example, suppose you want to set a button to station WLW whose frequency is 700 kilocycles. Refer to Fig. 1 which shows that this frequency falls within the operating range of buttons No. 3 or No. 4, whose range is 500 to 1000 KC. Therefore either button No. 3 or No. 4 can be used for the automatic tuning of WLW.

4. Remove the escutcheon around the push buttons by taking out the six screws holding it to the cabinet. This will expose to view six pairs of adjusting screws, each pair of which is used to tune in a station that you wish to set-up on a particular button.

5. Turn the band switch (Right hand knob) clockwise until the word "BROADCAST" appears in the lower opening in the dial scale. Then using the tuning knob (Center) tune in the station you desire to set to button No. 3. This is done so that you may identify the station by hearing its program.

6. Now turn the band switch knob to the extreme clockwise position (the word "AUTOMATIC" will now appear in the center dial scale opening). You will note when this switch is turned, the station previously tuned in will not be heard.

7. Now push in the third button from the left (No. 3 in Fig. 10). Using a small screw driver, insert it in the second screw from the left (No. 3a in Fig. 1). Rotate the screw SLOWLY until the program that you have previously tuned in manually is again tuned in. If it cannot be heard, advance the volume control. BE SURE THAT YOU ADJUST THIS PARTICULAR SCREW (3a) UNTIL THE INVERTED "V" SHADOW IN THE "TUNING EYE" IS NARROWEST. It is advisable that you turn the screw in and out so that you will tune across the station several times in order that you may be sure that you have located the correct tuning point.

8. Next insert the screw driver in the first screw on the left (No. 3b, Fig. 1) and turn it until the program is received with maximum volume. The correct position is indicated by the ends of the inverted "V" in the "Tuning Eye" being closest together. Now go back to screw No. 3a and see if any improvement in the reception can be made by adjusting it. Also repeat this adjustment for screw No. 3b.

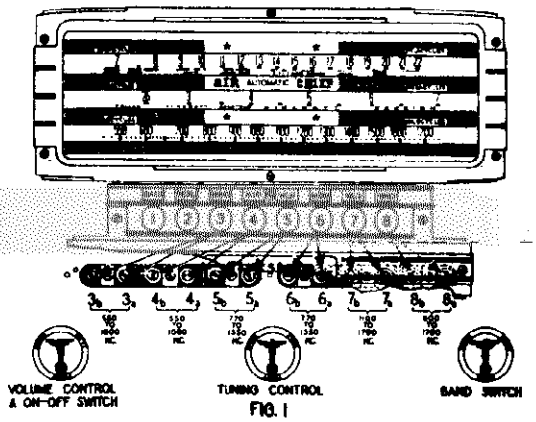

FIG. 1

9. Set up button No. 4 for the selected station in a similar manner, using screws No. 4a and 4b, and proceed to set up the remaining buttons in the same fashion, always tuning in the station initially with the "a" screw for that particular button.

10. Replace the escutcheon with its six retaining screws.

11. Label each button with the call letters of the stations you have selected, using the call letter tabs packed with your receiver. These tabs are to be moistened on their gummed side and inserted in the recesses in the escutcheon, directly above the push buttons.

HOW TO CHANGE THE OPERATING RANGE OF A BUTTON

The operating range of a button may be changed by merely changing the dual trimmer used with that button. Dual trimmers with the ranges indicated below can be obtained from your Firestone Dealer or serviceman under the following part numbers:

Part Number	Tuning Range	List Price
112942	1100 to 1700 KC.	$0.36
114505	770 to 1350 KC.	.45
112944	550 to 1000 KC.	.50

To make the change proceed as follows:

1. Remove the chassis from the cabinet.

2. By referring to Fig. 1, determine the dual trimmer associated with the button whose range you wish to change.

3. Unsolder the lead from the four terminals on the back of this dual trimmer.

4. Remove the 6/32 machine screw holding the dual trimmer to the front of the chassis.

5. From the above list select a dual trimmer which will cover the desired range.

6. Mount it on the front of the chassis with the 6/32 machine screw, and solder the leads to its four terminals. The button is now ready to be set to any strong station whose frequency is within the range of this new trimmer unit.

REPLACING THE DIAL POINTER DRIVE CORD

1. Tie a large knot in one end of about 51" of special dial cord, part No. 111302.

2. Thread the free end of the cord through hole A in drum C (threading from the inside of the drum out) See Fig. 2.

3. After pulling the cord through hole A, make one half turn around the drum C in a clockwise direction (viewed from the front), using the front groove in the drum.

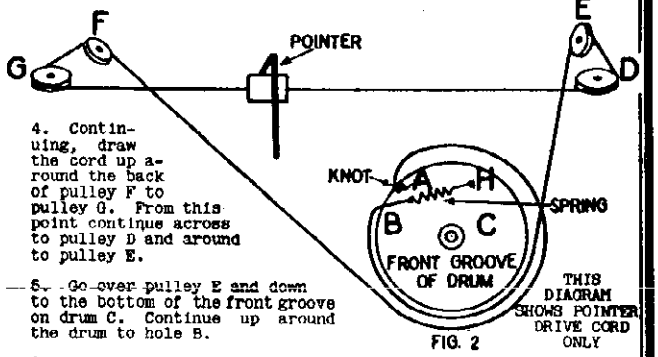

FIG. 2

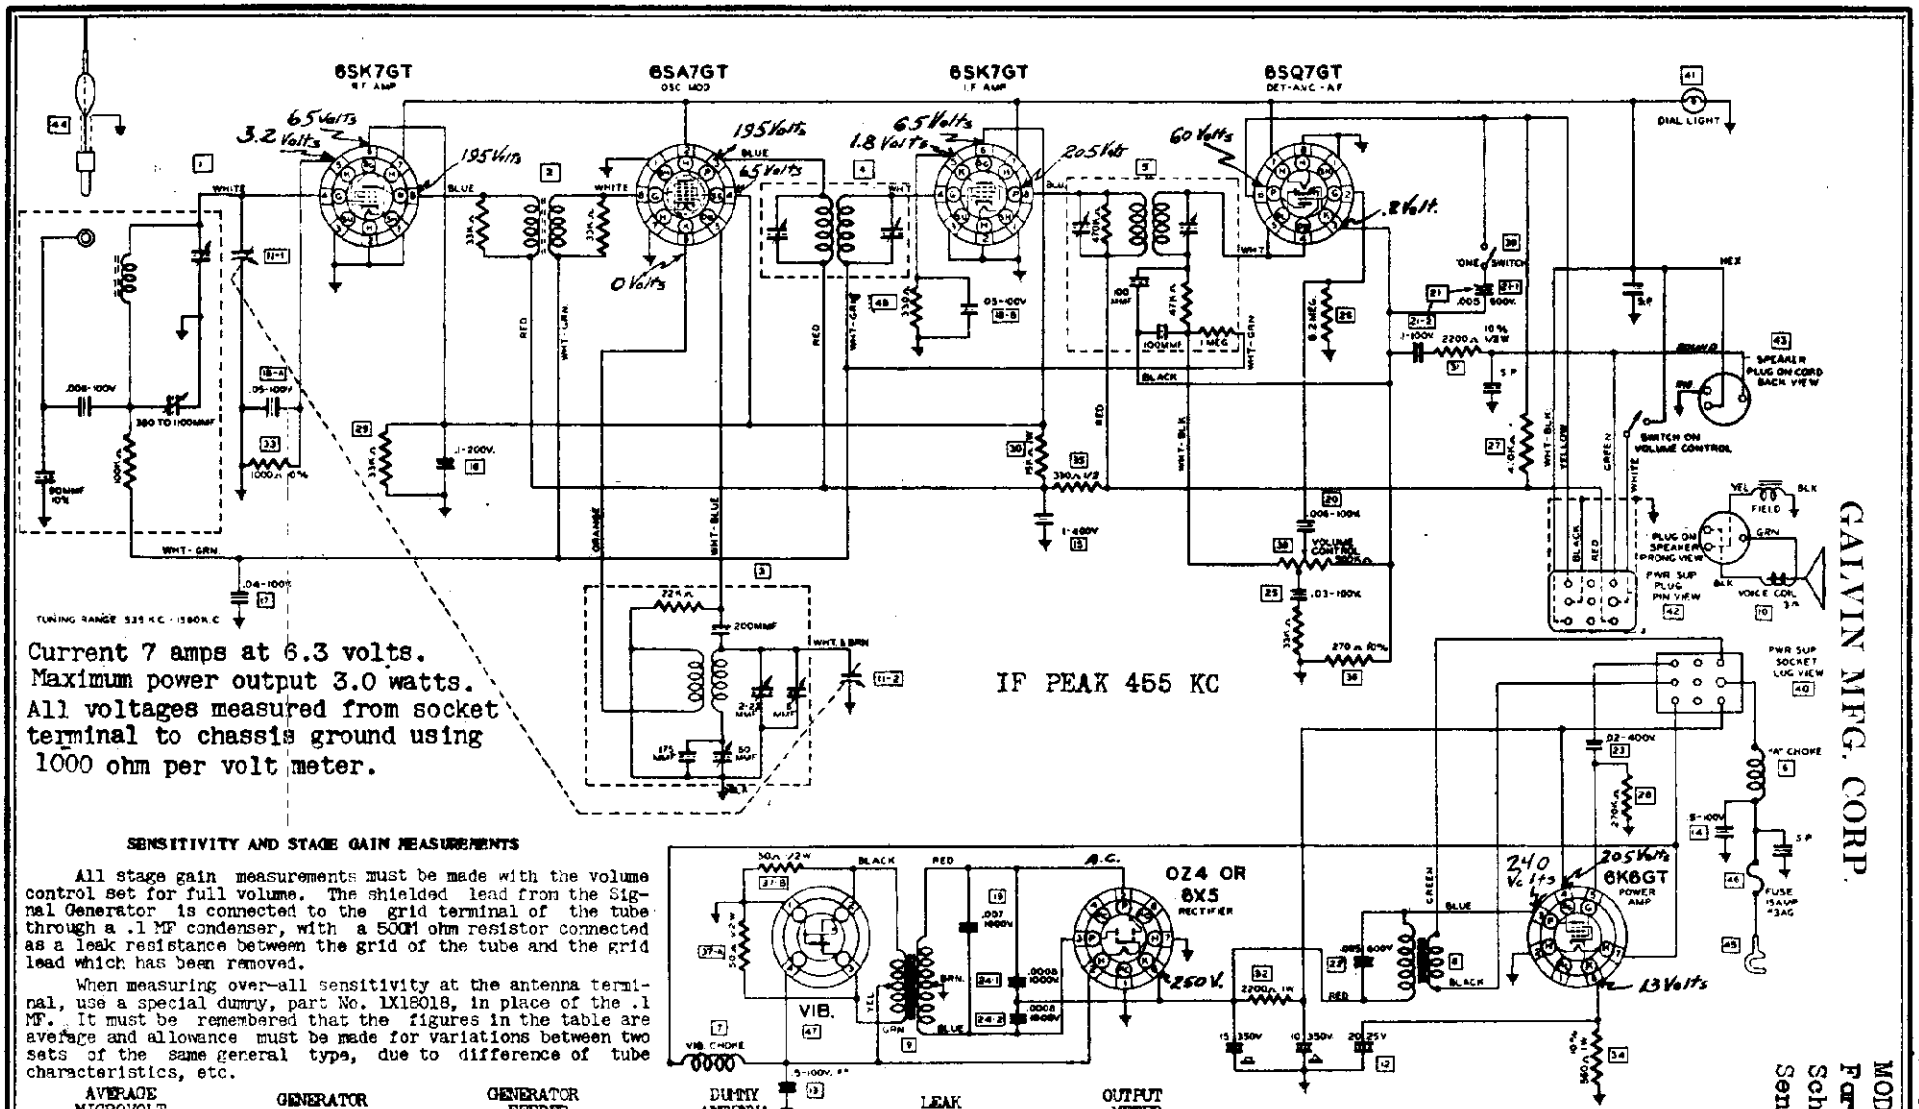
4. Continuing, draw the cord up around the back of pulley F to pulley G. From this point continue across to pulley D and around to pulley E.

5. Go over pulley E and down to the bottom of the front groove on drum C. Continue up around the drum to hole B.

6. Draw the cord through hole B and tie it to the end of the tension spring in such a manner that when the spring is clipped on to lug H it will be extended to about 1¾" long.



Current 7 amps at 6.3 volts.
Maximum power output 3.0 watts.
All voltages measured from socket terminal to chassis ground using 1000 ohm per volt meter.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the Signal Generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a special dummy, part No. 1X18018, in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

AVERAGE MICROVOLT INPUT *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	LEAK RESISTANCE	OUTPUT METER READINGS **
10,000	455 K.C.	I.F. Grid	.1	.5 Meg	1.76
200	455 K.C.	MOD. Grid	.1	.5 Meg	1.76
310	600 K.C.	MOD. Grid	.1	.5 Meg	1.76
26	600 K.C.	R.F. Grid	.1	.5 Meg	1.76
5	600 K.C.	Ant. Lead	***	None	1.76

* For one watt output.
1.76 volts equals 1 watt output for 3 ohm voice coil.
** Meter connected across voice coil.
*** Use special dummy part No. 1X18018 or M434B Booster Coil No. 17908 in series with a 25 MMF condenser.
NOTE: If set is not used with a Motorola Booster antenna, substitute a 40 MMF condenser for the Special Dummy.

TO INSTALL IN 1940 FORD & MERCURY

GALVIN MFG. CORP.

MODEL 25F
Ford, Mercury
Schematic, Voltage
Sensitivity, Gain

MODEL 25F
Alignment, Socket Trimmers, Notes Dial Assembly

GALVIN MFG. CORP.

ALIGNMENT PROCEDURE

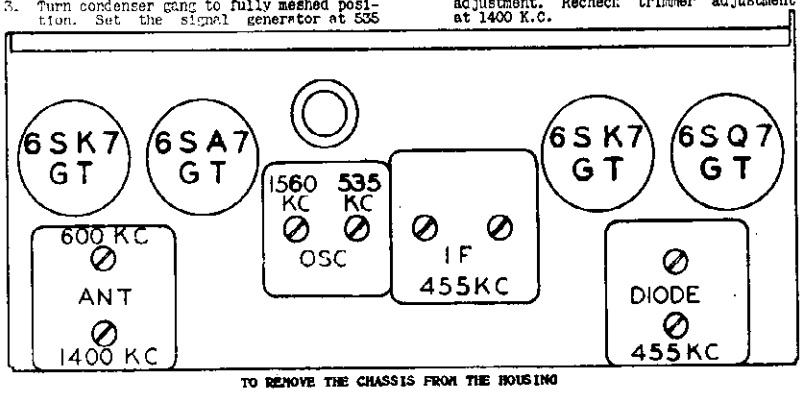
Remove the back cover (D) and place the radio on the service bench. Turn the volume control to maximum and leave it there throughout the alignment, reducing the signal generator output, if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid. (terminal No. 8) of the 6SA7GT oscillator -- modulator tube and to chassis ground using a .1 MFD. condenser in series with lead. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 455 K.C. and carefully adjust the two trimmers in the diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator, if necessary, to pick up signal.).
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

1. If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No. 1X18018 should be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.
2. Set the signal generator at 1560 K.C. and with the condenser gang still completely out of mesh, adjust the 1560 K.C. trimmer in the oscillator coil can to the point showing the highest output reading.
3. Turn condenser gang to fully meshed position. Set the signal generator at 535 K.C. and adjust the 535 K.C. oscillator pad in the oscillator coil can to point showing highest reading.
4. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the 1400 K.C. antenna trimmer in the antenna coil can to point showing highest reading.
5. Set the signal generator at 600 K.C. and turn the condenser gang until the pointer reads 600 K.C. while adjusting the antenna padder to point showing highest output reading. Rock the gang while making this adjustment. Recheck trimmer adjustment at 1400 K.C.



TO REMOVE THE CHASSIS FROM THE HOUSING

1. Place the radio in an upside down position on the service bench. (See Fig. 4)
2. Disconnect the speaker plug.
3. Remove the speaker mounting bracket (C) from the set housing and speaker support bracket (B). (4 screws)
4. Pull the push-buttons off.
5. Remove the chrome medallion plate (2 screws)
6. Remove the celluloid dial background (2 snap-in plugs)
7. Remove the top cover (A) (13 screws). Lift the dial light assembly off of the front cover.
8. Remove the speaker support bracket (B). (2 screws)
9. Turn radio over in an upright position. Remove 11 screws from the back cover (D).
10. Lay set on side and remove the remaining 3 screws on the back cover - (14 screws.)
11. Remove the remaining 8 screws from the housing and unsolder the various leads from the spark plate assembly. (See Fig. 5)

Note: When remounting, the long screw is to be used in position along side the antenna receptacle.

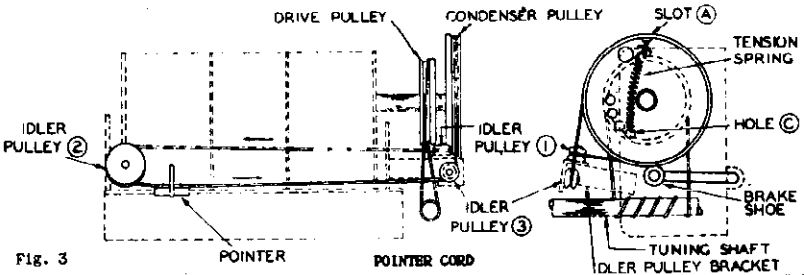


Fig. 3

1. Remove the chassis from the housing, and place on service bench.
2. Remove broken string.
3. Set condenser gang to fully closed position.
4. Cut a length of 30 lb. silk fish cord 27 inches long.
5. Thread one end of cord through slot "A" in condenser pulley and with an ordinary paper clip fasten it to the idler pulley bracket to hold in place. (See Fig. 3)
6. In a clock-wise direction run cord around condenser pulley, under brake shoe and over to idler pulley No.1 and around it in a clockwise direction.
7. Route string across chassis to idler pulley No. 2 and around it in a counter-clockwise direction.
8. Route cord back across chassis and up under idler pulley No. 3.
9. Route cord up and around condenser pulley 1/4 turn to slot "A".
10. Remove the paper clip from end of cord and knot the two ends of cord together inside of drive pulley. Fasten one end of the tension spring (41A 11091) to cord and the other end to hole "C" in the condenser pulley.
11. Cut off surplus cord.
12. To set pointer to correct frequency, tune in a station of known frequency and adjust pointer on string.

TUNING CORD

1. Remove the chassis from the housing, and place on service bench.
2. Remove the broken string.
3. Turn the condenser gang to fully meshed position.
4. Cut a length of 30 lb. silk fish cord 25 inches long.
5. Thread one end of cord thru hole (X) in drive pulley and with an ordinary paper clip fasten to tuning control bracket so that cord will stay in place.
6. In a clock-wise direction, wind cord one half turn around drive pulley and down to tuning shaft. (See Fig. 2)
7. Route cord 7 turns around tuning shaft as shown in Fig. 2 and up to drive pulley.
8. Continue in a clock-wise direction, one full turn to hole (X).
9. Knot the two ends of cord together inside of drive pulley and fasten one end of spring (41A14769) to cord and the other end to hole (Y) in drive pulley.
10. Cut off surplus cord.

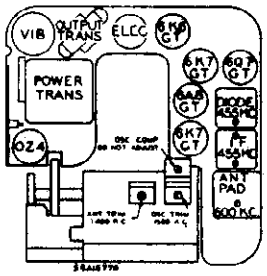
TO REMOVE CHASSIS FROM HOUSING

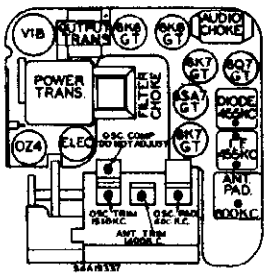
1. Lay the radio face down on the service bench and remove the back cover by removing the two thumb screws.
2. Remove the rattle clip from the housing which is bonded to the push button assembly, and pull the speaker pin terminals from their receptacles. Also remove the dial light from its mounting bracket.
3. Remove the sliminode assembly (2 screws).
4. Remove the screw along side of the antenna receptacle.
5. Turn the radio over on its back.
6. Pull the push buttons out.
7. Remove the four housing screws located near the medallion plate, but do not remove the four screws that hold the medallion plate to the housing.
8. Remove the 3 screws from each side of the housing (12 screws).
9. Remove the volume control bushing.
10. Turn the set over on its face.
11. Pull the wrap around housing off from the back.
12. Lift the front cover off.

CAUTION: When the front plate is reassembled to the chassis, make sure the tuning shaft does not bind in its bushing, thereby causing the push buttons to work hard.

NOTE: Some screws are longer than others and they must be put back in original positions so that no short circuits will occur.



MODEL 26-C
Figure 1



MODEL 26-C7
Figure 2

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Turn the volume control to maximum and leave it there throughout the alignment, reducing the signal generator output, if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid of the oscillator tube and to chassis ground using a .1 Mfd. condenser in series with lead. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 455 K.C. and carefully adjust the trimmer in the diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator, if necessary, to pick up signal.)
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

1. If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No. 1X18018 must be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.
2. Set the signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.
3. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.
4. Set the signal generator at 600 K.C. and turn the condenser gang until the dial pointer reads 600 K.C. Adjust the oscillator padder to point giving highest output reading.
5. Adjust the antenna padder located in the copper antenna coil can to the point giving the highest output reading.

NOTE: Step No. 4 is for Model 26-C-7 only. There is no 600 K.C. oscillator padder in the 26-C.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the Signal Generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500 M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring overall-sensitivity at the antenna terminal, use a special dummy, part No. 1X18010, in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same type, due to difference of tube characteristics, etc.

26-C Average Microvolt Input *	26C-7 Average Microvolt Input *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	LEAK RESISTANCE	OUTPUT METER READINGS **
8200	7000	465 K.C.	I.F. Grid	.1	.5 Meg	1.76
145	190	465 K.C.	MOD. Grid	.1	.5 Meg	1.76
160	215	600 K.C.	MOD. Grid	.1	.5 Meg	1.76
42	.55	600 K.C.	R.F. Grid	.1	.5 Meg	1.76
5	3	600 K.C.	Ant. Lead	***	None	1.76

* For one watt output.
** Meter connected across voice coil.
1.76 volts equals 1 watt output for 3 ohm voice coil.
*** Use special dummy part No. 1X18018 or M4849 Booster Coil No. 17908 in series with a 25 MMF condenser.
NOTE: If set is not used with a Motorola Booster antenna, substitute a 40 MMF condenser for the Special Dummy.

TUNING CORD

1. Remove the chassis from the housing, and place on service bench.
2. Remove the broken string.
3. Turn the condenser gang to fully meshed position.
4. Cut a length of 30 lb. silk fish cord 27 inches long.
5. Thread one end of cord thru Slot B in drive pulley and with an ordinary paper clip fasten to tuning control bracket so that cord will stay in place.
6. In a clock-wise direction, wind cord one full turn around drive pulley and up to tuning shaft. (See Fig. 3.)
7. Route cord 7 turns around tuning shaft as shown in Fig. 3 and down to drive pulley.
8. Continue in a clock-wise direction, three quarter turns to slot "B".
9. Knot the two ends of cord together inside of drive pulley and fasten one end of spring to cord and the other end to hole (C) in condenser pulley.
10. Cut off surplus cord.

POINTER CORD

1. Remove the chassis from housing and place on service bench.
2. Remove broken string.
3. Set condenser gang to fully open position.
4. Cut a length of 30 lb. silk fish cord 29 inches long.
5. Thread one end of cord thru slot A in condenser pulley and with an ordinary paper clip fasten it to the tuning shaft bracket to hold in place. (See Fig. 4.)
6. In a clock-wise direction run cord around condenser pulley, under brake shoe and over to idler pulley No. 3 and around it in counter-clockwise direction.
7. Route string across chassis to idler pulley No.2 and around it in a counter-clockwise direction.
8. Route cord back across chassis and down over idler pulley No. 1.
9. Route cord down and around condenser pulley 1/2 turn to slot "A".
10. Remove the paper clip from end of cord and knot the two ends of cord together inside of drive pulley and fasten one end of spring to cord and the other end to hook in condenser pulley.
11. Cut off surplus cord.
12. To set pointer to correct frequency, tune in a station of known frequency and adjust pointer on string.

Sensitivity, Dial Drive

GALVIN MFG. CORP.

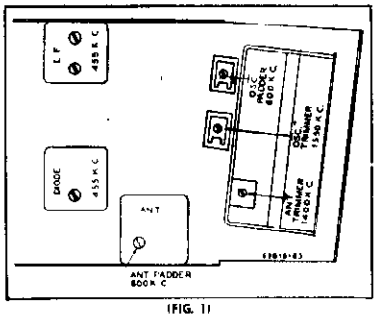
ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary. Fig. 1 shows trimmer locations.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid (terminal No. 8) of the 6SA7GT oscillator-modulator tube thru a .1 MF condenser and to chassis ground. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 455 K.C. and carefully adjust the trimmer in the diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator, if necessary, to pick up signal.)



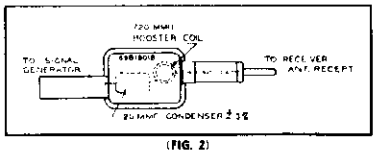
(FIG. 1)

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

NOTE:—A special dummy antenna, Motorola part 1X18018 should be used in series with the lead from the signal generator to the antenna receptacle, if the receiver is to be operated on a Motorola Booster antenna. If the car antenna is not Booster equipped, use a 50 MMF condenser instead. See Fig. 2.

1. Change the signal generator connection to the antenna lead, using the special dummy.
2. Set the signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.
3. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.
4. Set the signal generator at 600 K.C. and turn the condenser gang until the dial pointer reads 600 K.C. Adjust the oscillator padder to point giving highest output reading. Also adjust the antenna padder located in the copper antenna coil can to the point giving the highest output reading. (DO NOT ROCK GANG FOR EITHER ADJUSTMENT).



(FIG. 2)

REMOVING CHASSIS FROM HOUSING

1. Lay the radio on the service bench on its right side.
2. Remove the left hand side of the housing by taking off the thumb nut.
3. Leave the radio in this position.
4. Remove the seven screws on the right hand side of the housing, including the two which hold the "A" lead clips.
5. Now remove the six screws from the other side.
6. Turn the radio over so that it is in an upright position.
7. Remove speaker cable and grommet from slot in housing.
8. Remove right hand side of housing, after removing the hex nut. *Do not remove the two screws in the right hand side of the control head.*
9. Now pull chassis out of housing, guiding "A" lead out carefully.
10. When placing the chassis back in the housing, the long self-tapping screw is to be used in the position along side of the antenna receptacle.
11. Be sure "A" battery wire is routed as it was originally and held securely under the cable clips.

SENSITIVITY AND STAGE GAIN MEASUREMENT

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a special dummy part *#1X18018* in place of the .1 MF.*** It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

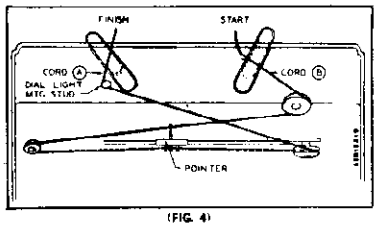
(FIG. 3)

All measurements from chassis ground to socket terminal using 1000 ohms per volt meter.
Current consumption—8 amps. Battery voltage—6.3.
Maximum power output—5 watts.

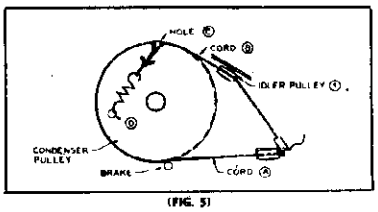
POINTER CORD

1. Remove push buttons and dial light assembly.
2. Cut broken dial cord and remove control head from chassis.
   (This requires removal of 2 self-tapping screws from right hand side of head and removal of "C" washer from volume control shaft.)
3. Cut 30 inch length of 30# test silk fish cord.
4. Lay control head on service bench and route cord around the three idler pulleys exactly as shown in Fig. 4.
5. Adjust cord so both ends are approximately equal length and clip to control head as shown in Fig. 4.
6. Set dial pointer at approximately 550 K.C. on dial scale and interlace cord in pointer clips.
7. Mount control head assembly back on chassis with 2 self tapping screws. Replace "C" washer on volume control shaft.



(FIG. 4)

8. Set gang to fully meshed position. This will place hole in condenser pulley at the top.
9. Remove paper clip from cord "A" and fish end of cord under brake shoe and around condenser pulley ½ turn to hole "C". Thread end of cord thru hole (C) and clip to control head. (See Fig. 5)
10. Remove paper clip from cord "B" and route cord the short distance from idler pulley No. 1 to hole "C" in condenser pulley.
11. Tie both ends of cord together inside pulley, then tie in tension spring (41A11091). Hook other end of spring in hole (D). Cut off surplus cord.
12. Replace dial light.
13. Tune in station of known frequency and adjust dial pointer to correct dial reading.
14. Reassemble in housing.



(FIG. 5)

TUNING CORD

1. Remove the chassis from the housing, and place on service bench with the tubes up.
2. Remove the broken string.
3. Turn the condenser gang to fully meshed position.
4. Cut a length of 30# silk fish cord 25 inches long.
5. Thread one end of cord thru hole (x) in drive pulley and with an ordinary paper clip fasten to volume control bracket so that cord will stay in place.
6. In a counter-clockwise direction, wind cord one full turn around drive pulley and down to tuning shaft. (See Fig. 3)
7. Wind cord in clockwise direction 7 turns around tuning shaft and up to drive pulley.
8. Continue in a counter-clockwise direction, three quarter turns to hole (x).
9. Knot the two ends of cord together inside of drive pulley and fasten one end of spring (41A14759) to cord and the other end to hole (Y) in condenser pulley.
10. Cut off surplus cord.

1.76 volts equals 1 watt output for 3 ohm voice coil.
*** Use special dummy part No. 1X18018 or M434B Booster Coil No. 17908 in series with a 25 MMF condenser.
NOTE: If set is not used with a Motorola Booster antenna, substitute a 50 MMF condenser for the Special Dummy.

TO REMOVE CHASSIS FROM HOUSING AND DIAL CORD INSTRUCTIONS SEE INDEX(MODEL 26-C).

Model 35-N
SPECIFICALLY DESIGNED TO INSTALL IN 1940 NASH

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Turn the volume control to maximum and leave it there throughout the alignment, reducing the signal generator output, if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid (terminal No.8) of the 6SA7GT oscillator—modulator tube and to chassis ground using a .1 Mfd. condenser in series with lead. Turn the condenser gang completely out of mesh. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 455 K.C. and carefully adjust the two trimmers in the diode coil can to the point showing the highest reading on the output meter. See Fig.1 (Advance the signal generator attenuator, if necessary, to pick up signal.)
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

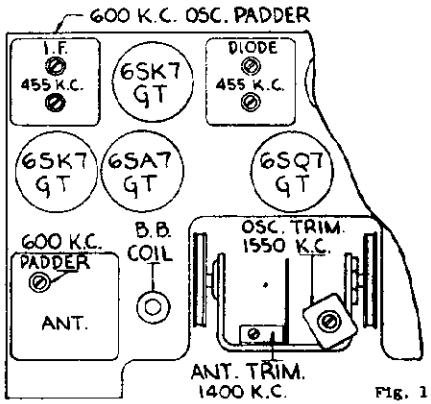

Fig. 1

R. F. ALIGNMENT

1. If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No.1X18018 must be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.

2. Set the signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.

3. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang to the point showing the highest output reading.

4. Set the signal generator at 600 K.C. and turn the condenser gang until the dial pointer reads 600 K.C. Adjust the oscillator padder to point giving highest output reading. Also adjust the antenna padder located in the copper antenna coil can to the point giving the highest output reading. (Do not rock gang for either adjustment.)

DIAL CORD INSTRUCTIONS

1. Remove the chassis from the housing.
2. Remove the front cover, after first removing the following items:
   (a) Dial scale (4 self-tapping screws)
   (b) Two self-tapping screws above the volume and tuning shafts.
   (c) Knobs.
   (d) "C" washer on volume control shaft.
   (e) Speaker pin terminals.
3. Remove broken cord.
4. Set gang in 3/4 mesh position.
5. Cut a 26 inch length of silk fish cord and thread through hole "A", temporarily clipping the end to the push-button assembly to hold in place.
6. Wind cord counter-clockwise around condenser pulley and through slot in front of push-button assembly.
7. Run cord around pulley 1, counter-clockwise and across chassis to idler pulley 2. See Fig.2.
8. Continue cord around idler pulley 2, in counter-clockwise direction.
9. Run cord across chassis to idler pulley 3.
10. Continue cord around idler pulley 3, in clockwise direction.
11. Wind cord around condenser pulley in counter-clockwise direction and down to slot "A".
12. Knot both ends of cord together inside of pulley and tie in tension spring.
13. Attach other end of spring to hook and cut off surplus cord.
14. To set pointer to correct frequency, tune in a station of known frequency, and adjust pointer on string to correct dial reading.
15. Reassemble in housing.

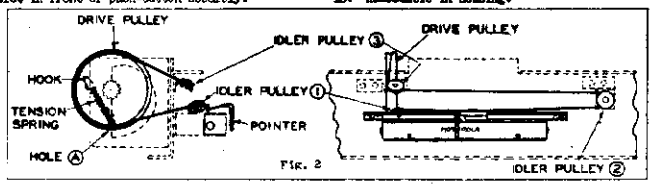

Fig. 2

Buick, 194
Schematic

Motorola

MODEL 29-B RADIO

ALIGNMENT PROCEDURE

Remove the chassis from its housing and place it on the service bench. Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid (terminal No. 6) of the 6SA7GT oscillator-modulator tube and to chassis ground. Turn the condenser gang completely out of mesh. Connect and output meter across the speaker voice coil. Use .1 MF condenser in signal generator lead.
2. Set the signal generator at 455 K.C. and carefully adjust the two trimmers in the Diode coil can to the point showing the highest reading on the output meter. (Advance the signal generator attenuator, if necessary, to pick up signal.)
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

R. F. ALIGNMENT

1. Change the signal generator connection to the antenna lead, using a 50 MMF condenser in series with it.
2. Set the signal generator at 1550 K.C. and with the condenser gang still completely out of mesh, adjust the oscillator trimmer to the point showing the highest output reading.
3. Set the signal generator at 1400 K.C. and turn the condenser gang to the signal at 1400 K.C. Adjust the antenna trimmer on the condenser gang (Through hole in chassis base) to the point showing the highest output reading.
4. Set the signal generator at 600 K.C. and turn the condenser gang until the dial pointer reads 600 K.C. Adjust the oscillator padder to point giving highest output reading. Also adjust the antenna padder located in the copper antenna coil can to the point giving the highest output reading. (DO NOT ROCK GANG FOR EITHER ADJUSTMENT)

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 50 MMF condenser in place of .1 MF.

The figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

* 7A7 Loctal tube was used in some chassis.

Current 7.1 Amp. at 6.1 Volts

Maximum power output 10 Watts.

TO REMOVE CHASSIS FROM HOUSING

1. Remove the eliminode assembly on the right side of chassis. (2 screws)
2. Remove the bottom cover (4 thumb screws) Then pull back.
3. Remove the 9 screws around the top and 2 sides of the front.
4. Remove the 3 remaining screws on the right side of the housing.
5. Remove the 3 remaining screws on the left side of the housing, including the one adjacent to the antenna receptacle.
6. Remove the 3 screws on the back of the housing.
7. Lay the radio face down on the service bench and lift the housing off.
8. When remounting, the long screw is to be used in position along side of antenna receptacle.
9. The eliminode assembly is to be mounted last.

POINTER CORD

1. Remove the chassis from housing.
2. Pull out the five push-buttons.
3. Remove the four screws which hold the escutcheon and remove same from front cover.
4. Remove broken cord.
5. Rotate condenser gang to fully meshed position.
6. Cut 28 inch length of 30 pound silk fish cord.
7. Thread one end of cord through slot (A). This is the slot nearest the front of chassis when condenser is fully meshed.
8. Run cord up and over rear idler pulley No. 1 in clockwise direction.
9. Continue cord across chassis to idler pulley No. 2 and around it in a clockwise direction.
10. Run cord back across chassis to front idler pulley No. 3 and around it in clockwise direction.
11. Run cord under brake shoe and around condenser pulley to slot (A).
12. Thread through slot (A).
13. Knot both ends of cord securely inside the slot.
14. Tie in one end of tension spring (41A11091) and hook other end of tension spring onto hook in condenser pulley.
15. Lace dial cord through hooks in dial pointer.
16. To set pointer to correct frequency, tune in a station of known frequency and adjust position of pointer on string.
17. Remount escutcheon plate.

Model 29-B

TO INSTALL IN 1940 BUICK

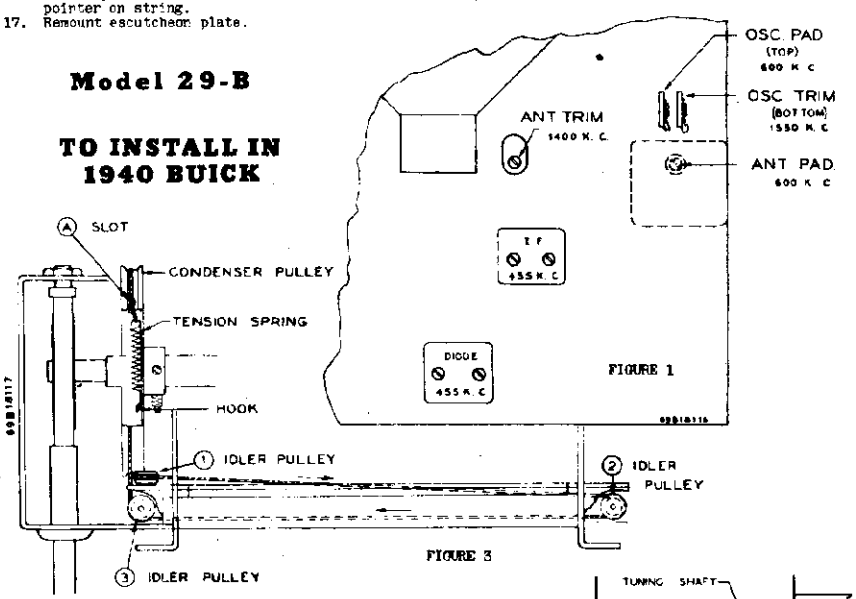

FIGURE 1

FIGURE 3

DIAL DRIVE CORD

1. Remove the chassis from the housing, and place on service bench with the tubes up.
2. Remove the broken string.
3. Turn the condenser gang to fully meshed position.
4. Cut a length of 30# silk fish cord 26 inches long.
5. Thread one end of cord through slot in drive pulley and with an ordinary paper clip fasten to tuning shaft bracket so that cord will stay in place.
6. In a counter clock-wise direction wind cord one full turn around drive pulley and up to tuning shaft.
7. Wind cord in clock-wise direction 7 turns around tuning shaft and down to drive pulley.
8. In a counter clock-wise direction, wind cord around drive pulley to slot (B).
9. Knot the two ends of cord together inside of drive pulley and fasten one end of spring (41A14759) to cord and the other end to hole in condenser pulley.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a 200 MMF condenser in place of .1 MF.

To measure over-all sensitivity of loop models, connect the signal generator to the coupling turn in the loop, using a 400 ohm dummy. The lead, including the resistor should be thoroughly shielded and the receiver must be at least 3 ft. away from the signal generator.

The figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

Models 5A and 5AA

** Output meter connected across voice coil.
.45 Volts equals 1 Watt output.
V.C. resistance — 5 ohms.

6 Tube Chassis

TO RESTRING DIAL DRIVE CORD

1. Remove dial crystal, pointer, dial scale and plate.
2. Cut a length of silk fish cord approximately 24 inches long.
3. Thread one end of cord through hole "A" in condenser pulley and clip it to the chassis with a paper clip.
4. Continue other end of cord over idler pulley "B" and down to tuning shaft. Make two turns counter-clockwise around tuning shaft. (See Fig. 3.)
5. Continue cord up to pointer pulley making one turn around it counter-clockwise.
6. Take cord over idler pulley "C" and around condenser pulley to the hole "A".
7. Tie both ends of cord together inside hole "A".
8. Tie in one end of tension spring and hook the free end of the spring in hole "D". Cut off surplus cord.

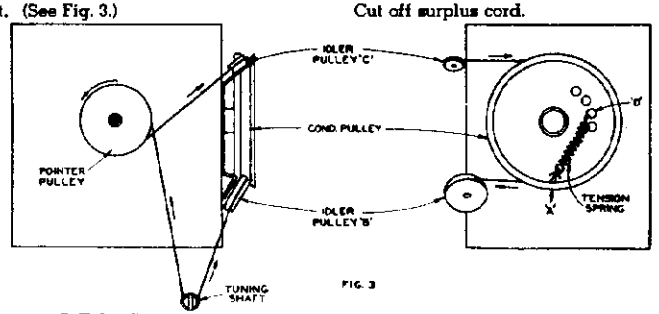

FIG. 3

5 Tube Chassis

TO RESTRING DIAL DRIVE CORD

1. Remove dial crystal, pointer, dial scale, and plate.
2. Cut a length of silk fish cord approximately 12 inches long.
3. Make two turns with cord around tuning shaft. (See Fig. 2.)
4. Continue both ends of cord around condenser pulley in opposite directions until they meet at the hole (A) in the rim of the pulley.
5. Thread both ends through the hole and tie them securely together inside the hole.
6. Tie in the dial cord tension spring and hook the free end of the spring in the hole (B). Cut off surplus cord.

* For .05 Watt output.

** Output meter connected across voice coil.

ALIGNMENT PROCEDURE
MODELS 61C AND 61D (WITHOUT LOOP ANTENNA)

1. Connect signal generator to control grid of 1st Det. tube (6A7) through a .05 MF. condenser. Do not remove grid cap. Also connect output meter across speaker voice coil. Turn band switch to "Broadcast" position. Turn condenser gang completely out of mesh.
2. Set signal generator at 455 K.C. and carefully adjust the four I.F. trimmers (located in top of I.F. coil cans) to point showing highest reading on output meter.
3. Leave band switch in "Broadcast" position. Connect signal generator to antenna and ground terminals, using a .0002 MF condenser in antenna lead. (Antenna — blue wire; ground — black wire.)
4. Set signal generator at 1750 K.C. Adjust BC OSC. trimmer until 1750 K.C. signal is heard.
5. Set signal generator at 1400 K.C. and turn condenser gang to signal at 1400 K.C. Adjust BC ANT. trimmer to point showing highest reading on output meter.
6. Set signal generator at 600 K.C. and rock pointer at 600 K.C. position on dial scale, while adjusting BC padder, until combination is found which gives highest output reading. (NOTE: If there is noise level at 600 K.C., padder can be adjusted to maximum noise without rocking gang and without use of signal generator. Use short wire for pick-up if necessary.
7. Turn band switch to "Short Wave" position. Replace .0002 MF condenser in signal generator lead with a 400 ohm carbon resistor.
8. Set signal generator and receiver dial both at 18.0 MC. Adjust S.W. OSC. trimmer until 18.0 MC signal is heard.
9. Set signal generator at 16.0 MC and turn condenser gang to signal at 16.0 MC. Adjust S.W. ANT. trimmer to point giving greatest output reading.
10. Set signal generator at 6.0 MC and rock pointer at 6.0 MC position on dial scale, while adjusting S.W. padder, until combination is found which gives highest output reading. (NOTE: May also be adjusted to maximum noise.)

MODEL 61D WITH LOOP ANTENNA

1. Loop should be connected to chassis during alignment.
2. Alignment procedure is the same as above except for step 5, which should be omitted, as there is no BC ANT. trimmer in the loop version of this model.

MODEL 81C WITH CYLINDRICAL LOOP

1. When the chassis is aligned on the service bench, the loop may be disconnected if the WHITE and BLUE pin terminals are clipped or wired together. See Fig. 2 for trimmer locations.
2. Alignment procedure is the same as for Model 61C, plus the wave trap adjustment which is as follows:
3. Feed 455 KC signal into antenna lead and adjust wave trap trimmer to minimum reading on output meter.

MODEL 81C WITH SQUARE LOOP

1. Loop should be connected to chassis during alignment.
2. Alignment procedure is the same as for Model 61C except for Step 5, which should be omitted, as there is no BC ANT. trimmer in this model.
3. There is no wave trap adjustment.

CHECKING CLOCK CONTINUITY

Although we have sealed the Time Tuning Clock against unauthorized tinkering, and have established a policy of voiding the guarantee if the seal is broken, it is possible to completely check the clock circuit for defects without removing the mechanism from its housing. This can be done by "ear" and by continuity.

The first step in checking a clock is to make sure that the motor runs and that it keeps accurate time. Just plug it into its receptacle on the chassis and check its time-keeping qualities against a known source of accurate time.

If this test indicates that the clock motor is not running, it would be advisable to make certain that the receptacle on the chassis base is "live" and that 110 volts, 60 cycle A.C. is available at that point.

Before attempting to check the clock continuity, it would be helpful to go through a little practice course in listening to the sounds the clock makes. First, remove the clock assembly from its mounting on the control panel of the receiver, and hold it in your hands while you turn the time set knob on the back. While turning the knob, hold the clock up to your ear, listening for the clicks. When the minute hand passes any of the four quarter-hour intervals into which each hour is divided, you will hear two clicks, the second of which falls very closely after the first one. These clicks are caused by the quarter-hour cam switch blades dropping off of the cams.

As you turn the time set knob, you will notice another single click which is a little louder and sounds a trifle more metallic than the double click which you get at the exact quarter-hour intervals. This single click will be heard when the minute hand is passing a point that is approximately half way between the quarter-hour positions. This click is caused by the contact on the twenty-four hour hand as it falls off of one time bar to make contact upon the next time bar.

If you will go through this operation several times, you will soon be able to identify these sounds. Once you are able to recognize them, you will be able to thoroughly check the continuity of the clock control circuit, without the necessity of looking inside the mechanism. Proceed as follows:

1. With the time set knob, turn the clock hands until they read fifteen minutes to twelve on the day cycle. Look through the peep-hole to make sure of this.
2. Slowly turn the time set knob forward until the minute hand indicates approximately two minutes to twelve. In the course of this movement you will hear, unless the clock is defective, a single click which indicates that the twenty-four hour contact has come to rest upon the twelve o'clock noon time bar.
3. Now *very slowly* continue to turn the time set knob forward until you hear the first click, which indicates that the top blade of the twenty-four hour cam switch has fallen off of the large cam, causing the cam switch circuit to close. As soon as you hear this first click, stop turning the time set knob, for if you turn it far enough to hear the second click, the contact will be broken. The trick is to turn it just far enough, but not too far.
4. Clear the clock of all previous settings by inserting a finger in the "OFF" position of the finger dial, and dialing counter-clockwise until the stop is reached.
5. With the round time-selecting knob on the front of the clock, turn the red time selecting pointer to 12:00 o'clock noon.
6. With a continuity meter, check continuity between Terminal No. 9 and all of the other terminals on the plug at the end of the clock cable. You should get no reading. Terminal No. 9 is connected to the common lead.
7. Dial the "OFF" position just as you would if you were setting up the clock to turn the radio off at 12:00 o'clock noon. Check continuity between Terminal No. 9 and Terminal No. 7. You should get a full scale reading indicating a complete circuit. (Terminal No. 7 connects to the off relay when the clock is plugged into the chassis).
8. Dial Station No. 1 and check continuity between Terminal No. 9 and Terminal No. 1 of the clock cable. A full scale reading should result.
9. In their respective order, dial Stations 2, 3, 4, 5, and 6, checking continuity after each dialing between Terminal No. 9 and Terminals 2, 3, 4, 5, and 6, respectively. In each case you should get a full scale deflection of your continuity meter between Terminal No. 9 and the terminal which corresponds in number to the position you have dialed on the finger ring.

The procedure through which you have gone up to this point will, if the proper readings have been obtained, tell you that the slider on the time bar which represents the 12:00 o'clock noon position, is making a proper contact with each of the station rings and the "OFF" ring in the clock.

10. Next turn the clock hands knob to the 12:15 o'clock position, also turn the red time-selecting pointer to the 12:15 o'clock position, and repeat Steps 1 to 9 for the 12:15 o'clock position. To check the clock 100%, it will be necessary to repeat the procedure ninety-six times, one for each fifteen minute interval of the twenty-four hour day.

However, if the test which you have made at the 12:00 o'clock noon position shows the mechanism to be O.K. it should not be necessary to go through the entire operation. A test made at 12:00 o'clock noon and 12:00 o'clock midnight, and tests at 6:00 A.M. and 6:00 P.M. should give you a fairly accurate test. However, it is possible that, due to damage or improper adjustment of one individual time bar or slider, the clock fails to operate at one particular quarter-hour period, although it operates as it should at all other times. In this case, a continuity test would be advisable at the particular time setting at which failure has been noted.

ELECTRIC TUNER SERVICE SUGGESTIONS

Following you will find a list of troubles you may experience with the automatic tuning system.

Each possible failure is followed by suggestions which may aid you in quickly solving your service problems with this model.

MOTOR DOES NOT RUN

1. Burned out 84 Tube (Black). This is a standby tube and should burn at all times.
2. ***Poor Contact at Push-Button Plug.*** Inspect the contacts between the plug and the receptacle on the chassis.
3. ***Open Circuit in Motor.*** Check all connections to motor and check motor winding for continuity.
4. 70 Mfd. motor starting condenser opened.
5. Motor magnet coil opened. (See Fig. 3.)
6. B plus fuse (No. 55 Pilot bulb) burned out. Accessible from rear of chassis base. (See Fig. 1.)
7. ***Magnet Fails To Release.*** If the magnet which has previously been energized, fails to release the latch bar for any reason, the motor cannot turn the mechanism.

MECHANISM RUNS SLUGGISHLY

1. ***Poor Contact Between Push-Button Plug and Receptacle.*** This will also result in voltage drop, and lessened motor power.
2. Tension on motor contact armature too great.
3. ***Gears Not Properly Meshed.*** Check all gears in assembly for binding due to improper meshing.
4. ***Defective Motor.***—Replace.

MOTOR FAILS TO REVERSE

1. ***Reversing Switch Not Properly Adjusted.*** See instructions elsewhere in this book.
2. ***Open Circuit in Motor.*** If one side of motor circuit is open, motor will run in one direction only.
3. ***Open Magnet Winding.*** An open magnet, will not pull latch down; consequently will not cause motor switch to reverse.
4. ***Latch Bar Spring Too Tight.*** If the latch bars operate under too much tension the magnet may not be able to pull the latch down.

FAILS TO RETAIN ORIGINAL SETTING

1. ***Latch Rings Not Locked Securely.*** The locking screw must be pulled down securely, otherwise, the shock of the sudden stopping will tend to slide the rings away from the original setting.
2. ***Original Setting Not Accurate.*** Resetting of magnets may be necessary after several days' use, during which time the mechanism goes thru a "Shaking down" process.
3. Cable assembly from station magnets touching latch bars. Dress cable.

IMPOSSIBLE TO SET UP STATIONS

1. ***Too Much Tension On Locking Levers.*** When the automatic locking screw is loose, the station rings should move freely. If the levers still hold the station rings partially locked, the screws which hold the levers in position should be loosened one-quarter to one-half turn.
2. ***Latch Rings "Out of Range."*** If the loosened latch rings slip on the drum until the notch falls out of reach of the latch bar, they can be brought back to position by following exactly the "setting procedure" outlined elsewhere in this book.

FAILS TO STOP AT STATION

1. ***Open Magnet Winding.*** Check for continuity and replace if necessary. Check latch bar cable assembly. See No. 6 below.
2. ***Latch Bar Defective.*** Inspect latch bar to make sure that it has not been damaged. Replace latch bar, if required.
3. ***Poor Contact at Push-Button Plug.*** A poor contact here means a voltage drop which reduces the pulling power of the magnet.
4. ***Improper Spacing of Magnet.*** Check the spacing between the latch bar armature and the magnet pole. When the tip of the latch bar is seated all the way down in the notch in the latch ring, the armature should not quite touch the magnet pole. A hair line of light should be visible between them.
5. ***Latch Rings Not Locked Securely.*** If the latch rings are very loose the motor will continue to run.
6. Cable assembly from station magnets, touching latch bars. Dress cable.

LATCH BAR STICKS IN NOTCH

1. ***Latch Bar Spring Weak.*** Check latch bar tension spring to make sure it is pulling away from the magnet with sufficient force. Spring tension is adjustable.
2. ***Armature Rivet Worn.*** There is a brass rivet at the tip of the armature, to prevent the armature freezing to the magnet. If this rivet is worn down, permitting the steel armature to actually touch the magnet pole, it may freeze in that position.
3. ***Burr On Tip of Latch.*** Latch tip should be smooth and shiny.
4. ***Binding in Latch Bearings.*** Latch must move freely but not sloppy.
5. ***Latch Tips Not Centered On Latch Rings.*** Latch tips must not rub bakelite guide rings. The latch bar bearing shaft is adjustable.
6. ***Friction Clutch Too Tight.*** A tension washer between the motor pinion and the brass pinion collar acts as a friction clutch to absorb the shock of stopping the motor quickly when a station is tuned. If the tension is too tight, the torque of the stopped motor will hold the latch bar tip in the notch.

SET DOES NOT TURN ON

1. "B" Fuse burned out (No. 55 Pilot Bulb) See Fig. 1.
2. Standby rectifier (black 84 tube) burned out.
3. Defective relay. See Fig. 1. Return to your Motorola distributor or factory for service. Relay plugs into socket in chassis base.

MODEL 300
MODEL 350
Alignment, Sensitivity

Model 300

ALIGNMENT PROCEDURE

Place the chassis on the service bench with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary. NOTE: Do not adjust the trimmer in the Osc. coil can that is covered with Scotch Tape. The original adjustment, made in the factory should not be tampered with. (Fig. 1/below, shows all trimmer locations.)

I. F. ALIGNMENT

1. Connect the signal generator to the control grid of the Osc.- Mod. tube (6A8GT) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm leak resistor from the grid of the tube to the grid cap just removed from the tube. Turn the condenser gang completely out of mesh. Connect an output meter across speaker voice coil.

2. Set the signal generator at 262 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter.

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

SETTING THE RANGE

1. Connect the signal generator to the control grid of the R.F. tube (6K7GT) using the same .1 MF condenser.

2. Set the signal generator at 1550 K.C. and with the condenser gang completely out of mesh adjust the 1550 K.C. oscillator trimmer to the point showing the highest output reading.

3. Set the signal generator at 535 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. oscillator padder for the highest output reading.

NOTE: The adjustments above set the range so the receiver will track with the calibrations in the control head.

R. F. AND ANTENNA ALIGNMENT

NOTE: If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No. 1X18018 must be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.

1. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust the 1400 K.C. antenna trimmer in the antenna coil can for maximum output reading.

2. Adjust the 1400 K.C.R.F. trimmer on the condenser gang for maximum output reading.

3. Set the signal generator at 600 K.C. and turn the condenser gang until the signal is heard. Adjust the 600 K.C. padder in the antenna coil can for the maximum output reading.

4. Recheck steps 1, 2, and 3, for accuracy.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the Signal Generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a special dummy, part No. 1X18018, in place of the .1MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

AVERAGE MICROVOLT INPUT *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	LEAK RESISTANCE	OUTPUT METER READINGS **
38,000	262 K.C.	I.F. Grid	.1	.5 Meg	1.76
1,200	262 K.C.	Mod. Grid	.1	.5 Meg	1.76
1,200	600 K.C.	Mod. Grid	.1	.5 Meg	1.76
60	600 K.C.	R.F. Grid	.1	.5 Meg	1.76
11	600 K.C.	Ant. Lead	***	None	1.76

* For one watt output.
** Meter connected across voice coil.
1.76 volts equals 1 watt output for 3 ohm voice coil.
*** Use special dummy part No. 1X18018.
NOTE: If set is not used with a Motorola Booster antenna, substitute a 40 MMF condenser for the Special Dummy.

Model 350

Place the chassis on the service bench with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary.

NOTE: Do not adjust the trimmer in the Osc. coil can that is covered with Scotch Tape. The original adjustment, made in the factory should not be tampered with. (Fig. 1 below, shows all trimmer locations.)

I. F. ALIGNMENT

1. Connect the signal generator to the control grid of the Osc.-Mod. tube (6A8GT) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm leak resistor from the grid of the tube to the grid cap just removed from the tube. Turn the condenser gang completely out of mesh. Connect an output meter across speaker voice coil.

2. Set the signal generator at 262 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter.

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

SETTING THE RANGE

1. Connect the signal generator to the control grid of the R.F. tube (6K7GT) using the same .1 MF condenser.

2. Set the signal generator at 1550 K.C. and with the condenser gang completely out of mesh adjust the 1550 K.C. oscillator trimmer to the point showing the highest output reading.

3. Set the signal generator at 535 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. oscillator padder for the highest output reading.

NOTE: The adjustments above set the range so the receiver will track with the calibrations in the control head.

R.F. AND ANTENNA ALIGNMENT

NOTE: If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No. 1X18018 must be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.

1. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust the 1400 K.C. antenna trimmer on the condenser gang for maximum output reading.

2. Adjust the 1400 K.C. R.F. trimmer on the condenser gang for maximum output reading.

3. Set the signal generator at 600 K.C. and turn the condenser gang until the signal is heard. Adjust the 600 K.C. padder on the antenna coil can for the maximum output reading.

4. Recheck steps 1, 2, and 3, for accuracy.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which has been removed.

When measuring over-all sensitivity at the antenna terminal, use a special dummy part #1X18018 in place of the .1 MF.*** It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

AVERAGE MICROVOLT INPUT *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	LEAK RESISTANCE	OUTPUT METER READING **
26,000	455 K.C.	I.F. Grid	.1 MF	.5 Meg	1.76 Volts
535	455 K.C.	Mod. Grid	.1 MF	.5 Meg	1.76 Volts
615	600 K.C.	Mod. Grid	.1 MF	.5 Meg	1.76 Volts
30	600 K.C.	R.F. Grid	.1 MF	.5 Meg	1.76 Volts
7	600 K.C.	Ant. Lead	40 MMF ***	None	1.76 Volts

*For one watt output
**Meter connected across voice coil
1.76 Volts equals 1 watt output for 3 ohm voice coil
***Use special dummy part No. 1X18018, or M434B booster coil Part No. 17908 in series with 25 MMF cond. if a Motorola Booster antenna is used.

ALIGNMENT PROCEDURE

Place the chassis on the service bench with the speaker and battery connected to it.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output if necessary. NOTE: Do not adjust the trimmer in the Osc. coil can that is covered with Scotch Tape. The original adjustment, made in the factory should not be tampered with. (Fig. 1 below, shows all trimmer locations.)

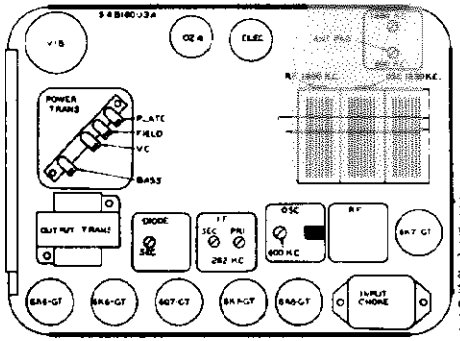

Fig. 1

I. F. 1. Connect the signal generator to the control grid of the Osc.-Mod. tube (6A8T) through a .1 MF condenser, having first removed the grid cap from the top of the tube. Connect a 500,000 ohm leak resistor from the grid of the tube to the grid cap just removed from the tube. Turn the condenser gang completely out of mesh. Connect an output meter across speaker voice coil.

2. Set the signal generator at 262 K.C. and carefully adjust the single trimmer in the Diode coil can to the point showing the highest reading on the output meter.

3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.

4. Repeat the I.F. and Diode adjustment several times for maximum accuracy.

SETTING THE RANGE

1. Connect the signal generator to the control grid of the R.F. tube (6K7GT) using the same .1 MF condenser.

2. Set the signal generator at 1550 K.C. and with the condenser gang completely out of mesh adjust the 1550 K.C. oscillator trimmer to the point showing the highest output reading.

3. Set the signal generator at 535 K.C. Turn the condenser gang completely in mesh and adjust the 600 K.C. oscillator padder for the highest output reading.

NOTE: The adjustments above set the range so the receiver will track with the calibrations in the control head.

R. F. NOTE: If the radio is to be operated on a Motorola Booster Antenna, a special dummy antenna Motorola part No. 1X18018 must be used in series with the lead from the signal generator to the antenna receptacle. Change the signal generator connection to the antenna lead, using the special dummy.

1. Set the signal generator at 1400 K.C. Turn the condenser gang until the signal is heard. Adjust the 1400 K.C. antenna trimmer in the antenna coil can for maximum output reading.

2. Adjust the 1400 K.C.R.F. trimmer on the condenser gang for maximum output reading.

3. Set the signal generator at 600 K.C. and turn the condenser gang until the signal is heard. Adjust the 600 K.C. padder on the antenna coil can for the maximum output reading.

4. Recheck steps 1, 2, and 3, for accuracy.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume. The shielded lead from the Signal Generator is connected to the grid terminal of the tube through a .1 MF condenser, with a 500M ohm resistor connected as a leak resistance between the grid of the tube and the grid lead which had been removed.

When measuring over-all sensitivity at the antenna terminal, use a special dummy, part No. 1X18018, in place of the .1 MF. It must be remembered that the figures in the table are average and allowance must be made for variations between two sets of the same general type, due to difference of tube characteristics, etc.

AVERAGE MICROVOLT INPUT *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	LEAK RESISTANCE	OUTPUT METER READINGS **

500	262 K.C.	MOD. Grid	.1	.5 Meg	1.76
550	600 K.C.	MOD. Grid	.1	.5 Meg	1.76
30	600 K.C.	R.F. Grid	.1	.5 Meg	1.76
7	600 K.C.	Ant. Lead	***	None	1.76

* For one watt output.
** Meter connected across voice coil.
1.76 volts equals 1 watt output for 3 ohm voice coil.
*** Use special dummy part No.1X18018.
NOTE: If set is not used with a Motorola Booster antenna, substitute a 40 MMF condenser for the Special Dummy.

Model 450

ALIGNMENT PROCEDURE

Place the chassis on the service bench with the speaker, acoustimator, and battery connected to it. The acoustimator is to be set in the "City" and "Voice" position.

Turn the volume control to maximum position and leave it there throughout the alignment, reducing the signal generator output, if necessary. NOTE: Do not adjust the trimmer in the R.F. coil can that is covered with scotch tape. The original adjustment made at the factory should not be tampered with.

Fig. 1 shows all trimmer locations.

I. F. ALIGNMENT

1. Connect the signal generator to the control grid of the modulator tube through a .1 Mfd. condenser. Connection may be made to the lug on the R.F. section of the gang condenser. Connect an output meter across the speaker voice coil.
2. Set the signal generator at 262 K.C. and carefully adjust the trimmers in the diode coil can to the point showing the highest reading on the output meter.
3. Adjust the two trimmers in the I.F. coil can to the point showing the highest output reading.
4. Recheck the I.F. and diode adjustment several times for maximum accuracy.

SETTING THE RANGE

1. Turn gang to fully meshed position.
2. Check the pin "A" on the fulcrum arm to make sure that it rests in the fall of the cam (absolute lowest point) when the condenser gang is in fully meshed position. See Fig. 2.

NOTE: Adjustment of the pin is made by revolving the cam on the condenser gang shaft.

CAUTION: Care should be taken so that the stop dogs allow the condenser gang to be turned to fully meshed position and fully opened position.

3. Set the signal generator at 1560 K.C. and connect it to the antenna receptacle through a 40 MMF condenser.
4. With the condenser gang completely out of mesh, adjust the 1560 K.C. oscillator trimmer on the gang condenser to point showing highest output reading.
5. Leaving the generator set at 1560 K.C. and the condenser gang completely out of mesh, adjust the antenna resonating condenser to maximum output.

R. F. AND ANTENNA ALIGNMENT

1. Still using the same 40 MMF condenser in the antenna lead, set the signal generator at 1400 K.C. and turn condenser gang until the signal is heard.
2. Adjust the 1400 K.C. trimmer in the R.F. coil can for highest output.

NOTE: The two locking screws "B" are to be loosened just the least bit so that the tension is released which will allow the eccentric screw to be turned but not loosened enough to allow the fulcrum arm to be moved.

3. Adjust the eccentric screw "A" to maximum output at 1400 K.C. and tighten the locking screws "B" securely.
4. Set the signal generator at 600 K.C. Turn the condenser gang until the signal is heard, and adjust the oscillator padder which is accessible through the hole in the chassis base, to maximum output.
5. Recheck steps 1, 2, 3, and 4.

SENSITIVITY AND STAGE GAIN MEASUREMENTS

All stage gain measurements must be made with the volume control set for full volume, and the acoustimator set at city and voice position. The shielded lead from the signal generator is connected to the grid terminal of the tube through a .1 MF condenser.

When measuring over-all sensitivity at the antenna terminal, use a 40 MMF in place of the .1 MF. It must be remembered that the figures in the tabls are average and allowance must be made for the variations between two sets of the same general type, due to difference of tube characteristics, etc.

AVERAGE MICROVOLT INPUT *	GENERATOR SET AT	GENERATOR FEEDER CONNECTED TO	DUMMY ANTENNA CAPACITY	OUTPUT METER READING **

Diagnosis of Troubles

6-B POWER CONVERTER

EFFECT	CAUSE
Does not operate	Storage Battery run-down. Battery connections loose. Relay not closing—heavy red or black battery wires may be twisted inside unit and holding relay armature open. "Blown" fuse—check all wiring before inserting new fuse. A defective vibrator will also "blow" the fuse. A good vibrator will have a smooth "hum" when holding your ear close to the unit; a worn vibrator will "sputter".
R. F. "Hash" noise in set, usually a frying-buzzing sound	A good antenna and ground must be used on the set. Power unit should be located away from the set by the length of the cable. On sets having short wave bands, noise may always be noticed on some parts of the band but is usually not objectionable.
High battery drain	The total drain on the six volt battery should be approximately one ampere plus the normal "A" drain of the set. Example: with model 650, 1 amp. plus .5 amp. total 1.5 amps. Excessive drain may be caused by defective transformer, vibrator, or filter condenser in the power unit or defective switch or by pass condenser in the set.

The type and function of each tube is as follows:

1—Type 12SA7 Mixer, First Detector-oscillator.

1—Type 12SK7 I. F. Amplifier.

1—Type 12SQ7 Second Detector, A.V.C. and First Audio.

1—Type 35L6GT Beam Output Amplifier.

1—Type 35Z4GT Rectifier.

SERVICE NOTES:

Voltages taken from different points of circuit to —B are measured with all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 117 volt A.C. line.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscilla-

MODEL 577D

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever an opening is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings of each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 1) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in. Release the lever.

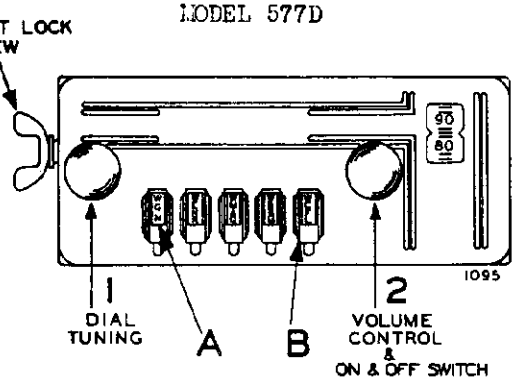

FIG. 2—FRONT VIEW

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 1) to the right (clockwise) as far as it will turn, and tighten the special locking screw ("C") located on left side of tuner dial assembly (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns, select the new station as explained. **Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.**

The automatic dial is now set up for quick tuning. **Press down on the lever and your favorite station is selected.**

MODEL 571

ALIGNMENT PROCEDURE

IMPORTANT: See Aligning Instructions on Page 4.

- Volume control—Maximum all adjustments.
- Connect —B of radio chassis to ground post of signal generator through .1 Mfd. Condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- **An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.**
- **Output indicating meter.**
- **Non-metallic screwdriver.**
- **Dummy antennas—.1 mfd. and 200 mmf.**

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Trimmer (C5) (See bottom of Radio, Fig. 3)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Trimmer (C2) (See bottom of Radio, Fig. 3)	Antenna	Adjust to maximum output
	1400 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1400 Kc.	Adjust position of antenna coil up or down (see Fig. 4)	Antenna Coil Adjustment	Adjust to maximum output (See Note "A")
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1720 Kc.	Adjust trimmer (C2) (See Fig. 3)	Antenna	Check for tracking (See Note "B")

NOTE "A"—The antenna coil assembly is made so that it is movable up or down. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C2) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track; if the trimmer requires considerable change, it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1720 Kc.

GAMBLE-SKOGMO INC.

MODEL 577C
Schematic, Voltag
Battery Notes

GENERATOR INTERFERENCE

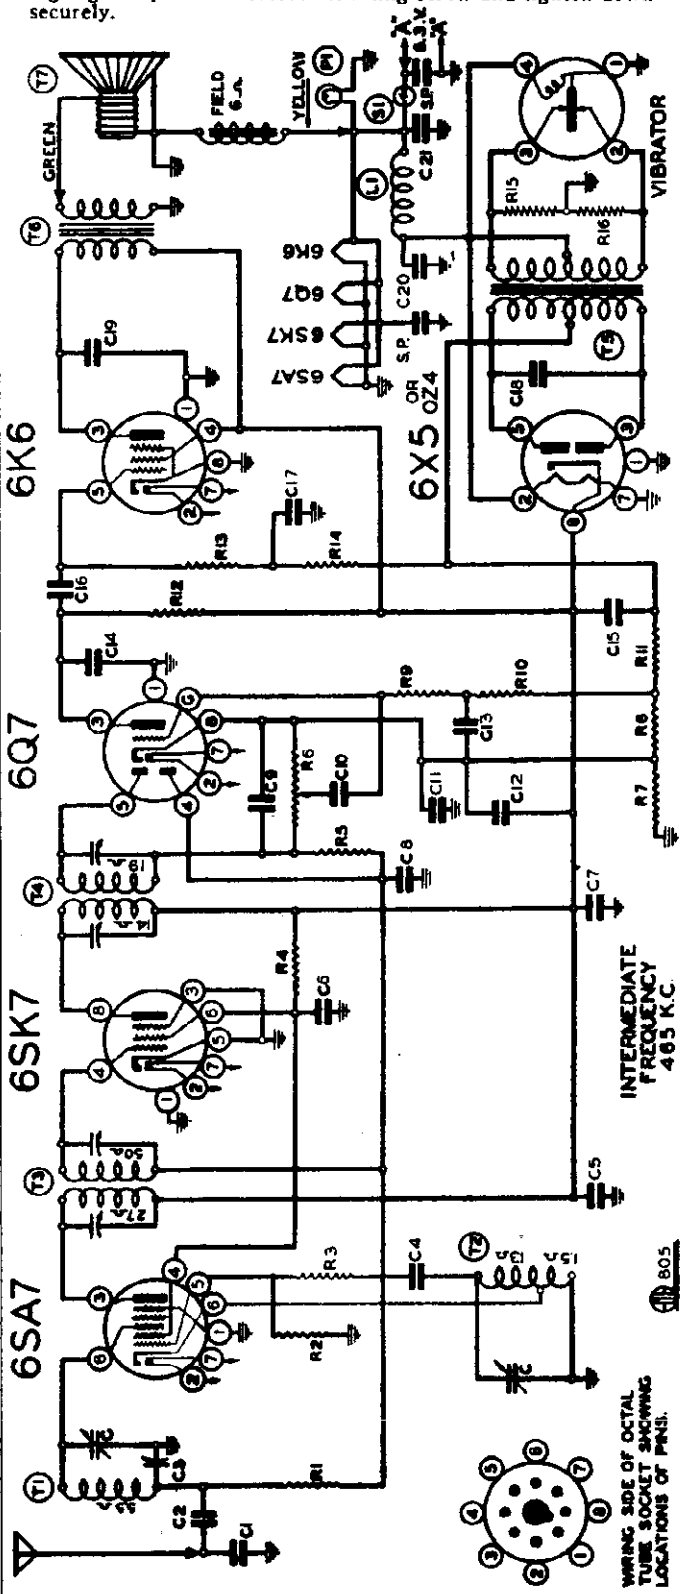
Remove the generator cutout mounting screw and fasten the condenser (100-81) bracket on the generator cutout mounting lug. Replace the cutout mounting screw and tighten down securely.

Connect the condenser lead to the battery terminal of the cutout. The generator condenser is absolutely necessary as it is used to eliminate a high pitched whining noise which would otherwise be heard as the motor is accelerated

CONNECTIONS TO BATTERY

The battery cable, number 107-82, (red wire with fuse receptacle at one end and terminal lug at other end) must be connected to battery terminal of ammeter. At the same time connect ammeter capacitor, number 100-82, to battery terminal of ammeter, other end of condenser to any convenient grounded screw on back of instrument panel. Make certain that insulating sleeve is slipped over fuse when fuse is placed in receptacle, before connecting to short battery cable from receiver.

When connected properly, the discharge due to current drawn by the receiver should not indicate on the ammeter. This is important, since if improperly connected, as shown by the deflection of ammeter, additional motor interference may be encountered.



ADJUST ANTENNA TRIMMER

Tune in a weak signal at approximately 600 K.C. with volume control about three-fourths on. Adjust trimmer screw "X" until maximum output is obtained. (See Fig. 1, Adjustment "X" on right side of radio)

MODEL 577C

Alignment, Trimmers
Socket, Tuner

GAMBLE-SKOGMO INC.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the bottom view.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently and insulating sleeve has been properly placed over fuse, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

DUMMY ANTENNAS

The dummy antennas referred to in the following instructions are:

"I.F. Dummy" —A .5 mfd. condenser connected in series with the test oscillator output lead.

"Broadcast Dummy"—A 125 mmfd. condenser connected in series with the output lead of the test oscillator.

RESONANCE INDICATOR

Use as a resonance indicator an output meter connected across the primary of the speaker input transformer, or by means of an adapter between the plate and screen terminals of the type 6K6 output tube. Maximum deflection of the meter indicates resonance. Use only enough signal to get a readily readable output. A low range output meter or the low scale of a multi-range meter should be used.

I.F. ALIGNMENT: (465 K.C.)

1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 465 K.C. in series with I.F. dummy antenna, to grid of 6SK7 I.F. tube.
2. Adjust trimmer condensers of output I.F. transformer No. 108121 to resonance with oscillator.
3. Move test oscillator connection to grid of 6SA7 tube and adjust trimmer condensers of input I.F. transformer No. 108139 to resonance with oscillator. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver. (See Fig. 3—top view, page 3.)

BROADCAST ALIGNMENT

1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. in series with broadcast dummy to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance. (This adjustment is the rear section of the two-gang condenser—see top view, Fig. 3).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust antenna trimmer (front section of gang condenser) to resonance (see top view, Fig. 3).
4. Re-set test oscillator to 600 K.C. and rotate variable condenser to 600 K.C. Adjust series pad in the antenna circuit for maximum gain. This pad is mounted on the side of the antenna can, adjustment "X."
5. Go back and check 1400 K.C. If adjustment is made here, check 600 K.C. again.
6. Check for sensitivity at 1000 K.C. by setting test oscillator to this frequency and picking up the signal by rotating variable condenser. Under no circumstances bend plates of variable condenser sections to correct tracking.

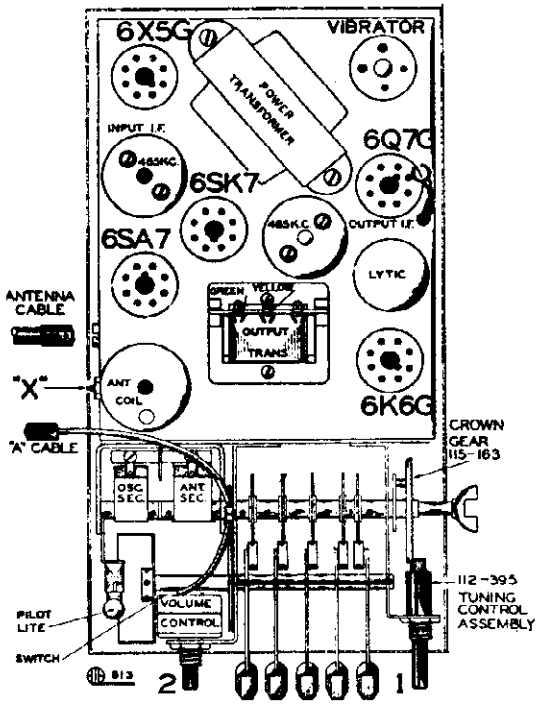

FIG. 3—TOP VIEW

PROCEDURE FOR SETTING THE AUTOMATIC LEVERS

There are five levers on the dial by means of which five stations may be selected, (See "B" Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including five.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever an opening is provided for inserting the call letter tabs, (See "A" Fig. 2).

Insert the call letter tabs in the rectangular openings of each of the automatic tuner levers. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

Press DOWN ALL THE WAY any one of the automatic tuner levers. Holding it down FIRMLY, tune in by means of the tuning knob (No. 1) the station you have assigned to this lever. Turn the tuning knob very slowly back and forth (while still holding lever in downward position) until the signal is clearest. The station will then be accurately tuned in Release the lever.

Press down another automatic tuner lever. Holding it down FIRMLY, carefully tune in the station assigned to this lever. Release this lever.

Follow this procedure until you have selected all of your favorite stations.

Now rotate the tuning knob (No. 1) to the right (clockwise) as far as it will turn, and tighten the special locking screw ("C") located on left side of tuner dial assembly (See Fig. 2).

It is VERY IMPORTANT that this locking screw is turned until it is ABSOLUTELY TIGHT.

This screw will lock in place all the stations you have selected on the automatic tuner levers. (Note: Locking screw "C" is loose when radio is shipped from factory).

If you should desire to change any station you selected to another, loosen the locking screw "C" one or two turns, select the new station as explained. Be sure to retighten the locking screw, otherwise the stations you have selected will not stay adjusted to the levers.

The automatic dial is now set up for quick tuning. Press down on the lever and your favorite station is selected.

GAMBLE-SKOGMO INC.

ALIGNING I.F. TRANSFORMERS: (465 K.C.):

Part No. 108-83 Output I.F. Transformer
Part No. 108-82 Input I.F. Transformer

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments

   (a) Connect external oscillator set at 465 kilocycles, in series with .1 mfd. condenser, to the control grid cap of the type 78 tube, and adjust the output I.F. transformer (No. 108-83) to resonance.

   (b) Move oscillator output clip from grid of 78 grid cap of 6A7 and adjust input I.F. transformer (No. 108-82) to resonance.

   (c) With oscillator still connected to 6A7, readjust output I.F. transformer (108-83) if necessary.

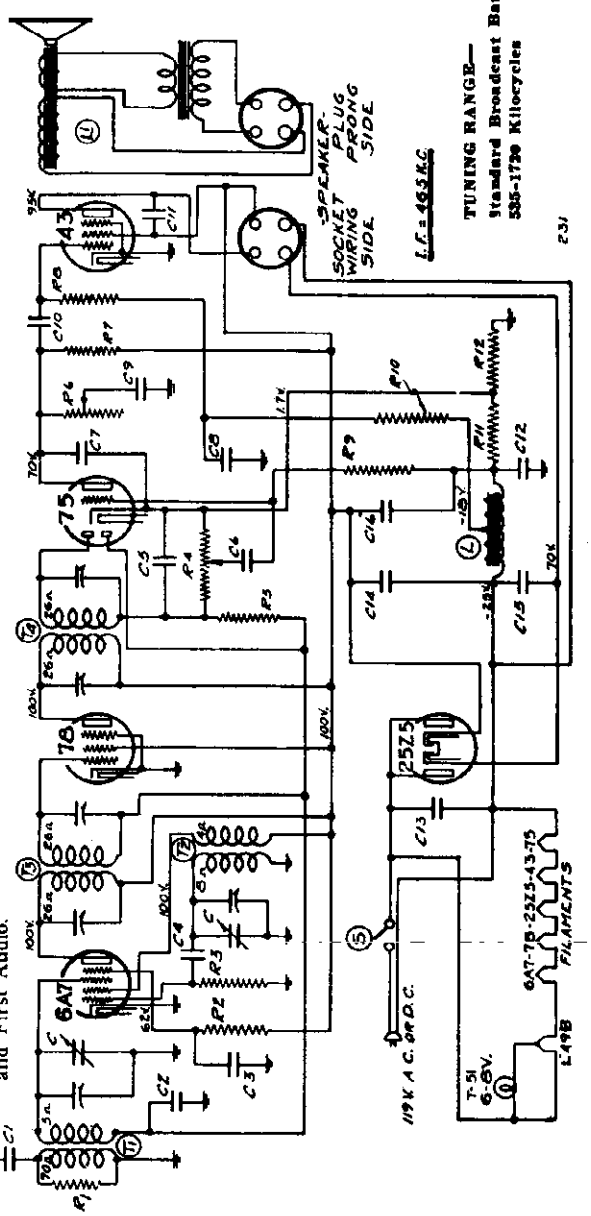
R.F. ALIGNMENT: (535-1720 K.C.)

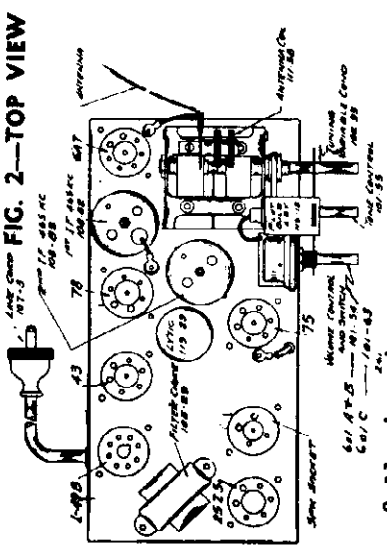
1. Unsolder the antenna wire from its terminal on the antenna coil and with gang condenser in its minimum capacity position, plates entirely out of mesh, connect an external oscillator in series with a 50 mmf. condenser to the antenna terminal on the antenna coil and chassis ground and make the following adjustments:

   (a) With external oscillator set at 1720 kilocycles, adjust oscillator trimmer (rear of gang condenser).

   (b) Re-set external oscillator to 1550 kilocycles, rotate condenser, pick up oscillator signal and adjust antenna trimmer to resonance (front section of gang condenser).

   (c) Check sensitivity at 600 and 1000 kilocycles.





No.	Part No.	Description

MODEL 601—SERIES A See schematic and parts above.

MODEL 601—SERIES B is the same as Series A, except for the following changes:-

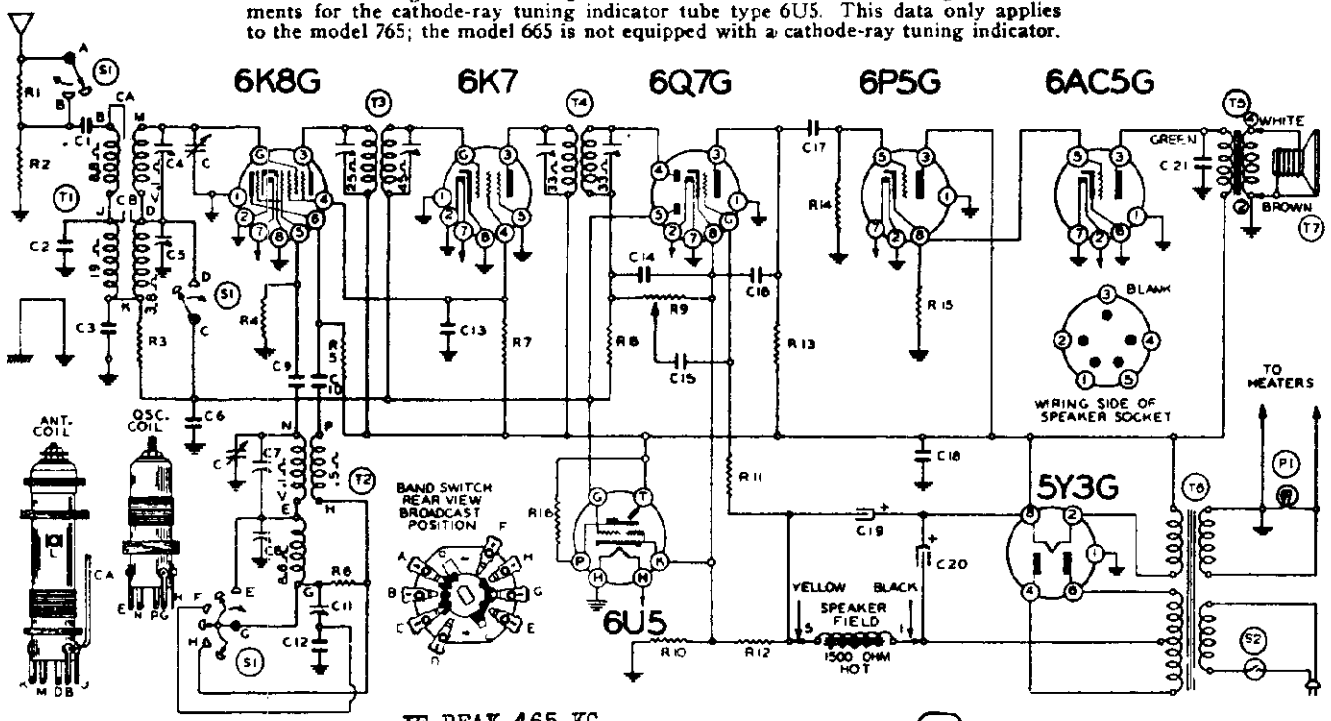
1 - The C15 condenser was eliminated.

2 - The C14 condenser was replaced by a C15 (Part #119-29) 30 mfd. capacity, and the C16 was replaced by a C14 (Part #119-29) 5 mfd. capacity.

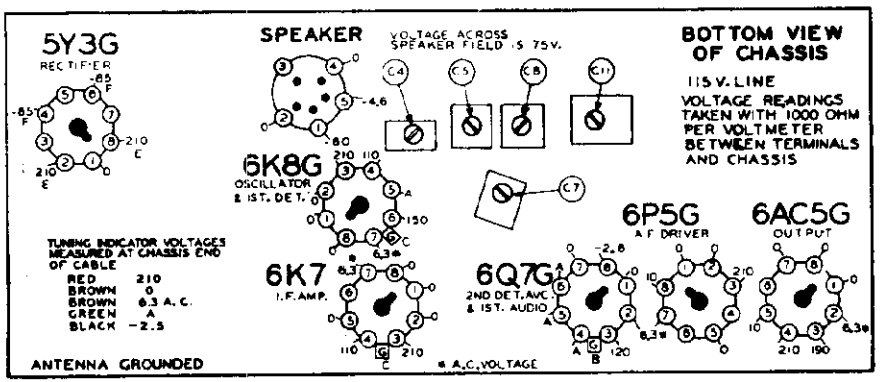
MODEL 601—SERIES C is the same as Series B (see above changes) except for the substitution of the following parts:

R4	101-63	500M Ohm Volume Control	C7	129-5	.0001 Mica—MT—20%
R7	130-102	500M Ohm—½W—20%—100V—Carbon			
R9	130-102	500M Ohm—½W—20%—100V—Carbon	S	101-63	On and off switch on Volume Control

NOTE: Circuit diagram and voltage chart show connections and voltage measurements for the cathode-ray tuning indicator tube type 6U5. This data only applies to the model 765; the model 665 is not equipped with a cathode-ray tuning indicator.



IF PEAK 465 KC



A - CANNOT BE MEASURED WITH VOLTMETER

MODELS 665 & 765 SERIES A

DESCRIPTION

TUBES:

The tube complement of this chassis consists of the following octal base glass and metal tubes:

The type and function of each tube is as follows:

1—Type 6K8G Triode Hexode, First Detector-oscillator.

1—Type 6K7 Remote Cut-Off Pentode, I. F. Amplifier (465 K. C.)

1—Type 6Q7G Duplex Diode Triode Second Detector, A. V. C. and First Audio.

1—Type 6P5G Driver Stage.

1—Type 6AC5G Positive Grid Triode Output Amplifier.

1—Type 5Y3G High Vacuum Rectifier.

1—Type 6U5 Cathode-Ray Tuning Indicator Tube (for Model 765).

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 25, 40 and 60 cycles and with primary taps for 110, 130, and 230 volts, (see parts list).

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on the voltage chart are measured with 115 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D. C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltage, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustments should be attempted with the chassis in the cabinet.

TO REMOVE CHASSIS FROM THE CABINET:

Remove the four bolts which are used to fasten the chassis to the cabinet shelf; pull the knob off their shafts and pull off the six button lever keys on front of dial.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 200 mmf., and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short wave (Extreme right rotation)	Set dial at 17 MC	Trimmer (C 7) (See Fig. 3)	Short wave Oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short wave (Extreme right rotation)	Dial set at 17 MC	Trimmer (C 4) (See Fig. 3)	Short wave Antenna	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C 8) (See Fig. 3)	Broadcast Oscillator	Adjust to maximum output
	1400 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 1400 Kc.	Trimmer (C 5) (See Fig. 3)	Broadcast Antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set dial at 600 Kc.	Trimmer (C 11) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
IMAGE REJECTION ADJUST-MENTS	2100 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1170 Kc. on dial	Wire capacitor (CB) (See circuit diagram)	Image rejection	Adjust by twisting for minimum output. (See note "B")
	2630 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1700 Kc. on dial	Wire capacitor (CA) (See circuit diagram)	Image rejection	Adjust by moving for minimum output. (See note "C")

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 2100KC is the image frequency of 1170 KC. Adjust wire capacity (CB) by twisting the two wires until a minimum output is obtained.

NOTE "C" 2630KC is the image frequency of 1700KC. Adjust wire capacity (CA) by moving the wire either toward or away from the antenna coil winding until a minimum output is obtained on the output meter.

- Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.
- After each band is completed, repeat the procedure as a final check.

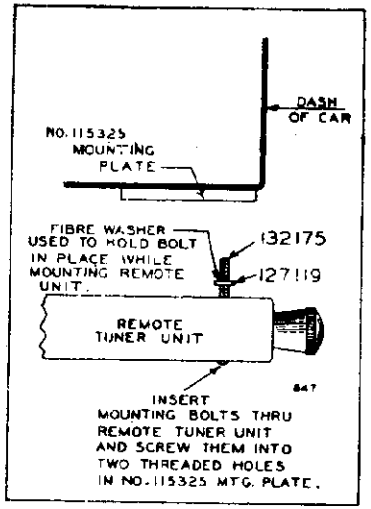

Fig. 1B—Remote Mounting

CONNECTIONS TO BATTERY:

CAUTION: Before making any battery connections, check the polarity of the vibrator unit (contained in radio unit) to determine whether it corresponds with the polarity of the storage battery in the car.

The radio is shipped from the factory with the vibrator inserted in its socket so that it will operate in cars in which the positive (+) post of the storage battery is grounded to the frame of the car.

In cars in which the negative (—) post of the storage battery is grounded to the frame of the car, the vibrator must be pulled out of its socket and rotated and reinserted into its socket so that the (—) sign on the top of the vibrator is opposite the red dot on the top of the transformer cover; (see Fig. 3, top view of radio chassis).

Check the polarity of the storage battery in car either by checking the actual wire connections on the battery or by using a voltmeter.

The ammeter cable, number 107236 (red wire with fuse receptacle at one end and terminal lug at other end), must be connected to battery terminal of ammeter. At the same time connect ammeter capacitor, number 10082 to battery terminal of ammeter, other end of capacitor to any convenient grounded screw on back of instrument dash panel.

Make certain the fuse is in the receptacle and the ammeter cable is properly connected to the short cable (number 107238), coming from the Remote Tuner Unit. (See Fig. 1A.)

In some installations it is advisable to connect the ammeter cable to the terminal on the ammeter which will not allow the current drawn by the radio to indicate on the ammeter, as additional motor interference may be encountered.

GENERATOR INTERFERENCE:

Remove the generator cutout mounting screw and fasten the condenser (10081) bracket on the generator cutout mounting lug. Replace the cutout mounting screw and tighten down securely.

Connect the condenser lead to the battery terminal of the cutout. The generator condenser is absolutely necessary as it is used to eliminate a high pitched whining noise which would otherwise be heard as the motor is accelerated.

ANTENNA CONNECTION:

Insert the antenna plug in cable into the back of the remote tuner unit (see Fig. 1A). The wire at the other end of the antenna cable is connected to the lead-in wire from the antenna. Keep the antenna cable as far away from car wiring as possible and ground the pigtail of the antenna cable shield at the antenna end.

A 36 inch shielded antenna cable is regularly supplied. If a roof or door hinge type antenna is used, this cable will be long enough in practically all cases to reach the corner post or column at which the antenna lead comes down. The shielded cable should be pushed up into the column as far as possible. The reason for this is that ignition interference may be picked up by any unshielded portion of the antenna cable.

If an under car or running board antenna is used, the shielding must be extended to the antenna in all cases. The pigtail on the end of the antenna cable shield must be well grounded at the extreme antenna end. If it is necessary to extend the antenna cable, be sure that a pigtail is put on the end of the shielded extension and that it is well grounded at the extreme antenna end.

To extend the antenna cable shielding, the antenna lead wire should be covered with heavy insulation, such as loom, to properly separate the shielding from the wire. Then connect the two wires together and connect the two shields together, care being taken that no strand of the shield touches the antenna wire.

Aerials suitable for steel roof and convertible cars can be purchased from your dealer.

The majority of 1937, 1938 and 1939 cars have steel roofs, and a running board or other car antenna such as the fish pole, door hinge or over the top types must be used. The 1936 Chrysler Motors cars (except Plymouth—but including Chrysler, Dodge and De-Soto) have a steel roof, separated from the body proper, which is used as an antenna.

PROCEDURE FOR SETTING THE AUTOMATIC PUSHBUTTONS:

There are six pushbuttons on the Remote Tuner Unit by means of which six stations may be set up for automatic tuning (see B, Fig. 2).

Make a list of local stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the top of each pushbutton a slot is provided for inserting the call letter tabs, (see A, Fig. 2).

Insert the call letter tabs.

NOW, PROCEED AS FOLLOWS:—

1. Push the dial tuning knob in hard enough to make it latch in.
2. Rotate the dial tuning knob to the left (counter-clockwise), until the knob can not be turned any further without forcing.

   You will note that as the knob is rotated it will turn easily until the pointer reaches the end of the dial scale and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point the knob will turn quite easily again until the tuner mechanism is completely unlocked. At this point do not force the knob any further. The tuner mechanism is now unlocked.

   (NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)
3. Push in all the way any one of the pushbuttons and at the same time hold in firmly the dial tuning knob. Both the dial tuning knob and the pushbutton should be pushed hard enough to make them stay latched in. The reason for holding the dial tuning knob in firmly when the pushbutton is pressed in is due to the latching mechanism in the Remote Tuner unit which is so constructed to release the dial tuning knob entirely when a pushbutton is pressed in. When setting up stations for automatic tuning, however, it is necessary that both the dial tuning knob and the pushbutton be latched in together.
4. Press in on the pushbutton which is latched in. Holding it in firmly, tune in by means of the dial tuning knob the station indicated on the station call letter tab on this pushbutton. Turn the dial tuning knob very slowly back and forth (while still pressing in firmly on the pushbutton), until the station is clearest. The station will then be accurately tuned in.
5. Push in all the way another pushbutton, at the same time holding the dial tuning knob in so that both the pushbutton and the dial tuning knob are latched in together. Holding the pushbutton in firmly, tune in the station indicated on the call letter tab on this pushbutton.
6. Follow this procedure until you have tuned in all of your favorite stations.
7. When the last pushbutton has been properly set up it is necessary to release it from the latched-in position before the tuner mechanism can be locked. To release this pushbutton, press in very slightly any one of the other pushbuttons. This will trip the latching mechanism and all the pushbuttons will be released to out position.
8. Now, Press on the dial tuning knob hard enough to make it latch in. Rotate the dial tuning knob to the right (clockwise) until the knob can not be turned any further without forcing it. This will lock the tuner mechanism and all the stations that have been set up on the pushbuttons will be locked in place for automatic tuning.
9. Press in any one of the pushbuttons and—YOUR FAVORITE STATION IS SELECTED.

The important steps to remember when setting up stations on the pushbuttons for automatic tuning are:

1. To unlock the tuner mechanism press on the dial tuning knob hard enough to make it stay latched in. Rotate the dial tuning knob to the left (counterclockwise) until the knob cannot be turned any further without forcing it.
2. To set a pushbutton, Push in all the way and hold in firmly both the pushbutton and the dial tuning knob so that both latch in. Hold in firmly the pushbutton and tune in the station by means of the dial tuning knob. Set all the pushbuttons in the same manner.
3. To release the last pushbutton push in very slightly any one of the other pushbuttons. This will trip the latching mechanism.
4. To lock the tuner mechanism push on the dial tuning knob hard enough to make it stay latched in. Rotate the dial tuning knob to the right (clockwise) until the knob can not be turned any further without forcing it. (NOTE: All the pushbuttons must be in out position when locking the tuner mechanism.)

RADIO LOCATION AND MOUNTING:

Determine the most satisfactory mounting position.

Lift the radio case up and temporarily hold it in the proposed position. The case should be mounted high enough to avoid interference with car controls and the location of the Remote Tuner unit in respect to the radio case should be considered. The limiting factor being the length of special connector cable which connects the Remote Tuner unit to the radio case. (This cable should not be altered in any manner).

Mark location for the mounting bolt, drill one one-half inch (½") hole, making certain that the paint around the hole on the engine side of the fire wall is scraped clean to insure a good ground connection between receiver and the frame of the car.

CAUTION: Before fastening the radio unit read very carefully the paragraph on "CONNECTIONS TO BATTERY." This concerns the polarity of the vibrator unit and must be thoroughly understood as the radio will not operate unless the polarity of the vibrator unit corresponds with the polarity of the storage battery in the car.

TUNER UNIT MOUNTING: It may be necessary in some instances to move dash panel light switches or car heater control switches, however, in the majority of cases the Remote Tuner Unit will mount very satisfactorily under the dash panel to the left of the steering column. Mount the unit as close to the steering column as possible to allow clearance for the emergency brake which is mounted on the extreme left hand side of some makes of cars.

Details for mounting are shown in Fig. 1A and Fig. 1B, General Installation view.

The bracket No. 115325 for mounting the Remote Tuner Unit has three rows of holes to facilitate the best mounting in all makes of cars.

Use the bracket as a template, marking the lip of the dash for three mounting holes for the bracket and two clearance holes for the Remote Tuner unit mounting bolts. (See Fig. 1A.)

Mount the bracket using either the flat head self-tapping screws or the flat head machine screws, lockwashers and nuts supplied.

Insert the two Remote Tuner Unit mounting bolts through the holes in the unit using the two fibre washers to hold the bolts in place while mounting the unit to the bracket (see Fig. 1B). Screw the mounting bolts into the threaded holes in the mounting bracket (eight threaded holes are provided so that the remote unit can be mounted forward or further back as desired). Fasten the unit securely.

Connect the battery cable, number 107237 coming from the radio case to the pin on the volume control assembly on the rear of the Remote Tuner Unit.

Connect the R. F. cable assembly (cable number 107231) by inserting the plug of the cable into the receptacle socket on the side of the radio unit case. Screw the threaded cap of the cable assembly to the threaded fitting on the radio case securely. (See Fig. 1A.)

Important: This cable should not be altered in any manner.

This unit has been carefully designed to facilitate servicing; the entire case can be removed by loosening three wing head screws, exposing all tubes, vibrator and receiver circuits.

All adjustments are accessible being located on the side and bottom of the Remote Tuner unit (See Fig. 4', a full eight inch electro dynamic speaker is used.

The output of the receiver is 9 watts.

GAMBLE-SKOGMO INC. Alignment, Tuner Trimmers

MODEL 678, Issue A

ALIGNMENT PROCEDURE

IMPORTANT—ADJUSTING ANTENNA TRIMMER:

Tune in any weak station between 600 and 800 kc.

Make sure that the antenna shunt trimmer on the Bottom of the Remote Tuner is turned all the way out (counter clockwise), (see adjustment "C1," Fig. 4.).

Adjust antenna series trimmer on the side of the remote Tuner Unit. For maximum output. (See adjustment "C2," Fig. 4.).

NOTE: If resonance (maximum output) cannot be obtained within the range of the antenna series trimmer "C2," turn the adjustment screw all the way out (counter clockwise) and then adjust the antenna shunt trimmer "C1" on the bottom of the remote tuner unit for a peak of maximum output.

The above arrangement will cover any antenna capacity that is now in use.

Failure to operate, noisy or weak reception is usually due to defective tubes, the tubes making poor contact with sockets or grid clips making poor contact with the caps of the tubes. Tubes may be checked very easily by replacing with other tubes which are known to be good. If fuse blows out frequently, the trouble is probably in the vibrator, it should be replaced. Do not attempt to make any adjustments on the vibrators.

ALIGNING INSTRUCTIONS:

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a test oscillator, as well as an output meter, must be used.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mf., 125 mmf.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Remote Tuner Dial Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7 I. F. Tube	Set dial at 1400 Kc.	Trimmers C19, C20 (See Fig. 3)	Output I. F.	See note "A" Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SK7	Set dial at 1400 Kc.	Trimmer C21 (See Fig. 3)	Output I. F.	See note "B" Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6A8	Set dial at 1400 Kc.	Trimmers C14, C15 (See Fig. 2)	Input I. F.	Adjust to maximum output
BROADCAST BAND	1565 Kc.	125 mmf.	Antenna lead	Set dial at 1565 Kc.	Trimmer C5 (See Fig. 4)	Oscillator	Adjust to maximum output
	1400 Kc.	125 mmf.	Antenna lead	Set dial at 1400 Kc.	Trimmers C1, C3 (See Fig. 4)	Antenna and R. F.	Adjust to maximum output
	600 Kc.	125 mmf.	Antenna lead	Set dial at 600 Kc.	Trimmer C2 (See Fig. 4)	Antenna series adj.	See note "C"

NOTE "A" IMPORTANT: To align the output I. F. transformer without using a cathode ray oscillograph a 10M ohm resistor must be shunted across the diode tuned circuit. Connect the resistor as indicated by points "X" and "Y" on the circuit diagram and the bottom view of the radio chassis Fig. 5. A red dot on top of output I. F. can designates location of trimmer "C19."

NOTE "B" Before adjusting trimmer C21 disconnect the 10M ohm resistor. Under no circumstances re-adjust trimmers C19 or C20 after the 10M ohm resistor has been removed.

For alignment of the output I. F. transformer using a cathode ray oscillograph the 10M ohm resistor is not used.

NOTE "C" Maximum gain for this adjustment depends on the capacity of the antenna system of the car in which the radio is installed. For the proper alignment of this adjustment see "Adjusting Antenna Trimmer."

ALIGNMENT OF THE IRON CORES

The iron cores for the antenna, R. F. and oscillator permeability coils have been very carefully adjusted at the factory and require no further adjustment, unless it becomes necessary to replace a coil, or if the adjustments have been tampered with.

The procedure for aligning the iron cores will be supplied with replacement coils when ordered.

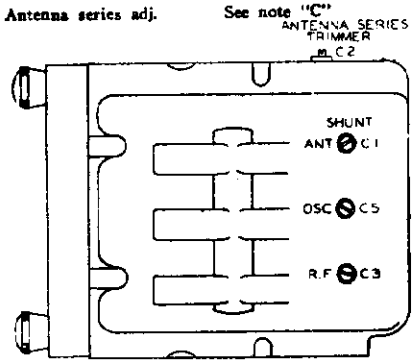

Fig. 4.—Bottom View of Remote Tuner

DESCRIPTION:

Model 678 is a six tube superheterodyne receiver having a tuning range of 535 K. C. to 1565 K. C.; operates from a six volt storage battery and uses the automotive type 6.3 volt tubes. The "B" supply is obtained from a synchronous type vibrator.

The I. F. frequency used is 465 K. C. The output I. F. coil has three tuned circuits giving superior band pass qualities and selectivity as compared to the conventional two tuned circuit coils. Antenna, R. F. and oscillator circuits are permeability tuned, offering automatic tuning applications that are both accurate and stable. The entire coil assembly is mounted in the Remote Tuner control head being connected to the oscillator and R. F. circuits by an R. F. transmission cable.

The R. F. oscillator, I. F. and audio amplifier including the power supply is contained in the speaker case.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the voltage chart.

In order to prevent signal from acting upon A.V.C. and affecting accuracy of voltage measurements, aerial and ground leads should be short circuited while making measurements.

All voltages are to be measured with 6.3 volts input to receiver. Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating which is known to be good, until the defective unit is located.

TUBE COMPLEMENT:

The tube complement of this chassis consists of the following metal and octal base glass tubes which are interchangeable with metal tubes.

1—Type No. 6K7 R. F. Amplifier.
1—Type No. 6A8—Pentagrid Converter (composite first detector and oscillator).
1—Type No. 6SK7—Remote Cut-off Pentode as an I. F.
1—Type No. 6Q7—Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1—Type No. 6J5G—Driver Amplifier.
1—Type No. 6N7—Push-Pull Output Amplifier

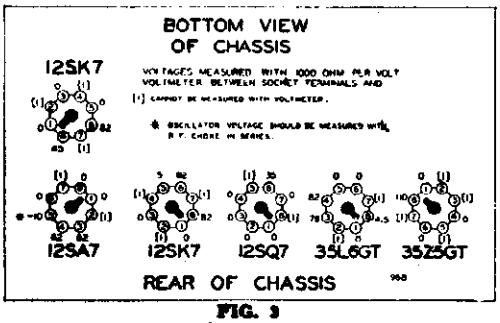

FIG. 3

ALIGNING INSTRUCTIONS:

Do not remove the back cover of the radio which contains the loop antenna from the chassis. It is important during alignment that the same distance between the loop antenna and the chassis be maintained as when the chassis is installed in the cabinet.

Slight adjustments to the oscillator and antenna circuits can be made without removing the chassis from the cabinet through two holes which are provided on the bottom of the cabinet.

The two adjustments on the variable gang condenser can be reached with a long insulated type screw driver through these two holes.

ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect B - of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 Mfd.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Four Trimmers on Top (See Fig. 1)	Output and Input I.F.	Adjust to maximum output
BROADCAST BAND	1650 Kc.	.1 MFD.	Grid of 12SA7	Rotor full open (Plates out of mesh)	Trimmer bottom of Front section of gang. (See bottom of radio)	Oscillator	Adjust to maximum output
	1400 Kc.	See Note "A"		Set dial at 1400 Kc.	Trimmer bottom of Rear section of gang. (See bottom of radio)	Antenna	Adjust to maximum output

NOTE "A" Lay the output lead from the generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the generator.

FREQUENCY RANGE 540 to 1650 K.C.

Power Consumption.....40 Watts
Power Output.....800 Milliwatts Undistorted, 1.5 Watts Maximum
Intermediate Frequency.....465 K.C.

MODEL 767, Series A
Tuner Data

GAMBLE-SKOGMO INC.

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages are to be measured with 115 volts A.C. line or a fully charged 6 volt storage battery.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagrams.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

SETTING THE AUTOMATIC TUNER LEVERS:

IMPORTANT—Read carefully before setting the automatic levers.

There are six levers by means of which six stations may be selected. Make a list of local stations or stations you tune in regularly; any number up to and including six.

Punch out from the set of station call letter tabs supplied, the call letters of the stations you have selected.

On the front of each automatic tuner lever button an opening is provided for inserting the call letter tabs.

Insert the call letter tabs in the rectangular openings of each of the automatic tuner buttons. One of the small celluloid tabs supplied should be inserted into place over each of the station call letter tabs.

NOW. PROCEED AS FOLLOWS:—

1. Pull the dial tuning knob **all the way out** (See Illus. "B," Fig 3), and rotate the tuning knob to the left (counterclockwise) until it cannot be turned any further (See Illus. "D," Fig. 3). This will unlock the automatic tuner mechanism. (NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

2. Press down **all the way** any one of the automatic tuner levers. Holding it down firmly, press in on the dial tuning knob No. 3 and tune in the station indicated on the station call letter tab on this lever. You will note that in order to tune the station, the dial tuning knob will have to be **pressed in** (See Illus. "E," Fig. 3). Turn the dial tuning knob very slowly back and forth **(while still holding the automatic tuner lever in downward position)**, noting the width of the shadow on the screen of the cathode-ray tuning indicator. **Minimum** width on the tuning indicator indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in.

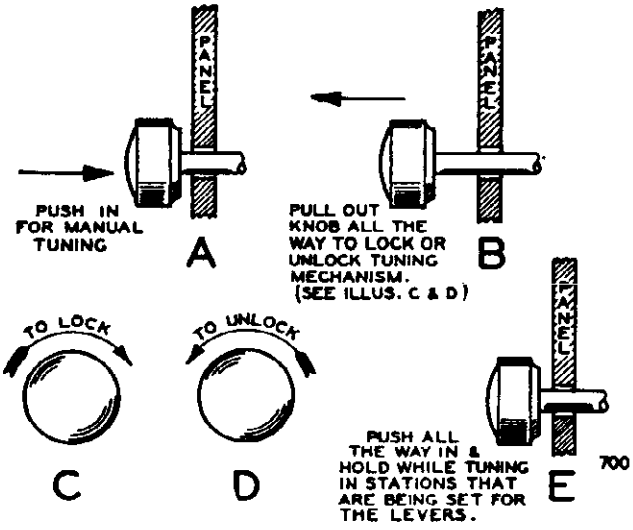

FIG. 3

3. Press down another automatic tuner lever. Holding it down **firmly, press in** on the dial tuning knob and carefully tune in the station indicated on the call letter tab on this lever.

4. Follow this procedure until you have selected all of your favorite stations.

5. Pull the dial tuning knob **all the way out** (See Illus. "B," Fig. 3) and rotate the tuning knob to the **right** (clockwise) until it cannot be turned any further (See Illus. "C," Fig. 3). This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place. After you have locked the tuner mechanism, push the dial tuning knob in.

6. If you should desire to change any station you selected to another, pull the dial tuning knob all the way out and rotate the knob to the left (counterclockwise) and unlock the tuner mechanism. Select the new station as explained.

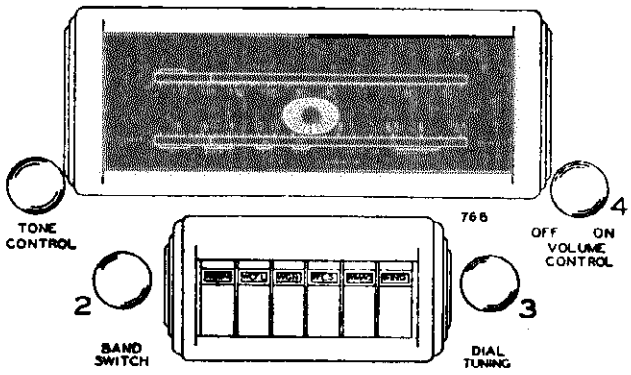

FIG. 2—FRONT VIEW

(NOTE:—**If the dial mechanism works hard when setting up a new station for one of the automatic tuner levers, it is due to the tuner mechanism not being unlocked all the way. Pull the dial tuning knob out all the way and rotate the knob to the left (counterclockwise) until it will turn no further. The dial mechanism should work freely with the tuner lever pressed down).**

7. After you have selected the new station, pull the dial tuning knob all the way out and rotate the knob to the right (clockwise) to lock the tuner mechanism. Be sure the knob is turned until it will turn no further, then **press** the dial tuning knob in.

8. The automatic tuner levers are **now** set up for quick tuning. Press down the lever key and—YOUR FAVORITE STATION IS SELECTED!

The **important** steps to remember when setting up stations on the tuner levers for automatic tuning are:

1. **To unlock the tuner mechanism pull the dial tuning knob all the way out.** You may find it necessary to rotate the knob slightly when pulling it out to make certain that the gears mesh properly. Rotate the dial tuning knob to the left (counterclockwise) as far as it will turn without forcing.

2. **To set a lever, press down all the way and hold in this** position while tuning in by means of the dial tuning knob the station you want this lever to be tuned to. (NOTE:—you will notice that it will be necessary to keep pressing in on the dial tuning knob while tuning in the station as a spring tends to push the knob out.) Set all the levers in the same manner before locking the mechanism.

3. **To lock the tuner mechanism pull the dial tuning knob all the way out.** Rotate the dial tuning knob to the right as far as it will turn making certain that it is tight, but it is not necessary to use force.

4. After locking or unlocking the tuner mechanism always return the dial tuning knob to its normal position **(pushed in).**

MODEL 767, Series A
Alignment, Voltage
Trimmers

GAMBLE-SKOGMO INC.

ALIGNMENT PROCEDURE

Model 767 Series A

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.
- Dummy antennas—.1 mfd., 200 mmf. and 400 ohms.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6K7	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8G	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Rotor full open (Plates out of mesh)	Trimmer (C9) (See Fig. 4)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 1500 Kc.	Trimmer (C6) (See Fig. 4)	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C12C) (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "A")
	465 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Set Dial at 600 Kc.	Trimmer (C1) (See Fig. 4)	I. F. Wave Trap	Adjust for minimum output
IMAGE REJECTION ADJUST-MENTS	2330 Kc.	200 mmf.	Antenna lead	Broadcast (Extreme left rotation)	Pick up signal at 1400 Kc. on dial	Trimmer (C3) (See Fig. 4)	Image rejection	Adjust for minimum output (See note "B")
SHORT WAVE BAND	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 17 Mc.	Trimmer (C3) (See Fig. 4)	Short Wave oscillator	Adjust to maximum output
	17 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Dial Set at 17 Mc.	Trimmer (C7) (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Short Wave (Extreme right rotation)	Set Dial at 6 Mc.	Trimmer (C13) (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "A")

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

NOTE "A" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "B" 1400KC is the image frequency of 2330KC. Adjust Trimmer (C3) until a minimum output is obtained.

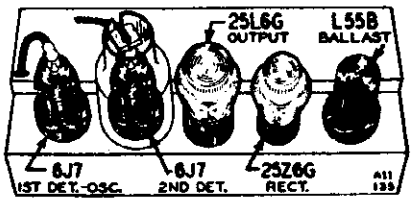
Power Consumption - 48 Watts (At 117 volts AC Supply) **Tuning Frequency Range** - - - - - 530 to 1730 KC

Power Output - - - - - - - .8 Watts Undistorted **Sensitivity** - - - - - - 180 Microvolts Average

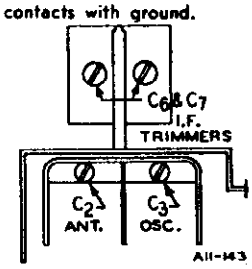
Selectivity - - 30 KC Broad at 100 times Signal

MAY, 1938

DC OPERATION—Filament and ballast tube voltages will be the same as AC (for 117 volt line). The plate, screen and bias voltages will be slightly lower than those shown above. When operated on DC, the rectifier tube acts as a low resistance series resistor with a drop of approximately 6 volts between plate and cathode.



CAUTION—In any service work on the AC-DC chassis, keep it on a wood or other insulated surface to avoid contacts with ground.



VOLTAGES AT SOCKETS FOR 117 VOLT AC LINE

See Note Below Regarding Voltages when Operated on DC

Volume Control Maximum—Antenna Lead Grounded—Readings taken with 1000 Ohm-per-volt Meter.

TUBE	FUNCTION	Voltage Between Socket Prong and Ground (Unless Otherwise Indicated)							
		Prong No. 1	Prong No. 2	Prong No. 3	Prong No. 4	Prong No. 5	Prong No. 6	Prong No. 7	Prong No. 8
6J7	1st Det. & Osc.		6.3(1)	98	98			6.3(1)	6.0
6J7	2nd Det.		6.3(1)	10	13			6.3(1)	
25L6G	Output		24(1)	92	98			24(1)	5

L55B	Ballast			56.6(3)				56.6(3)	4.5(4)

(1) AC voltage across terminals 2 and 7.
(2) AC voltage to ground.
(3) AC voltage across terminals 3 and 7.
(4) AC voltage across terminals 7 and 8.

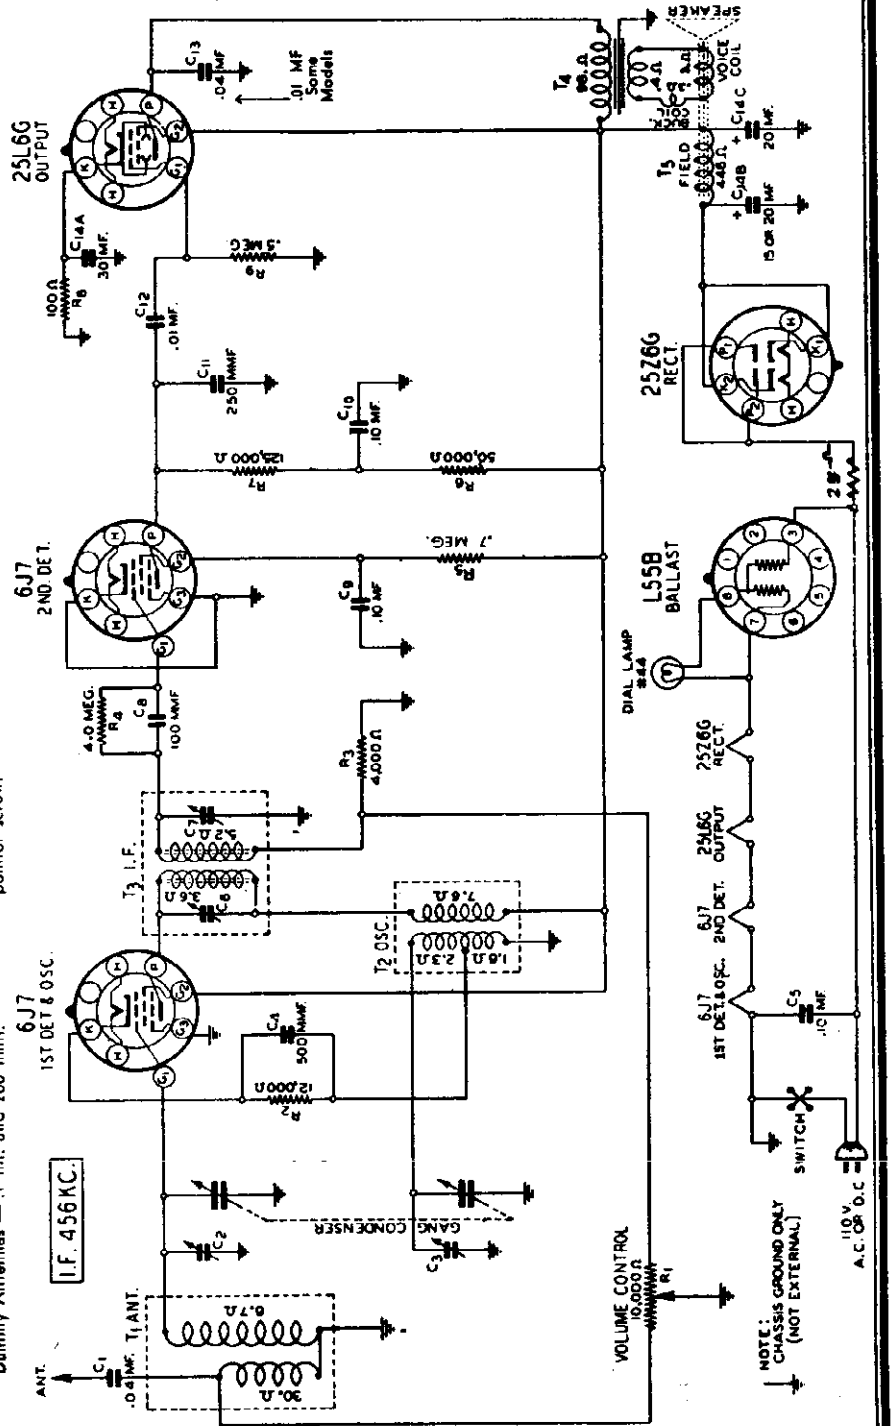
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments, Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Illustration)
456 KC	Grid of 1st Det.	.1 mf.	Turn rotor to full open	I.F. (C6) & (C7)
1730 KC	Antenna Lead	200 mmf.	Turn rotor to full open	Oscillator (C3)
1500 KC	Antenna Lead	200 mmf.	Turn rotor to max. output	Antenna (C2)

The following equipment is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas — .1 mf. and 200 mmf.

NOTE—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, loosen the pointer screw, set the pointer at the 800 KC mark and retighten the pointer screw.



MODEL 864

Socket, Sensitivity

GAMBLE-SKOGMO INC.

APRIL, 1938

Power Output . . . . . 6.5 Watts Undistorted
11.0 Watts Maximum

Selectivity - 32 KC Broad at 1000 times Signal (Sharp)

Sensitivity

B Range (Manual Tuning)	2.0 Microvolts Average
B Range (Automatic Tuning)	2.0 Microvolts Average
C Range	2.0 Microvolts Average
D Range	4.0 Microvolts Average

Speaker . . . . . 12" Dynamic

Tuning Frequency Range

B Range (Manual Tuning)	538	to	1630 KC
C Range (Manual Tuning)	1810	to	6350 KC
D Range (Manual Tuning)	6300	to	22000 KC
Buttons 1 & 2 (Automatic Tuning)	520	to	980 KC
Buttons 3 & 4 (Automatic Tuning)	650	to	1250 KC
Buttons 5 & 6 (Automatic Tuning)	820	to	1600 KC

Power Consumption - 100 Watts (At 117 volts 60 cycles)

This model is a 3 band AC operated radio with a 6 button automatic tuning unit. I.F. 456 KC.

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:
Line Voltage—117.
Volume Control—Maximum.
Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter.

The voltage between the control grids of the 6J5G balancing exciter and the 6F6G output tubes and ground is 22. This voltage cannot be read at the socket terminal because of the high resistance circuit, but can be read across resistors R18, 19, and 20.

Oscillation on D Band

If oscillation is encountered on the D band, change the oscillator grid resistor to 35,000 ohms.

Twenty-Five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer is used.

Caution

On models having an On-Off indicator disk behind the front of the cabinet, it is necessary to take the following precautions, when removing the chassis: Pull the chassis away from the front of the cabinet until the control shafts are clear of the cabinet. Then tilt the rear of the chassis upward. At the same time, keep the front of the chassis base clear of the bottom of the cabinet to prevent breaking the On-Off indicator disk on the volume control shaft. Now carefully pull the chassis out of the cabinet.

MODEL 902
Schematic, Voltage
Socket, Trimmer

MODEL 902

SPECIFICATIONS

Input Voltages and Currents

"A" Battery.....1.5 Volts—.30 Amperes
"B" Battery.....90 Volts—12 to 15 Ma.

Power Output - - - 140 Milliwatts Undistorted
Selectivity - - 41 KC Broad at 1000 Times Signal
Intermediate Frequency - - - - - - - 456 KC.
Speaker - - - - - - - - - 6" P.M. Dynamic
Tuning Frequency Range - - - 540 to 1800 KC.
Sensitivity (For .05 Watt Output)
Portable Model.....30 Microvolts Per Meter Average

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION A" RADIO	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Grid of 1st Det.	.1 mf.	Turn rotor to full open	1st I.F. (C6) & (C7) 2nd I.F. (C11) & (C12)
1600 KC	Grid of 1st Det.	.1 mf.	Turn rotor to full open	Oscillator (C2)
1500 KC	None—See Note		Turn rotor to max. output	Antenna (C1)

The following equipment is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antenna—.1 mf.

NOTE—Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Secure the back in place on the cabinet. Connections for the output meter may be made through the opening for the outside antenna and ground connecting posts. This opening is at the bottom of the cabinet near the back. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).

CALIBRATION (For model with pointer in back of celluloid dial scale)—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. IF THE POINTER IS AT A HIGHER KC MARK THAN 800 KC, grasp the drive cord below the tension spring. Hold the tuning control shaft motionless and slowly pull the drive cord down until the pointer is at the 800 KC mark. IF THE POINTER IS AT A LOWER KC MARK THAN 800 KC, grasp the drive cord above the tension spring. Hold the tuning control shaft motionless and slowly pull the drive cord up until the pointer is at the 800 KC mark.

CALIBRATION (For models with pointer in front of dial scale)—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, loosen the pointer screw, set the pointer at the 800 KC mark and retighten the pointer screw.

Antenna

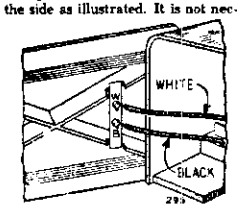
An outside antenna and ground are not required for this radio.

A loop antenna is built on the back cover of the cabinet. This makes the radio suitable for portable use.

If the radio is installed in a permanent location, a long outside antenna (50 to 100 feet) and a ground may be used. At the bottom of the cabinet near the back is an opening through which will be seen two connecting posts marked "A" and "G" for the outside antenna and ground connections respectively.

Batteries

Taking Off Back of Cabinet—To take off the back of the cabinet, first remove the wood screws which hold it in place. Then swing the back to the side as illustrated. It is not necessary to disconnect the two wires to the loop terminal strip. DO NOT TOUCH THE LOOP ANTENNA WIRES AS THEY MUST NOT BE MOVED.



Installing Batteries—To install the batteries, take off the back of the cabinet as explained above.

The following batteries are required:

Two 45 volt "B" batteries—Portable Size 4⅛" x 2½" x 5⅜" High
One 1½ volt "A" battery—Portable Size 3⅛" x 2⅛" x 5⅜" High

These are connected and placed in the cabinet as shown on the label in the cabinet. Note the position of the prongs on the plugs and the holes in the sockets on the batteries. Bring the battery wires over the wood bar as shown. Then insert the plugs in the sockets. The "A" battery plug has two prongs and the "B" battery plugs have three prongs.

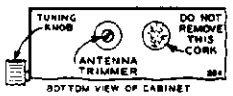
Cardboard in Back of Batteries—After the batteries are in place in the cabinet, the cardboard should be placed in back of them in order to make them fit snugly. If there is sufficient space, fold the cardboard at the score mark and use it double thickness. If this thickness is not required, cut the cardboard at the score mark and use one piece only. Then replace the back of the cabinet.

Adjusting Antenna Trimmer

After the batteries are installed and the back of the cabinet is in place, adjust the antenna trimmer.

Accurately tune in a weak station signal between 1400 and 1500 KC on the dial. With a screwdriver turn the adjusting screw of the antenna trimmer up or down until maximum output is obtained. This trimmer is reached through an opening in the bottom of the cabinet—see illustration. CAUTION: Do not remove the cork from the other opening at the bottom of the cabinet.

Readjust the antenna trimmer when a new set of batteries is installed.



BOTTOM VIEW OF CABINET

Tubes

The tube types and position of the tubes are shown on the label in the cabinet. To replace a tube, it will be necessary to remove the wood bar in back of the chassis by taking out the 2 screws which hold it in place.

MODELS 4912 and 4914

SPECIFICATIONS

Power Consumption - 28 Watts (At 117 volts AC Supply)
Power Output - - - - - - - .8 Watt Undistorted
Selectivity - - 60 KC Broad at 1000 times Signal
Intermediate Frequency - - - - - - - 456 KC
Speaker - - - - - - - - - 5" Electro Dynamic
Tuning Frequency Range - - - 528 to 1730 KC
Sensitivity - - 35 Microvolts per Meter Average (For .05 Watt Output)

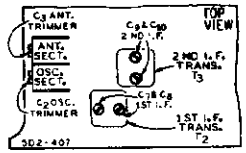
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
Connect Ground Post of Signal Generator to 8—(12SK7—Prong No. 3) in Chassis.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM (See Trimmer Illustration)
456 KC	Signal Grid of 1st Det. Connect at Stator of Large Gang Section.	.1 mf.	Turn Rotor to full open	1st I.F. (C7) & (C8) 2nd I.F. (C9) & (C10)
1730 KC	Antenna Clip	200 mmf.	Turn Rotor to full open	Oscillator (C2)
1560 KC	Antenna Clip	200 mmf.	Turn Rotor to max. output	Antenna (C3)

The following equipment is required for aligning:
Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antenna—.1 mf. and 200 mmf.

NOTE—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, first remove the celluloid crystal by taking out the 4 buttons at the corner. Hold the tuning knob and shift the pointer to the 800 KC mark.



Caution

The metal chassis is connected to one side of the line through a .25 mfd. condenser. Both AC and DC power lines are generally grounded on one side. If the side of the line not connected to the metal chassis through this condenser is grounded and the metal chassis comes in contact with an external ground, this condenser will be connected across the line and there will be an increase in hum.

Therefore, in any service work on the chassis, keep it on a wood or other insulated surface to avoid contacts with ground. The person working on the set should avoid getting in contact with any ground.

Antenna

A loop antenna is mounted on the back of the chassis base. For reception of local or powerful nearby stations no other antenna or ground is usually required.

However, more stations will be heard and noise will often be reduced by using an external antenna. This should preferably be on the outside of the building. For locations in the city or close to the broadcasting stations, the antenna should be 20 to 35 feet in length while for locations in the country or at a distance from the broadcasting stations, use a 35 to 60 foot antenna.

A GROUND CONNECTION IS REQUIRED if an external antenna is used. A ground connection may be obtained by connecting to a water pipe, radiator, or a pipe driven into the ground.

The antenna and ground connections are made at the clips marked "A" and "G" respectively on the back of the cabinet.

Location of Radio

Place radio preferably where it gets air circulation. Do not put it in a place where it will get too hot such as on a radiator.

Power Supply

This radio will operate on a power supply of 117 volts AC, 50 to 60 cycles only, or 117 volts DC.

When using the radio on AC, if there appears to be excessive hum, reverse the plug. Leave the plug inserted the way which gives the least hum.

Radios for 25 to 60 cycle AC operation are so marked.

CAUTION—110 Volt DC Operation—when used on a DC line, if the set does not operate after one minute, reverse the plug.

Tubes

The type and position of the tubes are shown in the illustration.

All tubes must be in the sockets to operate the radio.

To replace tubes, first remove the back cover. Then take out the 2 screws holding the loop antenna to the mounting brackets. Move the loop antenna to one side as far as connecting wires will permit.

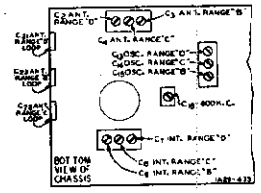
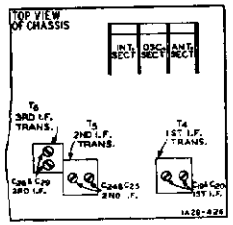
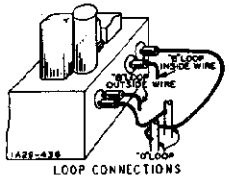
LOOP RANGE D					
21,000 KC See Note D	None—See Note D		D Range	Turn Rotor to Max. Output	Loop Trimmer (C21) Rock Rotor—See Note C







Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—For all adjustments with the exception of the B loop range adjustments, the pin tip should be in the external antenna hole of the Antenna Selection Socket—See illustration on page one.

NOTE B—If the pointer is not at 1500 KC on the dial, remove pointer from drive cord. Tune in a 1500 KC signal. Set pointer at the 1500 KC mark on the dial scale. Attach pointer to drive cord.

NOTE C—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE D—Re-install set in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place signal generator so that this loop is between 3 and 10 feet from loop in cabinet. Insert pin tip in loop antenna hole of Antenna Selection Socket—See illustration on page one.

NOTE E—Turn knob of loop until output is maximum.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

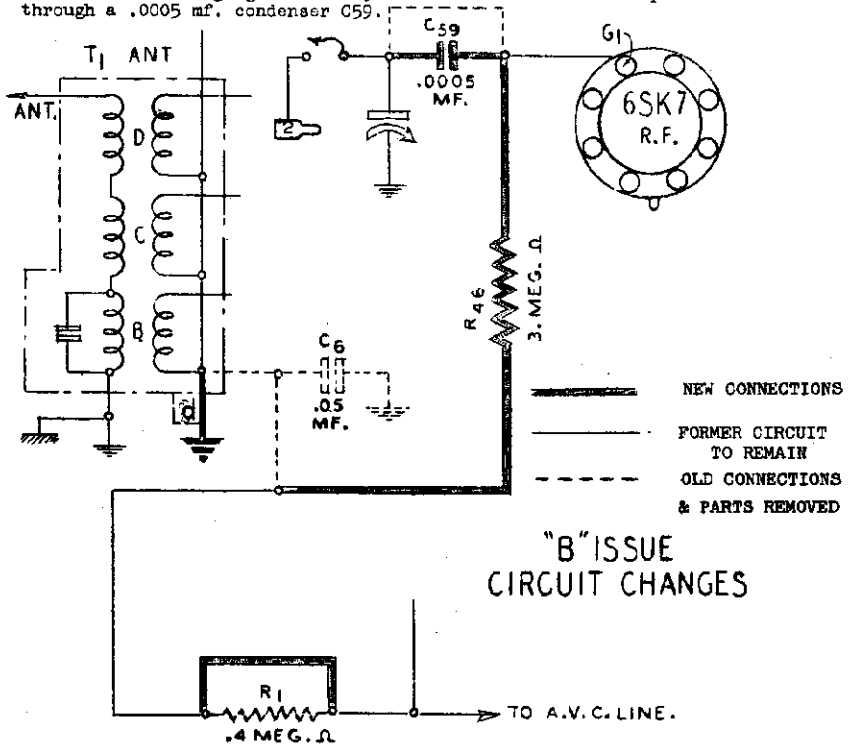
Subject CHANGES MADE FOR "B" ISSUE SETS TO REDUCE HUM MODULATION. **Date** Sept. 8, 1939

Resistor R1, 400,000 Ohms, in series with the AVC connection to the antenna coil, has been removed from the circuit.

The AVC line is no longer connected to the antenna coil at terminal "D." Instead, this terminal is connected to ground. The bypass condenser C6, .05 mf., formerly connected between the same terminal and ground, has been removed from the circuit.

The AVC line which formerly connected to the "D" terminal of the antenna coil and C6, is now connected through a 3 megohm resistor R46 to G1 of the 6SK7 R.F. tube.

G1 of the 6SK7 R.F. tube, which was formerly connected directly to the stator of the gang condenser, is now connected to this point through a .0005 mf. condenser C59.



Television Sound or Phonograph Connections

If Television programs ever become available in your community, the audio amplifier and speaker of this radio may be used to reproduce Television sound in conjunction with any "Television Picture Receiver and Sound Converter." Phonograph records may also be played through the radio.

On the back panel of the chassis base is a switch knob and a socket for a single shielded pin tip at which connections are made. The connector on the cable from a television receiver or from a phono pickup can be inserted in the socket. (The cable connector must be a single shielded pin tip type, Part No. M93.)

When phonograph or television sound reproduction is desired, the knob should be turned to the "Phono-Television Sound" position. For radio reception, the knob should be in the "Radio" position

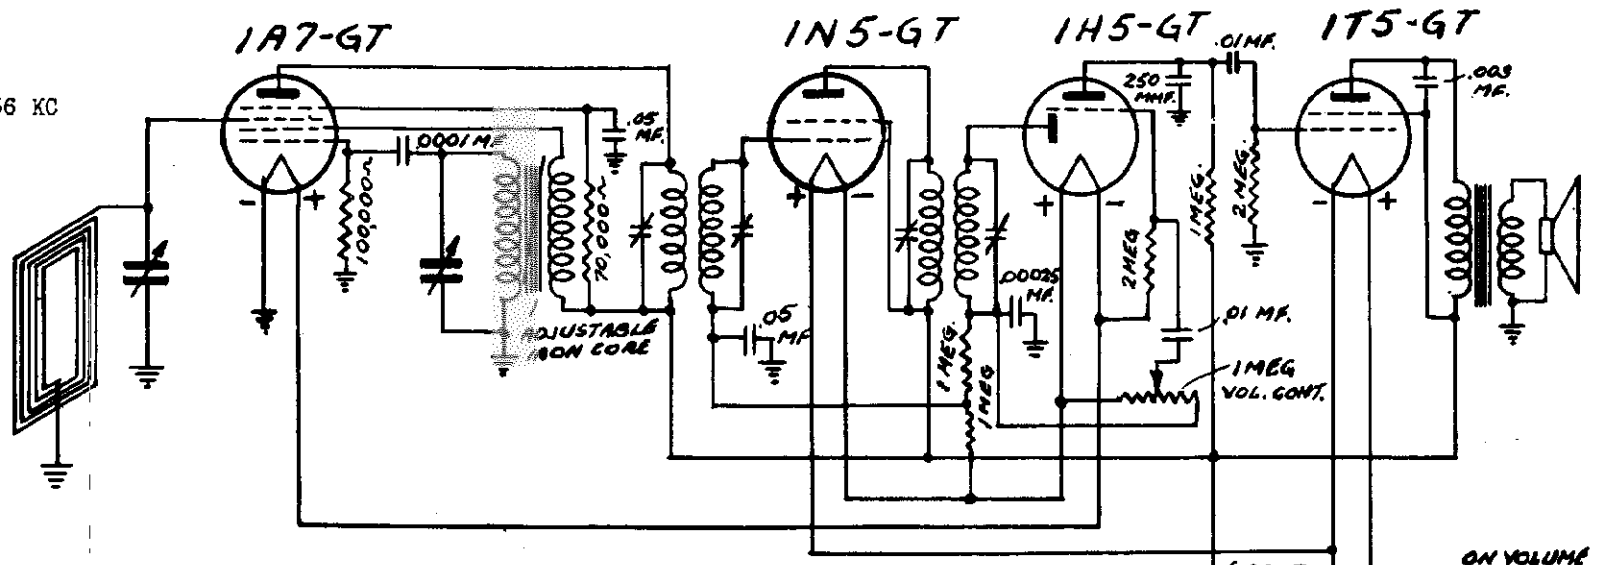
MODELS BP4 AND BP5.

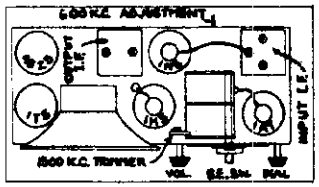
ALIGNMENT - Should the receiver require alignment proceed as follows. Remove the back. Remove the chassis from the cabinet. Set the test oscillator at 456KC and connect it to the grid of the 1A7G. The first I.F. Transformer is located on top of the chassis, the second I.F. is on the front apron, directly under the dial. All I.F. trimmers are aligned for maximum output.

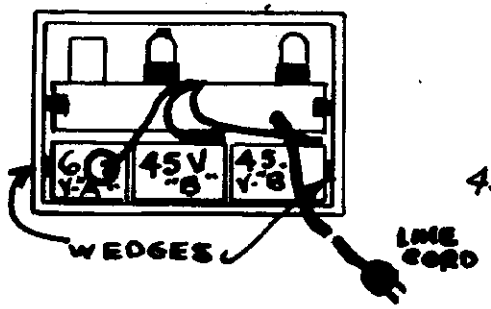
The high frequency antenna trimmer is aligned at approximately 1500 KC. Replace chassis in cabinet, and put the back in place. Now tune in a station at approximately 600 KC and adjust the OSCILLATOR through the hole in the bottom of the cabinet for maximum signal, while rocking the dial back and forth.

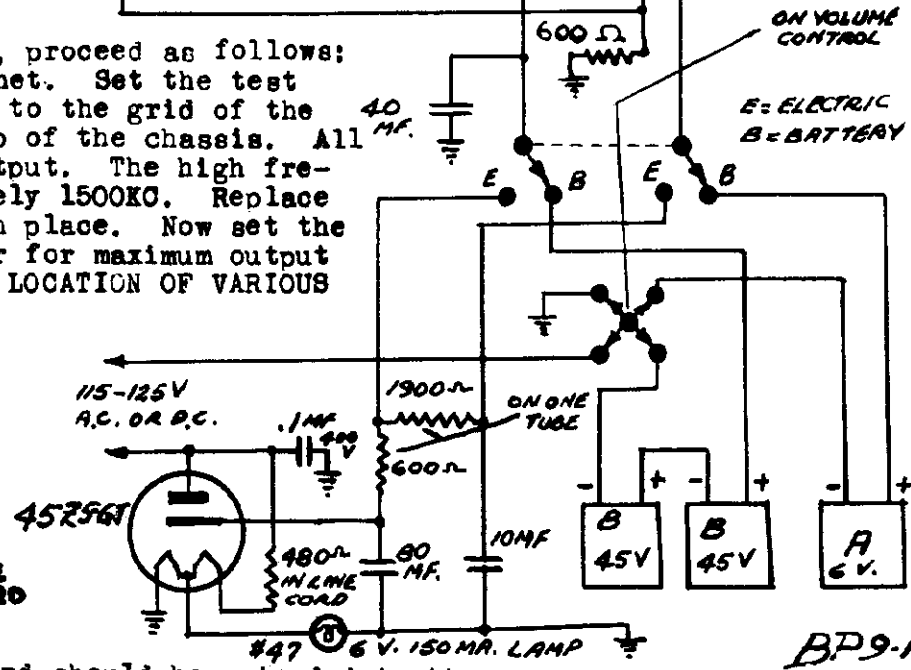
REV. 4-27-39



ALIGNMENT - Should the receiver require alignment, proceed as follows: Remove the back. Remove the chassis from the cabinet. Set the test oscillator at 456 KC and connect oscillator output to the grid of the 1A7G. The I.F. transformers are located on the top of the chassis. All I.F. transformers should be aligned for maximum output. The high frequency oscillator trimmer is aligned at approximately 1500KC. Replace the chassis in the cabinet and put the loop back in place. Now set the signal generator at 600KC and adjust the oscillator for maximum output while rocking the gang condenser. SEE DIAGRAM FOR LOCATION OF VARIOUS ADJUSTING SCREWS.







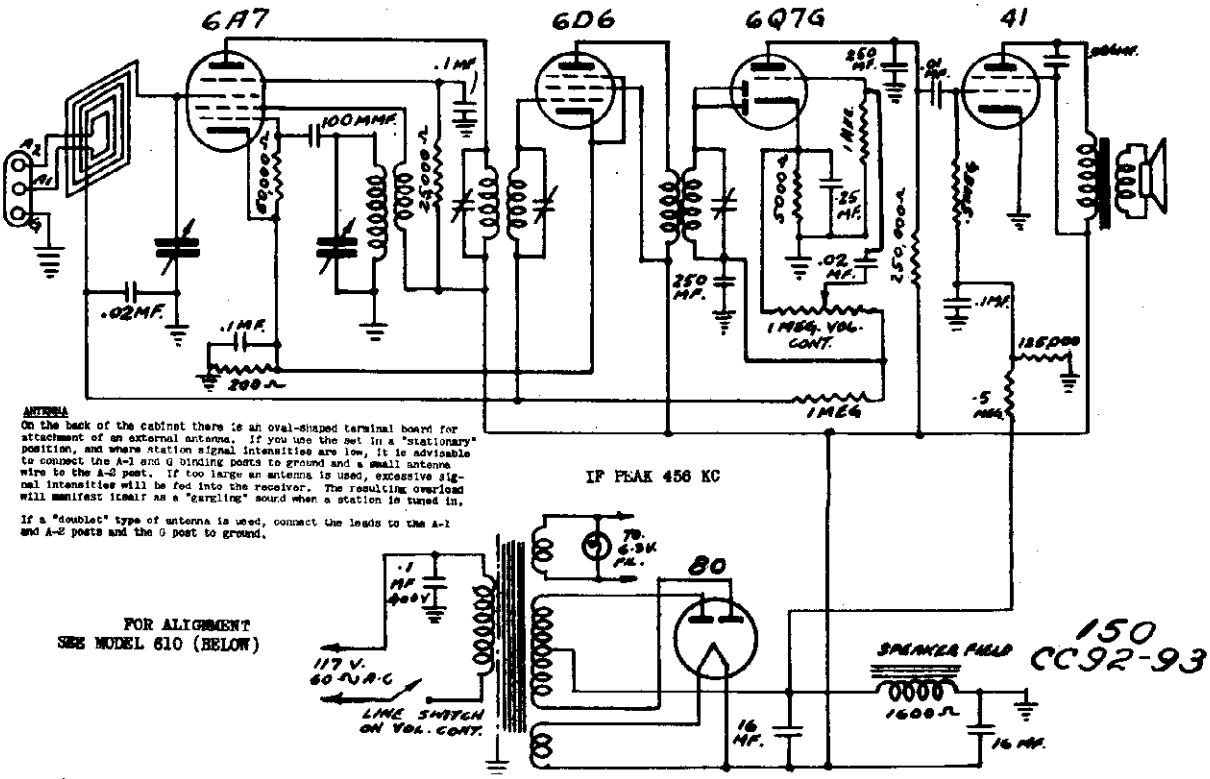
BP9-10

NOTE: When used in Electric operation, the line cord should be extended to its full length. If it is left closely folded while operating from the light line, the concentrated heat may damage the cord.

7-18-39

GAROD RADIO CORP.

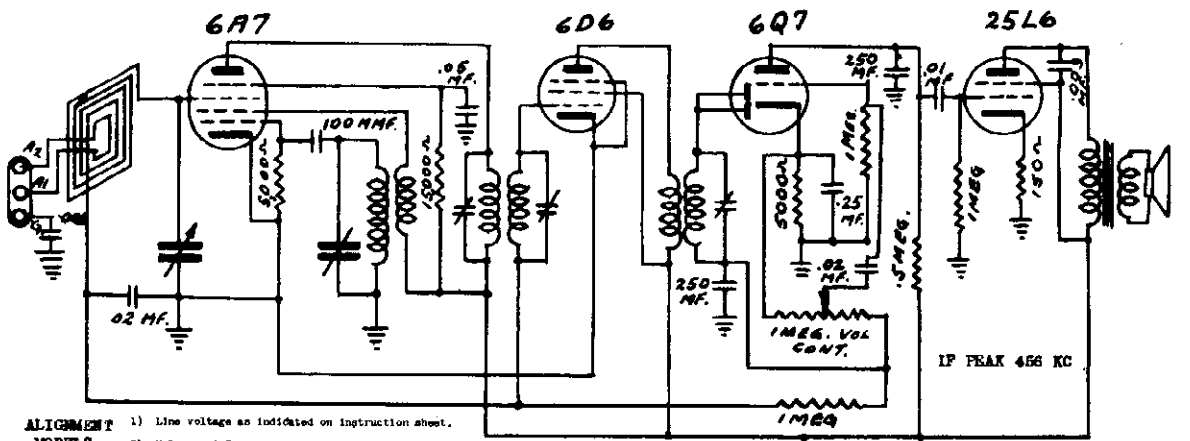
MODEL 150
MODEL 610
Schematic
Alignment



ANTENNA
On the back of the cabinet there is an oval-shaped terminal board for attachment of an external antenna. If you use the set in a "stationary" position, and where station signal intensities are low, it is advisable to connect the A-1 and G binding posts to ground and a small antenna wire to the A-2 post. If too large an antenna is used, excessive signal intensities will be fed into the receiver. The resulting overload will manifest itself as a "gargling" sound when a station is tuned in.

If a "doublet" type of antenna is used, connect the leads to the A-1 and A-2 posts and the G post to ground.

FOR ALIGNMENT
SEE MODEL 610 (BELOW)



ALIGNMENT
MODELS
150
610

1) Line voltage as indicated on instruction sheet.
2) Volume and Tone control at maximum volume positions.
3) Minimum Input from signal generator.

I.F. ADJUSTMENT

The signal generator is set at 456KC and is connected to the grid of the converter tube (6A7) through a .5 MFD condenser. Be sure to connect a resistor of approximately 25,000 OHMS between the converter grid and ground so that the grid circuit is at ground potential for D.C.

The Input I.F. transformer trimmers are adjusted for maximum output as indicated by the output meter connected across either the voice coil or the primary coil of the loud speaker.

The Output I.F. transformer trimmer is located underneath the chassis. Adjust the trimmer for maximum output as indicated on the output meter. The Input I.F. should now be re-checked for maximum output.

BROADCAST BAND ALIGNMENT

Connect the output of the signal generator to a loop antenna consisting of about five turns of "bell" wire making a circle a foot in diameter. This loop should be VERY LOOSELY coupled to the receiver loop and should not be less than one foot from the receiver.
Set the signal generator at 1500KC and tune the receiver until a response is indicated on the output meter with signal generator set at 1500KC. Rock the gang condenser while adjusting the oscillator trimmer condenser for maximum output.
The dial pointer should co-incide with the 1500KC mark on the dial. If it does not, check other calibration points at both ends of the scale before re-setting the pointer.

FOR ANTENNA CONNECTIONS
SEE MODEL 150 (ABOVE).

Alignment

GAROD MODELS 389; 453; 493; 939, 1239.

If this procedure is not adhered to, all adjustments will appear very broad. This is due to the action of the automatic volume control.

I.F. ADJUSTMENT - The signal generator is set at 455 KC and is connected to the grid of the converter tube (12A8) through a .5 MFD condenser. Be sure to connect a resistor of approximately 25,000 OHMS between the converter grid and ground so that the grid circuit is at ground potential for D.C.

The Input I.F. Transformer trimmers - are both adjusted for maximum output as indicated by the output meter connected across either the voice coil or the primary coil of the loud speaker.

The Output I.F. Transformer trimmers - are adjusted for maximum output as indicated on the output meter. The Input I.F. should now be re-checked for maximum output.

SHORT-WAVE BAND #1 MODELS 453, 493, 939 (ONLY) - Set the band switch to the extreme left-hand position which is short-wave band #1. Set the generator at 15.5 MC, turn the condenser until a response is indicated. The pointer should co-incide with the 15.5MC mark on the dial. Adjust the antenna trimmer for the short-wave band for maximum output while rocking the condenser gang from left to right.

SHORT-WAVE BAND #1 MODEL 389 (ONLY) - Set the band switch to the extreme right hand position which is short wave band #1. Turn the dial control knob to the extreme high frequency end so that the condenser plates are entirely out of mesh. The signal generator is connected to the "short-antenna" lead through a dummy antenna, consisting of a 250 MMFD condenser and a 400 OHM non-inductive resistor in series. Set the generator at 19MC, turn the condenser until a response is indicated. The pointer should co-incide with the 19MC mark on the dial. Adjust the antenna trimmer for the short-wave band located under the chassis on the antenna coils for maximum output while rocking the condenser gang from left to right.

BROADCAST BAND MODEL 1239 (ONLY) The dummy antenna for this band consists of only a 250 MMFD condenser. Set the Band Switch in the middle position and condenser plates completely out of mesh. Set the generator at 1500KC. Turn the variable condenser until a response is indicated. The dial pointer should now co-incide with the 1500KC mark on the dial. Adjust the 1500KC Antenna trimmer (located under the chassis near the band switch) for maximum output. Set the generator at 600KC and turn the variable condenser control until a response is indicated. Adjust the broadcast oscillator padder condenser (located on top of the chassis between the variable condenser and the output I.F. transformer) for maximum response while "rocking" the gang condenser. The high frequency adjustments should now be re-checked.

BROADCAST BAND MODELS 389, 453, 493, 939. The dummy antenna for this band consists of only a 250 MMFD condenser. Set the Band Switch in the Broadcast position and condenser plates completely out of mesh. Set the signal generator at 1550KC and adjust the broadcast oscillator trimmer until a response is indicated on the output meter. The generator is now set at 1500KC. Turn the variable condenser until a response is indicated. The dial pointer should now co-incide with the 1500KC mark on the dial. Set the generator at 600KC and turn the variable condenser control until a response is indicated. Adjust the broadcast oscillator padder condenser for maximum response while "rocking" the gang condenser. The high frequency adjustments should now be re-checked.

SHORT-WAVE BAND #2 MODELS 389, 493, 939. - Set the band switch to the middle position. Turn the dial control knob to the extreme high frequency end so that the condenser plates are entirely out of mesh. The signal generator is left connected as for band #1. The generator is set at 6.25 MC and the Band #2 osc. trimmer is opened until a response is indicated at the lower capacity setting of the trimmer.
Set the generator at 6MC and turn the variable condenser until a response is indicated. The pointer should now co-incide with the 6.MC mark on the dial. The antenna trimmer is then adjusted for maximum output while the condenser gang is rocked from right to left.
Set the generator at 2.4 MC and turn the variable condenser knob until a response is indicated. The padder for this band is now adjusted for maximum output while rocking the condenser gang from left to right. The high frequency adjustments should then be rechecked.

Long Wave Band: MODELS 453, 1239, The band selector switch is set in position for operation on the long wave band.(extreme right hand position). The receiver and generator are both tuned to 300 kc and the oscillator trimmer is adjusted for maximum response. The antenna and first detector trimmers are adjusted in the order named for maximum output.
The signal generator is then set at 150 kc and the signal is tuned in. The long wave padder condenser is adjusted for maximum response while the gang tuning condenser is rocked slightly to the left and right. The 300 kc adjustment should then be re-checked.

VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS.
No signal input—Max. Volume—Band "B."

Fig. 5. Socket Voltages

Models H-73, H-77, H-78, and H-79 employ three-band a-c receivers of the superheterodyne type using seven General Electric Pre-tested Tubes. Features of design include the new "Alnico" dynapower speaker, nine Feathertouch Tuning keys, six of which may be set up for favorite stations, a television audio or phonograph key, Visualux dial, iron-core I.F. transformers, iron-core oscillator trimmer coils for station keys and automatic volume control. In addition Model H-73 is equipped with the built-in "Beam-a-Scope" while Models H-77, H-78, and H-79 are equipped with the built-in "*Super* Beam-a-scope."

Models H-78 and H-79 each contain a phonograph mechanism for reproducing records. Model H-78 phonograph manually plays 10-inch or 12-inch records. Model H-79 phonograph incorporates an automatic record changer which will play either 10-inch or 12-inch records. Both mechanisms contain high-quality crystal pick-ups and constant speed, self-starting, silent electric motors.

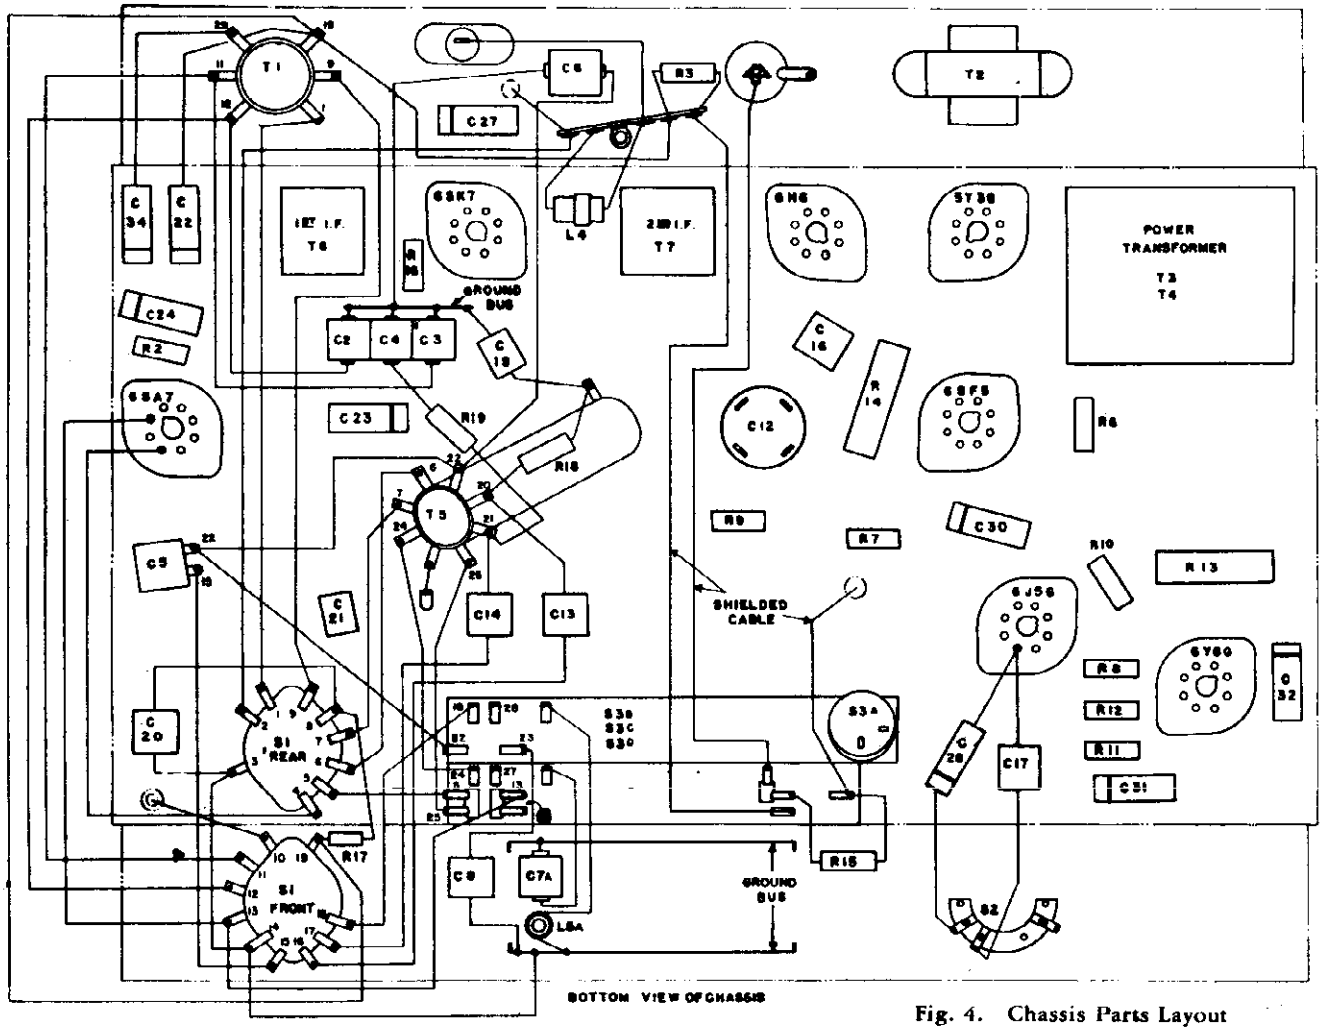

Fig. 4. Chassis Parts Layout

GENERAL INFORMATION

Super Beam-a-scope

The *Super* Beam-a-scope is essentially a tuned coil antenna wound on a frame and shielded by a Faraday screen against electrostatic disturbances. This construction favors the desired signal over a local man-made noise sources in three ways. First, since any noise source is composed of two components—electrostatic and electromagnetic fields—the *Super* Beam-a-scope may be revolved so that a null point is found where no voltage is produced from these two components. Due to the fact that this null point is very sharp, it is very unusual that any desired station will be in a direct line with the rejected noise signal and thereby have its signal strength reduced appreciably. In the second place, the *Super* Beam-a-scope eliminates local man-made noise sources in much the same way as a shielded antenna lead-in does in an ordinary antenna installation. In the third place the *Super* Beam-a-scope discriminates against the electrostatic component of an incoming wave in comparison with the electromagnetic component, because of the Faraday shield. Since the electrostatic component of a local noise source is a great deal larger than the electromagnetic component, this rejection property brings about an enormous increase in signal-to-noise ratio.

The above operation is only available on the broadcast band and in this position the *Super* Beam-a-scope is also the first tuned grid circuit. On the "C" and "D" bands, the *Super* Beam-a-scope is grounded at the grid end thus preventing absorption spots due to loop resonance.

Loud-speaker

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice coil assembly.

NOTE.—In no case should the magnet be removed from the assembled position without remagnetizing before replacing it.

Coil System

L-1 is the Beam-a-Scope. T-1 is the "C" and "D" band antenna transformer while T-5 is the oscillator transformer for all bands. All band switch and coil terminals are numbered in Fig. 3 and Fig. 4 to facilitate in locating common points.

The following table shows the coils in use for the various positions of the band and manual-automatic switch:.

Band Switch Position	Antenna Primary	Antenna Secondary	Oscillator Grid	Oscillator Cathode	Remarks
Band "B" Manual Position		L-1	L-6	24 to Gnd. of L-6	C-1 tuning condenser in circuit
Band "B" Automatic Tuning		L-1	L-6	25 to Gnd. of L-6	C-7 and L-5 trimmers and coils in circuit.
Band "C"	L-2	L-2	L-7	6 to Gnd. of L-7	L-1 and L-6 effectivelygrounded through C-22 and C-5 respectively.
Band "D"	L-3	L-3	L-8	7 to Gnd. of L-8	L-1, L-2 secondary grounded through C-22. L-6, L-7 grounded through C-5 and C-13 respectively.

Phonograph or Television Audio Connections

These models are equipped with a phono-terminal (pin jack) to allow the convenient connection of record players or television audio channels. General Electric plug, Stock No. RP-145, fits the pin jack. Models H-78, and H-79 use the plug connection from phonograph to radio and this plug may be readily removed to allow use of other record players, sound equipment or television sound converters.

NOTE.—A suitable load consisting of a 100,000-ohm resistor in series with .01 mfd. capacitor should be connected across the pick-up leads when using a crystal-type unit.

Alignment Procedure

The alignment procedure is given in table form
Use a standard I.R.E. "dummy" antenna, Fig. 7, in making all R.F. alignments. The relative position of the Beam-a-Scope with respect to the chassis materially affects R.F. alignment on "B" band; therefore, final alignment on "B band should be made after the chassis and Beam-a-Scope are mounted in the cabinet.

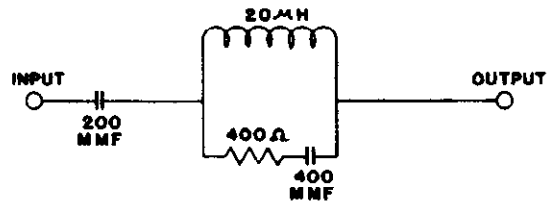

Fig. 7. I. R. E Dummy Antenna

PHONOGRAPH MECHANISM (H-78)

The phonograph mechanism used in this receiver has been designed to be as simple as possible and give long and trouble-free performance. Under normal operating conditions service difficulties should be negligible. Occasionally, however, certain adjustments may be required.

Trip Mechanism

The trip mechanism is of simple design and consists of a latch bar connected to the motor switch and a trip lever. The latch is held closed by means of a spring between the latch bar and the trip lever. The motor switch is mechanically connected to the latch bar so that when the trip mechanism is released, the motor switch is in the "Off" position. Be sure this latch bar mechanism works freely without binding.

The trip is actuated by an adjustable arm on the trip lever. When the eccentric groove in the record swings the tone arm back and forth, it pushes the latch out of engagement.

Crystal Pick-up

The crystal pick-up employs a crystal element which is coupled to a light needle chuck. The needle movement bends the crystal element thus generating voltage by the piezo-electric effect. The voltage developed is dependent upon the needle movement amplitude and the load resistance.

The crystal cartridge is a factory-sealed unit and no adjustments are provided. The cartridge is held in the tone arm by means of two screws. The pick-up and tone-arm assembly should require very little servicing and if treated with reasonable care should perform its function without attention for long periods of time.

Special Service Information

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage-measuring instrument is available.

(1) Stage Gains
- (a) Antenna Post to Converter Grid
  - Band "B" ..... 6 to 9
  - Band "C" ..... 3 to 4
  - Band "D" ..... 1.5 to 3
- (b) Converter Grid to 6SK7 Grid ..... 45 at 455 K.C. ‡
- (c) 6SK7 Grid to 6H6 Det. Plate ..... 45 at 455 K.C. ‡

(2) A 400-cycle signal of .04 volts across the volume control will give ½ watt speaker output.‡ (Volume control turned to maximum.)

(3) Average d-c voltage developed across oscillator grid resistor (R-2)
- Band "B" ..... 6 to 8 volts
- Band "C" ..... 5 to 7 volts
- Band "D" ..... 2.5 to 5 volts

‡ Variations of +10%, −20% permissible.

FOR RECORD CHANGER DATA SEE INDEX

ALIGNMENT PROCEDURE

I. F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. 2nd I.F. Pri. (T-7)	Gang condenser plates closed—"Manual" key depressed—connect audio input of oscilloscope to chassis and to junction of R-3 and R-15. Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude. The resultant curve is shown in Fig. 1.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. 1st I.F. Pri. (T-6)	

I. F. ALIGNMENT WITH OUTPUT METER

1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. 2nd I.F. Pri. (T-7)	Gang condenser plates closed—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. 1st I.F. Pri. (T-6)	

R. F. ALIGNMENT

1. Band "B"					Close gang plates—adjust pointer to first line at left end of tuning scale. Connect output meter across voice coil—tone control on "Bass" position.
2. Band "D"	21 M.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-4) Ant. (C-2)	The image of any "D" band signal should be heard 910 K.C. below signal input when (C-4) is on proper peak. Example: 18 M.C. image 17.09 M.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	6 M.C. with Modulation	Antenna Post	I.R.E.	Ant. (C-3)	Peak for maximum output with a low input signal.
4. Band "B"	580 K.C. with Modulation	Antenna Post	I.R.E.	Osc. Padder (C-5)	Set dial pointer to 580 K.C. and tune in signal with (C-5) while rocking gang condenser.
5. Band "B"	1500 K.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-6)	Peak trimmer for maximum output while rocking the gang condenser.
6. Band "B"	580 K.C. with Modulation	Antenna Post	I.R.E.	Osc. Padder (C-5)	Retrim for maximum output with a low input signal, rocking gang condenser.

Electrical Power Output

Undistorted.....8.5 watts
Maximum.....10 watts

GENERAL INFORMATION

Model H87

The Model H-87 is a three-band a-c operated receiver employing eight General Electric Pre-tested Tubes in a superheterodyne circuit. This receiver is equipped with nine Feathertouch Tuning Keys, six of which, may be set up for favorite stations. The three remaining keys allow power control, manual tuning and phonograph or television audio reception. The new *Super* Beam-a-scope, which is a highly efficient self-contained antenna circuit, is standard equipment on this model. Other features of design include: "Alnico" dynapower speaker, floodlighted station key finder, visualux dial, iron core I.F. transformers, automatic tone compensation, automatic volume control and push-pull output.

SUPER BEAM-A-SCOPE

Models H-87; HJ1005

The *Super* Beam-a-scope is essentially a tuned coil antenna wound on a frame and shielded by a Faraday screen against electrostatic disturbances. This construction favors the desired signal over a local man-made noise source in three ways. First, since any noise source is composed of two components—electrostatic and electromagnetic fields—the *Super* Beam-a-scope may be revolved so that a null point is found where no voltage is produced from these two components. Due to the fact that this null point is very sharp, it is very unusual that any desired station will be in a direct line with the rejected noise signal and thereby have its signal strength reduced appreciably. In the second place the *Super* Beam-a-scope eliminates the external return path to ground present in the case of an unshielded antenna. This reduces or eliminates local man-made noise sources in much the same way as a shielded antenna lead-in does in an ordinary antenna installation. In the third place the *Super* Beam-a-scope discriminates against the electrostatic component of an incoming wave in comparison with the electromagnetic component because of the Faraday shield. Since the electrostatic component of a local noise source is a great deal larger than the electromagnetic component, this rejection property brings about an enormous increase in signal-to-noise ratio.

The above operation is only available on the broadcast band and in this position the *Super* Beam-a-scope is also the first tuned grid circuit. On the "C" and "D" bands, the *Super* Beam-a-scope is grounded at the grid end thus preventing absorption spots due to loop resonance.

Loud-speaker *Models H87; HJ1005*

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice-coil assembly.

NOTE.—In no case should the magnet be removed from the assembled position without remagnetizing before replacing it.

Coil System *Models H87; HJ1005*

The "C" and "D" band antenna coils are wound on a single coil form T-6 as shown(Schematic)T-7 is the oscillator transformer for the "B," "C" and "D" bands. All switch points are numbered to facilitate in locating these switch points on the pictorial wiring diagram.

The following table gives the coils in use for the various positions of the band switch.

Band-switch Position	Antenna Primary	Antenna Secondary	Oscillator Primary	Oscillator Secondary
Band "B"	Lower portion of L-1	Upper portion of L-1	Lower portion of L-4	Upper portion of L-4
Band "C"	L-2 Primary (L-1 Primary shorted)	L-2 Secondary (Grid end of L-1 to ground)	Lower portion of L-5	Upper portion of L-5 (High side of L-4 to gnd. thru R-15. Mid tap of L-4 to gnd.)
Band "D"	L-3 Primary (L-1 Primary shorted)	L-3 Secondary (Grid end of L-) to ground. L-2 secondary grounded)	Lower portion of L-6	Upper portion of L-6 (High side of L-4 and L-5 to gnd. thru R-15. Mid tap of L-4 to gnd.)

Alignment Procedure *Models H87; HJ1005*

The alignment procedure is given in table form on the opposite page. Use the designated "dummy" antenna in making each individual alignment. I.F. alignment may be performed with the chassis removed from the cabinet and the Beam-a-Scope disconnected. R.F. alignment on "C" and "D" bands should be performed with the Beam-a-Scope disconnected and a 70 mmf. mica capacitor between the signal generator and the point of input. R.F. alignment on "B" band should be performed with the chassis and Beam-a-Scope mounted in the cabinet and properly connected.

3. Band B	455 K.C. and 30 K.C. sweep	Bass	Converter 6SA7 Grid	All I.F. Trimmers	

I.F. Alignment with Output Meter*

Band-switch Setting	Input Frequency	Tone Control Position	Point of Input*	Trimmer	Comments
1. Band B	455 K.C. modulated	Bass	I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—manual key depressed—output meter connected across voice coil—volume control at maximum—input as low as practical. Adjust all trimmers in order listed for maximum output.
2. Band B	455 K.C. modulated	Bass	Converter 6SA7 Grid	1st I.F. Sec. 1st I.F. Pri.	
3. Band B	455 K.C. modulated	Bass	Converter 6SA7 Grid	All I.F. Trimmers	

R.F. Alignment

Band-switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1. Band B					Mechanically adjust dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed. Connect output meter across voice coil.
2. Band C	6 MC modulated	Bass	Antenna Post**	Osc. (C-6) Ant. (C-3)	Set pointer to 6 M.C. mark and align (C-6). Peak (C-3) for maximum output.
3. Band D	21 M.C. modulated	Bass	Antenna Post**	Osc. (C-7) Ant. (C-4)	Set pointer to 21 M.C. mark and align (C-7). Peak C-4 while rocking gang condenser. The image of any signal on the D band should be 910 K.C. below input signal. Example: 15 M.C. image 14.09 M.C.
4. Band B	580 K.C. modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Set dial pointer to 580 K.C. mark and tune in signal with (C-8).
5. Band B	1500 K.C. modulated	Bass	Antenna Post***	Osc. (C-5)	Adjust C-5 for maximum output in vicinity of 1500 K.C. while rocking gang condenser.
6. Band B	580 K.C. modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Retrim (C-8).
7. Band B	1500 K.C. modulated	Bass	Antenna Post***	Osc. (C-5)	Repeak (C-5).

* Use "dummy" antenna consisting of .05 mfd. capacitor between signal generator and point of input.
** Use a "dummy" antenna consisting of 70 mmf. capacitor between signal generator and point of input with Beam-a-Scope disconnected.
*** Use an I.R.E. "dummy" antenna as shown in Fig. 2 between the signal generator and the point of input.

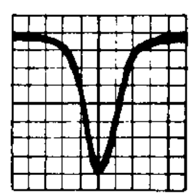

Fig. 3. I.F. Curve taken on G-E Oscilloscope OFM-1

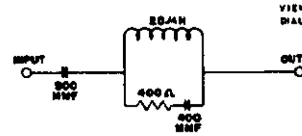

Fig. 2. I.R.E. Dummy Antenna

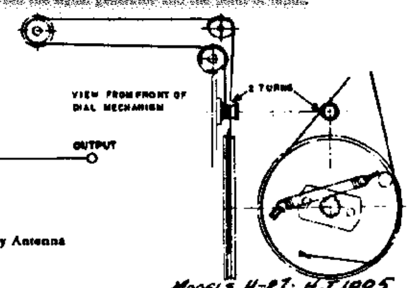

Models H-87; HJ1005

Models H-87; HJ1005

SPECIAL SERVICE INFORMATION

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

(1) Stage Gains‡

(a) Antenna Post to Converter Grid
Band "B" (Beam-a-Scope connected)*—3 at 1000 K.C.
Band "C" (Beam-a-Scope disconnected)**—3 at 4 M.C.
Band "D" (Beam-a-Scope disconnected)**—3 at 18 M.C.

(b) Converter Grid to 6SK7 Grid.........65 at 455 K.C.

(2) A 400-cycle signal of .05 volts across volume control will give ½-watt speaker output.‡ (Volume Control turned to maximum.)

(3) Average DC voltage developed across oscillator grid resistor (R1) with gang closed.

Band "B"..............................6.5 volts
Band "C"..............................7 volts
Band "D"..............................3.8 volts

*Use I.R.E. "dummy" antenna.
**Use 70 mmf. capacitor between signal generator and antenna post with Beam-a-Scope disconnected.
‡Variations of ± 10% —20% permissible.

REPLACEMENT PARTS LIST MODELS H-500U, H-510U AND H-520U (W and X Models Included)
(For Models Using 125A7GT Tube and 500,000 Ohm Volume Control)

Symbol	Description	List Price
*RB-008	BOARD—Terminal board (2 lug)	$0.10
*RB-036	BOARD—Terminal board (3 lug for Models H-500U, 510U)	.10

*RC-676	CAPACITOR—3 band padder (C-30)	.35
*RC-982	CORD—Power cord	.65
RC-1980	CLAMP—Antenna coil clamp for Models H-500U, 510U (Pkg. 5)	.10
RC-5126	CAPACITOR—30 mfd. 150 V.; 40 mfd. 150 V.; 20 mfd. 25 V.; dry electrolytic (C-17a, 17b, 17c)	$1.15
RC-7019	CONDENSER—Tuning condenser for Model H-500U (C-2a, 2b)	2.05
RC-7023	CONDENSER—Tuning condenser for Models H-510U, 520U (C-2a, 2b)	4.10
RC-8508	CARDS—Station letter cards for Models H-510U, 520U (W and X inc.)	.30
RC-9013	CONE ASSEMBLY—Speaker cone assembly for all models	.80
RD-111	DIAL—Dial scale for Models H-500U, 510U (W and X inc.)	.20
RD-140	DIAL—Dial scale for Model H-520U (W and X inc.)	.20
RD-410	DRUM—Tuning condenser drive assembly for all models in brown	.20
RD-411	DRUM—Tuning condenser drive drum assembly for all models in ivory and H-510UX	.60
RD-414	DRUM—Tuning condenser drive drum assembly for all models in onyx except H-510UX	.60
RH-007	HANE—Antenna bank for Models H-500U, 510U (W & X inc.)	.20
RK-048	KNOB—Control knob for all models in ivory	.15
RK-051	KNOB—Control knob for all Models in brown and H-510UX	.15
RK-055	KNOB—Control knob for all models in onyx except H-510UX	.15

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the grid of the 12SK7 through a .05 mfd. capacitor and align the 2nd I.F. transformer. Repeat the procedure, applying the 455 KC signal to the control grid of the (12A8GT) 12SA7GT and aligning the 1st I.F. transformer. Do not remove the grid lead from the converter tube. Finish alignment by over-all adjustments.

R.F. On Models H-500U and H-510U (W and X inc.) apply a 1500 KC signal through a 100 mmf. mica condenser to the antenna terminal. Rotate the gang condenser to the 1500 KC dial mark and align (C-3b). Peak (C-2a) for maximum output.

An additional alignment step is required on the Models H-500U and H-510U which use a 12SA7GT converter-oscillator tube. Tune these Models to a 580 KC signal after aligning at 1500 KC and peak (C-3b) oscillator padder for maximum output while rocking the gang condenser.

On Models H-520U (W and X inc.) apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the signal generator output which can be magnetically coupled to the receiver Beam-a-Scope. Rotate the gang condenser to the 1500 KC dial mark and align (C-3b) Peak (C-2a) for maximum output. Retune receiver to 580 KC signal and peak (C-3b) while rocking the gang condenser.

Symbol	Description	List Price
RK-306	KEY—Station selector key for Models H-510U, 510UW, 520U, 520UW (Pkg. 5)	.80
RK-308	KEY—Station selector key for Models H-510UX, 520UX (Pkg. 5)	$0.70
RL-685	COIL—Antenna coil for Models H-500U, 510U (L-1)	.80
RL-518	LOOP—Beam-a-Scope antenna for Model H-520U	.80

GENERAL INFORMATION

These models are compact superheterodyne receivers using five General Electric Pre-tested Tubes and operating from either a DC or AC source of power. Features of design include the new "Alnico" Dynapower speaker, single-ended and high filament-voltage tubes, and automatic volume control. Models H-510U and H-520U (W and X inc.) have four "Feathertouch Tuning" Keys. Models H-500U and H-510U (W and X inc.) have attached antennas while Model H-520 (W and X inc.) is equipped with the built-in "Beam-a-Scope." All models are fully approved by Underwriters' Laboratories.

Coil System

The "C" and "D" band antenna coils, L-2 and L-3 are wound on a single coil form as shown in Fig. 4. L-4, L-5 and L-6 compose the oscillator transformer for the "B" "C" and "D" bands. All switch points are numbered in Fig. 4 to facilitate in locating these switch points on the pictorial wiring diagram, Fig. 3.

The following table gives the coils in use for the various positions of the band switch:

Band-switch Position	Antenna Primary	Antenna Secondary	Oscillator Primary	Oscillator Secondary
Band "B"	Lower portion of L1	Upper portion of L1	Lower portion of L4	Upper portion of L4
Band "C"	L2 Primary (L1 Primary shorted)	L2 Secondary (Grid end of L1 to ground)	Lower portion of L5	Upper portion of L5 (High side of L4 to ground through R15. Mid tap of L4 to ground)
Band "D"	L3 Primary (L1 Primary shorted)	L3 Secondary (Grid end of L1 to ground. L2 secondary to ground)	Lower portion of L6	Upper portion of L6 (High side of L4 and L5 to ground through R15. Mid tap of L4 to ground)

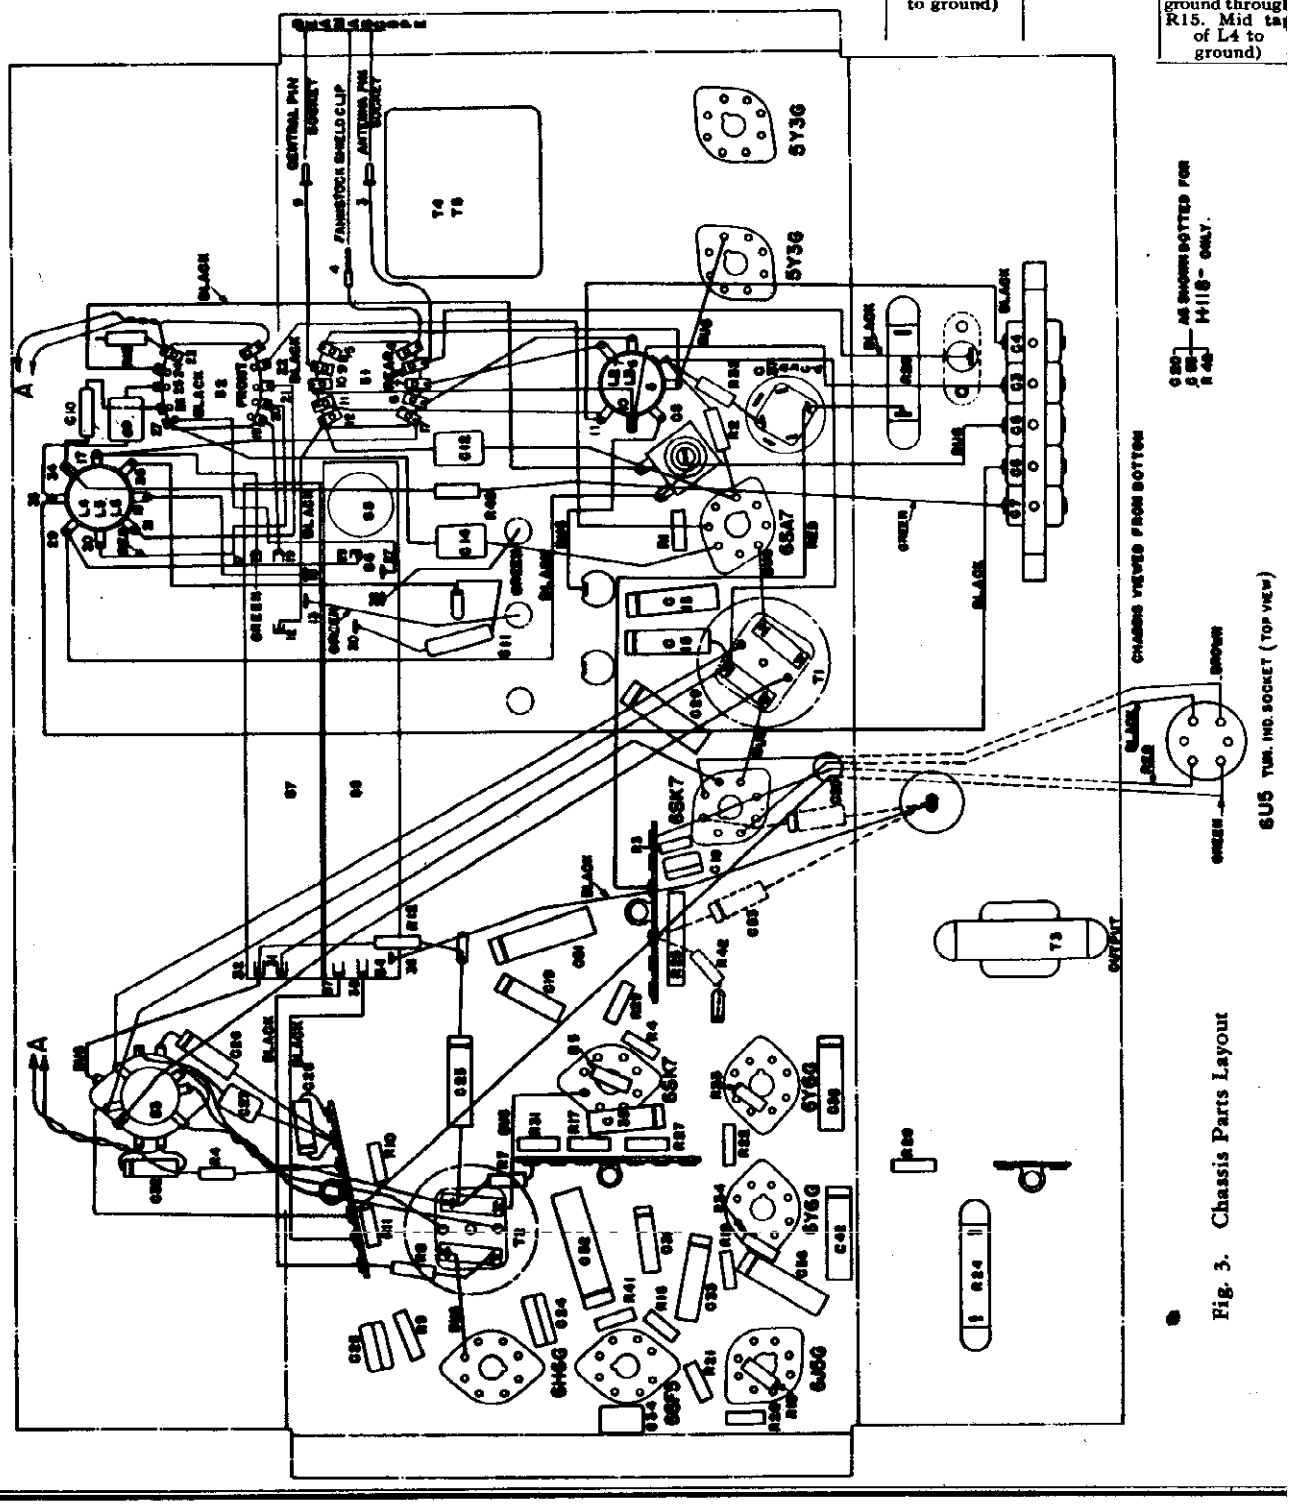

Fig. 3. Chassis Parts Layout

Super Beam-a-scope

The *Super* Beam-a-scope is essentially a tuned coil antenna wound on a frame and shielded by a Faraday screen against electrostatic disturbances. This construction favors the desired signal over a local man-made noise source in three ways. First, since any noise source is composed of two components—electrostatic and electromagnetic fields—the *Super* Beam-a-scope may be revolved so that a null point is found where no voltage is produced from these two components. Due to the fact that this null point is very sharp, it is very unusual that any desired station will be in a direct line with the rejected noise signal and thereby have its signal strength reduced appreciably. In the second place, the *Super* Beam-a-scope eliminates the external return path to ground present in the case of an unshielded antenna. This reduces or eliminates local man-made noise sources in much the same way as a shielded antenna lead-in does in an ordinary antenna installation. In the third place the *Super* Beam-a-scope discriminates against the electrostatic component of an incoming wave in comparison with the electromagnetic component, because of the Faraday shield. Since the electrostatic component of a local noise source is a great deal larger than the electromagnetic component, this rejection property brings about an enormous increase in signal-to-noise ratio.

The above operation is only available on the broadcast band and in this position the *Super* Beam-a-scope is also the first tuned grid circuit. On the "C" and "D" bands, the *Super* Beam-a-scope is grounded at the grid end thus preventing absorption spots due to loop resonance.

ALIGNMENT PROCEDURE

I.F. ALIGNMENT WITH OSCILLOSCOPE*

Band-switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1 Band B	455 KC and 30 KC Sweep	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—vertical input to ground and junction at R-8, R-9, and R-10. Adjust trimmers in order mentioned for a single curve of maximum amplitude. The resulting curve on the "Bass" position is shown in Fig. 2a.
2 Band B	455 KC and 30 KC Sweep	Bass	Converter 6SA7 Grid	1st I.F. Sec. 1st I.F. Pri.	
3 Band B	455 KC and 30 KC Sweep	Bass	Converter 6SA7 Grid	All I.F. Trimmers	
4 Band B	455 KC and 30 KC Sweep	Treble I	Converter 6SA7 Grid		The expanded curve taken with tone control at "Treble I" is shown in Fig. 2b. Excess sensitivity over "Bass" tone position indicates regeneration.

I.F. ALIGNMENT WITH OUTPUT METER*

1 Band B	455 KC Modulated	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—manual key depressed—output meter connected across voice coil—volume control at maximum—input as low as practical. Adjust all trimmers in order listed for maximum output. Note.—Do not attempt alignment in the expanded position.
2 Band B	455 KC Modulated	Bass	Converter 6SA7 Grid	1st I.F. Sec. 1st I.F. Pri.	
3 Band B	455 KC Modulated	Bass	Converter 6SA7 Grid	All I.F. Trimmers	

R.F. ALIGNMENT

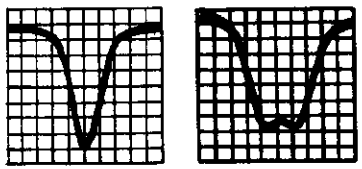
1 Band B					Mechanically adjust dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed. Connect output meter across voice coil.
2 Band C	6 MC Modulated	Bass	Antenna Post**	Osc. (C-6) Ant. (C-3)	Set pointer to 6 MC mark and align (C-6). Peak (C-3) for maximum output.
3 Band D	21 MC Modulated	Bass	Antenna Post**	Osc. (C-7) Ant. (C-4)	Set pointer to 21 MC mark and align (C-7). Peak C-4 while rocking gang condenser. The image of any signal on the "D" band should be 910 KC below input signal. Example: 18 MC image 14.09 MC.
4 Band B	580 KC Modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Set dial pointer to 580 KC mark and tune in signal with (C-8).
5 Band B	1500 KC Modulated	Bass	Antenna Post***	Osc. (C-5)	Adjust (C-5) for maximum output in vicinity of 1500 KC while rocking gang condenser.
6 Band B	580 KC Modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Retrim (C-8).
7 Band B	1500 KC Modulated	Bass	Antenna Post***	Osc. (C-5)	Repeak (C-5).

* Use "dummy" antenna consisting of .05-mfd. capacitor between signal generator and point of input.
** Use a "dummy" antenna consisting of 70-mmf. capacitor between signal generator and point of input with "Beam-a-Scope" disconnected.
*** Use an I.R.E. "dummy" antenna as shown in Fig. 7 between signal generator and the point of input.

Alignment Procedure

The alignment procedure is given in table form.

Use the designated "dummy" antenna in making each individual alignment. I.F. alignment may be performed with the chassis removed from the cabinet and the Beam-a-Scope disconnected. R.F. alignment on "C" and "D" bands should be performed with the Beam-a-Scope disconnected and a 70 mmf. mica capacitor between the signal generator and the point of output. R.F. alignment on "B" band should be performed with the chassis and Beam-a-Scope mounted in the cabinet and properly connected.



(a) Sharp Position (b) Expanded Position

SPECIAL SERVICE INFORMATION

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

(1) Stage Gains ‡

(a) Antenna Post to Converter Grid

Band "B" (Beam-a-Scope connected)*—3 at 1,000 KC
Band "C" (Beam-a-Scope disconnected)**—3 at 4 MC
Band "D" (Beam-a-Scope disconnected)**—3 at 18 MC

(b) Converter Grid to 1st 6SK7 Grid...30 at 455 KC
(c) 1st 6SK7 Grid to 2nd 6SK7 Grid...6 at 455 KC
(d) 2nd 6SK7 Grid to 6H6 Det. Plate...70 at 455 KC

(2) A 400 cycle signal of .05 volts across volume control will give ½ W. speaker output.‡ (Volume Control turned to maximum.)

(3) Average DC voltage developed across oscillator grid resistor (R1) with gang closed.

Band "B".....6.5 volts
Band "C".....7 volts
Band "D".....2.8 volts

‡ Variations of +10%, −20% permissible.
‡ Use I.R.E. dummy antenna.
** Use 70 mmf. capacitor between signal generator and antenna post.

AUTOMATIC PHONOGRAPHS

(Model H-79

The Model H-118 automatic phonograph mechanism plays up to twelve 10-inch records or ten 12-inch records. The record-changing mechanism is equipped with a cycle switch which during a record-changing cycle prevents power interruption, by pressing the turntable switch to "Off," until the tone arm is in the starting position.

OPERATION

Phono Key

To change from radio to phonograph reproduction press the "Phono-Tele" key. This operation likewise turns the power on if the radio has not been operating previously.

Phono Switch

This switch is located on the forward left-hand corner of the motorboard and starts or stops turntable operation.

Push-button Controls

On the forward right-hand corner of the motorboard are located four push-buttons which control the operation of the automatic record changer.

The forward button, marked "R" is the reject control. To reject a record being played or to start the record-changing cycle after the records have been placed on the holders, simply press this button down and then release.

The second button from the front marked "M" is the manual button. When records are to be played manually, this button should be pressed down until it locks in the depressed position. The record mechanism now operates as any manual record player.

The third button, marked "12," when pressed, sets the mechanism to play automatically a series of 12-inch records.

The fourth button, marked "10," when pressed sets the mechanism to play automatically a series of 10-inch records.

Record Holder and Release Lever

Located in rear left-hand corner and in the forward right-hand corner are the record-holder posts supporting the record holders and release levers. The record holder is underneath the release lever on either post.

To load the holder with 10-inch records, clasp one of the record holders with the left hand and with the right hand lift the release-lever knob turning the release lever until the figure "10" is opposite the index. Do the same with the other record holder and release lever. Now rotate the entire record holder and release lever assembly until the holder is pointed toward the center of the turntable. It may be necessary to raise the assembly slightly to start rotation. A certain position will be found when the holder is pointed toward the center where the assembly will settle into a recess. This is the correct position of the holder for loading.

To load the holder with 12-inch records, follow the above procedure except the release levers must be rotated with respect to the holders until the "12" markings are opposite their respective indices.

To remove records from the turntable, lift the holder assemblies and rotate the record holders until they clear the turntable area.

SERVICING

Oiling

The record-changer mechanism should be lubricated once a year with about a dozen drops of a good light machine oil at each of the following six points. All points can be reached from above, through holes in the mounting plate, as follows:

No. 1 Three oil holes on motor gear housing. Reach
No. 2 all three through two holes marked "A" on
No. 3 drawing.

No. 4 Through hole marked "B," drop the oil upon flat surface of cam. It will distribute itself to proper points.
No. 5 Through holes marked "C," see felt wick, and drop the oil directly upon it.
No. 6 Through hole marked "D," see felt wick, and drop the oil directly upon it.

If squeaks are heard compare the squeak with and without a load of records, stacked records themselves sometimes squeak against a center pin. See that all five wicks are in position, including three ¼-in. wicks in frame of Motor. See that each wick is thoroughly saturated (as it may not be if insufficient oil or too heavy oil has been used). Lift out all three motor wicks with tweezers; see if old oil has become gummy (commonly due to use of low-grade oil). If necessary, **clean gummed-up wicks with kerosene. See that each is saturated with good oil; then, before replacing them, drop a little good oil into the holes.**

(CONT.)

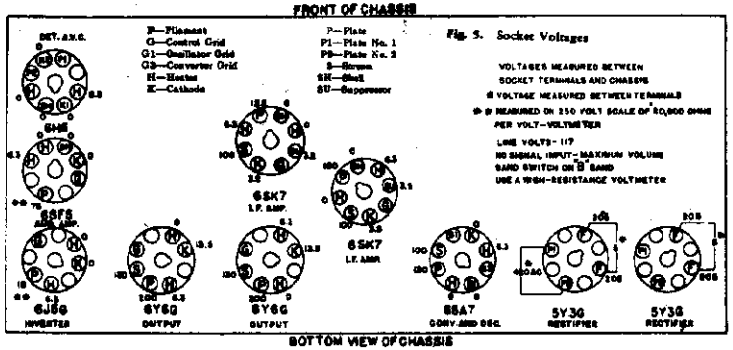

Fig. 3. Socket Voltages

Adjustments

There are three adjustments that can be made. All are correctly made at the factory, and ordinarily need never be altered. Should it become necessary to remake any of these adjustments, due to accident or tampering, proceed as follows:

A. ADJUSTING LANDING POSITION OF NEEDLE ON THE RECORD. (See Fig. 8.) This adjustment is made with a screwdriver from above—does not require removing Record Changer from cabinet. If needle comes down too far from edge of record, playing of records will not start at their beginning. **Turn Needle-drop Adjustment Screw very slightly counterclockwise.** If needle comes down too close to edge of record, needle may slip off edge of record. **Turn the adjusting screw clockwise.**

Compare also Paragraph 12 on page 11.

B. ADJUSTING DISTANCE FROM RECORD PIN AT WHICH TRIGGER WILL TRIP AND CHANGE-CYCLE WILL BEGIN. Turn Trip Adjusting Screw 18, **toward** the trigger for **earlier** tripping, or away from it for later tripping. This Record Changer does not depend, for automatic tripping, on the records being provided with any special grooves at end; it trips whenever needle comes within a certain distance of Record Pin. The factory adjustment is for 1⅛ in. from **center** of Record Pin. This is the most generally satisfactory distance; no modern record will then be cut off before playing is finished, and none will fail to trip at end. For certain records of early manufacture, it may not be possible to find an adjustment that will always trip and never cut off.

C. ADJUSTING HEIGHT TO WHICH TONE ARM RISES. The arm should rise, during the change-cycle, high enough so that it clears by only ⅛ in. the record above it, next to be played. (Be careful, before deciding that adjustment is necessary, to see that the record at bottom of stack is not a warped one.) To make this adjustment, **loosen the lock nut** on **Pickup Sleeve 22** (see Fig. 10) and **turn the sleeve to lengthen or shorten Pickup Plunger 21.** When correct adjustment is found, **tighten lock nut** again.

Motor Replacement

The service mechanic may be called upon to adapt the Record Changer to a different power supply. For this purpose, or in case of any service fault within Motor, remove entire Motor (with Record Pin and connecting gear drive) from the Record Changer, and replace it with a suitable new Motor. (In ordering a replacement Motor, specify the power supply.)

When mounting replacement Motor, it is most important to see that Record Pin is centered between the two posts of the Record Changer, that it stands perpendicular to Main Plate 53, and that it has not become bent so as to wobble. Even though the Posts are stout and not easy to bend, it is well to check them also, with a 12-in. combination square laid clear across the concave upper surface of Main Plate. When the new Motor has been attached, with three screws through Grommet Sleeves 51 (spacers) into its frame, and Record Pin is seen to revolve without appreciable wobble (a wobble would indicate that it has been bent in transit from factory) the correct position of Pin midway between the Posts can be accurately checked in this way: Place a single 12-in. record on the Record Holder, press "R" button, and turn turntable forward by hand. Immediately after the Record Holders open and let it fall, **turn Turntable slightly backward,** and with other hand **support the record between the Record Holders;** it can then be readily seen whether Record Pin is off center. If it is, **remove the record and Turntable,** and **loosen slightly the screw or screws nearest** the Record Holder to which record appeared **closest.** This should improve evenness of operation. However, unless the unevenness was very slight, it will be necessary for a permanent repair to **insert a shim** or **two** on one or more of the three screws (or change shims from one screw to another). The shims used are shaped like an ordinary washer, cut out at one side (see cut-away view at 52 in Fig. 11 showing a shim in place upon one of the Grommet Sleeves). Shims can readily be cut out with shears and punch from thin metal or cardboard. They should be inserted, around proper screws (when screws have been sufficiently loosened) between Motor Frame and metal Grommet Sleeve. **Do not insert shims next to rubber grommet.** In wiring up, consult schematic diagram for particular installation. Use only Underwriters' approved wire.

Trouble Shooting

Cases of failure to operate satisfactorily will generally be found due either to neglect of proper lubrication, or to tampering with the mechanism after it leaves the factory, or to injuries accidentally sustained as by external vibration or by impact of some heavy object. In addition there is always the possibility that any kind of spring may "go dead" (cease to operate without any visible breakage) even though the utmost factory precautions are taken against it—or that setscrews may work loose due to some external vibration. Damage from tampering is likely to take the form of bent parts; never bend any part during examination. Be careful, especially, **never to push upward** from below on Cam Connecting Rod Lift 37 while mechanism is operating; bending may result, and even slight bending here might interfere with correct timing of the cycle operations.

Among the principal trouble symptoms to which such causes may give rise, are the following:

1. MECHANISM IS SLOW IN STARTING, OR STALLS DURING A CHANGE-CYCLE, BUT A SLIGHT FORWARD PUSH WITH THE HAND STARTS IT AGAIN. May be caused by

a. Failure to lubricate properly. **Oil thoroughly,** per instructions above.

b. Loose setscrews.

c. Weakness of drive: line voltage may be abnormally low, or motor windings damaged.

2. MOTOR FAILS TO RUN, EVEN WHEN IT IS ENTIRELY DISCONNECTED FROM OTHER WIRING AND PROPER VOLTAGE IS APPLIED DIRECTLY TO THE TWO ENDS OF ITS WINDINGS. This indicates trouble in Motor windings. Unless the damage is easily seen and repaired, replace Motor, as above described.

3. MOTOR IS SLOW IN STARTING.

a. **Check oiling,** as directed above. It may not have been properly done; old oil may have become gummy.

b. Changer may have been in a very cold place, and may not yet have reached room temperature. Give it a fair chance to get warmed up, before concluding that Motor is defective, and proceeding as in Paragraph 2 above.

4. SQUEAKS OR OTHER NOISES, DURING PLAYING OF RECORDS.

a. **Check oiling,** as directed above. (If squeaks are heard, they will usually be found to come from the records—not from the mechanism.)

b. See that all setscrews are tight.

c. Examine Motor windings; especially the shading coils which encircle a portion of each laminated pole and make the Motor self-starting. If coils have been jarred loose at any point, they may be tightened accordingly.

5. CHANGER IS NOISY WHEN IN CYCLE. **Check oiling.**

6. MOTION OF TONE ARM TOWARD RECORD PIN WILL NOT TRIP CHANGER MECHANISM.

a. It may be found that, instead of trigger being actuated, there is stretching of Swivel Spring 95 (joining the lugs at ends of Swivel Spreaders 90 and 91), allowing the Spreaders to open. **Increase tension of Spring 95,** by bending slightly the lug on either Spreader. If this increased tension causes needle to jump across the record, needle may be a little out of vertical, radially—it may "lean" toward center of record. To remedy this, grasp Pickup arm and twist it, very slightly, in a clockwise direction, so that it stands vertical, or even leans a little in outward direction.

b. If trigger is being properly actuated, probably Cam Lever 39 is binding against Sub-Plate 41. Look for dirt or obstructions; see that rivets are working freely. If the Lever engages Cam Lever Pawl 34, so that Lift 37 forces its roller up into the groove on Cam gear 82, and if setscrews are tight, the change-cycle must operate, as Cam Gear turns.

7. PRESSING "R" BUTTON DOESN'T TRIP CHANGER MECHANISM.

a. Check Push-button Switch Unit 75: see whether there is an obstruction or a bent part which prevents "R" button from going clear down to the end of its travel.

b. Examine Reject Rod 78. If it does not trip, even when properly revolved by complete depressing of "R" button, the rod has probably been bent, and must be restored in same way. **Grasp the two ends and twist it slightly.**

c. If Trigger 16 is being properly actuated but without starting a change-cycle, see directions above, Paragraph 6-b.

8. PRESSING "M" BUTTON FAILS TO PUT CHANGER MECHANISM OUT OF ACTION SO AS TO ENABLE MANUAL OPERATION. Check Push-button Switch Unit as in preceding paragraph. First see that button goes clear down; then follow its action through Manual Rod 77.

9. MOTOR STOPS IMMEDIATELY WHEN PHONO SWITCH IS TURNED OFF DURING A CHANGE-CYCLE (instead of continuing to run, as it should, until needle is again upon a record, and then stopping). Or—

10. TURNING PHONO SWITCH OFF FAILS TO STOP CHANGER AT ALL. Either of these two conditions would indicate failure of Cycling Switch 85. Cycling Switch operates normally to short-circuit the manual Changer Switch (which may be located in position shown at 54, or elsewhere) during change-cycle only. Such damage to Cycling Switch (not likely to occur) would necessitate returning the entire Changer to factory.

11. CHANGER FAILS TO REPEAT LAST RECORD. See Paragraph 6, above.

12. NEEDLE LANDS PROPERLY BUT FAILS TO MOVE OVER INTO RECORD GROOVE. Tone arm is normally impelled toward center of records by Lead Spring 97. Should a slight increase in its tension be found necessary, this can be easily obtained by bending the lug, to which it is attached, down against Main Plate. If tendency then appears for needle to jump across record, check angle of needle (see Paragraph 6-a above).

13. RECORDS FALL UNEVENLY UPON TURNTABLE. Seldom objectionable, this is due to Record Pin not being correctly centered between Posts. If necessary, it can be corrected as described above; see "Motor Replacement."

14. LAST RECORD DROPS ON ONE SIDE ONLY. This suggests a Post bent out of perpendicular to Main Plate. Test with square as directed (see "Motor Replacement"). If Post must be straightened, be careful not to bend other parts.

15. CHANGER CONTINUES CYCLING. Due to failure of Lift 37 to fall back out of engagement with Cam Gear. Check the various rivets at which motion occurs, to find the point where friction or binding is interfering with freedom of motion.

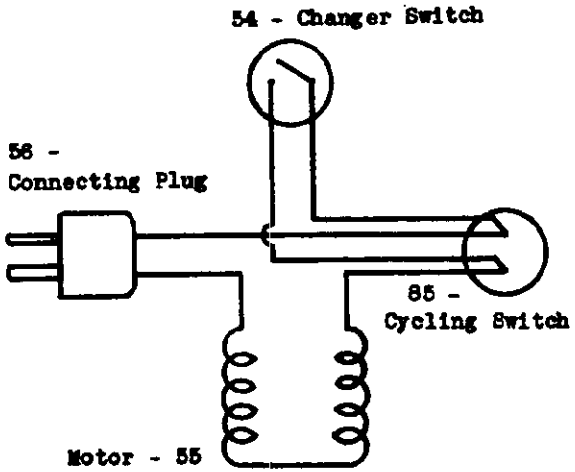

Fig. 12. Record Changer Wiring Diagram

16. RECORD IS DRIVEN, BUT NOT HEARD, OR NOT HEARD WITH PROPER VOLUME. See that Pickup cord is plugged in. Check amplifier and speaker and connections to them, thoroughly. If then trouble is still suspected in pickup, test its output with a vacuum-tube voltmeter. Playing an average record, output should test 1 to 2.5 volts. If pickup cartridge is found not to deliver proper output, remove it and install another.

17. SELECTOR PLATE FAILS TO SEPARATE BOTTOM RECORD FROM STACK. This is due either to a badly warped condition of the record, or to its being of a thickness very considerably different from those now in standard use. The design of both Release Levers and Record Holders is such as to accommodate a maximum variation in thickness and flatness of records, but certain records may be found which are so far out as to be impracticable for use in automatic changers.

If Necessary to Disassemble the Changer

Before attempting to remove Sub-Plate Assembly 83, detach Push-button Switch Unit 75 from Main Plate. To do this, start with Switch Unit Truss Bar 80. Then take out the screw which holds left end of Adjusting Rod Lever 94. Next remove Adjusting Rod 92 and Adjusting Rod Extension 79. Take out the screw Spring 73: then the screws holding Push-button Switch Unit 75 to Main Plate. Rods 77 and 78 can then, with due care, be extracted without bending. Free the Cam Connecting Rod 58 by loosening setscrew holding Spreader and Hub Assembly 59. Sub-Plate Assembly can then be detached without beinding parts. In reassembling, reverse the procedure.

Stock No.	Description	List Price
	AUTOMATIC RECORD-CHANGER ASSEMBLY	
RA-412	ARM—Swivel guide arm assembly (13, 88)	.75
RB-189	BRACKET—Adjusting rod bracket (86)	.10

RM-131	MOTOR—Motor and record pin assembly with mounting accessories, 115 V., 50 cycles, 78 rpm (55)	15.20
RM-132	MOTOR—Motor and record pin assembly, 115 V., 25 cycles, 78 rpm (55)	38.00
RP-158	PLATE—Tone arm lift plate	.20
RP-159	PLATE—Sub-plate and lever assembly (14, 16, 17, 32, 34, 39, 41, 42, 83)	4.40
●RG-711	GEAR—Idler gear and shoulder rivet assembly	.60
●RS-886	SCREW—Lift shoulder screw and nut	.30
RP-160	PLATE—Selector plate Assembly (Record holder and release lever)	3.80
RP-405	PIN—Tone arm hinge pin (Pkg. of 6)	.20
RP-406	POST—Front or rear changer post with mounting washer and nut (71)	.80
RP-407	POST—Swivel post with mounting washer and nut	.75
RR-932	ROLLER—Rear post spring roller (61)	.40
RR-933	ROD—Manual key rod (77)	.10
RR-934	ROD—Rejection key rod (78)	.15
RR-935	ROD—Cam connecting rod assembly (31, 35, 37, 58, 59)	1.40
RR-936	ROD—Adjusting rod assembly (79, 81, 92, 94)	1.60
RR-937	ROD—Changer connecting rod assembly (57, 72)	2.20
RR-938	REST—Tone arm rest	.20
RS-473	SPRING—Selector plate spring (Pkg. of 5)	.10
RS-474	SPRING—Release trigger spring (15) (Pkg. of 3)	.25
RS-475	SPRING—Cam connecting rod lift spring (Pkg. of 3)	.25
RS-476	SPRING—Pawl or extension rod spring (38, 79) (Pkg. of 3)	.25
RS-477	SPRING—Cam lever spring (36, 84) (Pkg. of 3)	.25
RS-478	SPRING—Rod or swivel guide arm spring (96, 87) (Pkg. of 3)	.25
RS-479	SPRING—Changer spreader spring (62) (Pkg. of 2)	$0.30
RS-480	SPRING—Swivel spreader spring (95) (Pkg. of 3)	.25
RS-481	SPRING—Manual and rejection rod spring (73) (Pkg. of 3)	.25
RS-482	SPRING—Motorboard mounting spring (Pkg. of 6)	.15
RS-483	SPRING—Adjusting screw lock spring (19) (Pkg. of 12)	.25
RS-484	SPRING—Pick-up plunger spring (Pkg. of 3)	.10
RS-485	SPRING—Pick-up lead spring (97) (Pkg. of 3)	.25
RS-486	SPRING—Hinge pin spring (Pkg. of 6)	.20
RS-512	SWIVEL—Swivel shaft and head assembly (23)	.90
RS-513	SLEEVE—Motor mounting grommet sleeve (51) (Pkg. of 3)	.25
RS-514	SWIVEL SPREADERS—Upper or lower swivel spreaders (90, 91)	.20
●RS-887 *RS-859	SCREW—Needle screw	.10
RS-877	SCREW—Trunnion shoulder screw (Pkg. of 3)	.25
RS-878	SCREW—Motorboard mounting screw (Pkg. of 4)	.20
RS-935	SHAFT—Front changer shaft and pin (74)	.60
RS-936	SHAFT—Rear changer shaft and pin (60)	.60
RS-3053	SWITCH—OFF-ON switch with lockwasher and 16-inch leads (54)	.90
RS-3054	SWITCH—Push-button switch unit (75)	1.70
RT-918	TURNTABLE—11½-inch mahogany flock turntable for Model H-118	2.20
RT-220	TONE ARM—Tone arm assembly with lamp bracket and cord assembly	2.40
RX-070	ASSEMBLY—Pick-up plunger, sleeve and nut assembly (21, 22)	.65
RX-071	ASSEMBLY—Stop lever and hub assembly (93)	.55
RX-072	ASSEMBLY—Swivel tube and trunnion assembly (20, 24, 25)	1.00

● FOR MODEL HJ-119

*Used on previous receivers.

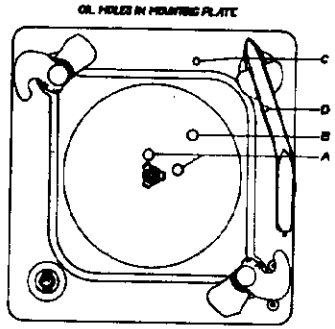

Fig. 9. Oiling Diagram

The Models H-116 and H-118 contain three-band a-c operated receivers employing eleven General Electric Pretested Tubes in a superheterodyne circuit. The receivers are equipped with eleven Feathertouch Tuning keys, eight of which may be set up for favorite stations. The three remaining keys allow power control, manual tuning and phonograph or television audio reception. Each model is also equipped with the new *Super* Beam-a-scope, a highly efficient, self-contained antenna circuit. Other features of design include: "Alnico" dynapower speaker, floodlighted station-key finder, visualux dial, iron-core I.F. transformers, automatic tone compensation, automatic volume control, and push-pull output.

The Model H-118 also incorporates an automatic record changer which will play either 10- or 12-inch records. A feature of the phonograph design is the automatic record-rejection mechanism which permits record rejection at any time during the reproduction by merely pressing the reject button. A high-quality crystal pick-up and tone arm assures full tone range and smooth needle tracking. A constant-speed, self-starting silent electric motor provides uniform turntable operation.

REPLACEMENT PARTS LIST

MODELS H-116 AND H-118

Stock No.	Description	List Price
	CHASSIS ASSEMBLY	
*RB-008	BOARD—Terminal board (2 lugs)	$0.10
*RB-026	BOARD—Antenna terminal board	.10
*RB-062	BOARD—Terminal board (6 terminals)	.10
*RB-093	BOARD—Terminal board (6 lugs)	.10
RB-174	BRACKET—Tuning eye bracket	.15
*RB-521	BEZEL—Pilot lamp bezel	.20
RB-1009	BOARD—Phono-terminal board	.10
RB-1010	BOARD—Loop terminal board	.10
*RC-099	CAPACITOR—.001 mfd. 600 V. paper (C-26)	.30
RC-011	CAPACITOR—.008 mfd. 600 V. paper (C-29)	.35
*RC-039	CAPACITOR—.01 mfd. 600 V. paper (C-28, 31)	.25
*RC-042	CAPACITOR—.01 mfd. 1000 V. paper (C-42)	.30
*RC-051	CAPACITOR—.02 mfd. 1600 V. paper (C-38)	.30
*RC-055	CAPACITOR—.008 mfd. 600 V. paper (C-32)	.25
*RC-072	CAPACITOR—.05 mfd. 200 V. paper (C-19, 20)	.35
*RC-082	CAPACITOR—.05 mfd. 600 V. paper (C-22, 35, 36)	.30
*RC-086	CAPACITOR—0.1 mfd. 200 V. paper (C-15, 33)	.30
*RC-104	CAPACITOR—0.1 mfd. 600 V. paper (C-13, 51)	.20
*RC-148	CAPACITOR—.25 mfd. 600 V. paper (C-52)	.35
RC-206	CAPACITOR—47 mmf. mica (C-14)	.35
*RC-216	CAPACITOR—47 mmf. mica (C-18, 25, 34)	.25
*RC-225	CAPACITOR—100 mmf. mica (C-24)	.25
RC-242	CAPACITOR—150 mmf. mica (C-12)	.25
*RC-263	CAPACITOR—470 mmf. mica (C-27)	.30
RC-307	CAPACITOR—750 mmf. silvered mica (C-11)	.40
RC-348	CAPACITOR—1600 mmf. mica (C-9)	.35
*RC-386	CAPACITOR—4300 mmf. mica (C-10)	.40
*RC-863	CORD—Power cord	.65
*RC-1087	CLAMP—Ant.-Osc. coil clamp (Pkg. 2)	.05
*RC-5148	CAPACITOR—20 mfd. 25 V. 20 mfd. 350 V., 20 mfd. 250 V., 40 mfd. 250 V., dry electrolytic (C-37a, 37b, 37c, 37d)	1.75
RC-6533	CAPACITOR—Padding capacitor (C-8)	.30
RC-8161	CABLE—Tuning indicator cable	.40
*RF-015	FOOT—Rubber mounting foot for chassis	.05
*RK-044	KNOB—Control knob (Pkg. 2)	.40
*RL-084	COIL—C and D band antenna coil (L-2, 3)	.75
*RL-289	COIL—B, C and D band osc. coil (L-4, 5, 6)	1.10
*RTN-001	NUT—Volume and tone control pal nut (Pkg. 5)	.10
*RQ-667	RESISTOR—2400 ohms, 2-W. carbon (R-25)	.20
*RQ-1215	RESISTOR—15 ohms, ½-W. carbon (R-15) (Pkg. 5)	.70
*RQ-1223	RESISTOR—33 ohms, ½-W. carbon (R-40) (Pkg. 5)	.70
*RQ-1239	RESISTOR—150 ohms, ½-W. carbon (R-28) (Pkg. 5)	.70
*RQ-1245	RESISTOR—270 ohms, ½-W. carbon (R-46) (Pkg. 5)	.70
*RQ-1247	RESISTOR—330 ohms, ½-W. carbon (R-5) (Pkg. 5)	.70
*RQ-1259	RESISTOR—1000 ohms, ½-W. carbon (R-33, 34) (Pkg. 5)	.70
*RQ-1291	RESISTOR—22,000 ohms, ½-W. carbon (R-1) (Pkg. 5)	.70
*RQ-1347	RESISTOR—4.7 meg. ½-W. carbon (R-41, 44) (Pkg. 5)	.70
*RQ-1487	RESISTOR—15,000 ohms, 1-W. carbon (R-45)	.20
*RR-351	RESISTOR—100 ohms, 3.4-W wire wound (R-24)	.20
*RR-352	RESISTOR—2200 ohms, 2.6-W. wire wound (R-26)	.20
*RS-223	SOCKET—Octal tube socket (Pkg. 5)	.80
*RS-236	SOCKET—Dial lamp socket assembly	.10
*RS-255	SOCKET—Electrolytic mounting socket	.05
*RS-3027	SWITCH—Band change switch (S-1, 2)	1.10
*RS-3032	SWITCH—Tone control switch (S-3)	.45
*RT-112	TRANSFORMER—50-60 cycle power transformer (T-4)	6.40
*RT-113	TRANSFORMER—25-cycle power transformer (T-5)	10.60
*RT-324	TRANSFORMER—1st I.F. transformer (T-1)	1.90
*RT-325	TRANSFORMER—2nd I.F. transformer (T-2)	2.20
RT-483	TRANSFORMER—Output transformer (T-3)	1.10
*RT-868	TRIMMER STRIP—B, C and D osc. and C and D ant. trimmers (C-3, 4, 5, 6, 7)	.70
*RT-868	TRIMMER STRIP—Ant. tuning trimmer strip (C-48, 50)	1.20
*RW-113	WASHER—Felt washers for control shafts (Pkg. 25)	.10
*RQ-1299	RESISTOR—47,000 ohms, ½-W. carbon (R-4, 8, 29) (Pkg. 5)	$0.70
*RQ-1303	RESISTOR—68,000 ohms, ½-W. carbon (R-18) (Pkg. 5)	.70
*RQ-1307	RESISTOR—100,000 ohms, ½-W. carbon (R-42) (Pkg. 5)	.70
*RQ-1311	RESISTOR—150,000 ohms, ½-W. carbon (R-23) (Pkg. 5)	.70
*RQ-1315	RESISTOR—220,000 ohms, ½-W. carbon (R-9, 22) (Pkg. 5)	.70
*RQ-1317	RESISTOR—270,000 ohms, ½-W. carbon (R-21) (Pkg. 5)	.70
*RQ-1319	RESISTOR—330,000 ohms, ½-W. carbon (R-17) (Pkg. 5)	.70
*RQ-1331	RESISTOR—1.0 meg. ½-W. carbon (R-2) (Pkg. 5)	.70
*RQ-1339	RESISTOR—2.2 meg. ½-W. carbon (R-11) (Pkg. 5)	.70
*RQ-1343	RESISTOR—3.3 meg. ½-W. carbon (R-20) (Pkg. 5)	.70
	CONDENSER-DIAL DRIVE ASSEMBLY	
*RB-172	BRACKET—Volume control bracket	.05
*RB-173	BRACKET—Tuning shift bracket	.20
*RB-174	BRACKET—Tuning indicator mounting bracket	.15
*RC-175	BRACKET—Reflector and pulley bracket assembly (R.H.)	.45
*RC-176	BRACKET—Reflector and pulley bracket assembly (L.H.)	.40
*RC-745	CONDENSER—Tuning condenser (C-1)	3.00
*RC-992	CUSHION—Tuning condenser cushion (Pkg. 3)	.10
*RC-1077	CLAMP—Tuning indicator clamp	.10
*RC-8131	CABLE—Condenser drive cable assembly	.20
*RC-8501	CARD—Station letter cards (1 set)	.25
*RC-8502	CARD—"Off" tab card (Pkg. 10)	.10
*RC-8503	CARD—"Manual" tab card (Pkg. 10)	.10
*RC-8504	CARD—"Phono-tele" tab card (Pkg. 10)	$0.10
*RD-409	DRUM—Condenser drive drum assembly	.30
*RD-510	DIFFUSER—Large diffuser strip	.05
*RD-511	DIFFUSER—Small diffuser strip	.10
*RE-200	ESCUTCHEON BAND — Escutcheon band-tuning	.20
*RE-201	ESCUTCHEON BAND — Escutcheon band-volume	.20
RE-209	ESCUTCHEON ASSEMBLY—Main dial escutcheon assembly	4.15
*RH-008	HAIRPIN COTTER—Tuning drive shaft retaining cotter (Pkg. 10)	.05
*RM-500	MASK—Reflector cover mask	.05
*RP-132	POINTER—Tuning pointer assembly	.25
*RP-303	PULLEY—Pulley and "C" slip assembly (Pkg. 2)	.10
*RR-926	REFLECTOR—Dial scale reflector	.15
*RS-463	SPRING—Drive cable spring (Pkg. 5)	.10
*RS-464	SPRING—Dial wheel and knob spring (Pkg. 10)	.05
*RS-864	SCREW—Tuning indicator clamp mounting thumb screw (Pkg. 10)	.40
*RS-925	SHAFT—Tuning control shaft	.05
*RS-1801	SHIELD—Dial lamp shield and reflector	.10
*RS-1802	SHIELD—Tuning indicator shield	.10
*RV-069	VOLUME CONTROL—2 megohms volume control (R-13)	.60
*RW-038	WINDOW—Celluloid station letter window (Pkg. 25)	.10
*RW-908	WHEEL—Dial wheel assembly	.30
	TOUCH-TUNING ASSEMBLY	
*RC-2001	CORE—Touch-tuning coil tuning core	.15
RC-2011	CUSHION—Touch-tuning coil cushion	.05
*RC-8229	CAPACITOR—7-65 mmf. trimmer (C-50)	.35
*RC-8527	CAPACITOR—20-180 mmf. trimmer (C-48, 49)	.35
*RC-8528	CAPACITOR—100-490 mmf. trimmer (C-43, 46, 56)	.35
*RK-205	KEY—"Feathertouch" tuning key (Pkg. 5)	.25
RL-9516	COIL—Touch-tuning trimmer coil assembly (L-7 to L-12)	7.10
RL-9517	COIL—Touch-tuning trimmer coil (Range: 1200 to 1550 K.C.) (Code—none) (L-12)	$0.15
RL-9518	COIL—Touch-tuning trimmer coil (Range: 850 to 1400 K.C.) (Code—Red) (L-10, 11)	.15
RL-9519	COIL—Touch-tuning trimmer coil (Range: 540 to 900 K.C.) (Code—Blue) (L-7, 8, 9)	.15
*RS-3033	SWITCH—"Feathertouch" tuning switch (S-4, 6)	3.40
*RS-3055	SWITCH—Power switch on key assembly (S-5)	.40
	BEAM-A-SCOPE ASSEMBLY	
*RB-1010	BOARD—Loop terminal board	.10
RC-8162	CABLE—Beam-a-Scope drive cable (Pkg. 5)	.20
*RL-507	LOOP—Beam-a-Scope antenna (L-1)	6.60
*RP-133	PLUG—Loop terminal plug	.05
RP-319	PULLEY—Beam-a-Scope drive pulley	.20
RS-515	SPOOL—Beam-a-Scope drive spool (Pkg. 5)	.15
*RS-1807	SHIELD—Beam-a-Scope shield	1.10
RS-4004	SPRING—Beam-a-Scope drive spring (Pkg. 3)	.10
RS-9002	SHAFT—Beam-a-Scope drive shaft	.05
	SPEAKER ASSEMBLY	
*RC-9009	CONE ASSEMBLY—14-inch speaker cone assembly	.85
*RC-9010	CONE ASSEMBLY—6½-inch speaker cone assembly	.90
*RP-128	PLUG—6½-inch speaker plug	.10
*RP-129	PLUG—14-inch speaker plug	.10
*RS-1012	SPEAKER—6½-inch Dynapower speaker (complete)	3.25
*RS-1014	SPEAKER—14-inch Dynapower speaker (complete)	6.00
*RT-954	TERMINAL—Speaker lead terminal (Pkg. 10)	.10
*RX-030	ASSEMBLY—6½-inch speaker mounting assembly	.10
*RX-062	ASSEMBLY—14-inch speaker mounting washer, nut, grommet assembly	.10

* Used on previous receivers.

SPECIFICATIONS

Over-all Dimensions

Model	HM-136
Height	40 inches
Width	32½ inches
Depth	13⅞ inches

Manual Tuning Drive Ratio 7:1

Electrical Specifications

115 Volts AC, 50-60 cycles, 140 watts.

Tuning Frequency Range

Frequency Modulation	39-44 MC
Short-wave	7500-22,000 KC
Police-Amateur	2400-7500 KC
Standard Broadcast	540-1700 KC

Intermediate Frequency

Frequency Modulation	2100 KC
"B," "C" and "D" Bands	455 KC

Electrical Power Output

Undistorted	15 watts
Maximum	20 watts

Tone Control ..... 5 position

Loud-speaker—"Alnico" Magnetic Dynamic

Type Cone	Curvilinear
Outside Cone Diameter	10 inches
Voice Coil Impedance (400 cycles)	3.5 ohms

Tubes

R.F. Amplifier	GE-6SK7
Converter-Oscillator	GE-6K8
I.F. Amplifiers	(2) GE-6SK7
Noise Limiter	GE-6SJ7

Phase Inverter	GE-6J5G
Power Output	(2) GE-6L6G
Rectifier	(2) GE-5Y3G
Tuning Indicator	GE-6U5
Dial Lamp	(2) MAZDA No. 44

FREQUENCY MODULATION

Frequency modulation marks another advancement in the field of radio transmission and reception. The remarkable realism and lack of noise which can be attained by this form of transmission has created widespread interest.

Present-day broadcasting stations superimpose sound programs on the radio frequency carrier signal by varying the carrier amplitude at the sound frequency rate. This is known as amplitude modulation.

Frequency modulated signals are obtained by varying the frequency of the carrier signal at the sound frequency rate. The amount the carrier frequency is varied is representative of the strength of the sound. The use of frequency variations as high as 60 or 70 KC positive and negative (120 or 140 over-all) requires the use of specially designed wide-band R.F. and I.F. amplifier stages. Such band widths preclude the use of carrier signals in the neighborhood of the broadcast band where 120 KC would cover a considerable portion of the band. Therefore, transmission frequencies have been established in the short-wave band between 39 and 44 MC.

GENERAL INFORMATION

The Model HM-136 is a combination frequency-modulation receiver and three-band radio using thirteen General Electric Pre-tested Tubes. Separate channels working into common tubes are employed for the detection and amplification of the frequency-modulated and amplitude-modulated R.F. and I.F. signals. An R.F. stage is employed in the frequency-modulated channel for increased sensitivity. Double interstage I.F. transformers are used with the frequency-modulated sections capacity-tuned and the amplitude-modulated sections inductively tuned. Other features of design include single-ended tubes in all stages except the converter-oscillator stage which uses a double section tube for increased stability, iron-core tuned oscillator coils for automatic station selection, noise limiter, discriminator, terminal board for conveniently connecting detector outputs to a public address system, "plug-in" type phono terminal, 10-inch curvilinear-type cone Dynapower speaker, and beam-power push-pull output.

ANTENNA

As a result of the high transmission frequencies the use of ordinary antennas for the reception of frequency-modulation signals is not satisfactory. General Electric builds a specially designed dipole antenna Model HT-9 for use with frequency-modulation receivers. For distances up to thirty miles from the transmitter a simple horizontal dipole with an over-all arm length of 10 feet 8 inches should give excellent results. The antenna should be located free of all obstructions and placed as a high as is practicable. A noticeable gain in signal strength will be obtained as antenna height is increased. Generally best results will be obtained if the dipole arms are horizontal and at right angles to the direction of the frequency-modulation station. The lead-in transmission line may be of any length up to 100 feet and should consist of low-loss antenna lead-in wire.

AMPLITUDE MODULATION

I.F. ALIGNMENT WITH OSCILLOSCOPE

Band-switch Setting	Input Frequency	Tone Control Position	Point of Input*	Iron-core Trimmer	Comments
1. Band B	455 K.C. and 30 K.C. sweep	Bass	2nd I.F. 6SK7 Grid	3rd I.F. Sec. 3rd I.F. Pri.	Condenser gang at minimum capacity—Manual key depressed—vertical input to ground and junction of R-4 and R-12. Adjust iron core trimmers in order mentioned for a single curve of maximum amplitude. Since iron-core trimmers are at top and bottom of shield cans most effective alignment can be obtained by using two non-metallic screwdrivers simultaneously.
2. Band B	455 K.C. and 30 K.C. sweep	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	
3. Band B	455 K.C. and 30 K.C. sweep	Bass	Converter Grid	1st I.F. Sec. 1st I.F. Pri.	
4. Band B	455 K.C. and 30 K.C. sweep	Bass	Converter Grid	All I.F. Trimmers	

I.F. ALIGNMENT WITH OUTPUT METER

1. Band B	455 K.C. modulated	Bass	2nd I.F. 6SK7 Grid	3rd I.F. Sec. 3rd I.F. Pri.	Condenser gang at minimum capacity—Manual key depressed—output meter connected across voice coil—volume control at maximum—input as low as practical. Adjust all trimmers in order listed for maximum output. Since iron-core trimmers are at top and bottom of shield cans most effective alignment can be obtained by using two non-metallic screwdrivers simultaneously.
2. Band B	455 K.C. modulated	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	
3. Band B	455 K.C. modulated	Bass	Converter Grid	1st I.F. Sec. 1st I.F. Pri.	
4. Band B	455 K.C. modulated	Bass	Converter Grid	All I.F. Trimmers	

R. F. ALIGNMENT

1. Band B					Connect output meter across voice coil and depress manual key.
2. Band B	1500 K.C. modulated	Bass	Antenna Post**	Osc. (C-9) Ant. (C-6)	Tune in signal by adjusting C-9. Peak C-6 for maximum meter reading.
3. Band B	580 K.C. modulated	Bass	Antenna Post**	Osc. Padder (C-13)	Set dial pointer to 580 K.C. mark and align C-13 for maximum meter reading while rocking the gang condenser.
4. Band C	6 MC modulated	Bass	Antenna Post**	Osc. (C-10) Ant. (C-7)	Set pointer to 6 M.C. mark and align (C-10). Peak (C-7) for maximum output.
5. Band D	21 M.C. modulated	Bass	Antenna Post**	Osc. (C-11) Ant. (C-8)	Set pointer to 21 M.C. mark and align (C-11). Peak C-8 while rocking the gang condenser. The image of any signal on the D band should be 910 K.C. below input signal. Example: 21 M.C. image 20.09 M.C.

* Use "dummy" antenna consisting of .05 mfd. capacitor between signal generator and point of input.
** Use an I.R.E. "dummy" antenna as shown in Fig. 1 between the signal generator and the point of input.

MODEL HM136
Circuit Data
Alignment Procedure

GENERAL ELECTRIC CO.

LOUD-SPEAKER

In order to realize the high fidelity inherent in a frequency-modulated system or present in a well-designed amplitude-modulated system, the audio amplifiers and loud-speaker must be capable of reproducing the signal as received. Conventional conical-type cone loud-speakers because of the sharp break at the cone throat tend to cut off the higher audio frequencies. The use of a curvilinear-type cone loud-speaker in the Model HM-136 eliminates this possible suppression of the higher audio tones and excellent frequency response from 30 to 10,000 cycles per second is obtainable.

To center the voice coil, loosen the two screws which clamp the speaker spider in position. These two screws are accessible from the rear of the speaker. Shift the spider around until the voice coil is centered, then tighten the screws in position.

Phonograph or Television Audio Connections

Each receiver is equipped with a phono terminal (pin jack) to allow the convenient connection of a record player or the detector output of a television converter. General Electric plug, Stock No. RP-145 fits the pin jack. When using a crystal type pick-up, a suitable load consisting of a 100,000 ohm resistor in series with a .01 mfd. capacitor should be connected across the pick-up leads.

Public Address System Connections

A terminal board is located on the back apron of the chassis permitting easy attachment of a public address system. This provision permits feeding programs from either type of transmission into an external amplifier and loud-speaker system. Three terminals are provided and are numbered 1, 2 and 3. To connect an external amplifier to his receiver remove the link connection between terminals No. 2 and No. 3 and reinsert between terminals No. 1 and No. 2. Connect the external amplifier between terminals No. 1 and No. 3, the ground side of the amplifier being connected to terminal No. 1. If the external amplifier input is not a high impedance type, an impedance matching network will have to be used to insure matching to the 2.0 megohm volume control.

Noise Limiter

The frequency-modulation noise limiter circuit which uses a 6SJ7 tube is essentially a fourth I.F. stage. The tube operates at low plate voltage (60 volts DC) so that plate current cut-off occurs with relatively small grid bias. A small cathode bias developed in R-40 establishes the operating point at the center of the linear portion of the grid-voltage plate-current characteristic. Normal signal input will swing the grid voltage considerably above and below the linear portion of the curve. Negative peaks of the signal voltage will be clipped off by tube cutoff. Positive peaks will be clipped off by grid bias limiting.

Since noise creates wiggles (variations) in the peaks of the carrier signal it can be eliminated by cutting off the carrier peaks. This function takes place in the noise limiter as described above providing, of course that the carrier signal is sufficiently strong to cause grid voltage swing above and below the cut-off points.

Discriminator

The discriminator circuit for a frequency-modulated signal input must secure the audio information by operating on frequency variations. Referring to the schematic diagram, Fig. 3, the frequency-modulated (FM) signal, after passing through the 6SJ7 limiter tube, is applied to the primary winding of the detector transformer (T-12). The secondary is a center tapped winding with the outer ends connected to the 6H6 detector plates as shown. Two 100,000 ohm resistors (R-25 and R-26) are connected in series across the 6H6 cathodes and it is across these resistors that the audio signal appears. The detector transformer (T-12) is tuned to the intermediate frequency (2.1 MC). An I.F. signal of 2.1 MC which is not modulated will swing the detector plates positive and negative an equal amount resulting in equal DC voltages appearing across diode resistors R-25 and R-26. Since these voltages are of opposite polarity the resultant voltage measured across the diode resistors will be zero. When the incoming I.F. signal is frequency modulated it will be swinging above and below the intermediate frequency of 2.1 MC by an amount proportional to the degree of modulation. As the modulated signal swings off the resonant frequency of 2.1 MC unequal voltages will be developed across resistors R-25 and R-26. The resultant voltage measured across both resistors will be equal to the difference between the voltage across R-25 and the voltage across R-26. This resultant voltage will vary in magnitude directly as the degree of modulation. The number of times per second the I.F. signal swings above and below the resonant point produces the audio signal. Hence, the volume of an audio signal is transmitted as the magnitude of the frequency swing of a carrier, and the frequency of an audio signal is transmitted as the rate at which the carrier frequency is swung.

ALIGNMENT PROCEDURE

Frequency Modulation

I.F. Alignment

Due to the good stability of components and the wide-band characteristics of the I.F. circuits, alignment should be unnecessary under normal operating conditions. Should I.F. alignment become necessary, it will require a cathode ray oscilloscope and a 2.1 megacycle signal generator with a superimposed ±200 KC sweep frequency. Many signal generators and mechanical frequency wobblers are available wherein the above requirements are fulfilled. As for example: GE Model TMV-97-C oscillator used in conjunction with the Frequency Modulator TMV-128-A will give a 200–300 KC sweep when operating on the 1500—3100 KC band of the test oscillator. To obtain the proper test oscillator mid-frequency (2.1 MC) the following procedure may be followed. Set "wobbler" condenser for about mid-capacity. Tune broadcast receiver to 2.1 MC. Adjust test oscillator tuning until signal is heard at maximum strength in the broadcast receiver. Connect the vertical plates of the oscilloscope across resistor R-36. A 100,000 ohm resistor should be connected in series with the high side of the oscilloscope. Using a .05 mfd. capacitor in series with the high side of the test oscillator output, insert the oscillator sweep signal into the receiver circuit first at the control grid of the 2nd I.F. 6SK7 and align transformer trimmers T-11. The resultant curve should be sharp on either side and quite broad and flat at the peak. Change the signal input to the 1st I.F. 6SK7 grid and align transformer trimmers T-10. The resultant curve should appear as the above stage only less broad at the peak. Align transformer trimmers T-9 with the signal input at the converter grid for sharpness and a flat peak. If peak will not flatten retouch the grid trimmer of transformer T-10. Do not retouch any other trimmers.

Leave the input of the oscillator sweep signal at the converter grid and connect the vertical oscilloscope plates across the resistors R-25 and R-26. Align transformer T-12 for an X-shaped crossover curve. Proper alignment of C-80 is indicated when the curve crosses about midway in the vertical plane. Proper alignment of C-79 is indicated when the sides of the curve near crossover are nearest to a straight line.

NOTE:—Keep signal input high enough so that noise limiter is functioning. This point is indicated when an increase in signal input no longer changes the size of the curve.

R.F. Alignment

Make sure the dial pointer coincides with the first division on the low frequency end of the dial scale when the gang condenser is completely closed.

1. Connect a 0–50 or 0–100 microammeter in series with the low end of R-36. A high resistance 0–10 V., D.C. voltmeter may be used instead of the microammeter. Connect the voltmeter across R-36 with a 100,000 ohm resistor in series with the high side.
2. Apply an unmodulated signal in the region of 43 megacycles to one of the antenna terminals using a 50-ohm resistor in series with the high side of the signal generator output.
3. Adjust pointer so it is set to the scale mark of the signal used and peak trimmers C-12, C-5 and C-4 progressively for maximum meter reading.

R.F. Amplifier.....GE-12SK7GT
Detector-Audio.....GE-12SF5GT
Power Output.....GE-50L6GT
Rectifier.....GE-45Z5GT

Power Supply (Volts)	Frequency (Cycles on AC)	Power Consumption (Watts)
105-125 AC or DC	40-60	30

Tuning Frequency Range

Band "B".....540-1700 KC
Alignment Frequency.....1500 KC

VOLTAGE CHART

Tube No.	12SK7GT	12SF5GT	50L6GT	45Z5GT
Plate to -B Volts	110	17*	120	115 AC
Screen to -B Volts	110		120	
Cathode to -B Volts	0	0	7.5	130
Filament Volts	12.6	12.6	50	Entire filament ** 45

Voltage measured when volume control is set to maximum.

Line Voltage—115 AC. No signal input. On DC, voltages should read approximately 10 per cent lower.

*Measured on 250-volt scale—1000 ohms per volt-meter.

**Measured between socket terminal No. 2 and No. 7.

GENERAL INFORMATION

Model H-406U is a compact four-tube AC-DC tuned radio frequency receiver that tunes the broadcast band of frequencies. This model has the full approval of the Underwriters' Laboratories.

When operating from a DC source of power, it is necessary to insert the power plug with the proper polarity; otherwise, the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT

Connect the high side of the signal generator through a 250 mmf. condenser to the antenna terminal. The low side of the signal generator output should be connected to the receiver chassis through a .05 mfd. condenser. Connect a suitable output meter across the voice coil leads; then proceed as follows:

1. With gang condenser plates completely closed, the tuning pointer should be over the last mark on the dial.
2. Tune receiver to the 1500 KC point on the dial; then align trimmers on the gang condenser at 1500 KC for a maximum output meter reading.

Electrical Power Output

Undistorted.....0.9 watts
Maximum.....1.8 watts

Loud-speaker—"Alnico" Magnet Dynamic

RECEIVER CIRCUIT DESCRIPTION

R.F. Unit

Starting at the antenna terminal posts, there follows a single-stage high-pass filter in the antenna primary to reduce video I.F. interference, a shunt capacity coupled secondary (C-78), and a video I.F. wave trap (C-95, L-20). The wave trap is broadly tuned at 11.75 MC. Any one of the three tuned circuits for each of the three television transmission bands can be connected into the secondary circuit by appropriate button. The secondary circuit when tuned gives a broad, flat response curve.

Converter-Oscillator and Amplifier

The 6P8G converter employs one half as the c and the other half as the biased first detector. The c is plate-tuned with vernier tuning permitted from t control panel through trimmer (C-3). The resultar I.F. signal of 12.75 MC and the audio I.F. signal MC developed in the converter-oscillator tube ci coupled through transformer T-7 to the first 1853 a tube.

Audio Unit

The audio I.F. signal is taken off the suppressor first 1853 tube. Two stages of 8.25 MC audio I.I 6SK7's follow. In the case of the HM-171 the au signal is then detected and the resultant audio signal available at terminals for insertion into a radio output In Model HM-185 the 6SK7 stages are followed by detector and driver, and a 6P6G output stage.

Video Unit

Four stages of video I.F. follow the converter sta third stage incorporates a wave trap for the adjacer channel at 14.25 MC. The nominal pass band f amplifiers is 12.75 to 10.75 MC. The second detector half of a 6F8G connected as a diode. The other hal 6F8G is used as the first video amplifier. The video c coupled directly to the picture tube grid.

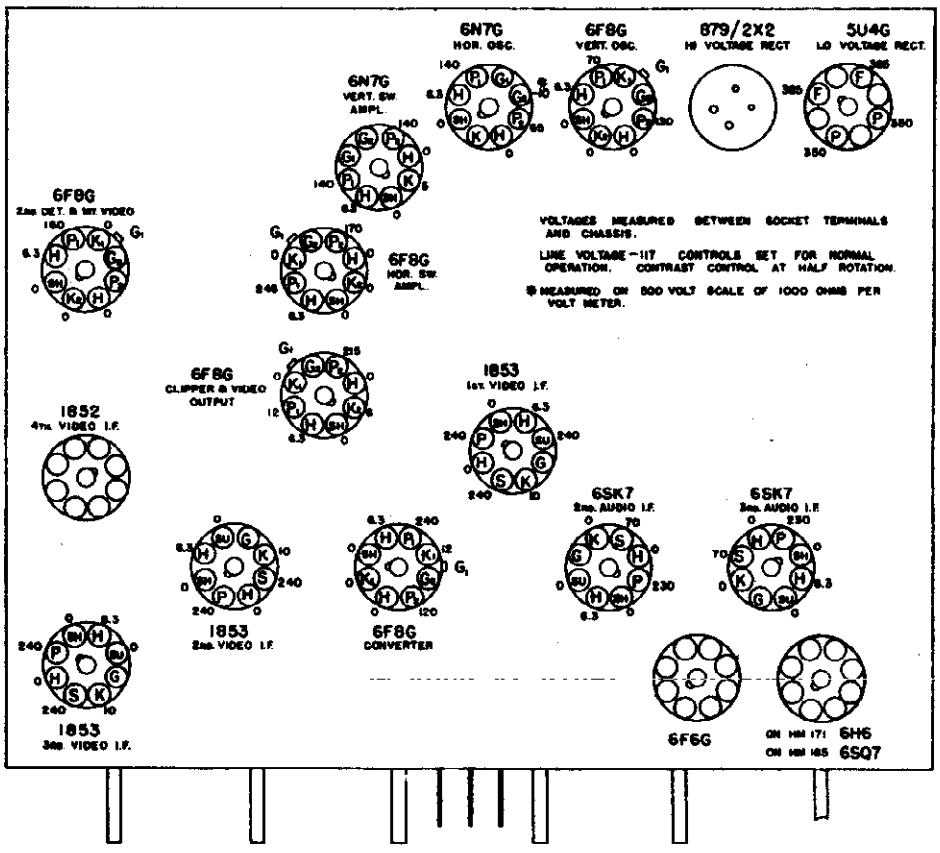

Fig. 9. Socket Voltages Models HM-171 and HM-185

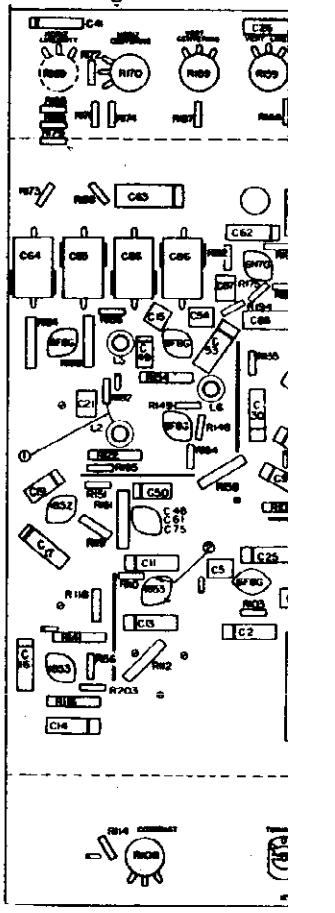

Fig. 1

Sync Pulse Clipper

Sync-pulses are taken off the plate of the clipper section of the clipper and video output tube. The video signals are separate by tube cut-off since the plate voltage is only about 12 volts.

Horizontal Oscillator-output

The clipper feeds the horizontal multivibrator 6N7G directly with needle-point, negative sync pulses. C-46 blocks the flow of vertical sync pulses, into the horizontal multivibrator since they are of a low order of frequency. The horizontal sync pulses which are amplified by the first section of the 6N7G are coupled to the grid of the second section and drive the circuit into violent oscillation. Resulting plate and grid current flow sends the tube to cut-off. The sawtooth wave so generated is applied to the horizontal sweep amplifier one section of which is a phase inverter. This push-pull sweep is coupled to the horizontal deflecting plates of the picture tube. Horizontal hold is controlled by varying the charging rate of the generator circuit, through (R-138). Compensating for high frequency loss adds a means of controlling horizontal linearity which is done through R-189. Width is varied by regulating the magnitude of the charge through R-140.

Vertical Oscillator-output

The sync pulses are also coupled into the vertical oscillator 6F8G where the circuits composed of C-73 and R-165 bypasses the horizontal sync pulses. The vertical sync pulses are coupled into the vertical sweep generator circuit causing violent oscillatory swings which result in sawtooth waves. The height control (R-146) determines the magnitude of the charge before the next oscillation thus governing the height of the picture. R-146, the horizontal hold control, governs the rate of charging. The vertical linearity control (R-159) accomplishes results similar to the horizontal linearity control. The vertical sweep amplifier produces push-pull output by phase inversion and this output is applied to the vertical deflecting plates of the picture tube.

Low Voltage Rectifier

Low voltage power is obtained from a 5U4G using one stage of choke filtering and the remaining of the resistance filter type.

High Voltage Rectifier

The anode voltage of the picture tube is obtained from a single half-wave rectifier with a protective resistor in series with the transformer plate lead.

Loudspeaker

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice coil assembly.

NOTE—In no case should the magnet be removed from the assembled position without remagnetizing after replacing it.

GENERAL ELECTRIC CO.

MODEL HM171
MODEL HM185
Alignment

GENERAL INFORMATION

General Electric Picture Receiver and Sound Converter Model HM-171, is a table type, 17-tube, superheterodyne receiver equipped with a 5-inch, electrostatic-deflected, picture tube. The receiver works in conjunction with any radio receiver, which is designed for phonograph reproduction, to reproduce the sound portion of the television broadcast.

General Electric Television Receiver, Model HM-185 is a console type, 18-tube, superheterodyne receiver with a complete sound channel and using a 5-inch, electrostatic-deflected picture tube.

Additional design features include iron-core I.F. tuning, automatic tone compensation, automatic volume control and constant high-gain antenna coupling circuit.

TELEVISION ALIGNMENT PROCEDURE

The problem of aligning the several circuits in a television receiver is much more involved and requires more specialized equipment than the alignment of conventional radio receivers. Fortunately, the use of stable components in carefully engineered circuits of wide-band characteristic reduces to a minimum the necessity for alignment under normal operating conditions. Should alignment become necessary the following equipment will be needed:

(A) For Video I.F. Alignment
- (1) Cathode ray oscilloscope
- (2) Wide band sweep oscillator capable of sweeping from 7.5 to 15 MC.
- (3) Marker system either provided in sweep oscillator or from separate signal generator for locating 12.75 and 10.75 MC points.

(B) Sound I.F. Alignment
- (1) Cathode ray oscilloscope
- (2) Wide band sweep oscillator capable of sweeping from 7.75 to 8.75 MC.

(C) R.F. Alignment
- (1) Cathode ray oscilloscope
- (2) Wide-band sweep oscillator capable of sweeping the following bands.
  - (a) 44 to 50
  - (b) 50 to 56
  - (c) 66 to 72

Electrical Specifications

Model	Power Supply (Volts)	Frequency (Cycles per Second)	Power Consumption (Watts)
HM-171	115–125	60	170
HM-185	115–125	60	170

Tuning Frequency Range

Band No. 1 ..... 44–50 MC.
Band No. 2 ..... 50–56 MC.
Band No. 3 ..... 66–72 MC.

Intermediate Frequencies

Television Video (Picture) ..... 12.75 MC.
Television Audio ..... 8.25 MC.

VIDEO I.F. ALIGNMENT

Input Freq.	Point of Input	Adjustments	Comments
1.			Connect vertical input cable of cathode ray oscilloscope across resistor R-182 of 6F8G video detector. See Fig. 1 or 4, arrow (1).
2. 7.5–15 MC Sweep	Control grid of 1853 (2nd video I.F.)		Connect output tap of video I.F. Sweep oscillator to control grid of 1853 (2nd video I.F.) See Fig. 1 or 4, arrow (2). Connect ground lead to chassis. Turn contrast control (R-108) to about half of maximum or to a point which gives satisfactory vertical deflection without overloading. Set horizontal centering and gain controls on oscilloscope to give suitable horizontal deflection. Adjust sweep phase to give curve similar to Fig. 6, curve 1.
NOTE: If sweep oscillator has marker points internally supplied, steps 3 and 4 may be omitted.			
3. Same as in No. 2 plus 12.75 MC	Same as in No. 2		Superimpose an accurately calibrated 12.75 MC signal in parallel with sweep signal. Signal will appear on sweep curve in oscilloscope as a wiggle, the center of which is a thin black line. With a pen or crayon mark this point on the screen of the oscilloscope. (NOTE: Hereafter the horizontal controls on the oscilloscope must not be touched.)
4. Same as in No. 2 plus 10.75 MC	Same as in No. 2		Superimpose an accurately calibrated 10.75 MC signal in parallel with sweep signal. Mark screen at point where signal appears on curve as in No. 3 above.
5. 7.5–15 MC Sweep	Same as in No. 2	Iron cores of detector transformer T-6	(Do not touch horizontal controls of oscilloscope. Adjust iron cores of T-6 until curve appears similar to Fig. 6, curve 1, with relatively flat top, 12.75 MC mark at corner of one side and 10.75 MC mark at corner of other side. These conditions plus maximum amplitude insure correct alignment.
6. 7.5–15 MC Sweep	Same as in No. 2	Iron cores of 4th video transformer T-5	Adjust iron cores for maximum gain, flatness and proper centering between markers as described in step No. 5 and illustrated in Fig. 6, curve 1.
7. 7.5–15 MC Sweep	Same as in No. 2	Iron cores of 3rd video transformer T-4	Adjust primary and secondary iron cores for maximum gain, flatness and proper centering. See Fig. 6, curve 1.
8. 7.5–15 MC Sweep	Converter grid, 6F8G	Iron cores of 2nd video transformer T-3	Connect low tap to grid (On top of tube). Adjust primary and secondary iron cores for maximum gain, flatness and proper centering. See Fig. 6, curve 2.
9. 7.5–15 MC Sweep	Converter grid, 6F8G	Iron cores of 1st video transformer T-7	Connect low tap to grid. Adjust iron cores for maximum gain flatness and proper centering.
10. 14.25 MC	Converter grid, 6F8G	Series iron core of 3rd video transformer T-4	Connect low tap to grid. Reduce horizontal gain to minimum. Adjust iron core for minimum line length.

R.F. ALIGNMENT

Signal Input	Point of Input	Adjustments	Comments
1.		Band width adjustment coupling condenser	Turn (C-78) in until tight, then open approximately 1/16 of a turn.
2. 44 to 50 MC Sweep	Antenna terminals	(L-8), (C-70), (C-67)	Depress band No. 1 push button. Set tuning control to mid-rotation. Adjust L-8 until curve is centered between maximum horizontal sweep points. Adjust C-70 and C-67 for maximum amplitude. See Fig. 6, curve 3.
3. 50 to 56 MC Sweep	Antenna terminals	(L-9), (C-71), (C-68)	Depress band No. 2 push button. Leave tuning control at mid-rotation point. Adjust L-9 for centering; C-71 and C-68 for maximum amplitude. See Fig. 6, curve 3.
4. 66 to 72 MC Sweep	Antenna terminals	(L-10), (C-72), (C-69)	Depress band No. 3 push button. Adjust L-10 for centering; C-72, C-69 for maximum amplitude. See Fig. 6, curve 3.

WAVE TRAP ALIGNMENT

1. 11.75 MC with 400 cycle modulation	Antenna terminals	Wave trap trimmer, C-95	Adjust for minimum signal response as seen on oscilloscope.

AUDIO I.F. ALIGNMENT

Input Freq.	Point of Input	Adjustments	Comments
1.			Connect vertical input cable of cathode ray oscilloscope across R-128. See Fig. 1 or 4 arrow (4).
2. 7.75 to 8.75 MC Sweep	Converter grid, 6F8G	Iron cores of 4th audio I.F. transformer T-9	Align for maximum amplitude. See Fig. 6, curve 4.
3. 7.75 to 8.75	Converter grid, 6F8G	Iron cores of 3rd audio I.F. transformer T-8	Align for maximum amplitude. See Fig. 6, curve 4.
4. 7.75 to 8.75	Converter grid, 6F8G	Iron cores of 2nd audio I.F. transformer L-12	Align for maximum amplitude. See Fig. 6, curve 4.

GENERAL ELECTRIC CO.

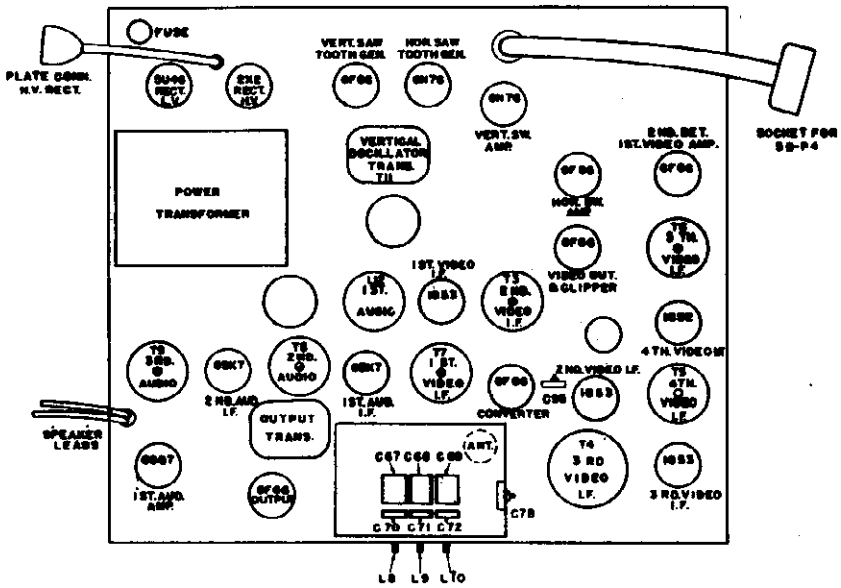

Fig. 8. Chassis Trimmer Location
Models HM-171 and HM-185

ANTENNA

In general, the television antenna should be of the dipole type located as high as is practical and in an area where the horizon in the direction of the television transmitter is not obstructed by buildings or structures. A noticeable gain in signal strength will be obtained as antenna height is increased. Since television radiation reacts similarly to light waves, reflection problems arise which often modify otherwise ideal installation locations. Consideration must also be given noise sources within buildings, or ignition noises from vehicles on adjacent streets. It is usually best to locate the dipole antenna on the side of the building away from the street thus allowing the building to shield the antenna from ignition noises.

The dipole should be erected with arms parallel to the ground and at right angles to the direction of the television station. If noise or reflection interference exist it may be better to point the dipole arms in the direction of the interference.

Noise interference and poor signal strength may dictate the use of a reflector. A reflector will increase the signal strength appreciably as well as increase the horizontal directivity.

CAUTIONARY INSTRUCTIONS

Extremely high voltages (2500 volts or more) are used in the operation of this receiver; therefore, every precaution must be exercised to insure safety to the service engineer and to the customer.

The back cover while in place, protects the user and should never be removed except by a qualified television service engineer.

The power-cord plug should not be inserted in a power supply outlet until a good, solid ground connection has been properly made to the receiver chassis.

For safety, the following operations must be performed with the power plug disconnected before working on the receiver with the back cover removed:

1. Locate the 879/2X2 high voltage rectifier tube socket.
2. Unsolder the lead (color-coded brown and yellow and measuring 3300 ohms to chassis) which is connected to the 879/2X2 tube socket.
3. Thoroughly insulate the exposed end of this lead.

All adjustments not accessible with the back cover in place can be made without energizing the high-voltage circuits.

Servicing of the high-voltage circuits can be satisfactorily performed with the power-cord removed from any power supply outlet. A resistance check of the circuit components will indicate any trouble existing. (HIGH VOLTAGES SHOULD NEVER BE MEASURED.)

The "picture tube" is highly evacuated and is consequently subject to a very great air pressure. If it is broken, glass fragments will be violently expelled. Handle with care, using safety goggles and gloves.

The large end of the "picture tube" particularly that part at the rim of the viewing surface—must not be struck, scratched, or subjected to more than moderate pressure. DO NOT FORCE THE SOCKET ONTO THE TUBE OR STRAIN ANY EXTERNAL CONNECTIONS. If it fails to slip into place smoothly, investigate and remove the cause of the trouble.

RTQ-1000	RESISTOR—350 ohms 10 W. wire wound (R-177)	$1.00
RTQ-1001	RESISTOR—1100 ohms 16 W. wire wound (R-163 on HM-185)	1.40
RTQ-1002	RESISTOR—1300 ohms 16 W. wire wound (R-163 on HM-171)	1.40
RTS-100	SOCKET—Chassis power receptacle	1.00
RTS-101	SOCKET—2 x 2 tube socket (4 prong)	.95
RTS-300	SHAFT—Focus control insulated shaft	.90
RTS-301	SHAFT—Coil tuning core shaft	.15
RTS-500	SWITCH—Station selector switch (S-1)	2.80
RTS-700	STUD—4¼-in. lg. stud for mounting R-163	.10
RTS-701	SETSCREW—Headless setscrew for focus control shaft assembly (Pkg. 5)	.10
RTT-0010	TRANSFORMER—Power transformer (T-12)	14.50
RTT-2000	TRANSFORMER—Antenna transformer (T-1)	1.00
RTT-3000	TRANSFORMER—1st Video I.F. transformer (T-7)	3.80
RTT-3500	TRANSFORMER—2nd Video I.F. transformer (T-3)	3.80
RTT-4000	TRANSFORMER—3rd Video I.F. transformer (T-4)	6.00
RTT-4500	TRANSFORMER—4th Video I.F. transformer (T-5)	3.80
RTT-5000	TRANSFORMER—5th Video I.F. transformer (T-6)	3.80
RTT-7000	TRANSFORMER—1st Audio I.F. transformer (L-12)	2.25
RTT-7500	TRANSFORMER—2nd Audio I.F. transformer (T-8)	3.80
RTT-8000	TRANSFORMER—3rd Audio I.F. transformer (T-9)	3.80
RTT-9000	TRANSFORMER—Vert. oscillator transformer (T-11)	2.80
RTW-100	WASHER—Picture tube rear support washer (rubber)	.80
RTW-500	WINDOW—Picture tube safety window (HM-185)	2.05
RTW-501	WINDOW—Celluloid station letter window (Pkg. 5)	.05
RTW-502	WINDOW—Picture tube safety window (HM-171)	1.60
RTX-1000	ASSEMBLY—Wave trap assembly (L-16, 17, 18, 19)	3.10
RTX-1003	ASSEMBLY—Wave trap assembly (L-20, C-94)	.80

Parts Used in Television Only

RTB-500	PUSH BUTTON—Station selector push button	.15
RTB-1000	BOARD—Focus control insulator mounting board	.80
RTB-1001	BOARD—Centering controls insulator mounting board	.40
RTB-1002	BOARD—I.F. terminal board (8-hole square)	1.40
RTB-1500	BACK COVER—Cabinet back cover (HM-185)	.45
RTB-1501	BACK COVER—Cabinet back cover (HM-171)	.35
RTB-2000	BUSHING—Insulating bushing for mounting R-153	.05
RTB-2001	BUSHING—Station trimmer shaft bushing	.10
RTC-1000	TRIMMER STRIP—20-200 mmf. trimmers (C-70, 71, 72)	.55
RTC-1001	TRIMMER STRIP—20-200 mmf. trimmers (C-67, 68, 69)	.55
RTC-5000	CONTROL—.25 megohm brightness control and power switch (R-157)	.80
RTC-5001	CONTROL—2.0 megohm centering control (R-169, 170)	.60
RTC-5002	CONTROL—2000 ohm tapered contrast control (R-108)	.60
RTC-5003	CONTROL—2.0 megohm focus control (R-167)	.60
RTC-5004	CONTROL—50,000 ohm horizontal speed control (R-123)	.60
RTC-5005	CONTROL—100,000 ohms hor. linearity control (R-189)	.60

* Used on previous receivers.

GENER

ANTENNA

In general, the television antenna should be of the dipole type located as high as is practical and in an area where the horizon in the direction of the television transmitter is not obstructed by buildings or structures. A noticeable gain in signal strength will be obtained as antenna height is increased. Since television radiation reacts similarly to light waves, reflection problems arise which often modify otherwise ideal installation locations. Consideration must also be given noise sources within buildings, or ignition noises from vehicles on adjacent streets. It is usually best to locate the dipole antenna on the side of the building away from the street thus allowing the building to shield the antenna from ignition noises.

The dipole should be erected with arms parallel to the ground and at right angles to the direction of the television station. If noise or reflection interference exist it may be better to point the dipole arms in the direction of the interference.

Noise interference and poor signal strength may dictate the use of a reflector. A reflector will increase the signal strength appreciably as well as increase the horizontal directivity.

General Electric Television Receiver, Model HM-
is a console type, 22-tube, superheterodyne receiver equip
with a full magnetic, short, 9-inch picture tube. The recti
power supply is on a separate chassis mounted in the lo
cabinet compartment with the speaker.

General Electric Television and Radio Receiver, M
HM-226-7A, is a console type instrument using the s
television receiver as the Model HM-225 with minor alt
tions for use in conjunction with a 7-tube radio recei
Model HM-226-7A is equipped with a full magnetic, sh
12-inch picture tube.

Additional design features include iron-core I.F. tun
automatic contrast control, automatic brightness con
automatic tone compensation, automatic volume cor
and a constant high-gain antenna coupling circuit.

TELEVISION ALIGNMENT PROCEDURE

The problem of aligning the several circuits in a television receiver is much more involved and requires more specialized equipment than the alignment of conventional radio receivers. Fortunately, the use of stable components in carefully engineered circuits of wide-band characteristics reduces to a minimum the necessity for alignment under normal operating conditions. Should alignment become necessary the following equipment will be needed:

(A) For Video I.F. Alignment
- (1) Cathode ray oscilloscope
- (2) Wide-band sweep oscillator capable of sweeping from 7.5 to 15 MC.
- (3) Marker system either provided in sweep oscillator or from separate signal generator for locating 12.75 and 9.75 MC points.

(B) Sound I.F. Alignment
- (1) Cathode ray oscilloscope
- (2) Wide band sweep oscillator capable of sweeping from 7.75 to 8.75 MC.

(C) R.F. Alignment
- (1) Cathode ray oscilloscope.
- (2) Wide-band sweep oscillator capable of sweeping the following bands.
  - (a) 44 to 50
  - (b) 50 to 56
  - (c) 66 to 72
  - (d) 78 to 84
  - (e) 84 to 90

VIDEO I. F. ALIGNMENT

Input Freq.	Point of Input	Adjustments	Comments
1.			Connect vertical input cable of cathode ray oscilloscope across resistor R-43 of 6H6 video detector. See Fig. 5, arrow one.
2. 7.5–15MC Sweep	Control grid of 1853 (2nd video I.F.)		Connect low output tap of video I.F. sweep oscillator to control grid of 1853 (2nd video I.F.). See Fig. 5, arrow two. Connect ground lead to chassis. Turn contrast control (R-67) to about half of maximum or to a point which gives satisfactory vertical deflection without overloading. Set horizontal centering and gain controls on oscilloscope to give suitable horizontal deflection. Adjust sweep phase to give curve similar to Fig. 8, curve 3.
NOTE: If sweep oscillator has marker points internally supplied, steps 3 and 4 may be omitted.			
3. Same as in No. 2 plus 12.75 MC	Same as in No. 2		Superimpose an accurately calibrated 12.75 MC signal in parallel with sweep signal. Signal will appear on sweep curve in oscilloscope as a wiggle, the center of which is a thin black line. With a pen or crayon mark this point on the screen of the oscilloscope. (NOTE: Hereafter the horizontal controls on the oscilloscope must not be touched.)
4. Same as in No. 2 plus 9.75 MC	Same as in No. 2		Superimpose an accurately calibrated 9.75 MC signal in parallel with sweep signal. Mark screen at point where signal appears on curve as in No. 3 above.
5. 7.5–15 MC Sweep	Control grid of 1852 (4th video I.F.)	Iron cores of detector transformer T-9	Connect high tap of video I.F. sweep oscillator to control grid of 1852 (4th video I.F.) See Fig. 5, arrow five. (Do not touch horizontal controls of oscilloscope.) Turn sweep phase to give as near a single curve as possible. Adjust iron cores of T-9 until curve appears similar to Fig. 8, curve 1, with relatively flat top, 12.75 MC mark half-way down one side and 9.75 MC mark at corner of other side. These conditions plus maximum amplitude insure correct alignment.
6. 7.5–15 MC Sweep	Control grid of 1853 (3rd video I.F.)	Iron cores of 4th video transformer T-8.	Connect low tap of video I.F. sweep oscillator to control grid of 1853 (3rd video I.F.). See Fig. 5, arrow six. Adjust iron cores for maximum gain, flatness and proper centering between markers as described in step No. 5 and illustrated in Fig. 8, curve 2.
7. 7.5–15 MC Sweep	Control grid of 1853 (2nd video I.F.)	Iron cores of 3rd video transformer T-7.	Connect low tap to grid. See Fig. 5, arrow two. Adjust primary and secondary iron cores for maximum gain, flatness and proper centering. Adjust series iron core for sharp cut-off on 9.75 MC side of curve. See Fig. 8, curve 3.
8. 7.5–15 MC Sweep	Control grid of 1852 (1st video I.F.)	Iron cores of 2nd video transformer T-6	Connect low tap to grid. See Fig. 5, arrow eight. Adjust primary and secondary iron cores for maximum gain, flatness and proper centering. Adjust series iron core for sharp cut-off on 12.75 MC side of curve. See Fig. 8, curve 4.
9. 7.5–15 MC Sweep	Converter Grid, 6P8G	Iron cores of 1st video transformer T-11	Connect low tap to grid. Adjust iron cores for maximum gain flatness and proper centering.
10. 14.25 MC	Converter Grid, 6P8G	Series iron core of 2nd video transformer T-6	To check alignment of 14.25 MC trap proceed as follows: Connect low tap to grid. Reduce horizontal gain of oscilloscope to minimum. Adjust iron core for minimum line length.
11. 8.25 MC	Converter Grid, 6P8G	Series iron core of 3rd video transformer T-7	To check alignment of 8.25 MC trap proceed as follows: Connect low tap to grid. Reduce horizontal gain of oscilloscope to minimum. Adjust iron core for minimum line length.

R. F. ALIGNMENT

Signal Input	Point of Input	Adjustments	Comments
1.		Band width adjustment coupling condenser	Turn (C-2) in until tight, then open approximately $\frac{1}{4}$ of a turn.
2. 44 to 50 MC sweep	Antenna terminals	(L-10), (C-3), (C-8)	Depress band No. 1 push button. Set tuning control to mid-rotation. Adjust L-10 until curve is centered between maximum horizontal sweep points. Adjust C-3 and C-8 for maximum amplitude. See Fig. 8, curve 5.
3. 50 to 56 MC sweep	Antenna terminals	(L-11), (C-4), (C-9)	Depress band No. 2 push button. Leave tuning control at mid-rotation point. Adjust L-11 for centering; C-4 and C-9 for maximum amplitude. See Fig. 8, curve 5.
4. 66 to 72 MC sweep	Antenna terminals	(L-12, (C-5), (C-10)	Depress band No. 3 push button. Adjust L-12 for centering; C-5 and C-10 for maximum amplitude. See Fig. 8, curve 5.
5. 78 to 84 MC sweep	Antenna terminals	(L-13) (C-83), (C-19)	Depress band No. 4 push button. Adjust L-13 for centering; C-83 and C-19 for maximum amplitude. See Fig. 8, curve 5.
6. 84 to 90 MC sweep	Antenna terminals	(L-14), (C-84), (C-20)	Depress band No. 5 push button. Adjust L-14 for centering; C-84 and C-20 for maximum amplitude. See Fig. 8, curve 5.

WAVE TRAP ALIGNMENT

Signal Input	Point of Input	Adjustments	Comments
1. 11.75 MC	Antenna terminals	Wave trap trimmer, C-88	Adjust for maximum dip in oscilloscope curve.

AUDIO I. F. ALIGNMENT

Input Freq.	Point of Input	Adjustments	Comments
1.			Connect vertical input cable of cathode ray oscilloscope between junction of R-4 and C-29 and chassis. See Fig. 5, arrow ten.
2. 7.75 to 8.75 MC sweep	Control grid of 6B8	Iron cores of 4th audio I.F. transformer T-4	Align for maximum amplitude. See Fig. 8, curve 6.
3. 7.75 to 8.75	Control grid of 6SK7	Iron cores of 3rd audio I.F. transformer T-3	Align for maximum amplitude. See Fig. 8, curve 6.
4. 7.75 to 8.75	Converter grid of 6F8G	Iron cores of 2nd audio I.F. transformer T-2	Align for maximum amplitude. See Fig. 8, curve 7.

RTL-4006	CHOKE—Video cathode choke (L-18)	.95
RTL-4007	CHOKE—Video diode choke (L-16, 17)	.75
RTL-5500	COIL—Focusing coil (L-24)	5.10
RTL-6000	YOKE—Deflection yoke (L-23)	12.00
RTN-001	NUT—Pal nut for all controls (Pkg. 5)	.10
RTP-001	PLUG—Female single slot plug on television chassis	.20
RTP-002	PLUG—Male plug on deflection yoke and focus cable	.40
RTQ-1003	RESISTOR—400 ohms damping (R-100)	1.00
RTQ-1004	RESISTOR—400 ohms 17.9 W. wire wound (R-70)	.85
RTQ-1005	RESISTOR—150 ohms 7.4 W. wire wound (R-18)	.55
RTQ-1006	RESISTOR—700 ohms 7.4 W. wire wound (R-77, 99)	.55
RTQ-1007	RESISTOR—1,500 ohms, 6 W.; 150 ohms, 9 W. wire wound (R-59, 101)	.85
RTQ-2010	RESISTOR—33 ohms 1 W. wire wound (R-88)	.40
RTR-001	RING—Picture tube support ring	.80
RTS-100	SOCKET—Power chassis power receptacle	1.00
RTS-102	SOCKET—Power fuse socket	
RTS-103	SOCKET—6 prong connector socket	.15
RTS-301	SHAFT—R.F. coil tuning core shaft	.15
RTS-501	SWITCH—Station selector switch	4.65
RTS-702	STUD—Focus coil adjustment stud	.15
RTS-703	SLEEVE—Picture tube rubber sleeve	.20
RTS-704	SCREW—Thumb screw for mounting picture tube bracket (Pkg. 2)	.10
RTC-6000	CARD—Station No. 1 tab card (Pkg. 10)	$0.05
RTC-6001	CARD—Station No. 2 tab card (Pkg. 10)	.05
RTC-6002	CARD—Station No. 3 tab card (Pkg. 10)	.05
RTC-6003	CARD—Station No. 4 tab card (Pkg. 10)	.05
RTC-6004	CARD—Station No. 5 tab card (Pkg. 10)	.05
RTC-6005	CARD—Station "Off" tab card (Pkg. 10)	.05
RTC-7000	CORD—Power cord assembly	1.80
RTC-7002	CABLE—Kinescope cable assembly on power chassis	1.25
RTC-7003	CABLE—Interconnecting power cable assembly (First hole from rear on right side of receiver chassis)	1.00
RTC-7004	CABLE—Interconnecting power cable assembly (Second hole from rear on right side of receiver chassis)	1.00
RTC-8002	CLAMP—Picture tube clamp	.20
RTC-8003	CLAMP—Deflection yoke clamp	.20
RTC-8004	CLAMP—Dry electrolytic mounting clamp (.06 mfd. 4,000 V.)	.20
RTC-8005	CUSHION—9-inch picture tube cushion	2.10
RTC-8006	CUSHION—12-inch picture tube cushion	2.40
RTE-101	ESCUTCHEON—Television station selector escutcheon	.35
RTG-101	GRID CLIP—6AL6G control grid clip	2.00
RTG-102	GRID CAP—High voltage rectifier grid cap	.90
RTG-202	GROMMET—Receiver chassis grommets (⅝ inch dia. black)	.05
RTG-203	GROMMET—Power chassis grommet (1 inch dia.)	.05
RTG-300	GUIDE—Screwdriver guide on focus coil assembly	.05
RTI-001	INSULATOR—High voltage rectifier socket mounting board	.90
RTI-002	INSULATOR—Television station trimmer strip mounting insulator board	.05
RTI-003	INSULATOR—Stand off insulator	
RTS-705	SHIELD—Back cover tube projection shield for model HM-226-7A	$0.40
RTS-800	SPRING—Picture tube support adjustment spring (Pkg. 5)	.10
RTT-0220	TRANSFORMER—High voltage power transformer (T-14)	17.70
RTT-0221	TRANSFORMER—Low voltage power transformer (T-13)	29.95
RTT-2000	TRANSFORMER—Antenna transformer (T-1)	1.00

RTW-504	WINDOW—Safety glass window for Model HM-226-7A	3.50
RTX-1001	ASSEMBLY—Wave trap assembly (L-1, 2, 3, 4, C-1, 7, 11, 13)	
RTX-1003	ASSEMBLY—Wave trap assembly (L-15, C-88)	.80
RTX-2000	ASSEMBLY—Chassis mounting assembly	.20

* Used on previous radio receivers.

(Prices Subject to Change without Notice)

CAUTIONARY INSTRUCTIONS

All adjustments not accessible with the back cover in place can be made without energizing the high-voltage circuits.

Servicing of the high-voltage circuits can be satisfactorily performed with the power-cord plug removed from any power supply outlet. A resistance check of the circuit components will indicate any trouble existing. HIGH VOLTAGES SHOULD NEVER BE MEASURED.

The "picture tube" is highly evacuated and is consequently subject to a very great air pressure. If it is broken, glass fragments will be violently expelled. Handle with care, using safety goggles and gloves.

The large end of the "picture tube"—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure. DO NOT FORCE THE SOCKET ONTO THE TUBE OR STRAIN ANY EXTERNAL CONNECTIONS. If it fails to slip into place smoothly, investigate and remove the cause of the trouble.

Extremely high voltages (4000 volts or more) are used in the operation of this receiver; therefore, every precaution must be exercised to insure safety to the service engineer and to the customer.

The back cover, while in place, protects the user and should never be removed except by a qualified television service engineer.

The power-cord plug should not be inserted in a power supply outlet until a good, solid ground connection has been properly made to the receiver chassis.

For safety, the following operations must be performed with power plug disconnected before working on the receiver with the back cover removed:

1. **Remove 879/2X2 tube from socket.**
2. **Detach top cap lead of 879/2X2 tube and insulate the contact end of this cap lead.**
3. **Ground the receiver chassis.**

TELEVISION RECEIVER CIRCUITS

The television receiver circuits are divided into the following sections:

1. R.F. Unit
2. Converter-Oscillator and Amplifier
3. Audio Unit
4. Video Unit
5. Sync Pulse Clipper—Amplifier
6. Horizontal Oscillator—Output
7. Vertical Oscillator—Output
8. Low Voltage Rectifier
9. High Voltage Rectifier

R. F. Unit

This unit, comprising all circuits between the antenna terminal posts and the converter grid, consists of a high pass filter input, a series tuned antenna coil primary, a shunt capacity coupled secondary (C-2) and a video I.F. wave trap (C-88, L-15). The wave trap is broadly tuned at 11.75 M.C. to prevent I.F. interference. Any one of the five tuned circuits for each of the five television transmission bands can be connected into the secondary circuit by pressing the appropriate button. The secondary circuit trimmers when properly tuned give a broad, flat response curve.

Converter-Oscillator and Amplifier

A plate-tuned oscillator is used with vernier tuning permitted from the front control panel through trimmer C-17. The resultant video I.F. signal of 12.75 M.C. and the audio I.F. signal of 8.25 M.C. developed in the converter-oscillator tube circuit is coupled through transformer T-11 to the 1852 amplifier tube.

Audio Unit

The audio unit is a conventional-type superheterodyne sound receiver with the I.F. stages tuned to 8.25 M.C. The audio I.F. signal is taken off through the suppressor of the 1st video I.F. tube.

Video Unit

This unit includes all the video I.F. amplifier stages, the video detector, two stages of video amplification and the picture tube input. Three wave traps are provided in this unit; one at T-6 for rejecting the audio I.F. of the adjacent television band, one at T-7 for rejecting the audio I.F. of the band concerned, and one in the cathode circuit of the 1st video, 6F8G, comprising L-18 and C-52, for removing the 12.75 M.C. video I.F. from the detected signal amplifier stages. A sensitivity control, known as contrast control, (R-67), is provided in the AVC circuits of the 6H6 video detector for varying the grid bias on the 2nd and 3rd video I.F. tubes.

D.C. reinsertion (automatic background control) is accomplished in the 2nd video 6F6G tube circuit by using part of the varying screen voltage developed across R-93 to control the picture tube grid voltage. A high impedance voltage divider, R-94 and R-95, is used and the coupling condenser, C-38, is made small to prevent low frequency variations in the plate supply from getting to the picture tube grid.

Sync-pulse Clipper—Amplifier

Sync-pulses are taken off the plate of the right section of the 1st video and clipper tube, 6F8G. The video signals are separated by tube cut-off since the plate voltage is only about 10 volts. The sync-pulses are then amplified in the sync amplifier tube and coupled through a high-pass filter to the grid of the horizontal oscillator.

Horizontal Oscillator—Output

The horizontal oscillator is a multi-vibrator with speed controlled by varying the small positive grid voltage through R-69. The horizontal pulses are passed through proper wave shaping and amplifier circuits to the horizontal deflection coils of the picture tube. Horizontal linearity is adjustable by varying R-91. Horizontal sweep size is controlled by R-60 in the cathode circuit of the 6AL6G. The degeneration resistor R-22 and series circuit across the secondary of the 6AL6G output transformer damp the output transient. Damping is adjustable through R-100.

Vertical Oscillator—Output

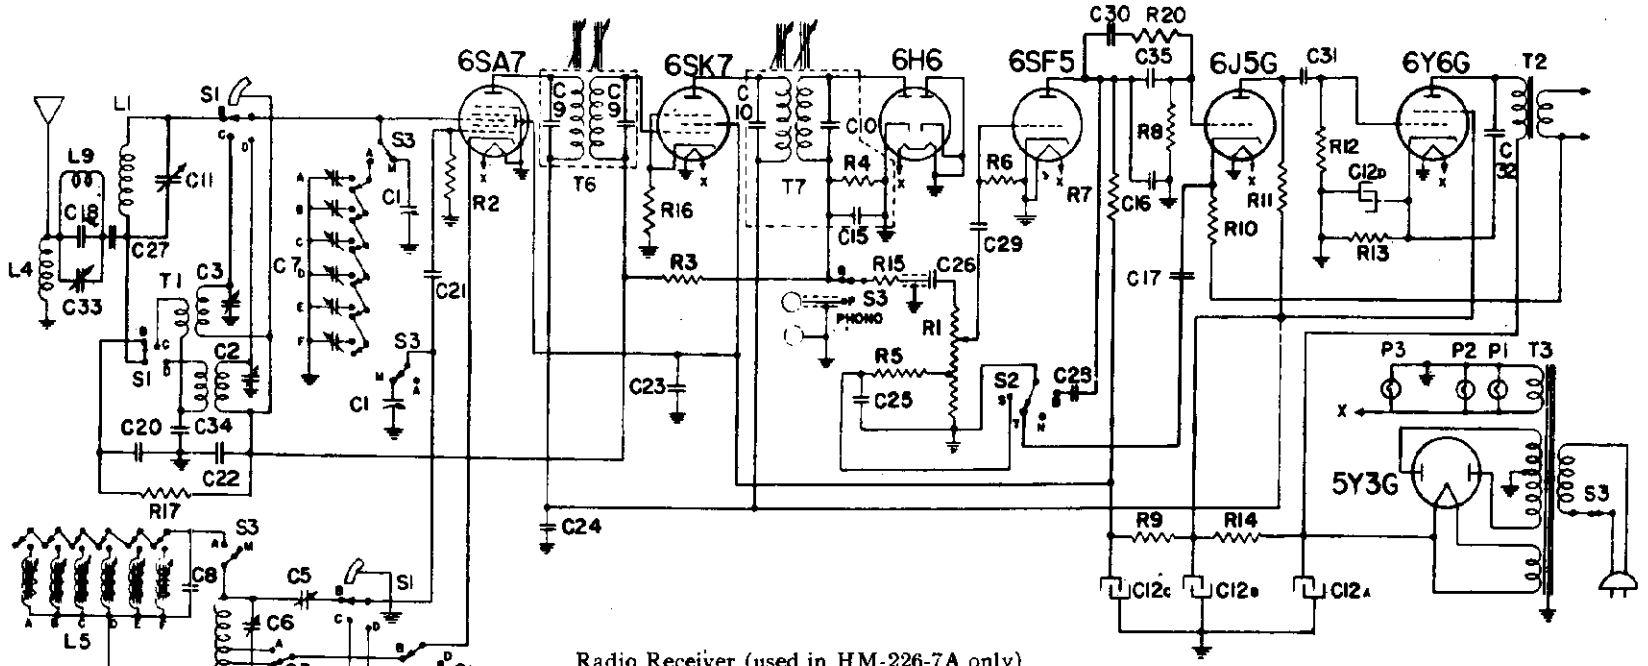
Vertical sync-pulses are separated from the horizontal pulses in the vertical clipper right section of 6F8G and are fed to the vertical oscillator. This oscillator is of the blocking type, transformer coupled. The generated sawtooth wave across C-70 is shaped by the vertical linearity control, R-53. The speed of the oscillator is controlled by R-79 and the length of sweep (size) is adjustable through R-65. The output is amplified and coupled to the vertical deflection coils of the picture tube.

Low-voltage Rectifier

Two 5U4G rectifiers are necessary to supply plate current which is over 300 ma. A combination of choke and resistance filters is used so that the audio and oscillator plate supplies will be free from video and sweep signals.

High-voltage Rectifier

The high voltage rectifier uses a resistance filter. The bleeder is connected across the filter input to reduce ripple. R-103 is inserted in the plate lead for protection.



Radio Receiver (used in HM-226-7A only)

Band "B"	540–1600 K.C.
Band "C"	2.1–6.5 M.C.
Band "D"	6.25–22.5 M.C.

LOUD-SPEAKER

To center the voice coil, loosen the two screws which clamp the speaker spider in position. These two screws are available from the rear of the speaker. Shift the spider around until the voice coil is centered, then tighten the screws in position.

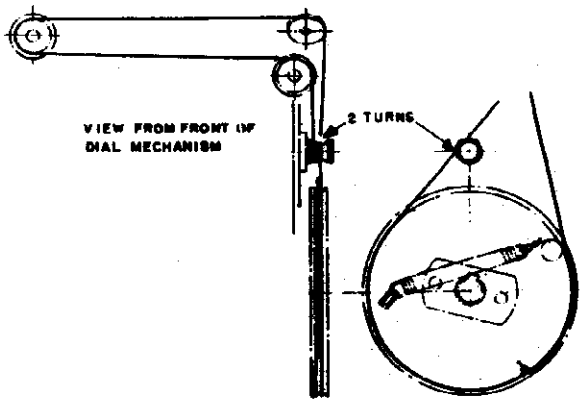

Fig. 14. Dial Drive Stringing Diagram

PHONOGRAPH CONNECTIONS

Model HM-226-7A radio receiver is equipped with a phono-terminal (pin jack) to allow the convenient connection of a record player. General Electric plug, Stock No. RP-145, fits the pin jack.

NOTE—A suitable load consisting of a 100,000 ohm resistor in series with a .01 mfd. capacitor should be connected across the pick-up leads when using a crystal-type unit.

MODEL HM226-7
Radio Alignme
Parts

RADIO ALIGNMENT PROCEDURE (Model HM-226-7A only)

I. F. ALIGNMENT WITH OSCILLOSCOPE

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. 2nd I.F. Pri. (T-7)	Gang condenser plates closed — "Manual" key depressed—connect audio input of oscilloscope to chassis and to junction of R-3 and R-15. Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. 1st I.F. Pri. (T-6)	

I. F. ALIGNMENT WITH OUTPUT METER

1. Band "B"	455 K.C. Sweep	I.F. Grid	.05 Mfd. or Larger	2nd I.F. Sec. 2nd I.F. Pri. (T-7)	Gang condenser plates closed—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. Sweep	Converter Grid	.05 Mfd. or Larger	1st I.F. Sec. 1st I.F. Pri. (T-6)	

R. F. ALIGNMENT

1. Band "B"					Close gang plates—adjust pointer to first line at left end of tuning scale. Connect output meter across voice coil—tone control on "Bass" position.
2. Band "D"	21 M.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-4) Ant. (C-2)	The image of any "D" band signal should be heard 910 K.C. below signal input when (C-4) is on proper peak. Example: 18 M.C. image, 17.09 M.C. Peak (C-2) while rocking the gang condenser.
3. Band "C"	6 M.C. with Modulation	Antenna Post	I.R.E.	Ant. (C-3)	Peak for maximum output with a low input signal.
4. Band "B"	1500 K.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-6) Ant. (C-11)	Align (C-6) on 1500 K.C. and peak output with (C-11).
5. Band "B"	580 K.C. with Modulation	Antenna Post	I.R.E.	Osc. Padder (C-5)	Align for maximum output with a low input signal, rocking gang condenser.
6. Band "B"	1500 K.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-6) Ant. (C-11)	Retrim at 1500 K.C.

Electrical Specifications

Rating	Power Supply (volts)	Frequency (cycles)	Power Consumption (watts)
A-6	115	60	55
A-5	115	50	55
C-2	115	25	55

Electrical Power Output (115-line volts)

Undistorted ..... 1.2 watts
Maximum ..... 2.0 watts

Loud-speaker—"Alnico" Magnetic Dynamic

Outside Cone Diameter ..... 4 inches
Voice Coil Impedance (400 cycles) .... 3.5 ohms

I.F. Alignment

Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply this signal to the grid of the 12B7 through a .05 mfd. capacitor and align the 2nd I.F. transformer. Repeat the procedure, applying the 455 KC signal to the control grid of the 12SA7GT and aligning the 1st I.F. transformer. Do not remove grid leads from the tubes. Finish alignment by over-all adjustments.

R.F. Alignment

Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2b) at 1500 KC and peak (C-2a) for maximum output. Change signal to 580 KC and tune receiver to signal. Peak (C-11) on the 580 KC signal by rocking the gang condenser. Retrim at 1500 KC.

GENERAL INFORMATION

Model HB-412 is a portable, four-tube, superheterodyne receiver designed to operate on any one of three types of power supply as listed under electrical specifications. Features of design include automatic power selector switch, built-in Beam-a-Scope, 4-inch Dynapower speaker, and automatic volume control.

The automatic power selector switch operates as follows: Inside the small door on the left side of the cabinet is the power selector lever. To operate radio on batteries see that the prongs on the power cord plug are inserted in the lever holes and the plug pushed in until it wedges between the cabinet wall and the lever. Place the rest of the power cord in the compartment and close the door. To operate radio on an AC or DC power supply merely remove the power cord and plug from the compartment and insert in a convenience outlet.

Note: Do not press in on power selector lever while power cord is in convenience outlet.

When operating from a DC source of power, it is necessary to insert the power plug with the proper polarity; otherwise the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

When the receiver is operating on batteries it will perform as soon as it is turned on. However, when operating from an AC or DC power supply, sufficient time must be allowed for the tubes to become heated.

Audio power output is obtained from the 1T5GT on battery operation, and from the pentode section of the 117L7GT on AC or DC, 115-volt operation. The driving grids of the two tubes are in parallel. On battery operation the 117L7GT is dead due to no filament voltage, as is the case of the 1T5GT on AC-DC, 115-volt operation. A tapped primary output transformer is used to insure matching to the different load impedances of the two output tubes. If the receiver does not operate on low line voltage check 117L7GT for low plate current since its plate current energizes the 3A8GT and 1A7GT

Precaution:

Model HB-412 when used on an AC power supply will have one side of the chassis connected directly to the line. In order to prevent injury to alignment equipment or shock to the servicemen, use an isolating transformer between the convenience outlet and the receiver power cord.

SERVICE DATA

Electrical Specifications

1. AC or DC Power Supply
   110–120 Volts, 25-60 cycles on AC, 25 watts

2. Battery Power Supply
   6-volt "A" supply, 90-volt "B" supply.

Recommended batteries for long life.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F. ..... 455 KC
R.F. ..... 1500 and 580 KC

The location of all trimmers is shown in Fig. 1.

General Alignment Notes

This receiver must be removed from the carrying case in order to perform the alignment. Special care must be exercised to place the batteries, Beam-a-Scope and chassis in the same relative positions with respect to one another as these components occupied in the case; otherwise, alignment will not be satisfactory.

I.F. Alignment

With batteries, Beam-a-Scope and chassis in position for alignment as mentioned above, and using an isolating transformer if operating from an AC power source (refer to precaution under "General Information"), set up and align as follows: Connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 KC and apply signal to the control grid of the 3A8GT tube through a .05 mfd. capacitor. Align the 2nd I.F. transformer trimmers. Next apply signal to the control grid of the 1A7GT through the same .05 mfd. capacitor and align the 1st I.F. transformer trimmers. Retouch the 2nd I.F. transformer trimmers while applying signal to the 1A7GT tube. Do not remove the grid leads from the tubes when applying the oscillator signal and keep the test oscillator output as low as a readable meter reading will permit.

R.F. Alignment

Place a one turn coupling loop not closer than six inches from the receiver Beam-a-Scope. Apply a 1500 KC signal to the coupling loop. Set pointer to 1500 KC and align the oscillator trimmer (C-1A). Peak (C-1B) for maximum output. Change test signal to 580 KC and with pointer in region of 580 KC peak (C-3) while rocking the gang condenser. Retrim at 1500 KC.

The Beam-a-Scope leads should be dressed the same after the components are mounted in the cabinet as during alignment.

Intermediate Frequency
455 KC

PRODUCTION CHANGES

Conversion changes from H-501 and H-511 to H-500U and H-510U were made progressively; hence, there are H-500U and H-510U receivers with 12A8GT converter-oscillator tube circuits (see Fig. 4) instead of the 12SA7GT circuit as shown in the schematic diagram, Fig. 5. Insert the 12A8GT circuit in place of the 12SA7GT circuit for those models having a 12A8GT tube. When ordering replacement parts for the 12A8GT circuit be sure to refer to the special replacement parts list.

Similarly there will be found receivers of Model H-500U, H-510U and H-520U which have a 2.0 megohm volume control circuit (see Fig. 3). If such is the case insert the 2.0 megohm volume control circuit in place of the 500,000 ohm volume control circuit shown in the schematic diagram (Figs. 5 and 6). When ordering replacement parts for the 2.0 megohm volume control circuit be sure to refer to the special replacement parts list.

Capacitor (C-12) was .002 mfd. in all early production receivers. It was later changed to .03 mfd. to improve performance.

Special Service Information

The following information will be found very useful in servicing of receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

(1) Stage Gains

	Gain
Antenna to 12A8GT grid	5 to 5.5 at 1000 KC
12A8GT grid to 12SK7 grid	42 at 455 KC‡
12SK7 grid to 12SQ7 detector plate	60 at 455 KC‡

(2) 0.1 volt, 400 cycle signal across volume control will give ½ watt speaker output. (Volume control turned to maximum).

(3) Average DC voltage developed across oscillator grid leak . . . . . 18 volt

Alignment

‡Variations of +10%, −20% permissible

Precaution—If the signal generator is AC operated use an isolating transformer between the power supply and the radio receiver power input. The use of an isolating capacitor is not recommended as AC current through the capacitor will introduce hum modulation and/or create the possibility of a burned-out signal generator attenuator.

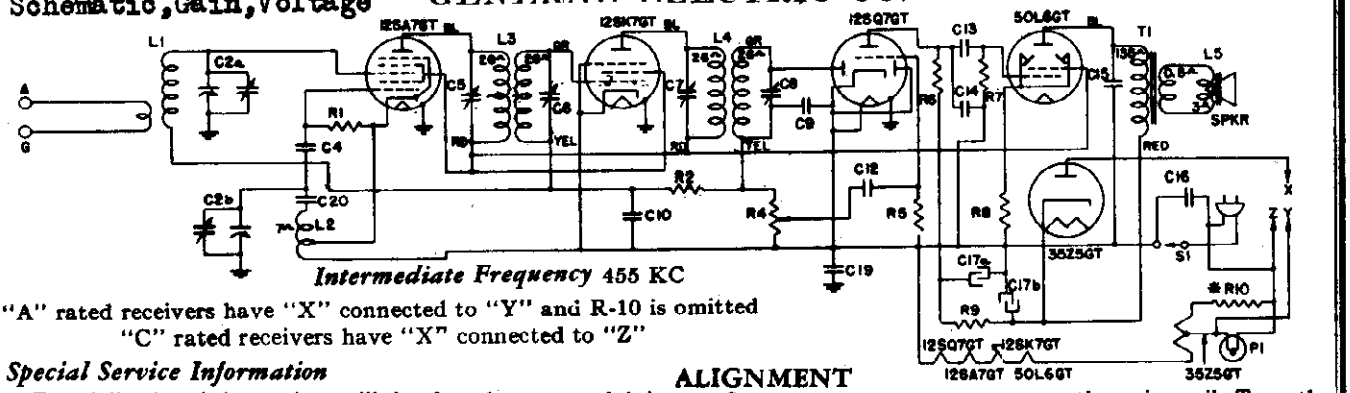
(When ordering drums, knobs, or keys, specify color)

MODEL HJ514

Schematic, Gain, Voltage

GENERAL ELECTRIC CO.

Socket, Alignment, Trimmers



Intermediate Frequency 455 KC

"A" rated receivers have "X" connected to "Y" and R-10 is omitted

"C" rated receivers have "X" connected to "Z"

Special Service Information

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

(1) Stage Gains — Gain

Antenna to 12SA7GT grid...3 to 3.5 at 1000 KC‡

12SA7GT grid to 12SK7GT grid.....50 at 455 KC ‡

12SK7GT grid to 12SQ7GT detector plate.....50 at 455 KC ‡

Gains shown in the first two stages do not contain the conversion gain which amounts to 1.1 at 1000 KC.

(2) 0.15 volt, 400 cycle signal across the volume control will give ½ watt speaker output. (Volume control turned to maximum.)

(3) Average DC voltage developed across oscillator grid leak.....15 volts

‡ Variations of +10%, −20% permissible.

The glass tubes used in the I.F. amplifier and 2nd detector stages are interchangeable with metal tubes.

RW-121	WASHER—Pointer felt washer (Pkg. 10)	.05

* Used on previous receivers—(Prices subject to change without notice).

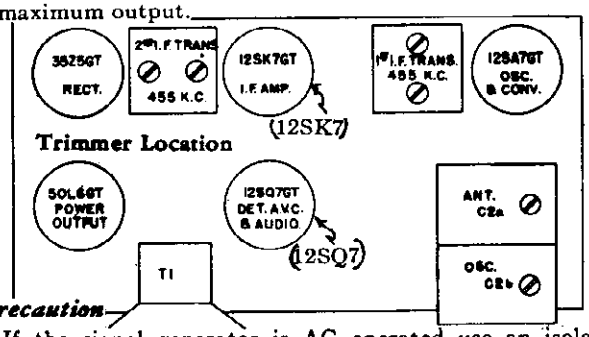
ALIGNMENT

I.F. Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the converter grid of the 12SA7GT through a 0.05 mfd. capacitor and align progressively the trimmers in the 2nd and 1st I.F. transformer cans. Do not remove the grid lead from the 12SA7GT.

R.F. To insert the R.F. signal use either a standard I.R.E. dummy between the signal generator and the receiver antenna post or a loop connected across the generator output which can be magnetically coupled to the receiver Beam-a-Scope. When using an I.R.E. dummy antenna for R.F. alignment, the ground lead from the signal generator to the receiver ground post should be omitted.

With the gang condenser wide open, align oscillator trimmer (C-2b) to 1650 KC. Change generator signal to 1500 KC, tune receiver to the signal and peak antenna trimmer (C-2a) for maximum output.



Precaution—If the signal generator is AC operated use an isolating transformer between the power supply and the radio receiver power input.

Rating	Power Supply (Volts)	Frequency (Cycles on AC)	Power Consumption (Watts)
A	115—AC or DC	40–60	30
C	115—AC or DC	25	30

Electrical Power Output (117-line volts)

Undistorted.....1.3 watts

Maximum.....1.9 watts

Loud-speaker—"Alnico" Magnetic Dynamic

Outside Cone Diameter.....4 inches

Voice Coil Impedance (400 cycles).....3.5 ohms

GENERAL INFORMATION

These Models are compact superheterodyne receivers u five General Electric Pre-tested Tubes. Operation is permit on either a DC or AC source of power. Features of de include the new "Alnico" Dynapower speaker, single-en tubes in the detector circuits, high-filament voltage t which eliminate line dropping resistors, and full approva the Underwriters' Laboratories.

Model	Power Supply (Volts)	Frequency (Cycles on A-C)	Powe Consu tion (Wat
H-502	115 Volts AC or DC	25–60	30
H-503, 530, 531, 532	115 Volts AC or DC	40–60	30

Electrical Power Output (115-line volts)

Undistorted.....1.2 w
Maximum.....2.3 w

Special Service Information

The following data will be very useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments.

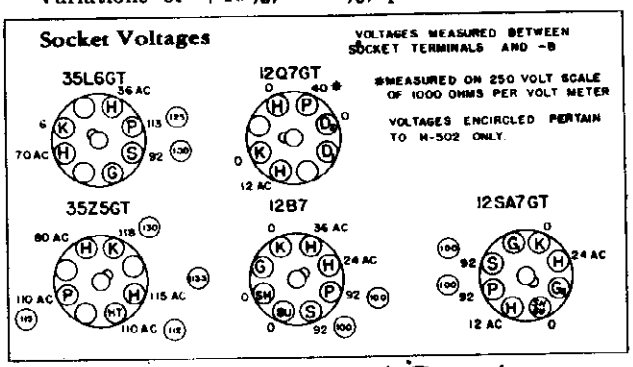
(1) Stage Gains

	Gain
Antenna to Converter Grid	3 to 4 at 1000 KC
Converter Grid to 12B7 Grid	45 at 455 KC‡
12B7 Grid to 12Q7GT Grid	80 at 455 KC‡

(2) 0.1 volt, 400 cycle signal across volume control will give ½ watt speaker output. ‡(Volume Control turned to Maximum).

(3) Average DC voltage developed across oscillator grid resistor (R-1)—12 volts.

Variations of +10%, −20%, permissible.



Loud-speaker—"Alnico" Magnetic Dynamic

Outside Cone Diameter.....4 inches
Voice Coil Impedance (400 cycles).....3.5 ohms

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Turn Volume Control to maximum. Set test oscillator to 455 K and keep the oscillator output as low as a readable m reading will permit.

Apply this signal to the grid of the 12B7 through a .05 capacitor and align the 2nd I.F. transformer. Repeat procedure, applying the 455 KC signal to the control gri the 12SA7GT and aligning the 1st I.F. transformer. Do remove grid leads from the tubes. Finish alignment by c all adjustments.

R.F. Apply a 1500 K.C. signal either through a standard I. dummy to the antenna terminal or through an additional connected to the generator output which can be magneti coupled to the receiver Beam-a-scope. Align (C-2b) at K.C. and peak (C-2a) for maximum output. Change si to 580 KC and tune receiver to signal. Peak (C-11) on 580 K.C. signal by rocking the gang condenser. Retri 1500 K.C.

GENERAL ELECTRIC CO.

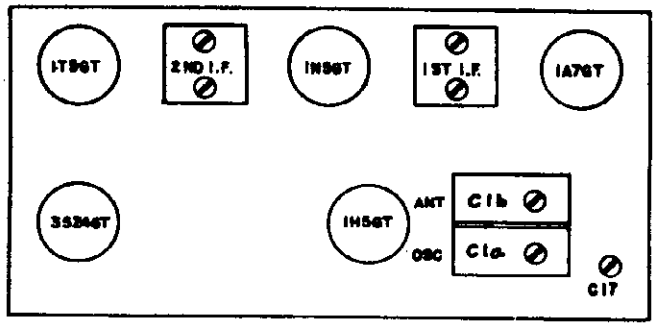

Fig. 1. Trimmer Location

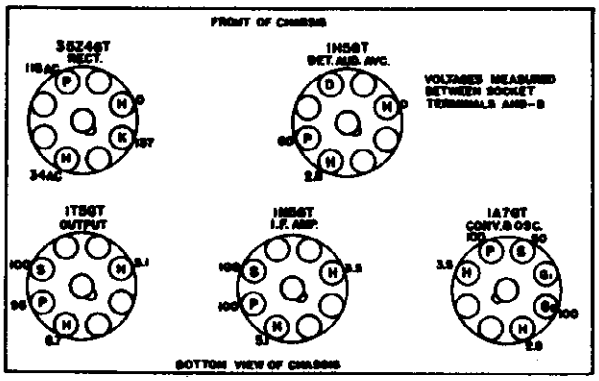
Precaution: The Model HB-504 when used on an AC power supply will have one side of the chassis connected directly to the line. In order to prevent injury to the signal generator, if AC operated, or shock to the serviceman, use an isolating transformer between the convenience outlet and the receiver power cord.



Line volts—118. No signal input.
When operated on a DC power supply, voltages are about 15% lower.
Voltages measured with a 20,000 ohms per volt meter.

2. Battery Power Supply
   1.5 volt "A" supply, 90-volt "B" supply.
   Recommended batteries for 300-hour life:
   (a) "A" supply—Eveready No. 718 or equivalent.
   (b) "B" supply—Eveready No. 762 or equivalent.

Tuning Frequency Range ..... 540–1600 KC

Intermediate Frequency ..... 455 KC

Maximum Power Output ..... 175 milliwatts

Loud-speaker—"Alnico" Magnet Dynamic

Outside Cone Diameter—5 inches.
Voice Coil Impedance (400) cycles 4.6 ohms.

GENERAL INFORMATION

The Models HB-504 and HB-505 are portable, five-tube, superheterodyne receivers which are designed to operate on any one of three types of power supplies as listed under electrical specifications. Features of design include automatic power selector switch, built-in Beam-a-scope, 5-inch "Alnico" magnet dynapower speaker and automatic volume control.

The automatic power selector switch operates as follows: When the door-cover at the side of the case is opened for the purpose of connecting the power cord to a convenience outlet, all batteries are automatically disconnected from the circuit. When the power cord is replaced and the door-cover is closed the radio is automatically returned to battery operation.

When operating from a DC source of power, it is necessary to insert the power plug with proper polarity; otherwise the receiver will fail to function. If any hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.—455 KC Broadcast—1500 and 600 KC
The location of all trimmers is shown in Fig. 1.

General Alignment Notes

This receiver must be removed from the carrying case in order to perform the alignment. Special care must be exercised to place the batteries, Beam-a-scope and chassis in the same relative positions with respect to one another as these components occupied in the case, otherwise, alignment will not be satisfactory.

I.F. Alignment

With batteries, Beam-a-scope and chassis in position for alignment as mentioned above, connect an output meter across the voice coil. Rotate the volume control to maximum. Set test oscillator to 455 KC and apply signal to the control grid of the 1A7GT tube through a .05 mfd. capacitor. Do not remove the grid lead from the 1A7GT. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers for maximum output.

R.F. Alignment

Place a coupling loop six inches from the receiver Beam-a-scope. Apply a 1500 KC signal to the coupling loop. Set pointer to 1500 KC and align the oscillator trimmer (C-1a). Peak (C-1b) for maximum output. Change test signal to 600 KC and with pointer in region of 600 KC peak (C-17) while rocking the gang condenser.

Special Service Information

The following data will be very useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments.

(1) Stage Gains. Gain‡

Antenna to Converter Grid	2.7 at 1000 K.C.
Converter Grid to 6SK7 Grid	28 at 455 K.C.
6SK7 Grid to 6SQ7 Diode Plate	87 at 455 K.C.

‡Variations of +10%, −20% permissible.

(2) Audio Gain.
.05 volts, 400 cycle signal across volume control with control set to maximum will give approximately ½ watt output at speaker.

(3) DC voltage developed across oscillator grid leak averages 13 volts.

Power Consumption is 55 watts at 115 volts AC or DC . AC frequency 25 - 60 cycles.

Power Output at 117 volts line:-

Undistorted..... 1.4 watt.

Maximum ..... 2.5 watt.

GENERAL ELECTRIC CO.

GENERAL INFORMATION

The above listed models are compact six-tube AC-DC superheterodyne receivers employing General Electric Pretested Tubes. Features of design include the built-in "Beam-a-Scope," 5-inch Dynapower speaker, single-ended tubes in the R.F. and I.F. circuits and automatic volume control.

Model H-610U (W & X inc.) also includes four "Feathertouch Tuning" keys.

Models H-620U (W & X inc.), H-630U and H-632U incorporate four "Feathertouch Tuning" keys and an additional frequency band permitting short-wave reception.

All models are fully approved by Underwriters' Laboratories. Model numbers ending in W or X indicate cabinet colors are in ivory or onyx respectively.

When operating from a DC source of power, it is necessary to insert the power plug with the proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F.-455 K.C. R.F.—1500 and 580 K.C.

The location of trimmers for the above models are shown in their respective diagrams, Figs. 1 and 2.

I.F. Alignment

Connect an output meter across the voice coil. Rotate the Volume Control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark at the low end of the scale. Turn the band switch to "B" band on the two band receivers.

Set test oscillator to 455 K.C. and apply signal to the control grid of the 6SA7 tube through a .05 mfd. capacitor. Do not remove the 6SA7 grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers for maximum meter reading.

R.F. Alignment

(1) *All models.*

Apply a 1500 K.C. signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2) at 1500 K.C. and peak (C-1) for maximum output. Change signal to 580 K.C. and tune receiver to signal. Peak (C-3) on the 580 K.C. signal by rocking the gang condenser. Retrim at 1500 K.C.

(2) *Models H-600U, 610U and 632U.*

Turn the band switch to "D" band after aligning on "B" band. Align (C-6) at 18 MC using an 18 M.C. signal. Peak (C-5) while rocking the gang condenser. The image of the 18 M.C. signal should be heard at approximately 17 M.C.

Special Service Information

The following data will be very useful to servicemen equipped with vacuum tube voltmeters or similar voltage measuring instruments.

(1) Stage Gains. Gain‡

Antenna to Converter Grid.....2.7 at 1000 K.C.
Converter Grid to 6SK7 Grid.....28 at 455 K.C.
6SK7 Grid to 6SQ7 Diode Plate.....87 at 455 K.C.

(2) Audio Gain.

.05 volts, 400 cycle signal across volume control with control set to maximum will give approximately ½ watt output at speaker.

(3) DC voltage developed across oscillator grid leak averages 13 volts.

‡Variations of +10%, −30% permissible.

GENERAL INFORMATION

The Model HJ-612 is a compact 6-tube AC-DC superheterodyne receiver employing General Electric Pre-tested Tubes. Features of design include built-in Beam-a-Scope, airplane-type dial, broadcast and police-amateur-aircraft coverage, and automatic volume control.

When operating from a DC source of power it is necessary to insert the power plug with the proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Rotate the volume control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark at the low end of the scale. Throw the band switch to "BC" (up).

Set test oscillator to 455 KC and apply signal to the control grid of the 6SA7 tube through a .05 mfd. capacitor. Do not remove the 6SA7 grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers for maximum meter reading.

R.F. Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the signal generator output which can be magnetically coupled to the receiver Beam-a-Scope. When using an I.R.E. dummy antenna for R.F. alignment do not connect a ground lead between the signal generator and the receiver. Align (C-2) at 1500 KC and peak (C-1) for maximum output. Change signal to 580 KC and tune receiver to signal. Peak (C-11) on the 580 KC signal by rocking the gang condenser. Retrim at 1500 KC.

Throw the band switch to "SW" band. Peak (C-16) on

Power Supply Volts	Frequency (Cycles on AC)	Power Consumption (Watts)
115 AC or DC	25–60	50

Electrical Power Output (117 Line Volts)

Undistorted.....1.4 watts
Maximum.....2.5 watts

Tuning Frequency Range

GENERAL INFORMATION

Models HJ-618 AC and HJ-618 DC are compact, table-model, radio-phonograph combinations using six General Electric Pre-tested Tubes in a superheterodyne circuit. Model HJ-618 AC is designed to operate on a 60-cycle source of power as shown under electrical specifications. Model HJ-618 DC incorporates the same chassis and phonograph as the Model HJ-618 AC but includes in addition an inverter unit which will allow operation on a DC source of power.

Phonograph

Type Pick-up	Crystal
Turntable Speed	78 R.P.M.

Special Service Information

Model	Power Supply (Volts)	Frequency (Cycles on AC)	Power Consumption (Watts)
HJ-618 AC	115 AC	60	75
HJ-618 DC	115 DC		85

Electrical Power Output

Undistorted	2.0 watts
Maximum	2.5 watts

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the grid of the 6SK7GT through a .05 mfd. capacitor and align the 2nd I.F. transformer. Repeat the procedure, applying the 455 KC signal to the control grid of the 6SA7GT and aligning the 1st I.F. transformer. Finish by over-all adjustments.

R.F. With gang condenser plates completely closed, set dial pointer to the first mark at the left end of the scale. Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2) at 1500 KC and peak (C-1 on HJ-628) or (C-20 on HJ-624) for maximum output. Peak (C-3) on 580 KC while rocking the gang condenser. Retrim at 1500 KC.

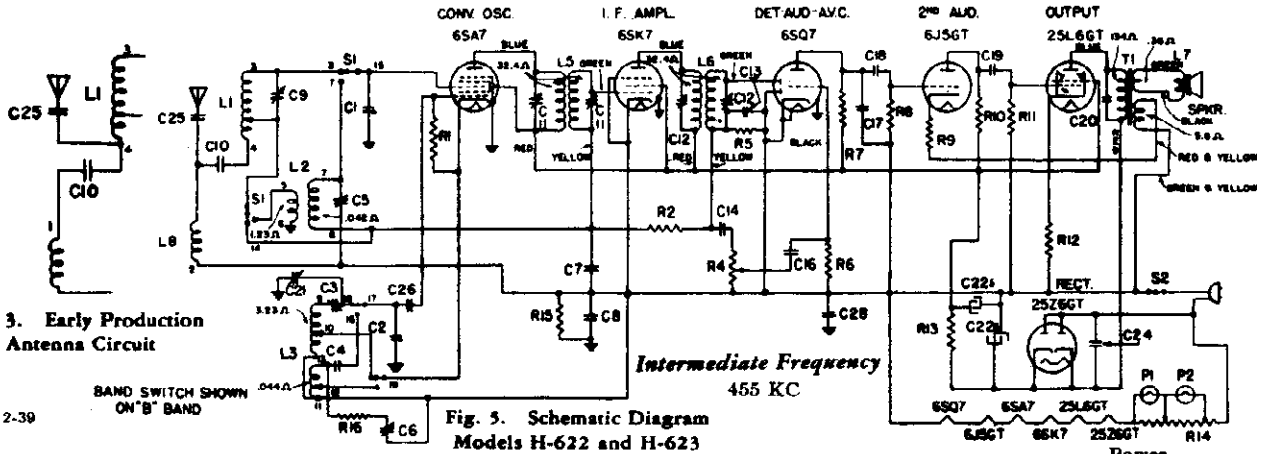

Fig. 3. Early Production Antenna Circuit

Fig. 5. Schematic Diagram Models H-622 and H-623

12-39

PRODUCTION CHANGES

Several hundred early production Model H-622 receivers were built with the antenna terminal connected as shown in Fig. 3. The remainder of these receivers were connected as shown in the schematic diagram, Fig. 5. The only difference between the two circuits is in the connection between the lower side of C-25 capacitor and the antenna circuit. Early production circuits had C-25 connected between L-1 and C-10. If hum is experienced when an outside antenna is used on these early production models with Fig. 3 antenna circuit, reverse the power plug in the power supply outlet. Should this procedure fail to attain the required results rewire C-25 into the circuit as shown in the schematic diagram, Fig. 5.

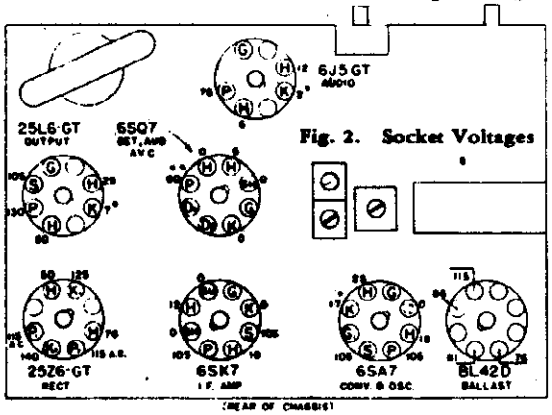

Fig. 2. Socket Voltages

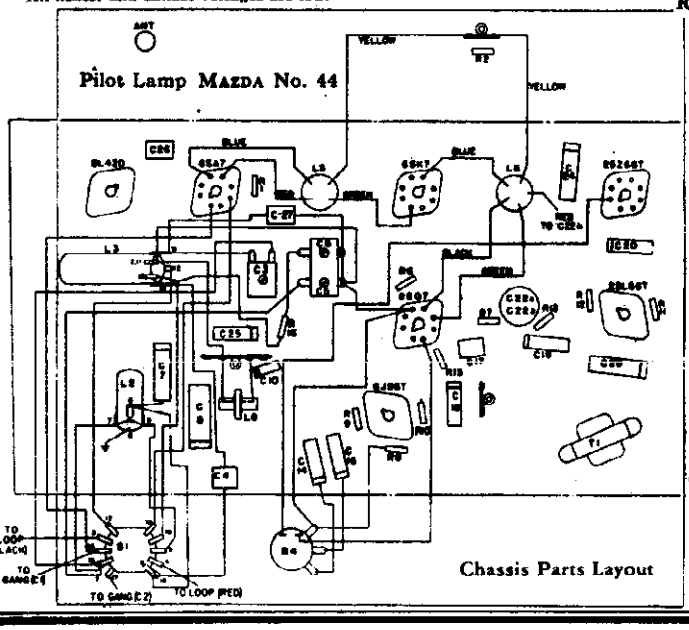
*Measured on 10 volt scale of 20,000 ohms per volt meter.
**Measured on 250 volt scale of 20,000 ohms per volt meter.
Line Volts—115.—No signal input.
Volume at maximum.
When operated on DC power supply, voltages are about 15 per cent lower.
All heater and ballast voltages are AC.



Chassis Parts Layout

Power Supply Volts	Frequency (Cycles on AC)	Power Consumption (Watts)
115 AC or DC	25–60	50

Electrical Power Output (117 Line Volts)

Undistorted.....1.4 watts
Maximum.....2.5 watts

Loud-speaker—"Alnico" Magnet Dynamic

Outside Cone Diameter.....6¼ inches
Voice Coil Impedance (400 cycles).....3½ ohms

Special Service Information

The following data will be very useful to servicemen equipped with vacuum-tube voltmeters or similar voltage-measuring instruments.

(1) Stage Gains — Gain ‡
Antenna Post to Converter Grid.....2.7 at 1000 KC
Converter Grid to 6SK7 Grid.....28 at 455 KC
6SK7 Grid to 6SQ7 Diode Plate.....87 at 455 KC

(2) Audio Gain
A 400 cycle signal of .05 volts across volume control will give approximately ½ watt speaker output. (Volume control turned to maximum.)

(3) DC voltage developed across oscillator grid resistor (R-1) averages 13 volts at 1000 KC.

‡Variation of +10%, −20% permissible.

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Rotate the volume control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark at the low end of the scale. Turn the band switch to "B" band (counterclockwise).

Set test oscillator to 455 KC and apply signal to the control grid of the 6SA7 tube through a .05 mfd. capacitor. Do not remove the 6SA7 grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers for maximum meter reading.

R.F. Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the signal generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-21) at 1500 KC and peak (C-9) for maximum output. Change signal to 580 KC and tune receiver to signal. Peak (C-3) on the 580 KC signal by rocking the gang condenser. Retrim at 1500 KC.

Turn the band switch to "D" band. Align (C-6) at 18 MC using an 18 MC signal. Peak (C-5) while rocking the gang condenser. The image of the 18 MC signal should be heard at 17.09 MC when (C-6) is on the proper peak.

GENERAL INFORMATION

The Models H-625, H-630, H-631, H-632, and H-633 are compact six-tube AC-DC superheterodyne receivers employing General Electric Pre-tested Tubes. Features of design include built-in Beam-a-Scope, airplane-type dial, four Feathertouch Tuning keys, broadcast and short-wave coverage, and automatic volume control.

Models H-625, H-631, and H-633 are fully approved by Underwriters' Laboratories.

When operating from a DC source of power it is necessary to insert the power plug with the proper polarity; otherwise, the receiver will fail to function. If excessive hum is noticed when the receiver is used on AC, reverse the power plug in the receptacle.

Alignment, Changes, Trimmers
Dial Drive Data, Parts

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F. ..... 455 KC
Band "B" ..... 1500 and 580 KC
Band "D" ..... 18,000 KC

The location of trimmers for the above models are shown in their respective diagrams, Figs. 1 and 2.

I.F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark at the low end of the scale. Turn the band switch to "B" band (counterclockwise).

Set test oscillator to 455 KC and apply signal to the control grid of the 6SA7 tube through a .05 mfd. capacitor. Do not remove the 6SA7 grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers for maximum meter reading.

R.F. Alignment

(1) *Models H-630, -631, -632, -633* Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the signal generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2) at 1500 KC and peak (C-1) for maximum output. Change signal to 580 KC and tune receiver to signal. Peak (C-3) on the 580 KC signal by rocking the gang condenser. Retrim at 1500 KC.

Turn the band switch to "D" band. Align (C-6) at 18 MC using an 18 MC signal. Peak (C-5) while rocking the gang condenser. The image of the 18 MC signal should be heard at 17.09 MC when (C-6) is on the proper peak.

(2) *Model H-625* The same alignment procedure as above may be followed for this model excepting that final R.F. alignment on "B" band should be made after the chassis and Beam-a-Scope are properly mounted in the cabinet and interconnected. The location of the Beam-a-Scope with respect to the chassis materially affects alignment.

NOTE.—A change exists in the "B" band trimmer arrangement on late production models. "B" band antenna trimmer (C-1) is eliminated. "B" band oscillator trimmer (C-2) is moved from the top of the gang condenser to the chassis deck and renumbered (C-21) (see Fig. 2). In aligning the late production Model H-625 apply 1500 KC signal as described for H-630. Set dial pointer to 1500 KC and align (C-21) for maximum output by rocking the gang condenser. Retune to 580 KC and peak (C-3) on 580 KC signal by rocking gang condenser. Repeat at 1500 KC.

Alignment on "D" band is the same as described for Model H-630.

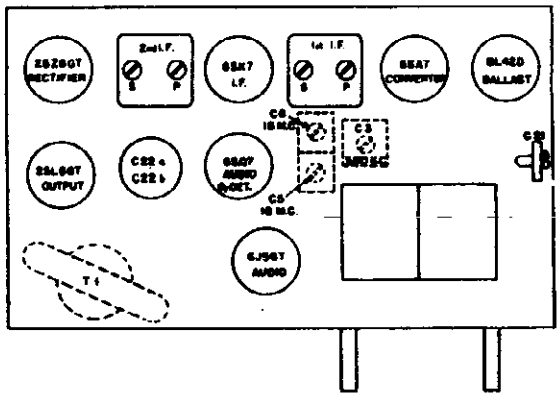

Fig. 2. Trimmer Location (Late Production Model H-625)

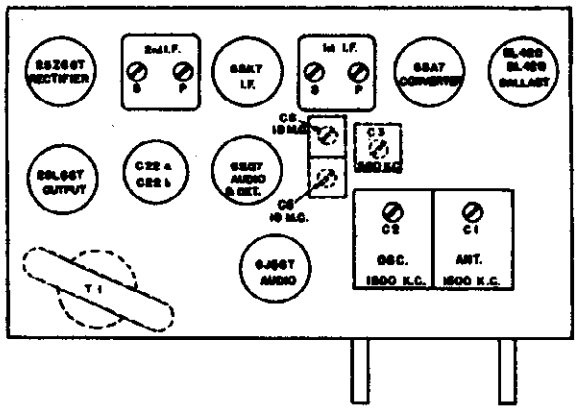
PRODUCTION CHANGES

Late production models of the H-625 have certain trimmer and coil changes incorporated which should be noted when ordering replacement parts.

1. "B" band trimmers (C-1) and (C-2) on top of gang condenser are removed. (C-1) antenna trimmer is completely eliminated. (C-2) oscillator trimmer is renumbered (C-21) and mounted on chassis deck (see Fig. 2).
2. "D" band antenna coil changed from Stock No. RL-088 (Code—Red) to RL-098 (Code—Orange).



NOTE.—Models H-630, -631, -632, -633 use BL42B Ballast. Model H-625 uses BL42D Ballast.

GENERAL INFORMATION

Models H-634, H-638 and H-640 employ three-band AC-DC receivers of the superheterodyne type using six General Electric Pre-tested Tubes. Features of design include the built-in "Beam-a-Scope," the new "Alnico" dynapower speaker, seven "Feathertouch Tuning" keys, a Visualux dial, iron core oscillator trimmer coils for station keys and automatic volume control.

In addition to the above features, the Model H-638 incorporates a phonograph mechanism for reproducing recordings. The phonograph plays 10-inch or 12-inch records and is manually operated. A constant speed, self-starting, silent electric motor and high-quality crystal pick-up insure realistic reproductions.

Coil System

L-1 is the Beam-a-Scope. On "B" band, L-1 operates as a loop antenna. On "C" and "D" bands, the grid end of L-1 is effectively grounded preventing absorption spots due to loop resonance. T-3 is the "C" and "D" antenna transformer while T-4 is the oscillator transformer for all bands. All band switch and coil terminals are numbered in Fig. 3 and Fig. 4 to facilitate in locating common points.

The following table shows the coils in use for various positions of the band and manual-automatic switch:

Band-switch Position	Antenna Primary	Antenna Secondary	Oscillator Grid	Oscillator Cathode	Remarks
Manual Tuning Band "B"		L-1	L-4	Section 3 to 27 of L-4	C-3a and C-3b tuning condenser in circuit
Automatic Tuning Band "B"		L-1	L-4	Section 3 to 28 of L-4	C-2 and L-7 trimmers and coils in circuit
Band "C"	L-2	L-2	L-5	Section 3 to 6 of L-5	L-1 and L-4 effectively grounded through C-14 and C-4 respectively
Band "D"	L-3	L-3	L-6	Section 3 to 7 of L-6	L-1, L-2 secondary grounded through C-14. L-4, L-5 grounded through C-4 and C-5 respectively

Loud-speaker

The voice coil is accurately and permanently centered the factory and should seldom give trouble. In case a voi coil needs recentering, it will be necessary to replace the ent cone and voice coil assembly.

Note—In no case should the magnet be removed from t assembled position without remagnetizing before replacing

Phonograph or Television Audio Connections

These receivers are equipped with a phono-terminal (p jack) to allow the convenient connection of record players television audio channels. General Electric plug, Stock N RP-145, fits the pin jack. The Model H-638 uses the pl connection from phonograph to radio and this plug may readily removed to allow use of other record players, sou equipment or television sound converters.

Note—A suitable load consisting of a 100,000-ohm resist and a .01 mfd. capacitor should be connected across the pic up leads when using a crystal-type unit.

Alignment Procedure

The alignment procedure is given in table form
Use a standard I.R.E. "dummy" antenna, Fig. 7, in maki all R.F. alignments. The relative position of the Beam Scope with respect to the chassis materially affects R. alignment on "B" band; therefore, final R.F. alignment "B" band should be made after the chassis and Beam-a-Sco are mounted in the cabinet.

Special Service Information

The following information will be found very useful servicing receivers if a vacuum-tube voltmeter or similar vo age-measuring instrument is available.

(1) Stage Gains
  (a) Antenna Post to Converter Grid
    Band "B" ..... 3.5 to 4.0
    Band "C" ..... 3.0 to 3.5
    Band "D" ..... 1.3 to 3.0
  (b) Converter Grid to 6SK7 Grid .... 60 at 455 K.C
  (c) 6SK7 Grid to 6SQ7 Det. Plate ... 35 at 455 K.C
(2) A 400-cycle signal of .05 volts across the volume co trol will give ½ watt speaker output.‡ (Volume co trol turned to maximum.)
(3) Average DC voltage developed across oscillator g resistor (R1).
    Band "B" ..... 6 to 8 volts
    Band "C" ..... 5 to 10 volts
    Band "D" ..... 2 to 5 volts

‡ Variations of +10%, −20% permissible.

ALIGNMENT PROCEDURE

I.F. Alignment with Oscilloscope

Band Switch Setting	Input Freq.	Point of Input	Dummy Antenna	Trimmer	Comments
1. Band "B"	455 K.C. Sweep	I.F. Grid and Minus B	.05 mfd. or Larger	2nd I.F. Sec. (C-13b) 2nd I.F. Pri. (C-13a)	Gang condenser plates closed—"manual" key depressed—connect audio input of oscilloscope to minus B and to the junction of R-4 and R-18. Adjust trimmers in order mentioned for a single symmetrical curve of maximum amplitude. The resultant curve is shown in Fig. 1.
2. Band "B"	455 K.C. Sweep	Converter Grid and Minus B	.05 mfd. or Larger	1st I.F. Sec. (C-12b) 1st I.F. Pri. (C-12a)	

I.F. Alignment with Output Meter

1. Band "B"	455 K.C. with Modulation	I.F. Grid and Minus B	.05 mfd. or Larger	2nd I.F. Sec. (C-13b) 2nd I.F. Pri. (C-13a)	Gang condenser plates closed—connect output meter across voice coil—keep input signal low and volume control on as far as possible. Adjust all trimmers for maximum output.
2. Band "B"	455 K.C. with Modulation	Converter Grid and Minus B	.05 mfd. or Larger	1st I.F. Sec. (C-12b) 1st I.F. Pri. (C-12a)	

R. F. Alignment

1. Band "B"					Close gang plates adjust pointer to first line at left end of tuning scale. Connect output meter across voice coil—tone control on "Bass" position
2. Band "B"	580 K.C. with Modulation	Antenna Post	I.R.E.	Osc. Padder (C-4)	Set dial pointer to 580 K.C. and tune in signal with (C-4)
3. Band "B"	1500 K.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-7)	Peak trimmer for maximum output while rocking the gang condenser
4. Band "B"	580 K.C. with Modulation	Antenna Post	I.R.E.	Osc. Padder (C-4)	Retrim for maximum output with a low input signal rocking gang condenser
5. Band "C"	6 M.C. with Modulation	Antenna Post	I.R.E.	Ant. (C-1c)	Peak for maximum output with a low input signal
6. Band "D"	21 M.C. with Modulation	Antenna Post	I.R.E.	Osc. (C-1a) Ant. (C-1b)	The image of any "D" band signal should be heard 910 K.C. below signal input when (C-1a) is on proper peak. Example: 15 M.C. image—14.09 M.C. Peak (C-1b) while rocking the gang condenser

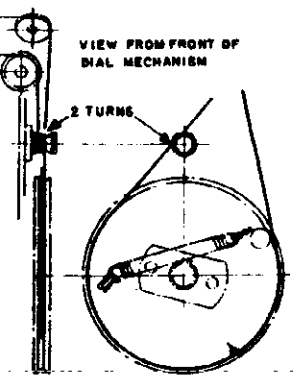

Fig. 6. Dial Drive Stringing Diagram

PHONOGRAPH MECHANISM (H-638)

The phonograph mechanism used in this receiver has been designed to be as simple as possible and give long and trouble-free performance. Under normal operating conditions service difficulties should be negligible. Occasionally, however, certain adjustments may be required.

Trip Mechanism

The trip mechanism is of simple design and consists of a latch bar connected to the motor switch and a trip lever. The latch is held closed by means of a spring between the latch bar and the trip lever. The motor switch is mechanically connected to the latch bar so that when the trip mechanism is released, the motor switch is in the "Off" position. Be sure this latch bar mechanism works freely without binding.

The trip is actuated by an adjustable arm on the trip lever. When the eccentric groove in the record swings the tone arm back and forth, it pushes the latch out of engagement.

Crystal Pick-up

The crystal pick-up employs a crystal element which is coupled to a light needle chuck. The needle movement bends the crystal element thus generating voltage by the piezo-electric effect. The voltage developed is dependent upon the needle movement amplitude and the load resistance.

The crystal cartridge is a factory-sealed unit and no adjustments are provided. The cartridge is held in the tone arm by means of two screws. The pick-up and tone-arm assembly should require very little servicing and if treated with reasonable care should perform its function without attention for long periods of time.

Alignment, Trimmers, Gain
Circuit Data, Notes

GENERAL ELECTRIC CO.

GENERAL INFORMATION

Models H-736 and H-708 employ two-band AC receivers of the superheterodyne type using seven General Electric Pretested Tubes. Features of design include the voltage doubler rectifier circuit, 12-inch Dynapower speaker, built-in Beam-a-Scope, "plug-in" type terminal for connecting a record player or television sound channel, six mechanical type "Feather-touch Tuning" keys and beam power output.

Model H-708 also contains an automatic-record-changing phonograph mechanism. High-quality reproduction is assured with a crysfal pick-up and constant-speed, self-starting, silent electric motor.

Voltage Doubler

The voltage doubler circuit used in Models H-736 and H-708 operates in the following manner; refer to Schematic Diagram Fig. 5. When the B minus side of the power line is positive the right-hand 25Z6GT rectifier will conduct charging up electrolytic capacitor (C-15) to near line voltage. On the reverse cycle when the B minus side of the power line is negative, the line voltage will add to the charge on (C-15) and will charge up electrolytic capacitor (C-22a) through the left-hand 25Z6GT rectifier to nearly twice line voltage. The series resistor (R-20) is inserted as a protective device for both rectifier tubes.

Phonograph or Television Sound Connections

These receivers are equipped with a phono-terminal (pin jack) to allow the convenient connection of a record player or television sound channel. General Electric plug, Stock No. RP-145, fits the pin jack. The Model H-708 uses the plug connection from pick-up to radio and this plug may be readily removed to allow use of another record player or a television sound converter.

NOTE: When using a crystal pick-up other than the one supplied with the Model H-708, a suitable load consisting of a 47,000-ohm resistor in series with a .0072-mfd. capacitor should be connected across the pick-up leads.

ALIGNMENT PROCEDURE

Alignment Frequencies

I.F. ..... 455 KC
"B" Band ..... 1500 and 580 KC
"D" Band ..... 18,000 KC

The location of trimmers for the above models is shown in Fig. 1.

I.F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark on the left-hand end of the broadcast scale. Turn the band switch to "B" band (counterclockwise) and the tone control to "Radio-Bass" (extreme counterclockwise).

Set test oscillator to 455 KC and apply signal to the control grid of the 6SA7GT tube through a .05 mfd. capacitor. Do not remove the 6SA7GT grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers (C-11 and C-12) for maximum meter reading.

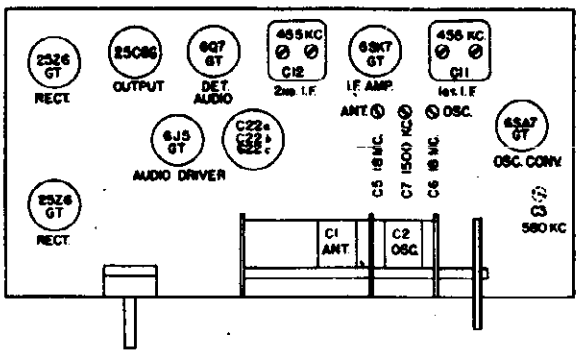

Fig. 1. Trimmer Location

R.F. Alignment

Apply R.F. signals through a standard I.R.E. dummy antenna to the antenna post on the rear apron of the chassis. The Beam-a-Scope must be connected for R.F. alignment and since its relative position with respect to the chassis materially affects the alignment on "B" band, it is advisable to perform the alignment when the chassis and Beam-a-Scope are properly mounted in the cabinet.

Align (C-3) on 580 KC when gang condenser is turned to the 580 KC dial mark. Peak (C-7) on 1500 KC while rocking gang condenser. Repeak (C-3) on 580 KC while rocking gang condenser.

Turn band switch to "D" band and turn gang condenser to 18 MC dial mark. Align (C-6) on 18 MC and peak (C-5) while rocking the gang condenser. The image of any "D" band signal should be heard 910 KC below the input signal when (C-6) is on the proper peak. Example: 18 MC image—17.09 MC.

Special Service Information

The following information will be found very useful in servicing receivers if a vacuum-tube voltmeter or similar voltage-measuring instrument is available:

(1) Stage Gains
  (a) Antenna Post to Converter Grid—10 at 1000 KC‡
  (b) Converter Grid to 6SK7 Grid—30 at 455 KC‡
  (c) 6SK7 Grid to 6Q7 Det. Plate—77 at 455 KC‡

(2) A 400-cycle signal of .06 volts across the volume control will give ½ watt speaker output.‡ (Volume turned to maximum.)

(3) Average DC voltage developed across oscillator grid resistor (R-1)—6 volts.

‡ Variations of +10%, −20% permissible.

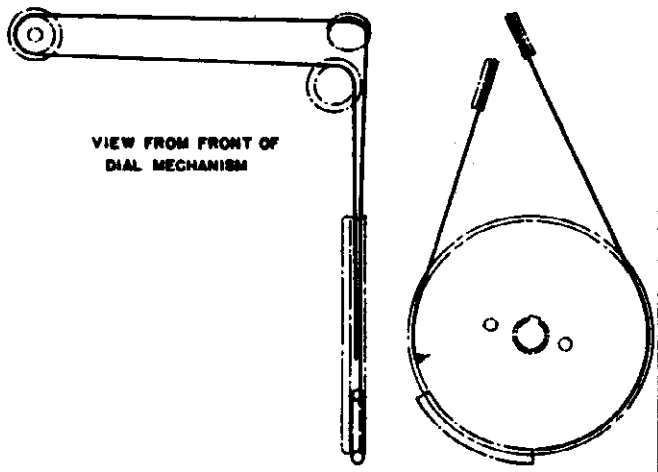

Fig. 3. Drive Cord Arrangement

Loud-speaker—"Alnico" Magnetic Dynamic

Outside Cone Diameter ..... 12 inches
Voice Coil Impedance (400 cycles) ..... 3.5 ohms

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering, it will be necessary to replace the entire cone and voice coil assembly.

NOTE: In no case should the magnet be removed from the assembled position without remagnetizing after replacing it.

ALIGNMENT PROCEDURE

I.F. Alignment

Connect an output meter across the voice coil. Rotate the volume control to maximum. Completely close the gang condenser plates and set the dial pointer to the first dial mark on the left-hand end of the broadcast scale. Turn the band switch to "B" band (counterclockwise) and the tone control to "Normal."

Set test oscillator to 455 KC and apply signal to the control grid of the 12SA7 tube through a .05 mfd. capacitor. Do not remove the 12SA7 grid lead. Keep the test oscillator output as low as a readable meter reading will permit. Adjust all I.F. trimmers (C-12 and C-13) for maximum meter reading.

R.F. Alignment

Apply R.F. signals through a standard I.R.E. dummy antenna to the antenna post on the rear apron of the chassis. The Beam-a-Scope must be connected for R.F. alignment and since its relative position with respect to the chassis materially affects the alignment on "B" band, it is advisable to perform the alignment when the chassis and Beam-a-Scope are properly mounted in the cabinet.

Align (C-4) on 580 KC when gang condenser is turned to the 580 KC dial mark. Peak (C-7) on 1500 KC while rocking gang condenser. Repeak (C-4) on 580 KC while rocking gang condenser.

Turn band switch to "D" band and turn gang condenser to 21 MC dial mark. Align (C-1A) on 21 MC and peak (C-1B) while rocking the gang condenser. The image of any "D" band signal should be heard 910 KC below the input signal when (C-1A) is on the proper peak. Example: 21 MC image —20.09 MC.

Turn band switch to "C" band and set pointer at 6 MC dial mark. Align (C-1C) on 6 MC while rocking the gang condenser.

Electrical Specifications HM-21
Record Player Oscillator

Rating	Power Supply (Volts)	Frequency (Cycles per Second)	Power Consumption (Watts)
A6	115–125	60	30
A5	115–125	50	30

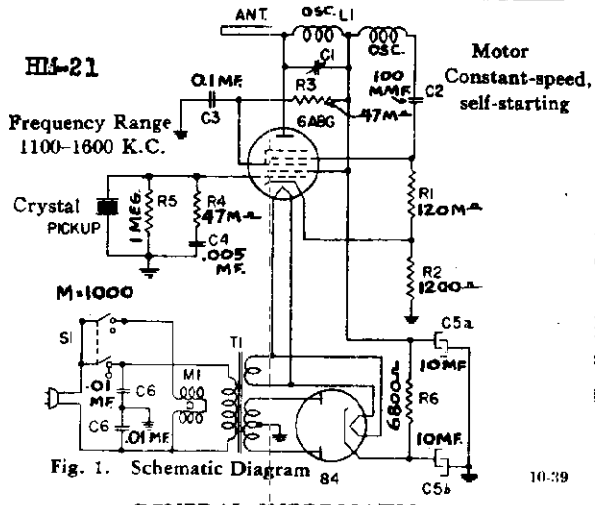

Fig. 1. Schematic Diagram 84 10-39

GENERAL INFORMATION

The Model HM-21 Wireless Record Player is a two-tube transmitter using a type 84 tube as a rectifier and a type 6A8G as an oscillator. Audio modulation is applied to the control grid of the 6A8G from a properly loaded crystal pickup circuit. The oscillator operates over a range of 1100–1600 kilocycles and the frequency is adjusted by the tuning trimmer (C-1). This trimmer is set to operate at approximately 1500 K.C. at the factory.

The turntable is driven at 78 revolutions per minute by a constant-speed, self-starting induction motor. The motor is properly lubricated at the factory for long operation and should not require attention under normal weather conditions.

The power control is a three-position switch. When this control is turned to the extreme counterclockwise position, all power is removed from the record player. When switched to the center position, power is applied to both the motor and the transmitter. When turned to the extreme clockwise position, power is still supplied to the transmitter but is removed from the motor. This last position provides a means of stopping turntable rotation without letting the tubes cool down from operating temperature.

FREQUENCY ADJUSTMENT

To adjust the frequency of the oscillator turn the tuning trimmer which is accessible through a hole in the bottom cover near the power control knob. This is a screwdriver control. Clockwise rotation of the trimmer raises the frequency while counterclockwise rotation lowers the frequency. Since the electrical capacity of the hand may detune the transmitter somewhat if rested on the record player during adjustment, it is best to rest the record player on the edge of a table or bench with the tuning trimmer side of the record player just far enough out from the edge to allow screwdriver adjustment of the tuning trimmer.

MODELS HJ-905, HJ-908, GENERAL INFORMATION

Models HJ-905 and HJ-908 employ three-band AC receivers of the superheterodyne type using nine General Electric Pre-tested Tubes. Features of design include the voltage doubler rectifier circuit, 14-inch Dynapower speaker, built-in *Super* Beam-a-scope, "plug-in" type terminal for connecting a record player or television sound channel, seven "Feathertouch Tuning" keys and beam power output.

Model HJ-908 also contains an automatic-record-changing phonograph mechanism. High-quality reproduction is assured with a crystal pick-up and constant-speed, self-starting, silent electric motor.

Model HJ-908B is the same as Model HJ-908 except in bleached mahogany cabinet.

Voltage Doubler

The voltage doubler circuit used in Models HJ-905 and HJ-908 operates in the following manner: refer to Schematic Diagram Fig. 5. When the B minus side of the power line is positive the right-hand 25Z6GT rectifier will conduct charging up electrolytic capacitor (C-34) to near line voltage. On the reverse cycle when the B minus side of the power line is negative the line voltage will add to the charge on (C-34) and will charge up electrolytic capacitor (C-27A) through the left-hand 25Z6GT rectifier to nearly twice line voltage. The series resistor (R-23) is inserted as a protective device for both rectifier tubes.

Phonograph or Television Sound Connections

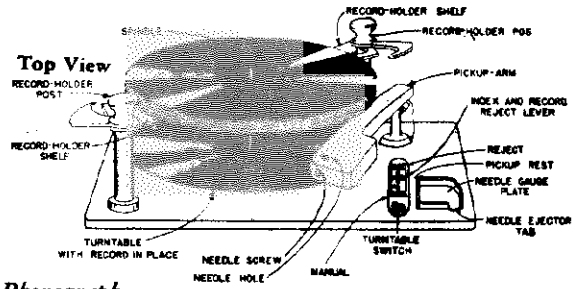
These receivers are equipped with a phono-terminal (pin jack) to allow the convenient connections of a record player or television sound channel. General Electric plug, Stock No. RP-145, fits the pin jack. The Model HJ-908 uses the plug connection from pick-up to radio and this plug may be readily removed to allow use of another record player or a television sound converter.

FEATHERTOUCH TUNING ADJUSTMENTS

When peaking the antenna trimmer of either of the first two left-hand station keys care must be exercised not to open the trimmer so far that tuning to the oscillator frequency results. If this occurs the tuning indicator shadow sector will vanish and a false indication will be given of tuning.

FOR OTHER AUTOMATIC RECORD CHANGER DATA SEE G69 VOL. X PAGE 9.

AUTOMATIC RECORD CHANGER (HJ-908)



Phonograph

Model.....HJ-908
Type.....Automatic Record Changer
Record Capacity
10-inch.....8
12-inch.....7
Type Pick-up.....Crystal
Turntable Speed.....78 R.P.M.

General Information

Model HJ-908 radio-phonograph combination is equipped with an automatic record changer. The turntable is driven through a friction drive wheel mounted on the turntable spindle. It is important that the drive motor spindle and rubber tires on the main driving wheel and idler pulley be kept clean and free from oil, grease, dirt or any foreign matter. Any quick-drying naphtha is satisfactory for cleaning these parts. The drive motor bearing is lubricated from an oil well filled and sealed at the factory. It should not require lubrication in the field. The turntable is not removable from the spindle without removing the tapered pin "24" which fastens the rubber-tired driving wheel to the spindle. Once the pin is removed, the driving wheel can be slipped off the spindle and the turntable and spindle assembly lifted upward from the motor board. Caution should be exercised not to bend the spindle. The spindle bearing should be oiled and the cup and ball thrust bearing oiled and checked for proper position.

PRODUCTION CHANGES

Early production receivers had a .002 mfd. 600 V. paper capacitor in series with the high side of (L1) primary, and the lower side was connected to the chassis.

The 6SA7GT, 6SK7GT, 6Q7GT and 6J5GT can be replaced with metal tubes if the receiver is realigned.

H-639 DC	115 DC		85

Electrical Power Output

Undistorted	2.0 watts
Maximum	2.5 watts

Loudspeaker—"Alnico" Magnetic Dynamic

Outside Cone Diameter	6.5 inches
Voice Coil Impedance (400 cycles)	3.5 ohms

The voice coil is accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice coil assembly.

NOTE—In no case should the magnet be removed from the assembled position without remagnetizing after replacing it.

ALIGNMENT PROCEDURE

I.F. Connect an output meter across the voice coil. Turn the volume control to maximum. Set test oscillator to 455 KC and keep the oscillator output as low as a readable meter reading will permit.

Apply signal to the grid of the 6SK7GT through a .05 mfd. capacitor and align the 2nd I.F. transformer. Repeat the procedure, applying the 455 KC signal to the control grid of the 6SA7GT and aligning the 1st I.F. transformer. Finish by over-all adjustments.

R.F. With gang condenser plates completely closed, set dial pointer to the first mark at the left end of the scale. Apply a 1500 KC signal either through a standard I.R.E. dummy to the antenna terminal or through an additional loop connected to the generator output which can be magnetically coupled to the receiver Beam-a-Scope. Align (C-2) at 1500 KC and peak (C-1) for maximum output. Peak (C-3) on 580 KC while rocking the gang condenser. Retrim at 1500 KC.

GENERAL INFORMATION

The Model HJ-1005 is a three-band a-c operated receiver employing ten General Electric Pre-tested Tubes in a superheterodyne circuit. This receiver is equipped with nine "Feathertouch" Tuning Keys, six of which may be set up for favorite stations. The three remaining keys allow power control manual tuning and phonograph or television audio reception. The new *Super* Beam-a-scope, which is a highly efficient self-contained antenna circuit, is standard equipment on this model. Other features of design include: Dual Dynapower speakers, floodlighted station key finder, visualux dial, iron core I.F. transformers, automatic tone compensation, automatic volume control and push-pull output.

Electrical Specifications

***Loud-speakers*—"Alnico" Magnetic Dynamic**

Outside Cone Diameters.....12 in. and 6½ in.
Voice Coil Impedances.....3.5 ohms

The voice coils are accurately and permanently centered at the factory and should seldom give trouble. In case a voice coil needs recentering it will be necessary to replace the entire cone and voice coil assembly.

Coil System

The "C" and "D" band antenna coils, L-2 and L-3 are wound on a single coil form as shown in Fig. 6. L-4, L-5 and L-6 compose the oscillator transformer for the "B" "C" and "D" bands. All switch points are numbered in Fig. 6 to facilitate in locating these switch points on the pictorial wiring diagram, Fig. 5.

The table opposite gives the coils in use for the various positions of the band switch.

Band-switch Position	Antenna Primary	Antenna Secondary	Oscillator Primary	Oscillator Secondary
Band "B"	Lower portion of L1	Upper portion of L1	Lower portion of L4	Upper portion of L4
Band "C"	L2 Primary (L1 Primary shorted)	L2 Secondary (Grid end of L1 to ground)	Lower portion of L5	Upper portion of L5 (High side of L4 to ground through R15. Mid tap of L4 to ground)
Band "D"	L3 Primary (L1 Primary shorted)	L3 Secondary (Grid end of L1 to ground. L2 secondary to ground)	Lower portion of L6	Upper portion of L6 (High side of L4 and L5 to ground through R15. Mid tap of L4 to ground)

SPECIAL SERVICE INFORMATION

The following information will be found very useful in servicing receivers if a vacuum tube voltmeter or similar voltage measuring instrument is available.

(1) Stage Gains ‡
- (a) Antenna Post to Converter Grid
  - Band "B" (Beam-a-Scope connected)*—3 at 1000 KC
  - Band "C" (Beam-a-Scope disconnected)**—3 at 4 MC
  - Band "D" (Beam-a-Scope disconnected)**—3 at 18 MC
- (b) Converter Grid to 1st 6SK7 Grid . . 30 at 455 KC
- (c) 1st 6SK7 Grid to 2nd 6SK7 Grid . . . 6 at 455 KC
- (d) 2nd 6SK7 Grid to 6H6 Det. Plate . . 70 at 455 KC

(2) A 400-cycle signal of .04 volts across volume control will give ½-watt speaker output.‡ (Volume Control turned to maximum.)

(3) Average DC voltage developed across oscillator grid resistor (R1) with gang closed.
- Band "B" 6.5 volts
- Band "C" 7 volts
- Band "D" 2.8 volts

‡ Variations of +10%, −20% permissible.
* Use I.R.E. dummy antenna.
**Use 70 mmf. capacitor between signal generator and antenna post.

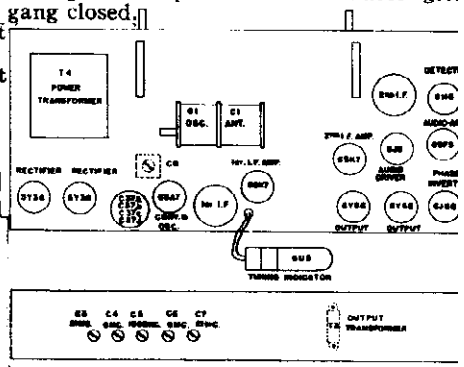

Fig. 1. Trimmer Location

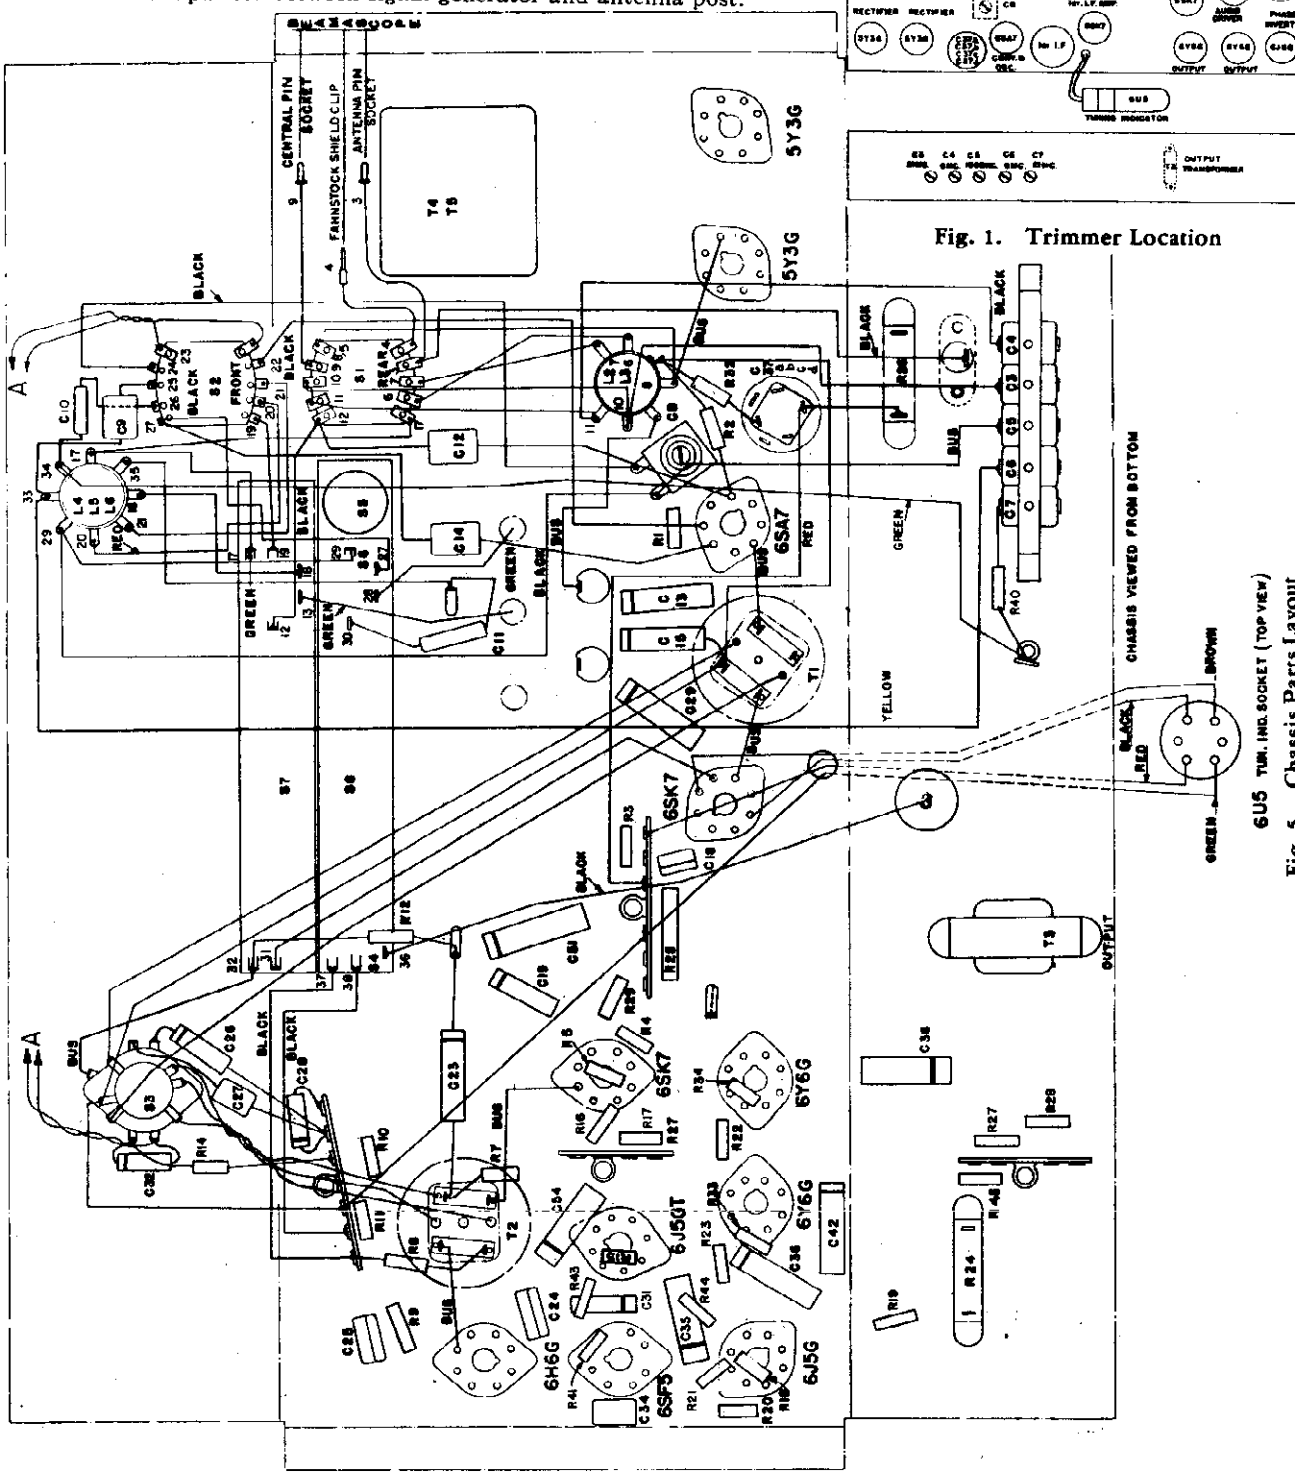

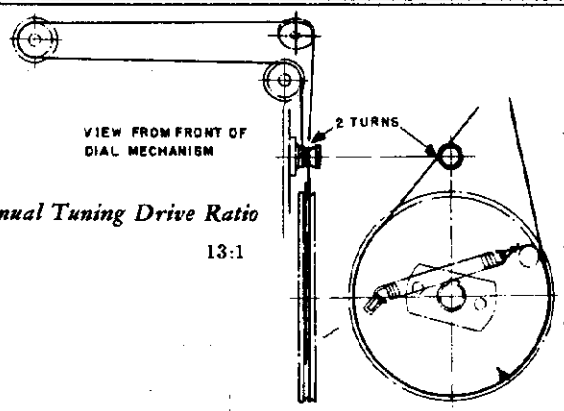

Fig. 3. Dial Drive Stringing Diagram

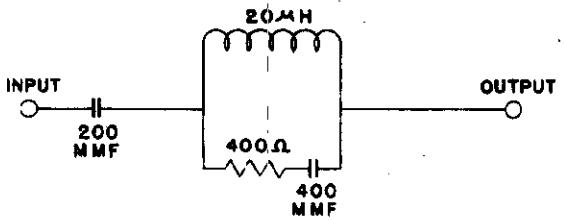

Fig. 4. I.R.E. Dummy Antenna

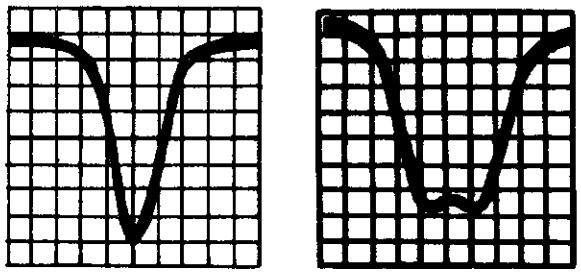
Alignment Procedure

The alignment procedure is given in table form on this and opposite pages. Use the designated "dummy" antenna in making each individual alignment. I.F. alignment may be performed with the chassis removed from the cabinet and the Beam-a-Scope disconnected. R.F. alignment on "C" and "D" bands should be performed with the Beam-a-Scope disconnected and a 70 mmf. mica capacitor between the signal generator and the point of input. R.F. alignment on "B" band should be performed with the chassis and Beam-a-Scope mounted in the cabinet and properly connected.



(a) Sharp Position (b) Expanded Position

Fig. 2. I.F. Curves Taken on G-E Oscilloscope OFM-1

I.F. ALIGNMENT WITH OSCILLOSCOPE*

Band-switch Setting	Input Frequency	Tone Control Position	Point of Input	Trimmer	Comments
1. Band B	455 KC and 30 KC Sweep	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—vertical input to ground and junction at R-8, R-9, and R-10. Adjust trimmers in order mentioned for a single curve of maximum amplitude. The resulting curve on the "Bass" position is shown in Fig. 2a.
2. Band B	455 KC and 30 KC Sweep	Bass	Converter 6SA7 Grid	1st I.F. Sec. 1st I.F. Pri.	
3. Band B	455 KC and 30 KC Sweep	Bass	Converter 6SA7 Grid	All I.F. Trimmers	
4. Band B	455 KC and 30 KC Sweep	Treble I	Converter 6SA7 Grid		The expanded curve taken with tone control at "Treble I" is shown in Fig. 2b. Excess sensitivity over "Bass" tone position indicates regeneration.

I.F. ALIGNMENT WITH OUTPUT METER*

1. Band B	455 KC Modulated	Bass	1st I.F. 6SK7 Grid	2nd I.F. Sec. 2nd I.F. Pri.	Condenser gang at minimum capacity—manual key depressed—output meter connected across voice coil—volume control at maximum—input as low as practical. Adjust all trimmers in order listed for maximum output. NOTE—Do not attempt alignment in the expanded position.
2. Band B	455 KC Modulated	Bass	Converter 6SA7 Grid	1st I.F. Sec. 1st I.F. Pri.	
3. Band B	455 KC Modulated	Bass	Converter 6SA7 Grid	All I.F. Trimmers	

* Use "dummy" antenna consisting of .05-mfd. capacitor between signal generator and point of input.

R.F. ALIGNMENT

1. Band B					Mechanically adjust dial pointer to first line at left-hand end of dial scale with condenser gang fully meshed. Connect output meter across voice coil.
2. Band C	6 MC Modulated	Bass	Antenna Post**	Osc. (C-6) Ant. (C-3)	Set pointer to 6 MC mark and align (C-6). Peak (C-3) for maximum output.
3. Band D	21 MC Modulated	Bass	Antenna Post**	Osc. (C-7) Ant. (C-4)	Set pointer to 21 MC mark and align (C-7). Peak C-4 while rocking gang condenser. The image of any signal on the "D" band should be 910 KC below input signal. Example: 15 MC image 14.09 MC.
4. Band B	580 KC Modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Set dial pointer to 580 MC mark and tune in signal with (C-8).
5. Band B	1500 KC Modulated	Bass	Antenna Post***	Osc. (C-5)	Adjust (C-5) for maximum output in vicinity of 1500 KC while rocking gang condenser.
6. Band B	580 KC Modulated	Bass	Antenna Post***	Osc. Padder (C-8)	Retrim (C-8).
7. Band B	1500 KC Modulated	Bass	Antenna Post***	Osc. (C-5)	Repeak (C-5).

** Use a "dummy" antenna consisting of 70-mmf. capacitor between signal generator and point of input with "Beam-a-Scope" disconnected.

*** Use an I.R.E. "dummy" antenna as shown in Fig. 7 between signal generator and the point of input.

ALIGNING I.F. TRANSFORMERS: (465 K.C.)

1. With volume control full on and with variable condenser at minimum capacity position, plates entirely out of mesh, and wi external oscillator set at 465 K.C. connected in series with a mfd. condenser, to the grid of the 1A6 tube (cap at top of tub adjust I.F. transformers, parts number 108-67 and 108-68, resonance. Both of these transformers have two (2) adjustmer each, they are accessible from the tops of the cans (for locati see top view).

Use as a resonance indicator an output meter connected acr the outside terminals of the speaker or by means of an adapt to the plate and screen of the type 950 output tube. Maximu deflection of the volt meter indicates resonance.

Use only enough signal to get a readily readable output.

A low range output meter or the low scale of a multi-ran meter should be used.

BROADCAST BAND ALIGNMENT:

1. Set external oscillator to 1720 K.C. and connect it in series wi a 200 mmfd. condenser to the antenna and ground posts.
   (a) With variable condenser in its minimum capacity positi plates entirely out of mesh, adjust oscillator trimmer (re section of variable condenser) to resonance.
   (b) Re-set external oscillator to 1400 K.C. Rotate variable co denser, pick up signal and adjust antenna trimmer (fro section of variable condenser) to resonance.
   (c) Re-set external oscillator to 600 K.C., move dial pointer 600 K.C., and adjust series pad, part number 124-14 (see t view), to resonance. While making this adjustment, slow rock variable condenser to and fro until maximum output obtained.
   (d) Check for sensitivity at 1400, 1000, 600 K.C. DO NO BEND PLATES.

Alignment

MODELS 685, 686 Rms 1 and 2.

TUBE COMPLEMENT

consists of the latest "Metal-Glass" tubes which are interchangeable with metal tubes. They are as follows:

1-Type 6L7 Pentagrid Mixer, First Detector.
1-Type 6C5 Oscillator.
1-Type 6K7 Remote Cut-off Pentode, I.F. Amplifier (465 K.C.).
1-Type 6Q7 Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1-Type 6F8 Pentode Output Amplifier.
1-Type 5Y3 or 5W4 High Vacuum Rectifier. (Note: 5Y3 available in "Metal-Glass" only.)
1-Type 6G5 Cathode-Ray Tuning Indicator. (Note: 6G5 available in all glass only)

The tube complement of the model 686 is as follows:

1-Type 6L7 Pentagrid Mixer, First Detector.
1-Type 6C5 Oscillator.
1-Type 6K7G Remote Cut-off Pentode, I.F. Amplifier (465 K.C.).
1-Type 6Q7G Duplex Diode Triode Second Detector, A.V.C. and First Audio.
1-Type 6F6G Pentode Output Amplifier.
1-Type 6Y3 High Vacuum Rectifier.

SERVICE NOTES:

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

All voltages as indicated on diagram are measured with 119 volts on the primary of the power transformer.

Resistances of coil windings are indicated in ohms on the schematic circuit diagram.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser; open by-pass condensers frequently cause oscillation and distorted tone.

ALIGNING INSTRUCTIONS:

CAUTION:—No aligning adjustments should be attempted without first thoroughly checking over all other possible causes of trouble, such as poor installations, open or grounded antenna systems, low line voltages, defective tubes, condensers and resistors. In order to properly align this chassis, an oscillator (generator) is absolutely necessary. No aligning adjustment should be attempted with the chassis in the cabinet. Remove the knobs and the four bolts which are used to fasten the chassis.

All adjustments should be made with a non-metallic screw driver.

DUMMY ANTENNAS:

The following dummy antennas are used in aligning and are referred to in the following alignment instructions as "Dummy 1," "Dummy 2," and "Dummy 3."

Dummy 1: (I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

Dummy 2: (Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

Dummy 3: (Middle and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

ALIGNING I.F. TRANSFORMERS; (465 K.C.):

Part No. 108-73 Output I.F. Transformer.
Part No. 108-74 Input I.F. Transformer.

These I.F. transformers have two adjustments, both of which are accessible from the top of chassis (see top view).

1. With volume control full on (the extreme right of its rotation), the band changing switch in the broadcast position, (extreme left of its rotation), and with the variable condenser set to approximately 1400 kilocycles, make the following adjustments:
   (a) Connect external oscillator set at 465 kilocycles, in series with "Dummy 1," to the control grid cap of the type 6K7 tube, and adjust the output I.F. transformer (No. 108-73) to resonance.
   (b) With "Dummy 1" still connected, move oscillator output clip from grid of 6K7 to grid cap to 6L7 and adjust input I.F. transformer (No. 108-74) to resonance.
   (c) With oscillator still connected to 6L7, readjust output I.F. transformer (108-73) if necessary.

BROADCAST BAND ALIGNMENT:
535 to 1720 Kilocycles

1. With band changing switch in the broadcast position, extreme left of its rotation, and with gang condenser in its minimum capacity position, plates entirely out of mesh, and with external oscillator connected in series with "Dummy 2" to tan antenna lead and black ground lead, make following adjustments:
   (a) Set external oscillator to 1720 K.C. and adjust broadcast antenna trimmer (Adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance (See top view of chassis, Fig. 1, for location of this adjustment.)
   (b) Re-set external oscillator to 1550 K.C., rotate variable gang condenser and pick up signal. Adjust broadcast antenna trimmer (Adjustment number 4) to resonance; also adjust preselector trimmer which is mounted on the top of the rear section of the three gang variable tuning condenser to resonance (See top view of chassis, Fig. 1, for location of this adjustment.)
   (c) Re-set external oscillator to 600 K.C., and adjust broadcast series pad to resonance by rotating condenser to approximately 600 K.C., rocking it slowly to and fro until by adjusting series pad maximum output is attained. This adjustment is located on the bottom of the chassis directly under the variable gang condenser. (See bottom view of chassis, Fig. 3.)
   (d) Repeat adjustments "a" and "b" until sensitivity is at its maximum.
   (e) Check for tracking and sensitivity at 1000 kilocycles. Under no circumstances bend plates of variable condenser sections to correct tracking.

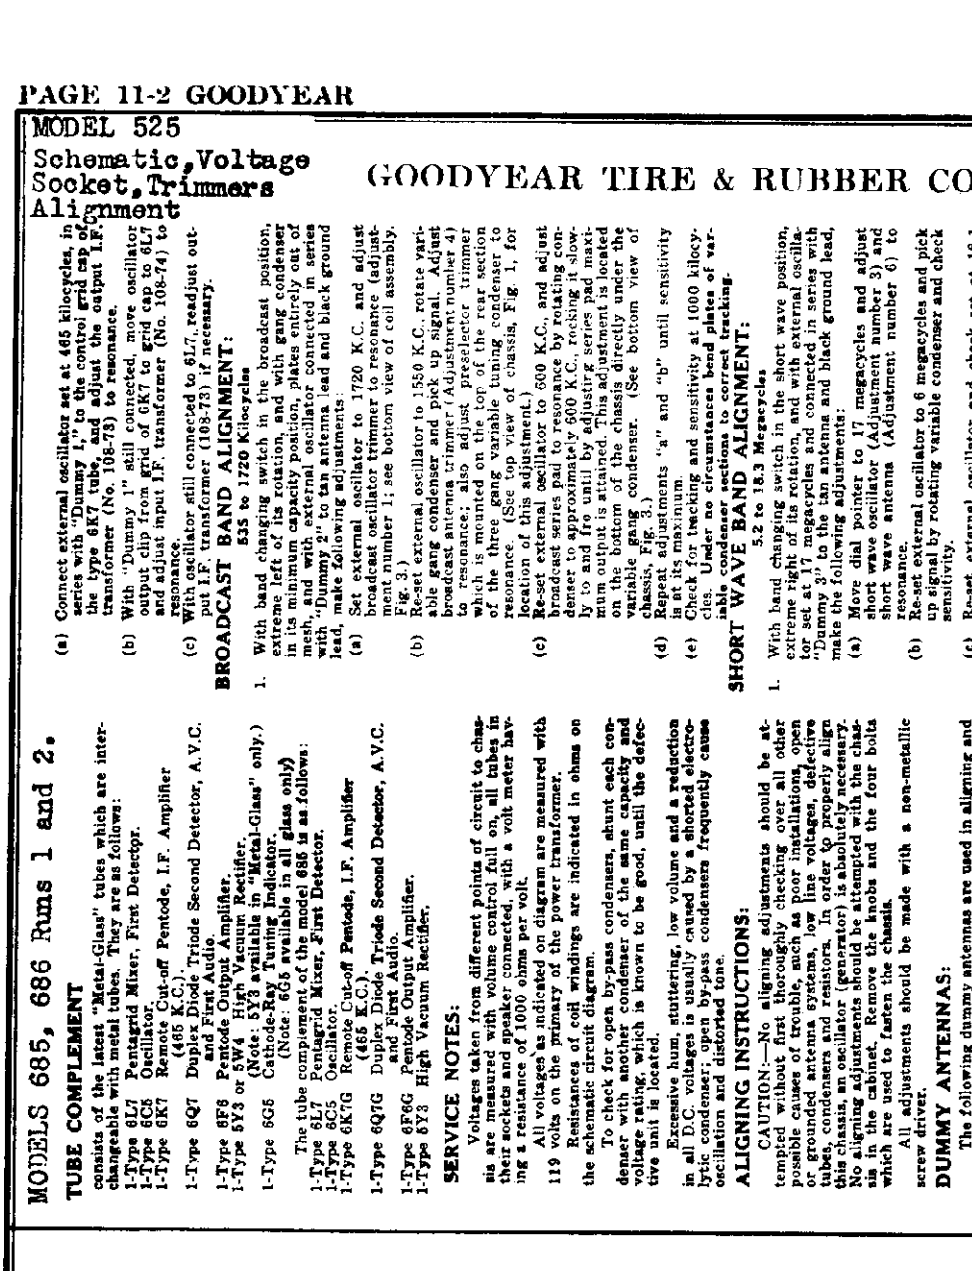
SHORT WAVE BAND ALIGNMENT:
5.2 to 18.3 Megacycles

1. With band changing switch in the short wave position, extreme right of its rotation, and with external oscillator set at 17 megacycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 17 megacycles and adjust short wave oscillator (Adjustment number 3) and short wave antenna (Adjustment number 6) to resonance.
   (b) Re-set external oscillator to 6 megacycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 18.1 megacycles and 5.3 megacycles for band coverage.

NOTE: It is extremely necessary in making all of these adjustments that the fundamental oscillator signal be tuned in and not the image frequency which will fall below the fundamental. An example of this is an image of a fundamental 18.3 megacycle signal appears near 17.4 megacycles.

MIDDLE WAVE BAND ALIGNMENT:
1695 to 5500 Kilocycles

1. With band changing switch in the middle wave position, center of its rotation, and with external oscillator set at 5000 kilocycles and connected in series with "Dummy 3" to the tan antenna and black ground lead, make the following adjustments:
   (a) Move dial pointer to 5000 kilocycles and adjust middle wave oscillator (Adjustment number 2) and middle wave antenna (Adjustment number 5) to resonance.
   (b) Re-set external oscillator to 1800 kilocycles and pick up signal by rotating variable condenser and check sensitivity.
   (c) Re-set external oscillator and check set at 5400 kilocycles and 1700 kilocycles for band coverage.



NOTE—CONNECTING CORD OF SET GETS WARM IN NORMAL OPERATION. DO NOT BECOME ALARMED.

Make sure that all tubes are pushed firmly in their proper sockets and that the clips are securely fastened to the caps on the tops of the tubes.

That the aerial is stretched out and that the connections to an outdoor antenna (if used) are good.

If necessary to change tubes or service chassis, UNDER NO CIRCUMSTANCES REMOVE BACK OR CHASSIS WITHOUT FIRST REMOVING PLUG FROM LIGHT SOCKET.

To remove chassis from cabinet, pull off knobs from front, remove back (held with screws to case). Remove four mounting screws, then chassis can be slipped out of case.

Should it be necessary, at any time, to rebalance this set the procedure is as follows. Attach a 456 kilocycle oscillator to the grid of the 6D6 tube in back of the variable condenser and adjust the trimming condensers of the I. F. transformers to maximum deflection on an output meter connected across the primary of the speaker input transformer. While adjusting these trimmers, the variable condenser should be at the maximum capacity position—at the extreme right of its rotation.

Next disconnect the antenna wire and connect an oscillator in series with a 75 mmf. condenser to the antenna coil. Rotate the condenser plates to the minimum capacity position—extreme left turn, and adjust the trimmer condenser of the rear section of the variable condenser to resonance with an oscillator set at 1725 kilocycles, then adjust the condenser of the front section of the variable condenser to resonance. Align at 1400—1200—1000—800—600—530 kilocycles. Bend slotted plates of variable condenser if necessary.

CONNECTIONS TO BATTERY:

The battery cable, number 152-2, (red wire with fuse receptacle at one end and terminal lug at other end) must be connected to battery terminal of ammeter. At the same time connect ammeter capacitor, number 148-3, to battery terminal of ammeter, other end of condenser to any convenient grounded screw on back of instrument panel. Make certain that insulating sleeve is slipped over fuse when fuse is placed in receptacle, before connecting to short battery cable from receiver.

ANTENNA CONNECTION:

The antenna is connected to the receiver by means of the antenna cable. The antenna wire is the single black wire projecting from the end of the cable. Splice this wire to the roof antenna lead and ground the pig-tail shielding as close to the corner post of the car as possible.

GENERATOR INTERFERENCE:

Remove the generator cutout mounting screw and fasten the condenser (148-1) bracket on the generator cutout mounting lug. Replace the cutout mounting screw and tighten down securely. Connect the condenser lead to the battery terminal of the cutout The generator condenser is absolutely necessary as it is used to eliminate a high pitched whining noise which would otherwise be heard as the motor is accelerated.

IF PEAK 175 KC.

DUMMY ANTENNAS:
The dummy antennas referred to in the following instructions are:
"I.F. Dummy" —A .1 mfd. condenser connected in series with the test oscillator output lead.
"Broadcast Dummy"—A 200 mmfd. condenser connected in series with the output lead of the test oscillator.

I.F. ALIGNMENT:
1. With variable condenser in its minimum capacity position (plates entirely out of mesh) and with volume control full on, connect test oscillator set at 175 K.C., in series with I.F. dummy antenna, to the grid cap of the type 6A7 tube.
2. Adjust trimmer condensers of both input (108-33) and output (108-34) I.F. transformers to resonance with oscillator. See top view for location of these transformers. There are two adjustments on each and they are accessible from the top of the transformer shield and should be adjusted with an insulated screw driver.

BROADCAST ALIGNMENT:
1. With variable condenser in its minimum capacity position, connect test oscillator set at 1550 K.C. and in series with broadcast dummy, to the antenna lead of receiver.
2. Adjust oscillator trimmer of variable condenser to resonance (this adjustment is on the end section of the three gang condenser—see top view).
3. Shift test oscillator to 1400 K.C. and pick up signal by rotating condenser and adjust R.F. (center) and antenna (front) trimmers to resonance, see top view.

(a) Check for sensitivity at 1000, 800 and 600 K.C. by setting test oscillator to these frequencies and picking up the signal by rotating variable condenser. Under no circumstances bend plates of oscillator section, bend R.F. and antenna plates only if absolutely necessary.

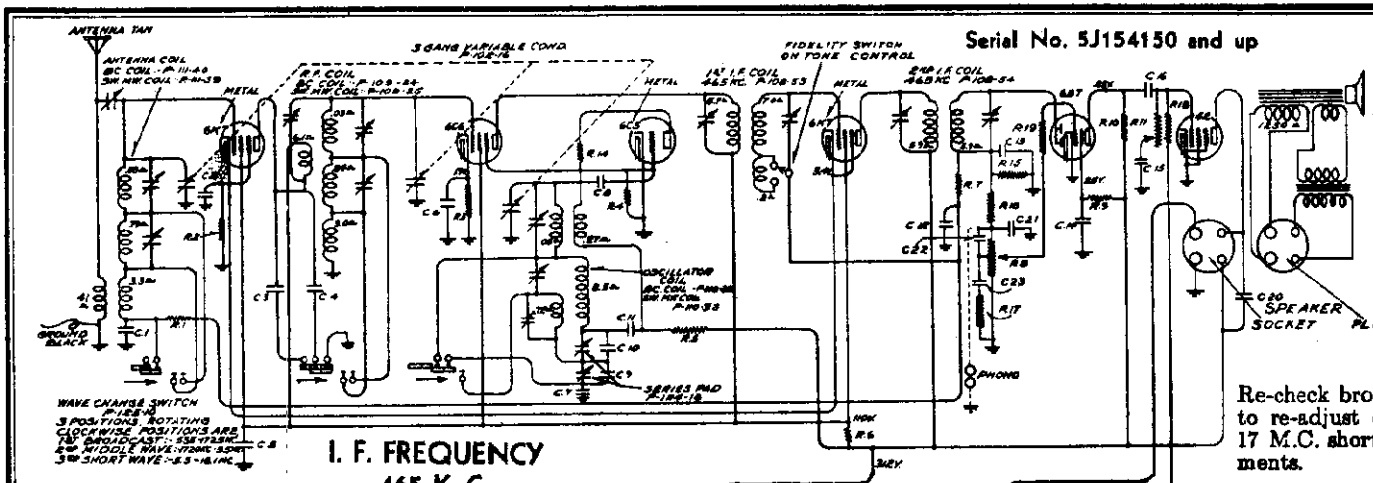
CHASSIS LAYO
MODEL 686 Run 2

NOTE:—
Model 685 does not have tone control or tuning indicator and uses 2 metal and four glass tubes.



ALIGNMENT FREQUENCIES

IF - 465 KC Four trimmers.

BC - BC Series Pad at 600 KC Osc.(3), RF (2), Ant.(1) at 1400 KC

SW - Osc.(8), RF(7), Ant.(6) at 17 MC.

INT.-MW Series Pad at 1800 KC RF(5), Ant.(4), Osc.(9) at 5MC.

Re-check broadcast alignment and if it is found necessary to re-adjust either R.F. or antenna trimmers, repeat the 17 M.C. short wave and 5 M.C. intermediate wave adjustments.

Dummy Antennas

(I.F.)—Consists of a .1 mfd. condenser connected in series with the external oscillator.

(Broadcast)—Consists of a 200 mmfd. condenser and a 20 ohm resistor connected in series with each other and in series with the external oscillator.

(Intermediate and Short Wave)—Consists of a .1 mfd. condenser and a 400 ohm resistor connected in series with each other and in series with the external oscillator.

DESCRIPTION

The tube complement of this chassis is as follows:

1—Type 6K7 Remote cut-off pentode R.F. amplifier
1—Type 6J7—pentode first detector.
1—Type 6C5 Oscillator
1—Type 6K7 Remote cut-off pentode I.F. amplifier (465 K.C.)
1—Type 6Q7 duplex diode pentode second detector, A.V.C. and audio.
1—Type 6F6—pentode output amplifier.
1—Type 5Y3 or 5W4—high vacuum rectifier.

Transformers are available and chassis are sometimes equipped with universal transformers for operation on 40 and 60 cycles and with primary taps for 108, 127, 150, 225 and 260 volts (see instructions) and also sometimes equipped with 25 cycle transformers with 105-115 volt or 220 volt primaries, not universals.

SERVICE NOTES

All voltages are to be measured with 119 volts on the primary of the power transformer.

Resistances of coils and transformer windings are indicated in ohms on schematic circuit diagrams.

To check for open by-pass condensers, shunt each condenser with another condenser of the same capacity and voltage rating, which is known to be good, until the defective unit is located.

Excessive hum, stuttering, low volume and a reduction in all D.C. voltages is usually caused by a shorted electrolytic condenser, open by-pass condensers frequently cause oscillation and distorted tone.

Voltages taken from different points of circuit to chassis are measured with volume control full on, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt. These voltages are clearly indicated on the circuit diagram.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

RUN 1 ONLY

NOTE: Chassis with serial numbers from 6C229300 to 6D242726 were equipped with a fuse in the primary circuit of the power transformer and supplied with a type 5Z4 rectifier tube.

This fuse is made accessible for replacement by removing fuse cover located on back flange of chassis, replace only with a 2 ampere fuse. If replacement fuse blows out, check tubes, (particularly 5Z4 rectifier) circuit, repair or replace defective tubes or parts.

NEVER ATTEMPT TO REPLACE FUSE WITHOUT FIRST DISCONNECTING POWER.

NEVER REPLACE WITH FUSE OTHER THAN 2 AMPERE RATING.

MODEL S20-R
Alignment, Antenna Not
MODEL SX-25
Antenna Notes

ANTENNA

The Sky Champion has an antenna input circuit which will allow the use of either a doublet or Marconi (inverted "L") antenna. The approximate antenna input impedance of the S20R is 400 ohms.

A very serviceable antenna will be the inverted "L", or Marconi type. This antenna should be approximately 75 feet long overall, including the lead-in to the set. Satisfactory operation of the Sky Champion is obtained throughout its tuning range with this type of antenna and because of that fact as well as its ease of construction it is highly recommended.

With the inverted "L" type of antenna A_2 must remain connected to G for best operation. While a ground connection is usually not necessary it might prove to be helpful in reducing noise. A cold water pipe or 6' foot rod driven in moist soil will be a very satisfactory ground when connected to the G terminal on the receiver. Connections to a radiator or gas piping are not recommended.

Should a doublet antenna be used it is suggested that a transmission line of 400 ohms value of impedance be constructed so that a most efficient transfer of energy is obtained. The commercially available all wave doublet antennas are usually provided with a coupling transformer which matches the transmission line to the receiver. This transformer connects to the A_1 and A_2 terminals on the antenna strip. The half-wave length-doublet antenna cut for a particular frequency can be computed by the following formula.

$$\text{Length in feet} = \frac{463}{\text{Frequency in megacycles}}$$

or for example, a half wave 20 meter or 14 megacycle antenna would be

$$\frac{463}{14} \text{ or } 33.7 \text{ feet long overall}$$

This type of antenna is broken in the center with an insulator and has the transmission line connected to each resulting quarter wave section at that point. This antenna is a very good performer, in a direction broadside to its length, only on the relatively narrow group of frequencies for which it was cut. It does not function well on harmonic frequencies.

When using either type of doublet antennas the transmission line should be connected to A_1 and A_2 binding posts. The wire connecting the A_2 to ground or G can be left connected if the performance of the receiver is improved.

ALIGNMENT PROCEDURE

455 KC, Intermediate-Frequency Alignment.
Have the controls set as follows:
AF and RF gain controls for maximum volume.
B.F.O. switch in the "OFF" position.
Set band switch to #2 band.
Set main dial to 2 megacycles, band spread to zero.

Remove 6K8 grid cap and connect the hot side of your 455 KC generator to this tube. Connect the ground terminal of the signal generator to the chassis of the receiver. Now feed a 455 KC signal into the receiver. Adjust all I.F. transformer trimmers on T1, T2, T3, for maximum gain.

R. F. ALIGNMENT

Re-connect the grid cap to the 6K8 tube. Connect the hot side of the generator to the A_1 antenna terminal on the rear of the chassis through a 400 ohm resistor. Be sure a jumper is connected to A_2 and G. Leave signal generator ground connected to the chassis of the receiver.

The location of the following trimmers and padders can be determined by referring to the top and bottom chassis views. All pad adjustments are for the low frequency end of each band while the trimmers are for the high frequency ends.

In order to get at the RF trimmers the guarantee card can be removed by placing a knife under the small snap fasteners holding it in place. So that most satisfactory adjustment of the trimmers and padders can be made, it is advisable to "Rock" the condenser gang across the signal being delivered by the generator until that particular circuit has been accurately peaked at all frequencies except 1400 KC and 4 MC.

Bands	Trim at	Pad at
1	1400 KC Adjust C_A C_B C_C	600 KC Adjust Pad Band 1

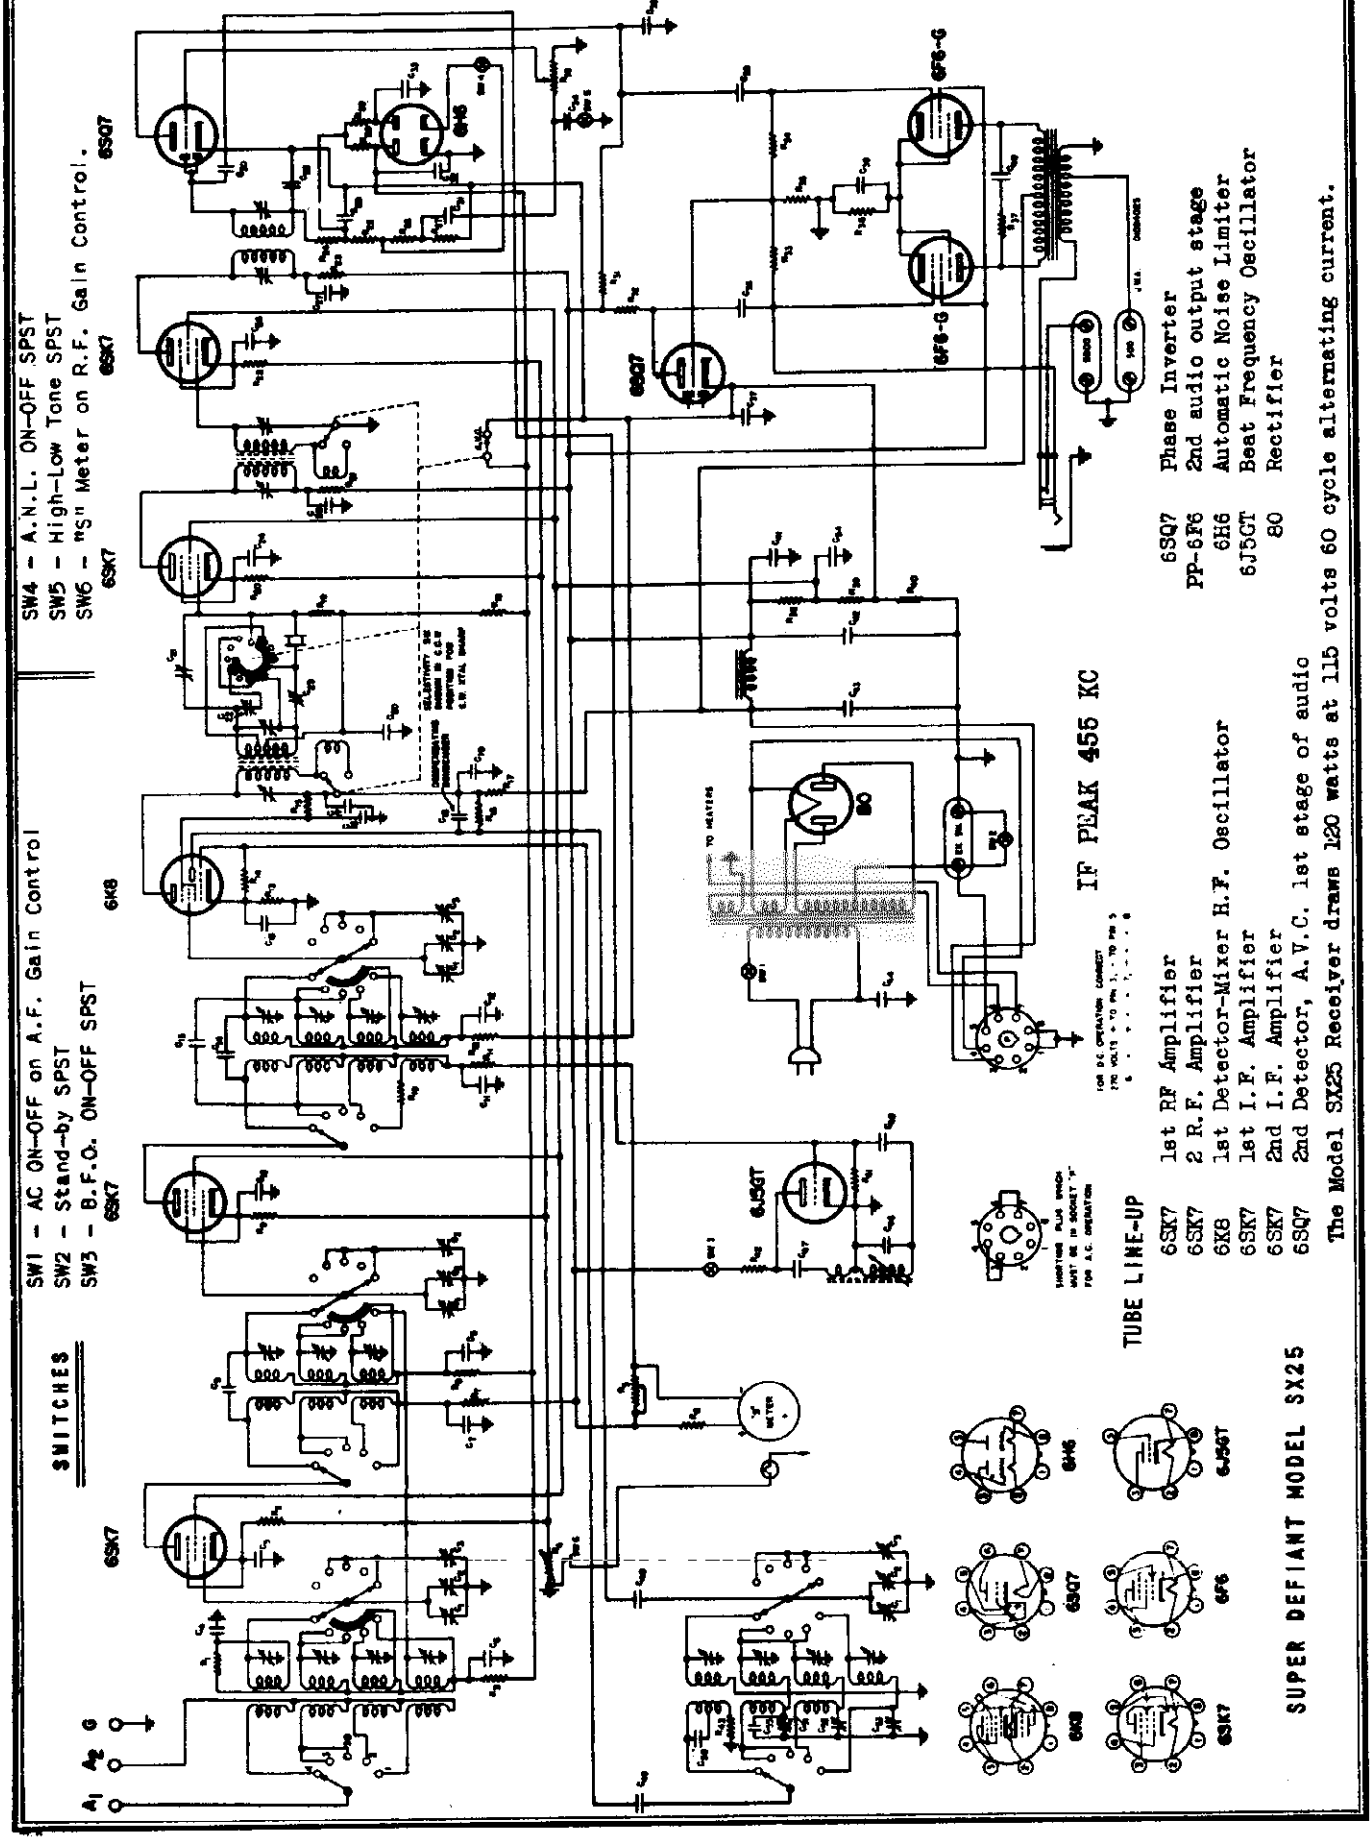
4	34 MC Adjust C_J C_K C_L	17 MC No pad on this Band

MODEL SX-25, Super Defiant
Schematic

THE HALLICRAFTERS INC.



THE HALLICRAFTERS INC.

MODEL SX-25, Super Defiant
Alignment, Trimmers, Parts
Frequency Meter Tuning

FREQUENCY METER TUNING

Around the outer edge of the main tuning dial the amateur bands for which "Frequency Meter Tuning" is available are marked with the red numerals; 10 - 20 - 40 and 80. Set the red line beneath these numerals directly opposite the hair-line on the window and switch to the correct band. The band spread scale will indicate correct frequency within the limits of the accuracy of the setting and calibration.

The band spread dial of the SX25 Model is calibrated so that the operator may determine quite closely the frequency of the signal to which he is listening on the 10 to 80 meter amateur bands inclusive. The outer edge of this dial is marked off in 100 divisions for additional ease in logging and locating stations.

BAND 3B -- Special reference is called to this position of the Band Switch so that no confusion will be experienced. Band 3B is the same as Band 3 and is used in order to have the band spreading of the 40 meter band accomplished through approximately the same number of degrees on the Band Spread Scale as occupied by the other amateur bands for which calibration appears. When the Band Switch is placed in position 3B another section of the band spread condenser is paralleled in the circuit. Band 3 main scale calibration will read somewhat high when the Band Switch is set on 3B.

Note: The accuracy of the main dial calibration will hold only if the BAND SPREAD condenser is set at minimum capacity, or the position indicated by 100 on the Band Spread dial which has been approached by turning the Band Spread Knob in a clockwise direction, or to the right, as far as it will go.

MODEL SX-25 Super Defiant
Alignment Procedure, Notes

THE HALLICRAFTERS INC.

"S" METER

When the R.F. gain control is advanced until a switch is heard to operate, a light will appear behind the translucent scale of the meter itself. Only when this light is on will the meter indicate in "S" units. When so adjusted the meter can be used as a resonance indicator. With the R.F. gain control backed off from maximum the meter is still in the circuit but will not indicate carrier level accurately. On the rear apron of the chassis is the "S" meter adjustment screw. To set the "S" meter, disconnect the antenna and have the R.F. Gain Control on full and the selectivity switch in the "I.F. SHARP A.V.C. ON" position. Now, adjust this knurled knob until the meter reads zero. Reconnecting the antenna and tuning in a station will show its relative carrier intensity.

The 500 and 5000 ohm terminals are for connections to a loud speaker or other load of those impedance values. The matching SX25 speaker should be connected to the 5000 ohm strip. When headphones are plugged into the phone jack the 5000 ohm speaker connection is automatically disconnected.

The "EXT. SWITCH" terminal strip is for external switch provisions should the receiver be controlled by a remote switch or relay. The SEND-REC switch on the panel must be in the Send Position when an external relay is used for stand-by operation.

Unless otherwise specified the SX25 Receiver operates on 100-125 volt 50-60 cycle current. A universal model is available on special order for operation on 110-250 volt, 25-60 cycle current.

ALIGNMENT PROCEDURE

455 KC, Intermediate-Frequency Alignment.
Have the controls set as follows:
AF and RF gain controls for maximum volume.
B.F.O. switch in the "ON" position.
Set band switch to #2 band.
Set main dial to 2 megacycles, band spread to 100.
Selectivity switch in "AVC OFF" xtal phone position.

Remove the 6K8 tube grid cap. Connect a 1 megohm resistor between grid cap and grid of 6K8 tube. Now connect the hot side of the signal generator to the grid of the 6K8 tube through a .1 MFD condenser. Connect the ground terminal of the signal generator to the chassis of the receiver. Remove modulation from generator and feed a 455 KC signal into the receiver and set the pitch control to give a beat note of approximately 1000 cycles. Adjust all I.F. transformer trimmers for maximum gain with the exception of the secondary trimmer on transformer T1. Identified on top chassis view as T1S. In adjusting this trimmer it will be noted that the output reaches a maximum goes through a dip and then back to maximum again. Wobbulate the IF frequency and align to the dip between the two maximum points. A distinct change in the crystal note sounding like an apparent broadening of the crystal action will be noted when the correct adjustment has been reached. At this point in the alignment it is necessary to make an adjustment on the phasing control as follows: Tune the signal generator so that its signal will go through zero beat and then to the other side of zero beat until a signal of approximately 5000 cycles is heard in the speaker or headphones. Now carefully adjust the "PHASING CONTROL" until this signal is reduced in volume to a minimum. Reset the signal generator to its original frequency and recheck the adjustment of T1S. Now repeak carefully the other trimmers on I.F. transformers for maximum gain. Place the selectivity switch in the "CW. XTAL" position leaving all controls on the receiver as previously adjusted. Again wobbulate the frequency of the signal generator carefully through the very narrow range of the crystal peak. Adjust small trimmer through hole in the bottom plate marked "TXS" until the sharp crystal peak reaches maximum output. At this point the crystal is extremely sharp and maximum output is possible. If this setting gives too sharp crystal filter action this "TXS" trimmer can be adjusted counter-clockwise for broader crystal response to suit the operator.

B.F.O. ADJUSTMENT

In the center of the "PITCH CONTROL" shaft, after the knob has been removed, you will find a recessed screw for adjustment of the Beat Frequency Oscillator.

Before rotating this screw with a suitable screw-driver loosen the set screw on this shaft. This set screw can be reached through a hole in the bottom plate directly under the B.F.O. Assembly marked "BFA".

Now tune in a signal on the receiver with the BFO off. Exact resonance can be determined with the controls so adjusted that the "S" meter will indicate. After you have assured yourself that you have the signal properly tuned in place the selectivity switch in anyone of the three "AVC OFF" positions. Turn the BFO switch to the "ON" position. You now can adjust the screw in the center of the pitch control shaft until a beat note is heard. Tighten the set screw through the bottom plate, replace the knob and the BFO adjustment is completed.

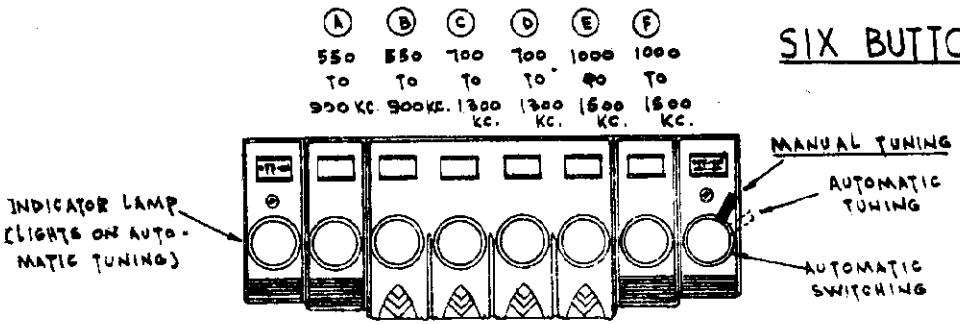
R. F. ALIGNMENT

Re-connect the grid cap to the 6K8 tube. Connect the hot side of the generator to the A_1 antenna terminal on the rear of the chassis. Be sure a jumper is connected to A_2 and G. Leave signal generator ground connected to the chassis of the receiver.

The location of the following trimmers and padders can be determined by referring to the top and bottom chassis views. All pad adjustments are for the low frequency end of each band while the trimmers are for the high frequency ends.

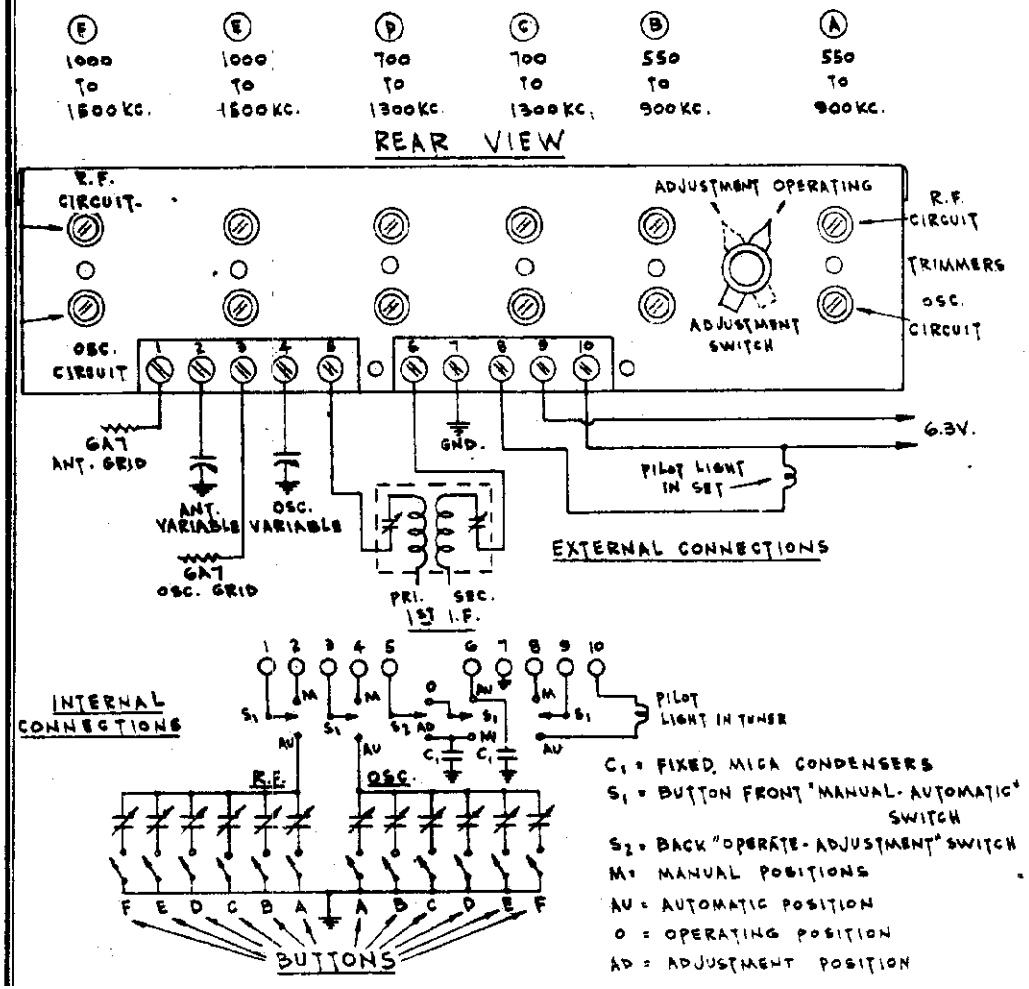
In order to get at the RF trimmers the guarantee card can be removed by placing a knife under the small snap fasteners holding it in place. So that most satisfactory adjustment of the trimmers and padders can be made, it is advisable to "Rock" the condenser gang across the signal being delivered by the generator until that particular circuit has been accurately peaked.

SIX BUTTON AUTOMATIC TUNER



NOTE:-THE ADJUSTMENT SWITCH AND I.F. CONNECTIONS WERE ELIMINATED FROM THIS CIRCUIT, THEREFORE, OMIT ANYTHING PRETAINING TO THEM.

This push button assembly is for convenience and rapidity in the selection of favorite stations. Use preferably on strong local stations of good quality or the major networks. It in no way affects the operation of the normal manual tuning control, located below the dial which is used as heretofore, but is rather an adjunct for convenience.



C_1 = FIXED MICA CONDENSERS
S_1 = BUTTON FRONT "MANUAL-AUTOMATIC" SWITCH
S_2 = BACK "OPERATE-ADJUSTMENT" SWITCH
M = MANUAL POSITIONS
AU = AUTOMATIC POSITION
O = OPERATING POSITION
AD = ADJUSTMENT POSITION

CHOOSING THE STATIONS FOR AUTOMATIC TUNING Before any adjustment, select the six stations desired. Check their frequency and choose them so that two are from the low frequency end of the broadcast band, two are from the middle frequency and two are of the higher frequencies. Note that all trimmers in the back are marked with the range they cover. Be sure that each set of trimmers is used for only a station within its range.

In most cases this should accommodate the six most popular stations. Occasionally three stations might be desired in one frequency group. Since there are only two buttons available, the least important station will have to be tuned in by the manual control. The chosen stations should be lined up on the buttons in the order of their frequency with the lowest frequency on the left hand side, the next higher frequency to the right of it and so on until the highest frequency station is on the furthest right hand button.

Remove the two small wood screws and take off the front escutcheon. Insert in the order chosen and in the correct windows, the station call letters desired behind the little celluloid windows.

ADJUSTMENT FOR A PARTICULAR BUTTON Each button is wired up to a particular trimmer set in the back. The back adjustment is approximately directly behind its button. For example,- the last button nearest one end of the cabinet is adjusted by the last trimmer nearest that same end of the cabinet. Again, the third button from one end of the cabinet is adjusted by the third set of trimmer screws from that same end.

METHOD OF STATION ADJUSTMENT Having picked the station desired, the button for it and the trimmer screws behind the button, the next step is adjustment of the trimmers to actually receive the desired station. Turn back the switch to ADJUSTMENT position. Tune in manually the desired station and leave there. Turn the front automatic button switch to right or automatic position (left button will light up). Turn bottom screw of trimmer (oscillator) until desired station is heard. Switch back and forth between manual and automatic positions for easy identification of the desired station. Turn volume control up.

CAUTION - It is usually necessary at the beginning to arbitrarily screw top or RF trimmer in fairly tight to right. Sometimes a loud " puttering " or oscillation will be heard as lower, oscillator, screw is turned. When this occurs, tighten up (turn right, clockwise) the upper RF trimmer and then continue adjusting the oscillator until desired station is heard. The actual receiving of the station will always first have to be accomplished by the oscillator trimmer.

After the station is heard, tune upper trimmer for maximum response.

Repeat both trimmer adjustments for greater accuracy.

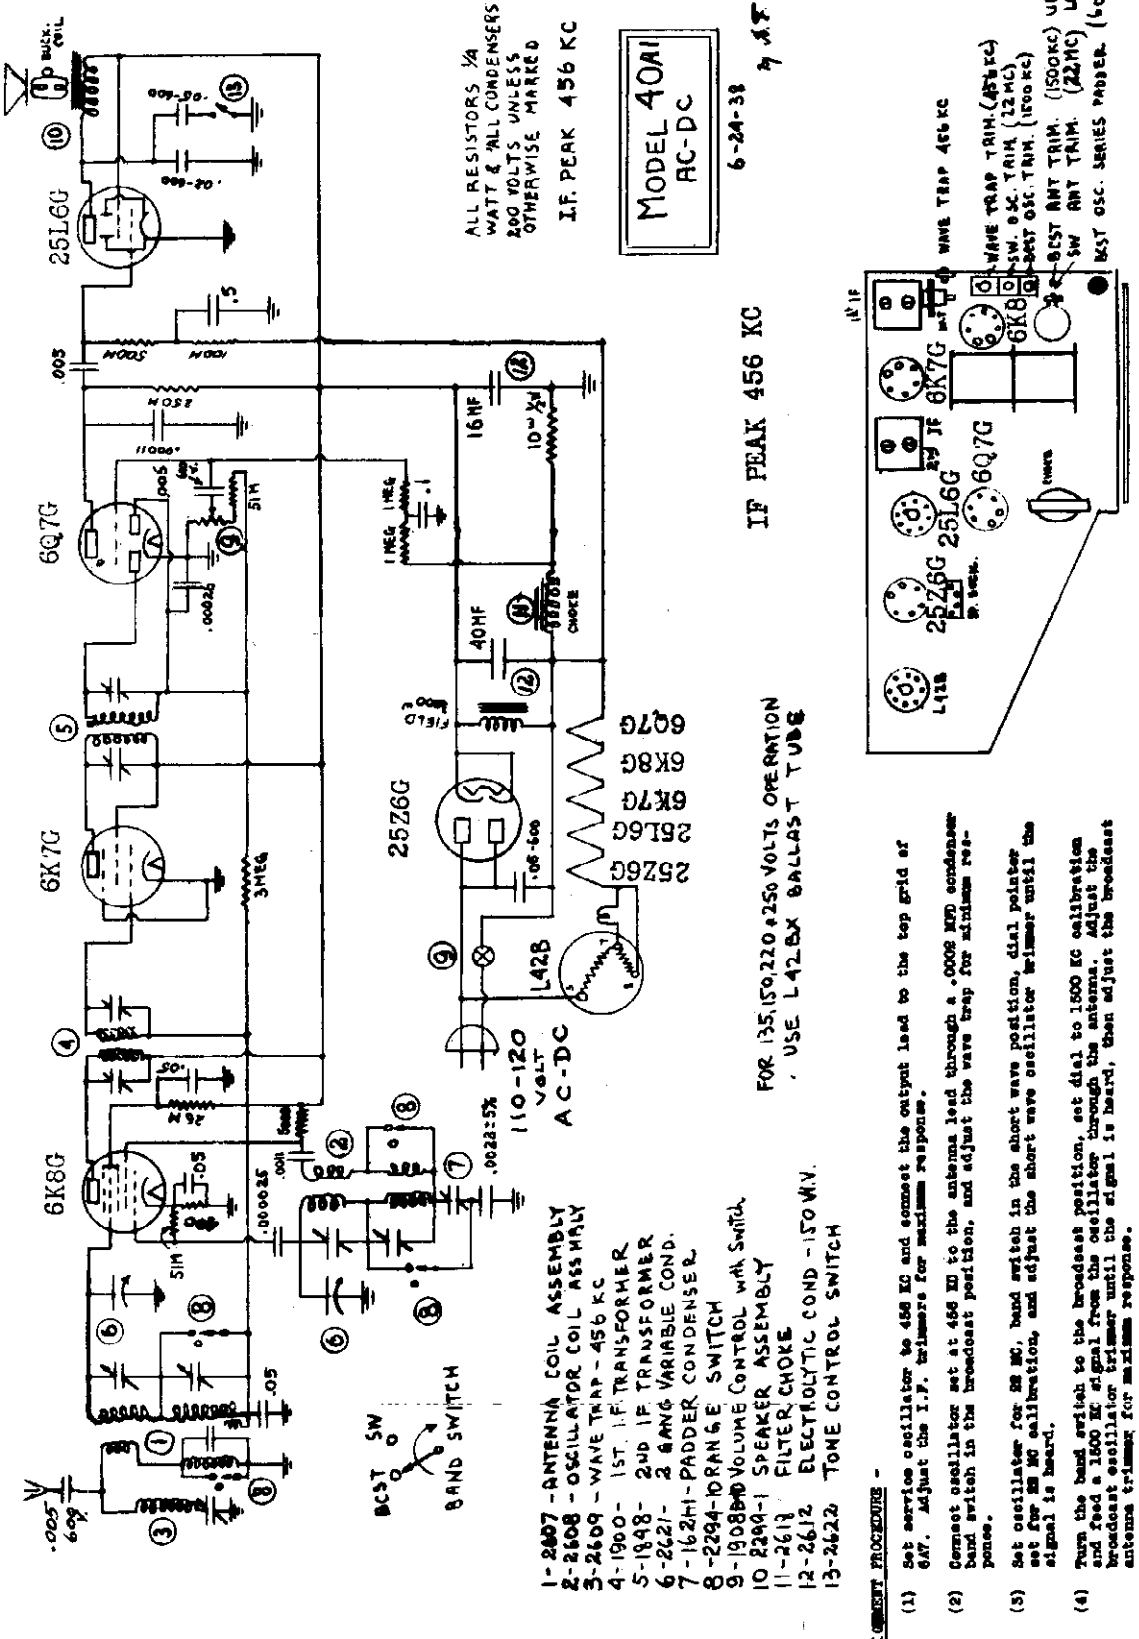
Continue to the next button and adjust its bottom and top trimmers behind it.

After all trimmers have been adjusted, turn back switch to OPERATION position and leave there in that position henceforth.

The receiver is now ready for use. The front button switch will instantly permit use of either automatic or manual tuning without any interaction or dependence of one upon the other

MODEL 40A1
Schematic, Socket
Alignment, Trimmers

HALSON RADIO & TELEVISION INC.



ALIGNMENT PROCEDURE -

(1) Set service oscillator to 456 KC and connect the output lead to the top grid of 6K7. Adjust the I.F. trimmers for maximum response.

(2) Connect oscillator set at 456 KC to the antenna lead through a .0002 MFD condenser Set switch in the broadcast position, and adjust the wave trap for minimum response.

(3) Set oscillator for 22 MC, band switch in the short wave position, dial pointer set for 22 MC calibration, and adjust the short wave oscillator trimmer until the signal is heard.

(4) Turn the band switch to the broadcast position, set dial to 1500 KC calibration and feed a 1500 KC signal from the oscillator through the antenna. Adjust the broadcast oscillator trimmer until the signal is heard, then adjust the broadcast antenna trimmer for maximum response.

(5) Set the test oscillator to 600 KC and adjust the broadcast osc. series padder for maximum response by simultaneously adjusting the padder and rocking the tuning dial.

(6) Repeat procedure numbers 4 and 5 for greater accuracy.

(7) Turn the set to the S.W. Band, set the test oscillator to 22 MC, tune in signal with the set and adjust the S.W. antenna trimmer for maximum response. Use 400 ohm dummy antenna.

MINOR REASONS FOR FAILURE TO FUNCTION - Defective tubes, grid caps off, volume control not fully turned on, line plug reversed on DC, tubes not in their proper sockets, shorted aerial defective plug or wiring loose in socket.

Measurements were made on 115 volt AC line, with line voltage adjustment set at 115 volt tap. Set sensitivity and audio gain controls at minimum. A.V.C. Manual Switch should be in manual position. CW-MOD Switch in C.W. position, Limiter Switch in "On" position, and "Send-Receive" switch in receive position. D.C. readings were obtained with voltmeter having a resistance of 1000 ohms per volt. Use chassis as a common terminal. Voltages within ±10% are satisfactory. The 6.3 volt A.C. filament reading is obtained between chassis and terminal No. 2 on strip. Terminal No. 10 on strip is blank except when used for battery operation.

MODEL 200 Series
Circuit Data

HAMMARLUND MFG. CO., INC.

CIRCUIT ARRANGEMENT

TWO-STAGE T.R.F. AMPLIFIER: For maximum sensitivity, high image ratio, and low noise level, the "SP-200" has two stages of tuned radio frequency amplification ahead of the mixer stage. The antenna input circuit is electrostatically shielded from

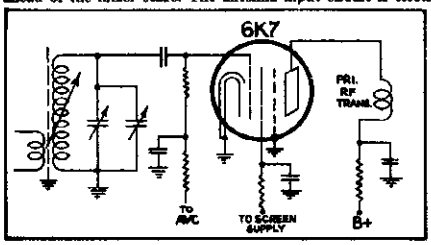

FIG. 2—Circuit diagram of first T.R.F. amplifier showing the electrostatic shield which reduces noise pickup.

the grid circuit of the first tube. This permits the use of low impedance transmission lines between the antenna and the receiver with a minimum of noise pick-up. When lines or lead-ins of the two wire type having an impedance of approximately 100 ohms are employed, no matching transformer is necessary. The input impedance of the receiver is approximately 112 ohms. The two tuned R.F. stages are employed on all bands covered by the receiver. Both inductive and capacitive trimming are employed in all signal frequency circuits.

OSCILLATOR AND MIXER: Two separate tubes are employed in the oscillator and mixer stages to improve stability and prevent pulling. There is a very respectable gain in the mixer stage which tends to minimize any noise that may be generated in the rest of the receiver. In fact, the gain in this stage is so great that the noise contributed by the following stages is negligible.

BAND SPREAD: In order to maintain relatively uniform band spread in the various tuning ranges of the receiver, every gang of the band spread condenser is subdivided into three sections. This allows the use of a proper sized condenser for maximum spread regardless of the position of the wave change switch. There are approximately 85 degrees spread for each of the important amateur bands, and there is also a corresponding spread over the other frequencies outside the amateur band.

CRYSTAL FILTER UNIT: The crystal filter used in the "Super-Pro" is an exclusive HAMMARLUND development and will be found only in HAMMARLUND receivers. This new filter has five ranges of selectivity varying from broad for phone reception, to knife-edge selectivity for single signal code reception. There are three positions for voice reception, and two for C.W. telegraph. The output of the filter is relatively constant over the entire selectivity range and has, therefore, little effect on "S"

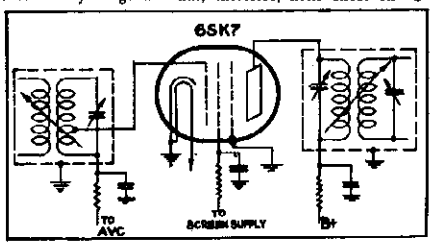

FIG. 3—Typical I.F. amplifier circuit with variable selectivity characteristics. Each circuit has isolating resistor and condenser to assure stability.

meter readings. Selectivity in the crystal filter circuit is not varied by detuning the load circuit. All circuits remain exactly in tune and selectivity is varied by changing the "Q" of the load circuit. This, together with the balanced phasing condenser, eliminates interlocking of controls and changes in filter gain when the selectivity is varied. Every precaution has been taken to effectively shield all circuits so that there is no feed-back or instability to impair the performance on even the highest frequencies. Stability is further insured by employing isolating resistor networks in every circuit that offers the slightest path for feed-back.

I.F. AMPLIFIER: There are three I.F. amplifier stages in the "SP-200." This elaborate amplifier is required in order to obtain a very high degree of selectivity. Special transformers are employed to hold down the gain per stage in order to maintain a high degree of selectivity and maximum stability. The band width of the I.F. amplifier is controlled by a cam arrangement which varies the coupling in two of the I.F. transformers. The I.F. channel is variable from 16 kc. down to 3 kc. with the crystal filter out of the circuit. The crystal filter, when in the circuit, is variable down to better than 100 cycles. Thus, full range selectivity is available. This wide degree of variable selectivity permits the operator to select the band width providing highest quality reproduction with a minimum of interference. In the "SP-200," the band width can be adjusted to suit operating conditions.

AVC SYSTEM: The automatic volume control system in the "SP-200" is extremely efficient. Both R.F. stages and the first two I.F. stages are automatically controlled by the incoming signal in order to compensate for variation in signal strength due to fading. This system is very fast in operation and will hold a rapidly fading signal to a relatively constant output. Special amplifier and rectifier stages are employed in order to obtain maximum efficiency.

BEAT FREQUENCY OSCILLATOR: The beat frequency oscillator circuit is designed to effectively heterodyne signals of various magnitudes. This oscillator is of the electron coupled type and is thoroughly isolated from the rest of the receiver. Careful selection of circuit values has resulted in excellent stability.

SECOND DETECTOR: A 6H6 connected in a half-wave rectifier circuit is employed for the second detector. The proper selection of circuit values in this circuit has resulted in a minimum of distortion. This circuit is more or less conventional and complete technical details are available by referring to the diagram.

NOISE LIMITER: The noise limiter in the "SP-200" is the latest development in audio peak limiting devices. It is designed to work with or without the AVC system and will follow variations in incoming signal strength. It is automatic and needs no adjustment. The limiter is designed to cut off interference of the automobile ignition nature at a point equal to approximately 100% modulation of the carrier of the signal being received. This provides for reception of 100% modulated signals without seriously affecting the quality of the voice or music. It must be remembered that this limiter will only limit interference of very short pulse duration. Such interference, as caused by auto ignition systems and similar disturbances will be reduced to a negligible quantity.

A.F. AMPLIFIER: The audio frequency channel of the series 200 "Super-Pro," is designed for high quality reproduction. The first stage is a 6C5 triode voltage amplifier. The second stage is a single 6F6 triode connected and used as a driver for the output amplifier which is a pair of 6F6's operated in push-pull, class AB. The rated output of this amplifier is approximately 14 watts. The fine quality of the A.F. amplifier in the "Super Pro" is particularly apparent when the band width control is set in the wide position. There is no tone control in this amplifier and none is needed. The A.F. portion of the "Super-Pro" will respond equally well to both low and high frequencies. Attenuation of the higher frequencies is accomplished by narrowing the I.F. band width. In this manner, the band width control serves to control tone.

POWER SUPPLY: The power supply for the "SP-200" is an extra heavy duty unit designed to furnish filament plate and grid bias voltages. The power supply is a separate unit connected to the receiver by a flexible cable. Being a separate unit, the power supply introduces a minimum of hum in the receiver and also reduces the overall temperature rise of the receiver, and thus permits better stability. The high voltage rectifier in the power supply is a 5Z3 connected in a full wave circuit with a two-section filter consisting of 32 mf. capacity and a 15 henry filter choke. The field of the speaker serves as a second filter choke in standard model receivers. In special models, a choke is mounted in the power supply to take the place of the speaker field. Grid bias for the entire receiver is supplied by an 80 rectifier tube operating from a tap on the high

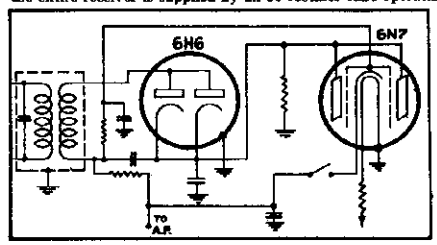

FIG. 4—"Super-Pro" noise limiter designed to reduce automobile ignition interference and other disturbances having similar characteristics.

voltage secondary. The C-Bias supply also has a multi-section filter consisting of three 8 mf. condensers, and three resistors. The primary of the standard power supply has three taps for operation on 105, 115, and 125 volt power lines. A fuse is also provided to guard against damage in cases of overload.

CALIBRATION: The main tuning dial of the "Super-Pro" is calibrated for all frequencies covered by the receiver. In the process of manufacture, every effort is made to maintain accuracy and, as a result, the accuracy of the calibration is guaranteed to be within ½ of 1% of the highest frequency of the band in use. When using the calibrated dial, it should be remembered that the figures are intended as a tuning guide and not for frequency measuring purposes.

"S" METER": The "S" meter in the "Super-Pro" was designed to provide greatest satisfaction to the operator. It is, in no way, limited by fixed, factory-made adjustments. A variable control on the rear of the chassis allows the operator to set the maximum reading of the meter to conform with his particular system of reporting signal strength in "S" numbers. The meter can be adjusted to read "S-9" on any signal from 10 to 10,000 microvolts. It is adjusted at the factory to indicate "S-9" on a 25 microvolt signal, but as pointed out above, this can readily be changed. Another feature is the centrally located scale. This is much more convenient than a scale that starts at the extreme left of the meter dial, and brings the indicating pointer well out in the clear. Special meter design has also eliminated the possibility of damage due to an extremely strong signal.

SELECTIVITY

The selectivity curves shown are representative curves made on a sample receiver and will hold reasonably true for all models. These curves were taken with the signal generator operating at the intermediate frequency and these curves will maintain throughout the entire range of the receiver, except at the very low frequency end of the broadcast band where the R.F. selectivity has a very slight narrowing effect. The selectivity of the "Super-Pro" is divided into two distinct ranges. In Fig. 5, appear the wide band curves. These curves were made at 4 different positions of the band width control. However, the actual selectivity obtainable is continuously variable between curves 3 and 16. Particular attention should be paid to the steepness of the sides of these curves. They are relatively straight and do not have the usual flare at the outer limits. This means that there will be less background interference from stations operating either higher or lower in frequency than the station being received. The advantage of having continuously variable selectivity over relatively wide limits in a receiver is readily apparent when one considers that the operator has absolute control and can adjust the receiver to compensate for almost any degree of interference that may be present. For example, when interference is not serious, the band width control can be set to the widest position and permit high quality reproduction of either voice or music. In other cases where interference is present, the band width control can be adjusted to the point where selectivity is just sufficient to eliminate interference. This adjustment provides maximum fidelity with a minimum of interference. It also permits the operator to utilize the extreme sensitivity of the "Super-Pro." Even in crowded bands, the selectivity can be adjusted to a point where interference is not bothersome and the sensitivity can be turned up to provide reception of extremely weak signals with marked clarity.

In Fig. 6, the variable selectivity crystal filter curves are illustrated. It will be noticed that the crystal filter fills in the gap very nicely between position "3" of the band width control and what would normally be maximum crystal selectivity for code reception. This variable selectivity crystal filter is an exclusive HAMMARLUND development and will be found only in a HAMMARLUND receiver. The crystal filter has five ranges of selectivity. The first three are intended for phone reception. The widest position of these, however, will permit good quality music under conditions where interference would, in most cases, make reception impossible. Positions four and five are for CW code reception and provide the usual single signal response.

SENSITIVITY

The sensitivity of the "Super-Pro" is exceptional and, in the majority of cases, limited only by noise picked up by the antenna system. Internal receiver noise has been held down to an extremely low value so that the limiting factors in the receiver itself are the noises originating in the first tube and its associated tuned circuit. The gain in the R.F. amplifier is adjusted so as to reduce the effective noise originating in the following tubes and tuned circuits. The result of this proper circuit design is a very

MODEL 200 Series
Circuit Data, Operation
Alignment, Trimmers

HAMMARLUND MFG. CO., INC.

favorable signal-to-noise ratio on even very weak signals. Since sensitivity depends, to a great extent, upon overall noise level, the variable selectivity characteristics of the "Super-Pro" becomes doubly important, for, by narrowing the band width, noise can be reduced and thus better sensitivity is available.

PERFORMANCE

The "Super-Pro" is available to cover several frequency ranges. Such information as is given in this book will pertain to all models. The two standard models have the following tuning ranges:

SP-200	SP-200-S
540 – 1160 kc.	1250 – 2500 kc.
1160 – 2500 kc.	2.5 – 5 mc.
2.5 – 5 mc.	5 – 10 mc.
5 – 10 mc.	10 – 20 mc.
10 – 20 mc.	20 – 40 mc.

Other models are available to cover low frequencies in the neighborhood of 150 to 400 kc. as well as certain higher frequencies. In the two standard models, there is a convenient overlap of bands. The main tuning dial is calibrated in megacycles for the three high frequency bands, and in kilocycles for the two low frequency bands. Every effort is made to maintain a high degree of accuracy in calibrating the receiver and it is guaranteed to be at least ½ of 1% of the highest frequency of the band in use.

The sensitivity of the new "Super-Pro" is truly remarkable. By careful circuit design, the overall set noise has been held down to a minimum, thus making it possible to receive extremely weak signals with favorable signal-to-noise ratio. The variable selectivity feature of the "Super-Pro" permits the operator to make full use of the extreme sensitivity even under most severe conditions of interference. Selectivity can be adjusted to cut down interference within very close limits. The advantages of variable selectivity are tremendous when one considers that conditions of interference are not always the same. Under certain conditions, it may be possible to use quite a wide band width and thus enjoy improved tone, as well as easier tuning. Under other conditions, where interference is quite bad, the band width can be narrowed just enough to eliminate interference and in that case, the best possible fidelity that can be obtained without too much interference, is available. In a case where there is practically no interference from other stations, the band width can be adjusted to its widest point and high fidelity reception can be enjoyed.

AVC action in the "Super-Pro" is very efficient. Actual measurements on a sample receiver prove that a very great change in input is required to produce a 2 to 1 change in output. This means that rapidly fading signals can be held to a relatively constant output.

Images (two-spot tuning) on the "Super-Pro" have been eliminated, except in extremely rare cases. The average image ratio will be found to be in the neighborhood of 175,000 to 1 at 1 mc.; 65,000 to 1 at 2 mc.; 34,000 to 1 at 3.5 mc.; 10,000 to 1 at 7 mc.; 1,000 to 1 at 14 mc.; and 150 to 1 at 28 mc.

The audio frequency amplifier in the "Super-Pro" has a rated output of approximately 14 watts. It is capable of excellent quality reproduction. It will be found that the available output power is greatly in excess of that required when the receiver is used for communication purposes. Greatest intelligibility will be obtained on weak signals when the audio gain is kept down, not because of any amplifier limitation, but because the overall noise level will be too great a shock to the ear and make it difficult to follow the desired signal.

OPERATION

Although the "Super-Pro" is a highly technical piece of apparatus, with quite a large number of controls, it is relatively easy to operate. There are 15 controls on the panel. However, they are not all used at the same time. The number of controls necessary for operation will depend on the type of service for which the receiver is being used. The major controls are the band switch, main tuning, band spread, and audio gain. The remaining controls are brought into play as conditions demand their use. Assuming that the speaker, power supply and antenna have been connected according to instructions, the various controls should be set in the following positions: crystal selectivity, off; "phasing" on zero; "band width" on 6; "limiter," off; switch under the limiter control in "AVC" position; "sensitivity," maximum (10); band spread dial on 100; "signal" switch, on "modulation"; the toggle switch just beneath, should be set on "Speaker"; "audio gain" on 6; send-receive switch on "Rec."; beat oscillator on zero. Then, turn the main switch in the center of the panel marked "On-and-Off" to the on position. This puts the entire receiver in operation. The band switch should be adjusted to either the broadcast band or the next highest frequency band. This should permit reception of local stations and allow the operator to familiarize himself with various adjustments. The band width control should be adjusted to provide the most pleasing tone when there is no serious interference. Otherwise, it should be adjusted to the point providing best tone quality with a minimum of interference. The beat oscillator is turned on when the "signal" switch is in the "CW" position. The beat oscillator control varies the pitch of the heterodyne. This feature is used for code reception and for locating weak signals. The "limiter" control turns the noise limiter on and off. The noise limiter is most valuable on the shorter waves where automobile ignition interference is more serious. So far, we have considered the receiver adjustments necessary for phone reception. For code reception, the "AVC-Man." control should be set in the "Man." position and the sensitivity control turned down to provide proper sensitivity. On strong signals, this control should not be turned all the way on because there will be a tendency to overload the receiver. Volume is controlled with the "audio gain" control and not with the "sensitivity" control. The crystal filter is very effective and easy to operate because of its excellent stability. The first three positions are generally used for phone reception and will serve for code reception where interference is not severe. The last two positions are for code reception exclusively. When the crystal selectivity control is adjusted for optimum selectivity, the phasing control should be used to reject heterodyne interference or "whistle." The receiver can be temporarily silenced by turning the "Send-Receive" switch in the "Send" position. This allows the receiver to be ready for instant service and is more commonly called the "stand by switch" when the receiver is used for communication purposes. All tuning can be done with the main tuning control. In this case, the band spread dial is left at 100. The band spread dial operates so as to spread out a narrow band of frequencies in the neighborhood of the frequency at which the main dial is set. The band spread dial works continuously throughout the entire range of the receiver except on the lowest frequency bands. In this manner, many short wave broadcast or amateur bands can be spread out over the band spread dial for easy tuning. The wave ranges of the receiver are so arranged that when the band spread and main dial are set for 80 meter amateur band reception the 40-meter band as well as the other amateur bands will appear on the band spread dial merely by turning the wave change switch. This is a great convenience and eliminates the necessity for searching each time for the amateur band which is to be covered by the band spread dial. For ear-phone operation, ear-phones are plugged into the terminal strip so marked on the rear of the chassis, and a switch on the front panel changes the receiver from ear-phone to loud speaker operation

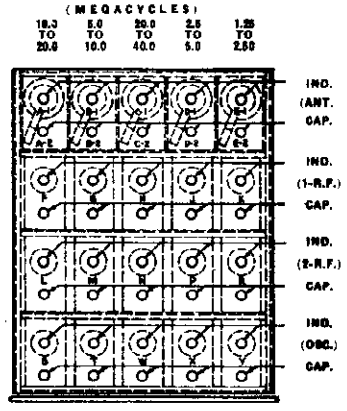
The next feature for consideration is the "S" Meter. This is used to judge relative signal levels and also as a tuning indicator. Maximum reading of the meter always indicates that the receiver is in exact tune with the station. The meter is calibrated in "S" units from 1 to 9, and the relative reading on any particular signal can be changed by re-setting the meter control adjustment which is located toward the rear of the chassis. The chassis drawing shows the position of this adjustment. A suggested method of adjusting the meter would be to tune in a signal of moderate strength. If you are accustomed to calling this signal, "S-8" or "S-9," then adjust the meter control so that it indicates that value. This adjustable meter arrangement allows the operator to provide reports consistent with his usual system of reporting. No amount of explaining will teach the operator exactly how to control a receiver. Experience is absolutely necessary in order to obtain best results.

H.F. OSCILLATOR AND R.F. ALIGNMENT

Connect the output of the test oscillator to the "A.A." terminal strip. Connect the output meter to the speaker voice coil terminals. The controls on the front panel should be set as follows:

(1) Band Change Switch on 540–1160 K.C. (2) Main Tuning Dial on 1100 K.C. (3) Band Spread Dial on 100. (4) Sensitivity Control "To Produce appropriate output meter reading." (5) Audio Gain Control "Full On." (6) C.W.-MOD switch on "MOD." (7) A.V.C.-MANUAL Switch on "MANUAL." (8) SEND-RECEIVE Switch on "RECEIVE." (9) "Phones-Speaker" Switch on "PHONES."

Turn the receiver over, bottom side up, placing a small block of wood under the rear of the switch section to protect the shield cans and tubes. The main tuning unit bottom plate should remain in place while H.F. oscillator and R.F. adjustments are being made. In order to facilitate the alignment of these stages, we have indicated in dotted lines, the coil positions beneath the bottom cover plate, together with all capacity and inductance adjusters. Capacity adjusting condensers are located on the coil bases and inductance adjusters extend through the top of each coil. The coil markings correspond to the designations on the schematic wiring diagram. Set the test oscillator to produce a 2.5 MC. signal. Adjust the trimmer capacitor "Y" until a peak reading is obtained in the output meter. Now set the main tuning condenser dial to 1.26 MC. and adjust the test oscillator for a 1.26 MC. signal. Turn the inductance adjustment on coil "Y" for a peak reading on the output meter. As these two adjustments react on each other it will be necessary to repeat them until no further change in either capacity or inductance is necessary. This realignment should only be done after making sure that the calibration of main dial is incorrect.



Turn the main tuning dial to 2.5 MC. and set the test oscillator for 2.5 MC. signal. Adjust each capacitor on coil "R"-"K"-"E2" in the order named, for peak reading on the output meter. The Sensitivity control should be adjusted so that no overloading occurs and an appropriate reading on the output meter is maintained. Now set the main tuning dial at 1.26 MC. and the test oscillator on the same frequency and turn the "inductance adjustments" on coil "R"-"K"-"E1" for peak reading on the output meter. These adjustments are also interlocking and should be repeated until no further improvement can be noticed. This completes the H.F. Oscillator and R.F. coil alignment for the frequency range of 1.25 to 2.50 MC.

The alignment procedure of the H.F. Oscillator and R.F. coils in the remaining frequency ranges is exactly the same as outlined for the 1.25–2.50 MC. band. Test oscillator frequencies and main tuning dial settings vary as follows:

Range	*Capacity Frequency*	*Condensers*	*Inductance Frequency*	*Coils*
1.25 to 2.50 MC.	2.5 MC.	Y-R-K-E2	1.26 MC.	Y-R-K-E1
2.5 to 5.0 MC	5.0 MC.	X-P-J-D2	2.5 MC.	X-P-J-D1
20.0 to 40.0 MC.	40 MC.	W-N-H-C2	20 MC.	W-N-H-C1
5.0 to 10.0 MC.	10.0 M.C.	T-M-G-B2	5.0 M.C.	T-M-G-B1
10.0 to 20.0 MC.	20.0 M.C.	S-L-F-A2	10.0 M.C.	S-L-F-A1

I. F. ALIGNMENT

The following adjustments should only be attempted after making certain that the I.F. channel of the receiver is out of alignment.

The alignment of the I.F. amplifier may be checked as follows: Connect a low reading (1 volt) output meter across the voice coil terminals. Connect a test oscillator (modulated at 400 cycles or less) to the antenna terminals of the receiver. Set the crystal selectivity switch on Number 1, the phasing control on the arrow, and the band-width control at 3. With the AVC-MANUAL switch on "manual" and the A.F. gain at 10, adjust the sensitivity control for an output meter reading of approximately 1 volt, with the test signal tuned accurately. Now, check the settings of the I.F. tuning condenser on T-2, T-3, and T-4 (*DO NOT DISTURB* the screw tuning adjustments of the Crystal Filter T-1). Then reduce the A.F. gain to protect the output meter and throw the AVC-MANUAL to "AVC" and turn the sensitivity control to 10. Then adjust T-6 for maximum "S" meter reading. This can be done most satisfactorily by adjusting the input from the test oscillator to produce an "S" reading of approximately 8.

To check the alignment of the Crystal Filter T-1, an oscillograph and sweep frequency oscillator are required. First adjust the sweep frequency oscillator to exact agreement with the crystal resonant frequency with the Crystal Selectivity switch on Number 5, and the phasing control on the arrow. Then, set the switch on Number 1 and adjust the lower screw on T-1 for maximum height, and the upper screw for symmetry of oscillograph image.

HAMMARLUND MFG. CO., INC.

MODEL 200 Series
Assembly, Selectivity Curve

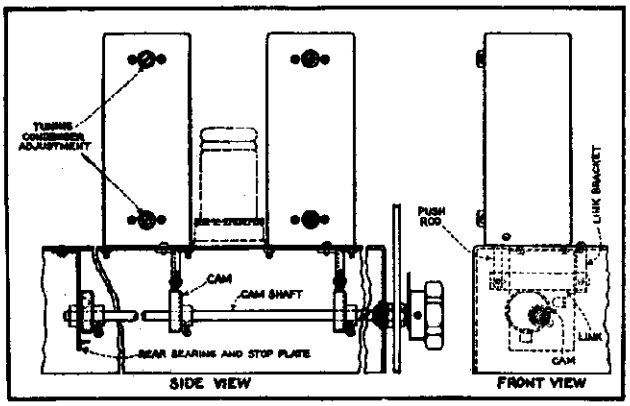


FIG. 1—Band width control which varies selectivity and permits the operator to adjust the receiver for best quality obtainable with minimum interference.

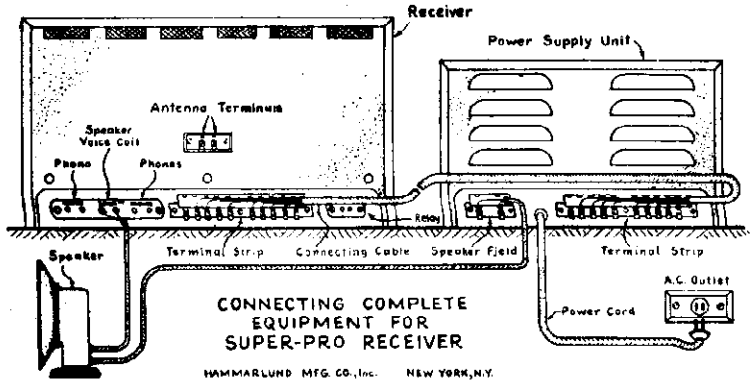

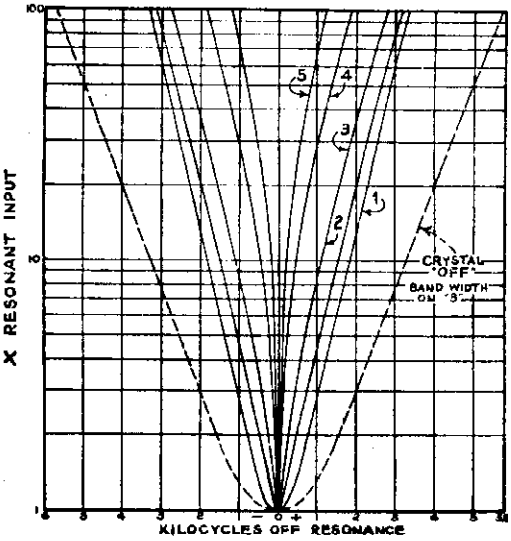

FIG. 6—Variable crystal filter selectivity curves showing five positions of the control switch. Positions 1, 2 and 3 are intended for voice reception. Position 1 is broad enough to permit reception of music. Positions 4 and 5 are for single signal code reception.

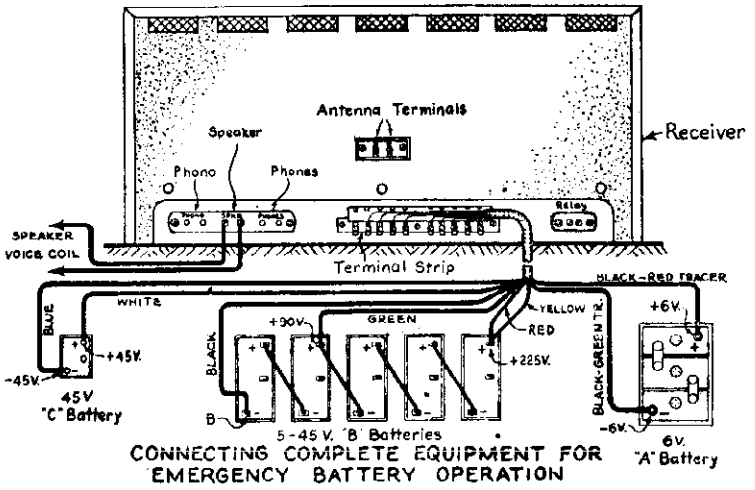
The two drawings on this page show the proper method of connecting the receiver, power supply, and speaker together. The drawing above shows a standard installation, while the diagram below indicates receiver connections when batteries furnish the power. Protective covers are furnished for all important terminal strips and they should always be in place.



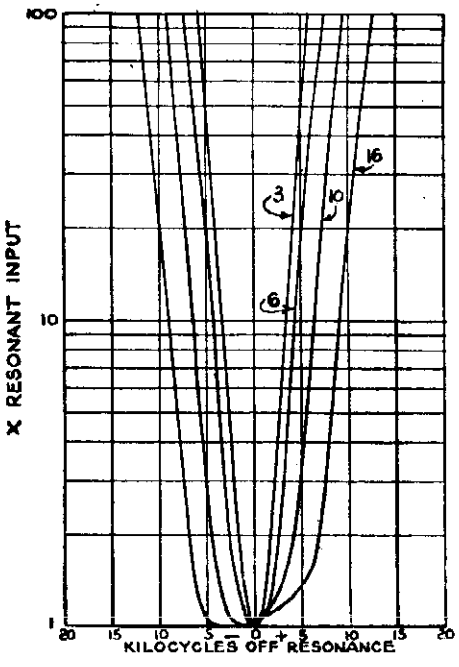


FIG. 5—I.F. curves taken at four positions of the band width control. The actual selectivity of the I.F. amplifier is continuously variable between curves 3 and 16. Particular attention should be paid to the sharp cut-off which greatly reduces back-ground interference.

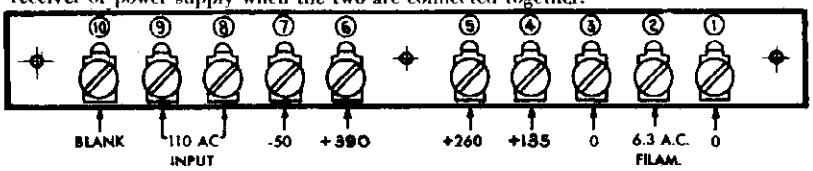
Drawing below provides voltage readings at the various terminals on either the receiver or power supply when the two are connected together.



MODEL 200 Series
Notes, Parts

HAMMARLUND MFG. CO., INC.

ANTENNA REQUIREMENTS

The input of the Series 200 "Super-Pro" is approximately 112 ohms. This means that for best results, the antenna should be coupled to the receiver by means of a low impedance transmission line. The doublet type antenna produces best results. Any well-known low impedance lead-in cable can be used with satisfaction. The use of low impedance lead-ins provides less chance for the lead-in itself to pick up extraneous noises. The low impedance lead-in, together with the electrostatic shield built into the antenna coil of the receiver, reduces noise to a minimum. It must be remembered that every antenna has a period of resonance and works best at that frequency. When erecting a doublet antenna, it is advisable to arrange its physical dimensions so that it will resonate in the band of frequencies where most sensitivity is desired. Care taken in designing and erecting an antenna will pay for itself many times in superior results.

DESIGN

The general design of the new "Super-Pro" embraces over five years of extensive research and experimentation. Individual components in the majority of cases have been specially designed for this receiver. The tuning inductors contained in the tuning unit are individually wound on low-loss forms. There are 20 in this group. Each coil has its own form and is mounted on an Isolantite base. This base also accommodates the variable trimming capacitor. All oscillator trimmers are of the air dielectric type and add considerably to the overall stability of the receiver. High stability mica trimmers are employed in the R.F. circuits.

The band change switch is especially designed for the "Super-Pro" and is unlike any other switch used for this purpose. The cam-operated knives contact stationary fingers and complete the circuit. Thus, no moving part carries current to cause noise or stray coupling. All contacts are silver-plated and will provide years of reliable service. The contacts are designed and placed so that the capacity between them is reduced to a negligible amount. This eliminates frequency drift due to change in dielectric constant during temperature rise. The I.F. transformers in the "Super-Pro" are designed particularly for this receiver. Each coil is wound on an Isolantite form and the coupling between them is mechanically variable to provide control of selectivity. Air dielectric trimmers are employed for maximum stability. Each grid coil in the I.F. unit is tapped near the low potential end so that changes in tubes will not affect the alignment of the receiver. This method also permits the use of a large number of stages operating at relatively low gain in order to obtain a maximum degree of selectivity without instability that might exist with a small number of stages operating at maximum gain.

SUPER-PRO MODELS AND PRICES

Code	Type	Tuning Range	Speaker	List Price
SP-210-X	Crystal	15-560 Meters	Jensen 10" Dynamic	$465.00
SPR-210-X	Crystal Rack	15-560 Meters	Jensen 10" Dynamic	482.50

PSC-10	Speaker cabinet finished to match receiver			8.50

Above prices cover 110-115-125 volt, 50 to 60 cycle models with tubes, crystal, and speaker. Receiver and power supply enclosed in wrinkle finished table type metal cabinets. Special models for 50-60 cycles with universal type power supply tapped for 115, 125, 140, 230, and 250 volts, also available at no increase in price. Twenty-five cycle models, $20.00 additional.

* In this model, the 1000 to 2000 meter band is substituted for the 60 to 120 meter band.

Receiver in cabinet measures 21½" wide, 15¼" deep, and 12¼" high. Power supply in cabinet measures 13" wide, 7½" deep, and 8½" high. Rack models fit standard 19" relay racks. Shipping weight approximately 110 pounds.

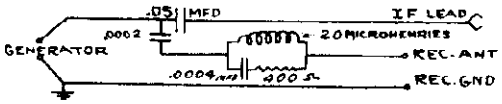
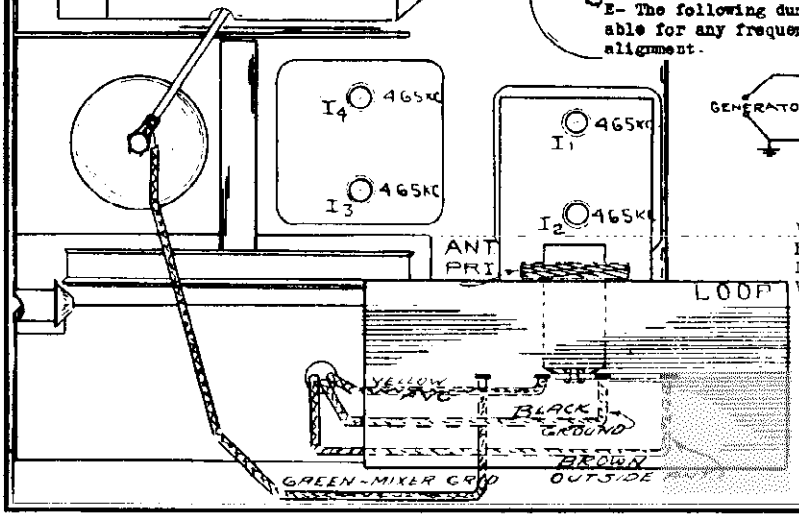
x	600 KC	600 KC	Brown lead		CUT PLATE	OSC. SECTION

NOTES

A- Each step of the alignment should be repeated in the original order for greater accuracy. Keep output from Signal Generator low. The I.F. trimmers are reached through the two holes on the top of each I.F. can.
B- When aligning the short wave bands, do not adjust to the IMAGE frequency. For example, if the adjustment is correctly made at 21 MC, then a weaker image will be heard at 21,000 KC less 930 KC, or about 20,070 KC on the dial.
C- When adjusting this pad, move the tuning hand back and forth and adjust padder until the peak of greatest intensity is obtained
D- See that the tuning hand is set exactly on the last line above 540 when the condenser is at maximum capacity.
E- The following dummy antenna circuit is recommended, since it is adaptable for any frequency range. The grid cap should remain in place during alignment.





SOCKET VOLTAGE READINGS
Voltage taken from ground with line voltage at - 117 AC:
High voltage reading off rectifier = 330 V.
Drop across speaker field = 90 V.
Voltage taken with 1,000 Ohm per volt meter -

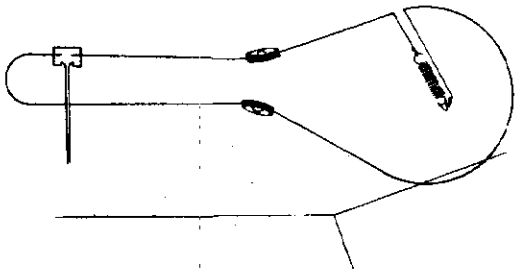
Dial Mechanism
300 Series

THE TUNING CONTROL

To provide smooth push button tuning with a minimum amount of effort the tuning shaft has a spring return which disengages the rubber friction drive from the large drive pulley after the tuning knob has been held down while tuning the set manually. There is no adjustment required on this mechanism.



THE ABOVE DIAGRAM SHOWS THE EXACT DRIVE CORD ARRANGEMENT IN CASE A REPLACEMENT IS REQUIRED. THE LAYOUT IS SHOWN WITH THE VARIABLE CONDENSER ALL THE WAY IN AT MAXIMUM CAPACITY AND THE TUNING HAND AT THE LAST LINE ABOVE 550.

The drive string running from one pulley across the dial plate to the other pulley may be slightly higher at its point of mounting to the tuning hand, this will maintain a slight downward pull on the hand to avoid wobble. Another cause of wobble would be caused by crimping the lugs of hand around the string in such a manner that the string would be out of line.

A slight amount of petroleum jelly along the top edge of the dial will provide a smoother travel of the hand. Arrange the long section of the hand straight and with sufficient clearance from the dial plate face to avoid scratching the numerals.

THE STRING TENSION of the drive string is maintained by the coil spring mounted on the large drive pulley. Too much tension will cause an extra load in tuning. Lack of tension will naturally cause backlash.

See that dial light sockets do not touch top edge of tuning hand as it moves across dial plate.

Since the pull against the large pulley is quite great, see that the set screws in the pulley hub to the condenser shaft are tight to avoid slipping.

THE PUSH BUTTONS must extend straight outward. If a chassis is removed, see that the push-button screw shanks are not bent so as to bind against the openings in the cabinet panel.

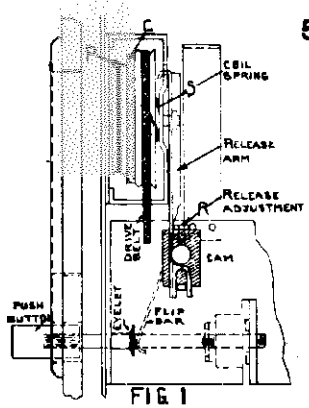


FIG 1

500 Series Dial Mechanism

FIG. 1. SHOWS THE DIAL DRIVE MECHANISM IN ITS NORMAL STATIONARY POSITION ENGAGED FOR MANUAL TUNING. THE CORK ASSEMBLY C IS FRICTIONED AGAINST THE FACE OF STRING PULLEY P, DUE TO PRESSURE OF COIL SPRING S. THE PUSH BUTTON IS NOT PRESSED IN, LEAVING A SMALL GAP BETWEEN THE BRASS EYELET AND THE FLIP BAR.

FIG. 2. SHOWS THE PUSH BUTTON ON ITS WAY IN, AT THE VERY START OF WHICH THE EYELET MOVES THE FLIP BAR, CAUSING THE RELEASE ARM TO OVERCOME THE COIL SPRING TENSION AND DRAW THE CORK CLUTCH AWAY FROM THE STRING PULLEY FACE, POINT G. ALL OF THIS ACTION TAKES PLACE BEFORE THE PUSH BUTTON SCREW STARTS TO ACTUATE THE VARIABLE CONDENSER.

THE OBJECT OF THE ABOVE MECHANISM OF COURSE IS TO ELIMINATE THE PRESSURE THAT OTHERWISE WOULD BE REQUIRED IF THE MANUAL TUNING CONTROL HAD TO BE SPUN AROUND WHEN USING THE PUSH BUTTONS.

THE SCREW ADJUSTMENT R, FIG. 1, WILL PROVIDE THE PROPER AMOUNT OF CLUTCH RELEASE CLEARANCE AT G, FIG. 2.

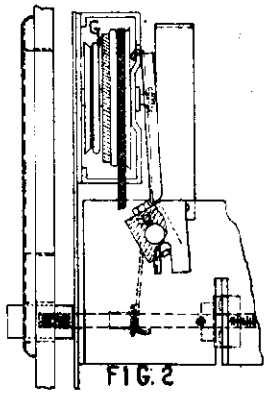

FIG. 2

LACK OF SMOOTHNESS in dial operation may be due to:

- Too much tension on dial string.
- Incorrect adjustment with release action causing drag. (See adjustment R).
- Fly wheel will rub on cabinet shelf if the rubber cushion is not in place beneath chassis.
- See that dial light sockets do not touch top edge of tuning hand as it moves across dial plate.
- Do not adjust the belt to a greater tension than is necessary.
- Slipping of the dial mechanism may be due to any of the above items or lack of sufficient cork friction which in turn may be due to weakness in tension spring S (Fig. 1) or a tight bearing at this point.

SETTING-UP THE PUSH BUTTONS

300 Series 500 Series

1. Leave the set turned on at least 15 minutes before making settings.
2. Decide upon the six stations that you want to tune in automatically.

It is preferable to set the lower frequency stations, starting with the button on the right.

3. Tune the station with the regular tuning knob, making certain the station is EXACTLY IN TUNE, then with the fingers loosen the push button with a twist to the left of about one-half turn, now push the button ALL THE WAY IN.
4. Carefully release button and tighten it with a twist to the right.
5. Repeat above procedure for the other five buttons for five other stations and insert station letter tab in position for each button.

THE PUSH BUTTONS WILL ONLY OPERATE CORRECTLY WHEN THEY ARE OPERATED WITH A FIRM, QUICK THRUST, KEEPING FINGER ON BUTTON UNTIL DIAL POINTER COMES TO A STOP.

THE STRING TENSION of the drive cord is maintained by the coil spring on the large drive pulley FIG. 4.

THE PUSH BUTTONS must extend straight outward, before a chassis is mounted in the cabinet, see that the push-button screw shanks are not bent so as to bind against the escutcheon holes.

THE DRIVE BELT tension is very easily obtained between the tuning shaft and the pulley by raising or lowering the frame when the two screws B, B (Fig. 3) are loosened. Do not get the belt too tight. The belt runs directly on the tuning shaft, the rubber grommet on the shaft is merely acting as a guide.

TO REPLACE THE DRIVE BELT (1) remove screws B, B and D, D from frame, permitting frame to be disassembled (2) loosen set screws holding lead fly wheel on tuning shaft. This will allow tuning shaft to be pulled out to loop the belt in place.

THE REPLACEMENT OF THE CORK clutch is also accomplished by removing screws B, B and D, D.

THE TUNING HAND should be set to the end calibration line above 550 KC when the condenser is at maximum capacity.

The drive string running from one pulley across the dial plate to the other pulley will be higher at the point of mounting on the tuning hand, this will maintain a slight downward pull on the tuning hand which will prevent wobble. Another cause of wobble would be in crimping the lugs around the string causing the string to be out of line.

A slight amount of petroleum jelly along the top edge of the dial plate is beneficial. Arrange the long section of the hand so it will not scratch the dial numbers.

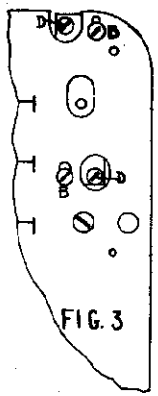

FIG. 3

(Four stations for Series 300)

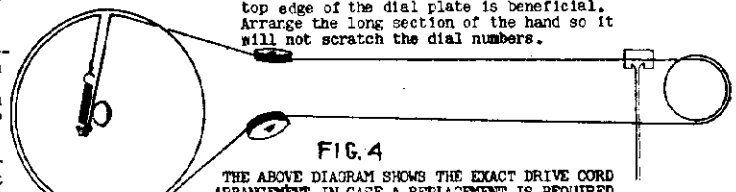

FIG. 4

THE ABOVE DIAGRAM SHOWS THE EXACT DRIVE CORD ARRANGEMENT IN CASE A REPLACEMENT IS REQUIRED. THE LAYOUT IS SHOWN WITH THE VARIABLE CONDENSER ALL THE WAY IN AT MAXIMUM CAPACITY AND THE TUNING HAND AT THE LAST LINE ABOVE 550.

INSTALLATION AND OPERATING INSTRUCTIONS
AUTOMATIC PHONOGRAPH COMBINATION

INSTALLATION

PREPARING FOR OPERATION - Remove the bracket "A" securing the pickup and needle mechanism. This bracket is shown in place in Figure 1. It is held to the motorboard by means of a screw "B". Remove the screw, lift off the bracket and replace screw in motorboard to cover hole. Then remove red bolts "C" and "D" which hold the motorboard secure during shipment. These are also shown in Figure 1. When these bolts are removed it will allow the wood strips to be taken out. "E" and "F".

The two record holder posts (See Figure 6) are covered with paper held in place by rubber bands as is also the pickup. Remove these paper coverings.

THE SCREWS THAT HOLD THE RADIO CHASSIS ARE LOOSENED JUST ENOUGH TO ALLOW THE WOOD STRIPS (USED IN SHIPMENT) TO BE REMOVED. CAUTION: ONLY A SMALL AMOUNT OF TURNING OF THE WING SCREWS IS NECESSARY. IF THEY ARE TOO LOOSE THE CHASSIS WILL DROP OUT OF POSITION AND THE PUSH BUTTONS WILL NOT OPERATE PROPERLY.

LOCATION: The instrument should be located near an electric outlet and on a level surface. The cabinet should not be located near a source of heat such as a radiator or register. If the cabinet is placed parallel to a wall, at least an inch space should exist between the back of the cabinet and the wall, for best tone quality. The instrument must be installed in a level position for proper operation of the phonograph.

POWER SUPPLY: Unless otherwise specified on the chassis and on the power transformer, the standard receiver is to be operated from an alternating current only - (105 to 120 Volts, 60 cycle).

SPEED REGULATION: There are no adjustments on the Phonograph Motor for speed regulation since the design of the motor is for a constant speed, similar to an electric clock. Be certain that the power line frequency is the same as specified on the motor frame, the standard models being 60 cycle.

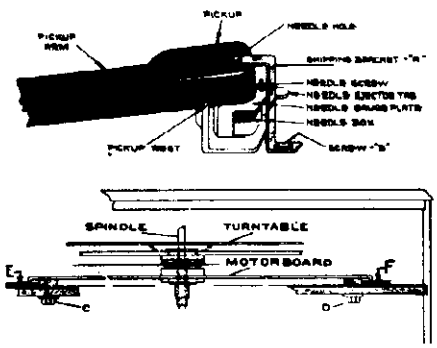

Figure 1 - Unpacking

PHONOGRAPH INSTRUCTIONS

CAUTIONS - 1. NEVER USE FORCE TO START OR STOP THE MOTION OF ANY PART OF THE RECORD-CHANGING MECHANISM OR PICKUP ARM.

2. THE USE OF RECORDS WHICH HAVE BECOME WARPED OR DAMAGED THROUGH IMPROPER CARE MAY CAUSE THE MECHANISM TO JAM AND DAMAGE THE INSTRUMENT. IN ADDITION, RECORDS WHICH HAVE BECOME WARPED WILL SLIDE ON ONE ANOTHER WHEN PLAYING, RESULTING IN UNSATISFACTORY REPRODUCTION.

3. THIS INSTRUMENT IS NOT RECOMMENDED FOR PLAYING 10-INCH AND 12-INCH RECORDS IN MIXED SEQUENCE. IF THE USER DESIRES THIS SERVICE HE MUST BE POSITIVE THAT ALL RECORDS ARE PERFECTLY FLAT AND FREE FROM WARP. THE INDEX AND RECORD REJECT LEVER MUST BE SET AT "10" AND AFTER PLAYING THE LAST SELECTION THE PICKUP WILL COME DOWN IN POSITION FOR A 10-INCH RECORD AND REPEAT THE PLAYING OF THIS LAST RECORD ON A 10-INCH DIAMETER UNLESS THE TURNTABLE SWITCH IS TURNED OFF. ANY JAMMING OF THE MECHANISM UNDER THESE CONDITIONS INDICATES THAT THE RECORDS USED ARE NOT PERFECTLY FLAT OR THAT THEIR EDGES ARE NOT SUFFICIENTLY SMOOTH TO PERMIT NORMAL OPERATION OF THE SEPARATORS IN DROPPING EACH RECORD IN SEQUENCE ONTO THE TURNTABLE.

4. DO NOT LEAVE RECORDS ON THE RECORD HOLDER POSTS, AS THEY ARE LIABLE TO WARP. KEEP YOUR RECORDS IN A RECORD FILE (ALBUM OF CABINET) WHEN NOT IN USE. IF ANY RECORDS SHOULD BECOME WARPED, PLACE THEM ON A FLAT SURFACE WITH A FLAT HEAVY ARTICLE, SUCH AS A LARGE BOOK, ON TOP AND LEAVE THEM IN THIS POSITION FOR A FEW DAYS.

ONLY LOAD YOUR RECORDS ON THE RECORD HOLDER SHELVES AFTER THE PICKUP IS IN ITS REST POSITION AND THE TURNTABLE STOPPED WITH TURNTABLE SWITCH AT "OFF".

TURNTABLE SWITCH: The Turntable Switch is a toggle type located in the front of the index plate on the motorboard (See Figure 6). It is used to start and stop the motor.

INDEX LEVER: The Index Lever moves in a small arc in the slot in the index plate. (See Figure 6). The plate is labeled for four positions of the lever - "Manual" "12", "10" and "Reject". If a single record is to be played the automatic record-changing feature will not be used and the Index Lever should be set to the "Manual" position.

If either 10 or 12-inch records are to be played automatically the index lever must be moved to the position indicating the size records that are to be played. If 10-inch records are to be played, or 10 and 12 inch mixed, the Index Lever must be set at "10" and if 12-inch records are to be played, the lever must be set at "12". To reject a record being played, or to start the record-changing cycle in case the record just played does not have the standard eccentric or spiral changing groove simply push the lever to the "REJECT" position and let go. The pickup will raise up and swing outwards and the next record will drop down. Upon releasing the lever, it will automatically return to the "10" position. If you are playing a series of 12-inch records, the lever should be returned to the "12" position after rejecting a record. Keep the lever in its "MANUAL" position when not actually playing records automatically.

Before operating the phonograph, either automatically or manually, be sure that the Pickup Arm is down at playing level and can be easily moved by hand. If not, the Index Lever will be in "10" or "12" and an "eject cycle" must be completed to bring the arm down. To do this, turn the Power switch on the radio panel to "ON" position, then throw the turntable switch "ON". The turntable will start to revolve and the cycle of motion of the pickup Arm will be resumed. When the Pickup Arm comes down, turn off the turntable switch.

TO OPERATE THE PHONOGRAPH: To play records, set the radio Power switch to the "ON" position. With the Index Lever at Manual and the pickup resting on the support over the needle gauge plate, arm in groove, loosen the needle screw and drop a needle, point first, through the needle hole in the pickup. (See Figures 1 and 6). The needle will be stopped in the right position by the needle gauge plate. Press gently on top of pickup to seat it squarely on the gauge plate. Then tighten the needle screw with your fingers.

Lift the Record Holder shelves, Figure 6, with the fingers underneath and revolve to clear the record circle, also push back the lever sticking up adjacent to the rear record holder post. You now have clear access to the turntable. Place the first record upon the turntable with the spindle protruding through the center of the record.

Swing the shelves back into position, down in place and load up. For automatic operation seven 10-inch records or six 12-inch records may be stacked on the record holder shelves.

It is not recommended to mix 10 and 12 inch records for automatic operation. Records should never be stacked higher than the spindle.

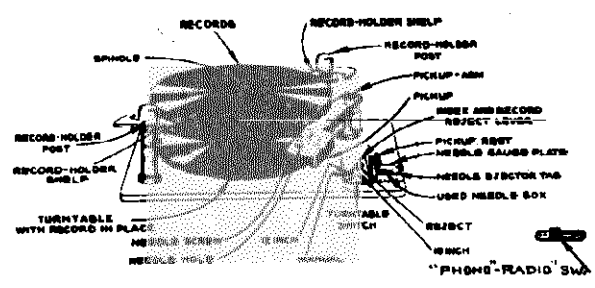

Figure 6

STEP BY STEP PROCEDURE FOR OPERATING PHONOGRAPH

A. TO PLAY 10" OR 12" RECORDS INDIVIDUALLY:

1. Move Index Lever to "Manual" position. See Figure 6.
2. Make sure the pickup arm is resting in its groove with pickup over used needle box. See Figures 1 and 6.
3. Lift the record holder shelves and swing outwards. See Figure 6.
4. Push back the vertical lever near the rear record holder post.
5. Place single record on turntable.
6. Turn power on at receiver, and switch to "Phono" position.
7. Turn on turntable switch. See Figure 6. The turntable will start revolving. Wait till it has reached its normal speed.
8. Lift pickup arm and carefully place needle in first groove of record,
9. Adjust "Volume" and "Tone" as for radio. The same controls are used.

The phonograph will not shut off until the turntable switch (Figure 6) or the Receiver switch is turned off.

To repeat the selection on records with the center changing groove, set index lever to the 10" or 12" position depending upon which size record is being played.

MODEL 302APC MODEL 520APC
MODEL 308APC MODEL 580APC
Automatic Phono.Data

B. TO PLAY 10" OR 12" RECORDS SO THAT RECORDS WILL CHANGE AUTOMATICALLY AFTER EACH SELECTION.

1. Move index lever to "Manual" position. Fig. 6.
2. Make sure the pickup arm is resting in groove with pickup over reject needle cup. Figs. 1 and 6.
3. Place first record on turntable as for individual playing.
4. Swing the record holder shelves inward into place down on their posts and extending over the turntable. Fig. 6.
5. Stack any amount up to seven 10-inch records on the record holder shelves.
6. Turn power on at receiver, and switch to "Phono" position.
7. Turn on turntable switch. Fig. 6.
8. With index lever still in the "Manual" position lift pickup arm and lower to first groove of record.
9. Move index lever to 10 or 12 inch position depending on the size records being played.
10. Adjust volume and tone as for radio.

Records with the center changing groove will change automatically at the end of each selection until the end of the last record is reached. The last record will repeat itself until the Turntable Switch or Power-Tone control is turned off. To bring down another record at any time during playing of series, push the index lever, (Fig. 6) to "Reject" and let go. Bring back to "12" if you are playing 12-inch records.

CAUTION: DO NOT STOP THE TURNTABLE WITH TURNTABLE SWITCH OR POWER-TONE KNOB UNTIL THE PICKUP IS DOWN AT THE END OF A CYCLE.

TO CHANGE NEEDLE: To change needle, place the pickup over the Needle Gauge Plate, with the pickup Arm resting in the support groove, loosen the Needle Screw, press down the Needle Ejector Tab to drop the needle into the Used Needle Box (Figs. 1 and 6). Allow the gauge plate to return to its normal position. Drop a new needle point first, into the needle hole, press gently on pickup to seat it squarely on gauge plate and tighten the needle screw with your fingers.

NEEDLES: Good needles are essential to best reproduction. It is advisable to use medium-tone needles and these may be purchased from your Retail Store. Do not reinsert a used needle in the pickup. Change your needles frequently, worn needles distort reproduction and may damage the records. A rack for holding needle books will be found at the back of the compartment under the lid. To enply used needles from the needle box, lift the pickup and move to left out of the way, then tilt up used needle box at front and lift out of its hole in the motorboard. Press the ejector tab to open the lid, to replace, slide the lug on the back into its groove in the motor board and press the box into plate.

RECORDS: Handle your phonograph records carefully. It is advisable to purchase your records from The Retail Store where you may have them played over on an instrument of this type. Keep your records in a record album or lay them flat when not in use. Never leave them on the Record-Holder shelves. Electrically transcribed records are best. Worn or poorly transcribed records result in distortion. Records with the eccentric or spiral center groove are necessary for automatic operation, either change or repeat.

LUBRICATION: Petrolatum or petroleum jelly should be applied to cam, main gear, spindle pinion gear, and gear of record posts. Light machine oil should be used in the tone arm vertical bearing, record post bearings, and all other bearings of various levers on underside of motorboard.

Apply a few drops of light machine oil to the motor spindle bearing. The oil hole has a screw plug. Do not allow oil or grease to come in contact with rubber mounting of tone arm base, rubber bumper, or rubber spindle cap.

BC	600 KC	600 KC	Ant. Post	C	P_{14}	Osc. Pad.

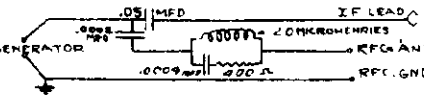
A- Each step of the alignment should be repeated in the original order for greater accuracy. Keep output from signal Generator low. The I.F. trimmers are reached through the two holes on the top of each I.F. can.

B- When aligning the short wave bands, do not adjust to the IMAGE frequency. For example, if the adjustment is correctly made at 21 MC, then a weaker image will be heard at 21,000 KC less 930 KC, or about 20,070 KC on the dial.

C- When adjusting this pad, move the tuning hand back and forth and adjust padder until the peak of greatest intensity is obtained.

D- See that the tuning hand is set exactly on the last line above 540 when the condenser is at maximum capacity.

E- The following dummy antenna circuit is recommended, since it is adaptable for any frequency range. The grid cap should remain in place during alignment.



POWER SUPPLY - (Standard Models)
= 105-120 V, 60 Cycle
CONSUMPTION 105 WATTS APC + 30
POWER OUTPUT - (MAX.) = 12 W. upo 8

IMPORTANT: Use high resistance voltmeter of at least 1000 ohms/volt.
NOTE A: The bias voltage on the grids of the 6K7G R.F.; 6K7G I.F. and the diode plates of the 6Q7G tube is 2.45 volts measured across resistor No. 30.
NOTE B: The bias voltage on the grid of the 6K6G is -17 volts measured across resistor No. 44.

ALIGNMENT PROCEDURE

THIS MATERIAL APPLIES TO BOTH MODELS SA-39 AND DB-39 UNLESS OTHERWISE INDICATED BY NOTES BELOW.

TO PROPERLY ALIGN THESE RECEIVERS IT IS ESSENTIAL THAT YOU FOLLOW THIS PROCEDURE EXACTLY.

BEFORE ALIGNING THE I.F. TRANSFORMERS THE GREEN-WHITE JUMPER LOCATED UNDER THE FIRST I.F. TRANSFORMER MUST BE CONNECTED AS SHOWN IN FIGURES 2 AND 4 OTHERWISE ALIGNMENT WILL BE INCORRECT.

AFTER ALIGNING THE I.F. TRANSFORMERS. TRANSFER THE GREEN-WHITE JUMPER LOCATED UNDER THE FIRST I.F. TRANSFORMER TO ITS ORIGINAL POSITION.

1– Connect the output meter across the speaker voice coil or
(a) For Model SA-39, connect between the plate of the 6K6G and chassis in series with a .1 mfd. condenser.
(b) For Model DB-39, connect between the plates of the two 6V6G output tubes.
NOTE:- The more sensitive type of meter should be connected across the voice coil.

2– Connect the ground lead of the signal generator to the receiver chassis and leave it connected in this manner throughout the entire alignment procedure.

3– Turn the volume control to the maximum volume position.

4– With the gang condenser in full mesh, set the pointer to the end of the calibration slot on the low frequency end of the dial scale. This can be done by loosening the set screw in the dial cord drive drum, (see "E" in figure 5 on page 11) holding the gang condenser in full mesh and turning the drum until the pointer is correctly set. Then retighten the set screw in the dial drum.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GEN. OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.01 MFD CONDENSER	CONTROL GRID OF 6J7G TUBE	262 KC.	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1–2	1ST I. F.	IMPORTANT: CHANGE JUMPER ON BOTTOM OF 1ST I.F. TRANSFORMER TO CONNECT TERMINALS A & B INSTEAD OF A & C. (SEE FIGURE 1 OR 3 ON PAGE 9. ADJUST FOR MAXIMUM OUTPUT. THEN REPEAT ADJUSTMENT. (THIS IS NOT NEEDED ON MODEL DB-39 ONLY)
				3–4	2ND I.F.	
CONNECT A 125 MMFD. MICA CONDENSER TO THE END OF THE SIGNAL GENERATOR LEAD. CONNECT THE OTHER END OF THE CONDENSER TO POINT "X" SHOWN IN FIGURES 1 OR 3 ON PAGE 9.		1350 KC.	1350 KC.	5	OSCILLATOR (SHUNT CONDENSER)	IMPORTANT: CHANGE JUMPER ON BOTTOM OF 1ST I.F. TRANSFORMER TO CONNECT TERMINALS A & C INSTEAD OF A & B. (SEE TRIMMER LOCATION CHART ON PAGE 9) ADJUST TRIMMER TO BRING IN SIGNAL.
SAME AS ABOVE		1350 KC.	TUNE TO 1350 KC. GENERATOR SIGNAL	6	ANTENNA (SHUNT CONDENSER)	ADJUST FOR MAXIMUM OUTPUT.

ADDITIONAL SERVICE DATA

HOW TO REPLACE THE DIAL POINTER DRIVE CORD

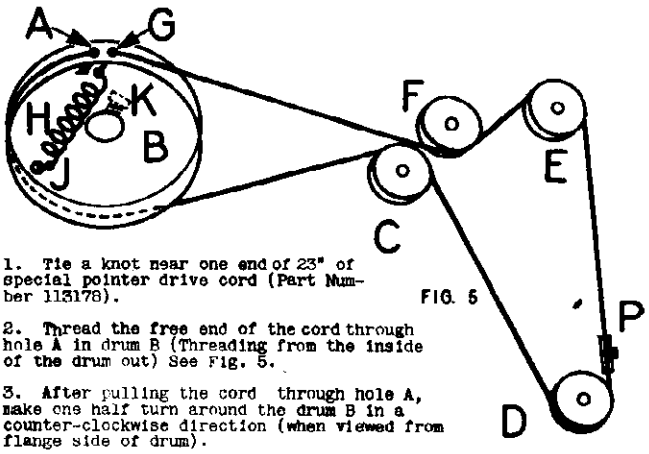

FIG. 5

1. Tie a knot near one end of 23" of special pointer drive cord (Part Number 113178).

2. Thread the free end of the cord through hole A in drum B (Threading from the inside of the drum out) See Fig. 5.

3. After pulling the cord through hole A, make one half turn around the drum B in a counter-clockwise direction (when viewed from flange side of drum).

4. Continuing, draw the cord over to the back of pulley C and around to pulley D. From this point continue across to pulley E and around to pulley F.

5. Go around pulley F and up to the top of drum B to hole G.

6. Draw the cord through hole G and tie it to the end of tension spring H in such a manner that when the spring is clipped to lug J, the spring will be extended to approximately 7/8 inch.

HOW TO SET UP THE PUSH BUTTONS.

To set up the push buttons, proceed as follows:

1. Turn on the set and allow it to operate for at least one-quarter hour before attempting to set up the push buttons.

2. Select the five stations to which the buttons are to be set. Be sure to select nearby, powerful stations, since weak signals will generally give better results when tuned in manually. Any button may be set to any desired station.

3. Grasp the tuning knob and pull it out, (outward movement is slight, about 1/8 inch) so that the drive pinion engages the condenser drive gear and the set may be tuned manually.

4. Tune in the station to which you wish to set the particular button. Be sure to tune in the station correctly by TUNING TO THE POINT WHERE THE PROGRAM IS HEARD WITH THE LEAST HISS OR DISTORTION, AND NOT TO THE POINT OF GREATEST VOLUME.

5. Grasp the push button being set up, and turn it to the left (counter-clockwise) about one whole turn.

6. Push this button all the way in, and keeping it pushed in, turn right (clockwise) until reasonably tight.

7. Set up the remaining four buttons in a similar manner.

8. Label each button with the call letters of the stations you have selected, using the call letter tabs and celluloid covers packed with your receiver. Insert the call letter tab in the recess in the push button, and cover it with the celluloid tab.

9. To use your push button tuner, first push in the tuning knob. Then push in the button labelled with the call letters of the desired station. Be sure to push the button all the way in.

AUDIO OSCILLATION IN MODEL DB-39 RECEIVER.

Occasionally audio oscillation or howl may be encountered in this model. This is caused by an audio voltage being fed back to the audio section of receiver from the speaker cord. The remedy is to locate the speaker cord away from the 6R7-G and 6V6-G tubes, holding it in place with a rubber band if necessary.

INCORRECT TUNING OF PUSH BUTTONS

Occasionally a receiver may be found which will not tune-in stations accurately when push button tuning is used. The causes and remedies for this are as follows:

1. Push buttons incorrectly set-up. Remedy: Reset the button to the desired station being sure to tune in the station carefully.

2. Extreme sharpness of tuning of the receiver. Remedy: The green-white jumper wire on the bottom of the 1st I. F. transformer may be improperly connected. The correct connection for normal operation of the receiver is shown in Fig. 1 (Terminals A and C should be connected together.

LOW SENSITIVITY

Low sensitivity may be due to improper adjustment of the antenna compensator, trimmer #8 (see alignment procedure page). This trimmer is accessible without removing the set from the car. When the readjustment of the compensator is necessary, care should be taken that the antenna, if of the under-car type, is clean and free of accumulation of mud or slush which would alter its capacity and lower its resistance. In such cases, the antenna and its insulators should be washed, and preferably, allowed to dry before making adjustment. Doing this sharpens the tuning of the compensator and makes possible an accurate setting.

FAILURE OF RECEIVER TO OPERATE

Failure of the receiver to operate may be due to one or more causes. When a receiver is found in such condition, its parts should be checked as follows:

1-FUSE

The fuse may be burned out or making poor contact. In cases of burnout, replace with another 15 Ampere fuse. If second fuse fails, remove receiver from car and investigate condition of vibrator and receiver circuits. DO NOT USE A HIGHER RATING FUSE.

2-TUBES

Unfasten the trunk clamps holding the speaker case cover. This will enable you to reach the tubes. Check to see that all tubes are in their proper sockets. One or more tubes may be defective. To determine their condition, remove them from the receiver and test with a tube tester, or if a tube tester is not available, replace the tubes, one at a time, with tubes known to be good, until the defective tube is located.

3-VIBRATOR

Improper operation of the vibrator is usually evidenced by one of the following symptoms: Receiver blows fuses, receiver is dead or weak, reception is intermittent, reception is noisy and unsteady. To check the vibrator, replace the suspected unit with a new vibrator. Do not attempt to adjust the defective unit.

4-CIRCUIT

Failures within the basic circuits of the receiver may be isolated by a systematic test procedure. The receiver should be removed from the car and placed where it will be readily accessible. The top cover and speaker case cover should be removed from the case. The defect in the receiver can then be located by means of continuity, voltage, or stage analysis, using a signal generator.

When checking the receiver, using a signal generator, a signal is fed progressively into the I. F. and R. F. stages of the receiver, until the defective stage is located, and a continuity or voltage check may then be given that stage to isolate the defective unit or circuit.

ADJUSTMENT OF IRON CORES IN COILS.

The Antenna, R. F., and Oscillator coils have adjustable iron cores. Any adjustment of these cores will necessarily change the inductance of the coils and therefore extreme caution must be exercised where adjustment becomes necessary. THE CORE OF THE OSCILLATOR COIL MUST NOT BE ADJUSTED AT ANY TIME. The correct method of adjusting the R. F. and antenna coil cores is adequately covered under "Alignment Instructions"

LOW SENSITIVITY

In cases of low sensitivity not traceable to weak tubes or defective parts, check the setting of the antenna trimmer. If the set has been aligned using any dummy antenna other than the 80 mmfd. condenser recommended, the setting of this condenser will be off considerably.

In all cases, the trimmer should be adjusted to the regular car aerial. Install the set in the automobile and connect it to its antenna. Do not mount the control unit but place it in some accessible place. Tune in a weak station, near 1400 KC, remove the plug button covering the antenna trimmer from the case, and adjust this trimmer for maximum volume.

Another possible cause of low sensitivity is mis-alignment of the I. F. transformers caused by the upper and lower units being aligned at different times, since one I. F. trimmer is on the control unit and the balance are in the lower unit. To correct this, realign both units of the receiver as described under "Alignment Procedure."

REPLACING TUBES IN CONTROL HEAD

1. Remove the two Phillips screws at the bottom of the instrument panel grill. Lift out the grill.
2. Remove the four machine screws holding the speaker plate.
3. Insert a screwdriver blade in the slot in the front of the control head and pry off the lower cover. This will give access to the 6A8 and 6SK7 tubes.

HUM

A possible source of hum difficult to trace, is caused when the lower end of the volume control accidentally becomes grounded in the control unit, in addition to the ground which is made in the lower radio unit. Removing the accidental grbund in the control head will clear up this difficulty.

IGNITION NOISE

If ignition noise is excessive, first make sure the installation man has performed all the operations described in paragraphs 20 and 21.

Additional bonnet grounding strips (Stewart-Warner Part No. 118718, Hudson Part No. BO-161417) may be helpful in further reducing ignition interference. The best location for these can be determined by grounding the hood to the body at various points with a knife. If the grounding strip is located at a point 10½ inches from the center of the car, install an additional strip at a point 23¼ inches from the center as shown in Fig. B.

A change has been incorporated in the radios now being built to reduce ignition noise. This change can be made in the field by a radio service man if excessive noise is still encountered after following all previous instructions.

One antenna motor noise choke (Hudson Part No. BO-161580, Stewart-Warner Part No. 118726) is required and full instructions to make this change are given here.

INSTALLATION OF ANTENNA CHOKE

The antenna noise choke (Stewart-Warner Part No. 118726, Hudson Part No. BO-161580) is a single layer choke coil wound on a ceramic body which looks like an insulated resistor. It is to be installed inside the control unit in place of the resistor connected in series with the antenna lead on early sets. Later sets already have the choke.

Remove the top cover of the control unit. Check whether a resistor or small choke connects to the blue antenna lead. (See Fig. 1.) If it is a choke wound on a resistor body, the change has already been made. If you find a plain, insulated resistor connected to a terminal lug to which the blue wire from the antenna socket is connected, proceed with the change. This resistor has a value of 68 ohms and can be identified by its blue body, grey end and black dot.

Remove the resistor.

Remove the two screws holding the antenna socket to the case.

The antenna trimmer must now be connected to a different terminal on the antenna coil. This trimmer is the one which can be adjusted through the side of the case. A bare wire runs from the antenna coil terminal A, through the top trimmer lug to the control grid of the 6SK7 tube.

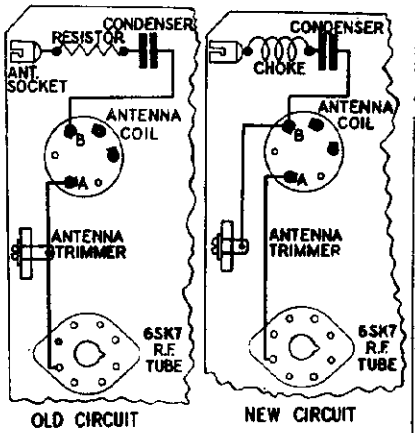

FIG. 1. Diagram Illustrating Recommended Antenna Circuit Changes

Disconnect this wire from the antenna coil terminal and from the trimmer terminal. Slip a piece of spaghetti tubing over this wire and re-connect it to the same lug on the antenna coil. (Marked A in Figure 1.)

Connect the trimmer condenser to the antenna coil terminal nearest the corner of the chassis. (Marked B in Figure 1.) This is the terminal to which the antenna series mica condenser connects.

Replace the antenna socket using the two mounting screws.

Solder the choke to the terminals from which you removed the resistor (see Fig. 1).

Check to see that the wiring of the unit has not been pushed over so as to interfere with the dial drive cord.

After this change is made, it is absolutely essential to realign the antenna trimmer. This must be done with a signal generator and an .80 mmfd. condenser in series with the antenna lead and the signal generator. If any other capacity is used, adjustment will be incorrect.

The antenna trimmer can and should be aligned to the regular car aerial. To do this we suggest connecting the radio in the car so it will operate but without mounting the control unit in place on the instrument panel. Arrange it so you can get at the antenna trimmer easily. Tune in a weak station near 1400 kc. on the dial and adjust the antenna trimmer for maximum volume.

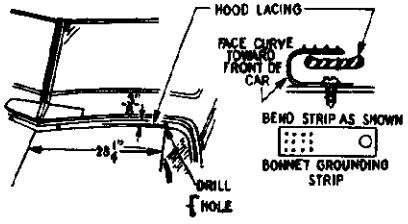

Fig. B. Bonnet Grounding Strip Mounting Details

ALIGNMENT PROCEDURE

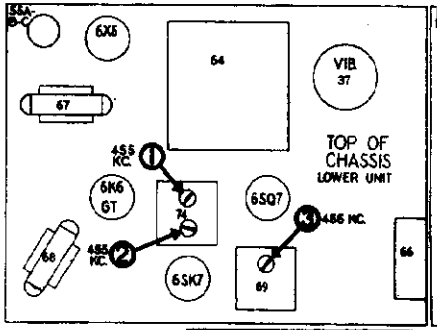
For alignment an output meter and accurately calibrated signal generator are required.

1. Connect the output meter across the voice coil or between the plate of the output tube and chassis in series with a .1 mfd. condenser. The more sensitive type of meter should be connected across the voice coil.
2. Remove only the top cover of the lower unit and the bottom cover of the control unit.
3. Connect the ground lead of the signal generator to the receiver chassis and leave it connected in this manner through the entire alignment procedure.
4. Turn the volume control to maximum volume position and leave it throughout the entire alignment procedure.

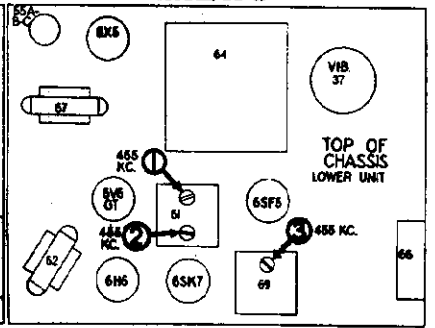
DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECTION OF SIG. GEN. OUTPUT TO RECEIVER	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
.1 MFD. CONDENSER	CONTROL GRID OF 6A8	455 KC.	ANY POINT WHERE IT DOES NOT AFFECT THE SIGNAL	1-2	2nd I.F. LOWER UNIT	ADJUST FOR MAXIMUM OUTPUT. THEN REPEAT ADJUSTMENT.
				3	1st I.F. LOWER UNIT	
				4	1st I.F. CONT. UNIT	
80 MMFD. MICA CONDENSER	ANTENNA CONNECTION ON SET	1580 KC.	SET SO THAT GANG COND. IS ENTIRELY OUT OF MESH	5	OSCILLATOR (SHUNT) CONDENSER	CAREFULLY ADJUST FOR MAXIMUM OUTPUT.
80 MMFD. MICA CONDENSER	ANTENNA CONNECTION ON SET	1400 KC.	ACCURATELY TUNE TO 1400 KC. GENERATOR SIGNAL	6	ANTENNA (SHUNT) CONDENSER UNDER PLUG BUTTON ON END OF CONTROL UNIT	ADJUST FOR MAXIMUM OUTPUT.
80 MMFD. MICA CONDENSER	ANTENNA CONNECTION ON SET	600 KC.	TUNE TO 600 KC. GENERATOR SIGNAL	7	OSCILLATOR (SERIES) CONDENSER	ADJUST FOR MAXIMUM OUTPUT. TRY TO INCREASE OUTPUT BY DETUNING TRIMMER AND RETUNING RECEIVER DIAL.
Now repeat adjustments made on trimmer numbers 5, 6 and 7.						

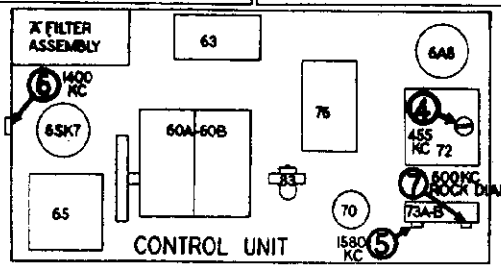
After the set has been installed in the car, tune in a fairly weak station near 1400 KC, and adjust trimmer No. 6 under the plug button on the end of the control head until maximum volume is obtained.

MODEL SA-40



MODEL DB-40





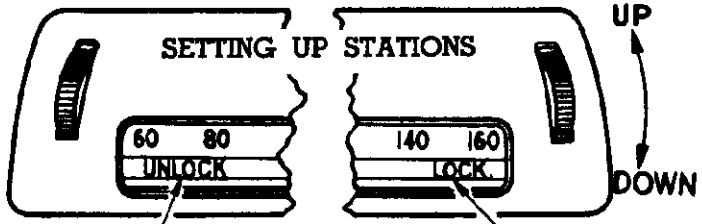


FIG. 2. Locking and Unlocking Mechanisms

TO UNLOCK: Turn Manual Tuning Control DOWN about 70 to 100 strokes AFTER word UNLOCK appears. Turn until control turns hard after turning easily. NEVER FORCE CONTROL AFTER THIS POINT IS REACHED.

TO LOCK: Turn Manual Tuning Control UP about 70 to 100 strokes AFTER word LOCK appears. Turn until control turns hard after turning easily. NEVER FORCE CONTROL AFTER THIS POINT IS REACHED.

The new Hudson Featertouch Control can be set to stations without any tools. This design has a tremendous advantage over other types of tuners, in that any button can be set to any station. The buttons can be set in any order and one or more buttons later reset without changing the settings of the remaining ones.

IMPORTANT PRECAUTION: In order to assure perfect results you must observe all instructions. One very important precaution during set-up is to never touch a button already set while control unit is unlocked. For example, if some buttons are set and while working on the remainder you accidentally touch one already set, the setting on this button will change. This will necessitate resetting of the button accidentally touched.

HOW TO SET UP PUSH BUTTONS

(a) Operate set for about ten minutes before setting up buttons.

(b) TO UNLOCK TUNING MECHANISM: Rotate right (tuning) control downwards until word UNLOCK shows at the left side of dial. Continue to turn until wheel tightens. (70 to 100 strokes will be required). A more complete description of this procedure is given below under the heading "Unlocking Tuning Mechanism."

(c) Tune in desired station with (tuning) control.

(d) Hold down the button selected and move tuning control up and down leaving it in position where tone is deepest. Release button.

(e) Follow same procedure for other buttons. IMPORTANT: After setting any button, it must not be touched until after mechanism has been locked as in (f). Otherwise it is necessary to reset it as in (c) and (d).

(f) LOCK TUNING MECHANISM: Rotate tuning control upwards until word LOCK appears at right side of dial. Continue to turn until wheel tightens (70 to 100 strokes will be required). A complete description of the locking operation is also given below.

(g) Insert station call letter tab in front of each button. The tabs are inserted by flexing them and allowing them to snap into place in the buttons.

SETTING UP EARLY RADIOS

Some of the earliest radios produced require a slightly different set-up procedure than given above. This same procedure can be used on later sets though it is not necessary.

After unlocking the tuning mechanism, proceed as follows for each button:

1. Tune station in manually.
2. Now hold the manual tuning control and push the button to be set up several times.
3. After pushing and releasing button several times, hold button down and again tune station carefully by turning manual tuning control back and forth slightly.
4. Repeat for other buttons.

The essential difference between this procedure and the one given above is that the button is pushed and released several times in quick succession after desired station is tuned in but before final tuning adjustment is made.

UNLOCKING TUNING MECHANISM

In setting up this mechanism, you must understand the action of the control during locking and unlocking.

The unlocking operation begins AFTER the tuning control is turned to the point where the word UNLOCK appears. To complete the unlocking operation, the tuning control must be turned quite a bit AFTER this point is reached. When unlocking begins, the tuning control may turn quite hard, but then it begins to turn quite easily. You must continue to turn it downwards until it again turns hard. Because of the high gear ratio, it may require 18 to 24 complete turns of the tuning control to reach this point. Since you can turn this control only a quarter of a turn at a time, it may require 70 to 100 strokes of the finger on the control to completely unlock the mechanism. The tuning control will NOT reach a definite stop when the mechanism is unlocked. However, when the control turns easily for quite a while, then turns harder, the unlocked position is reached. In this position the tuning control will spring back when you take your finger off after turning it. At this point, the tuning indicator will function if you turn the tuning control back (up). IMPORTANT: WHEN THIS POSITION IS REACHED, DO NOT FORCE THE TUNING CONTROL FURTHER DOWN.

LOCKING TUNING MECHANISM

The locking action begins when you continue to turn the tuning control upwards after the word LOCK appears.

The action is much the same as described under UNLOCKING and it will require as many turns of the tuning control to lock the mechanism as were needed to unlock it.

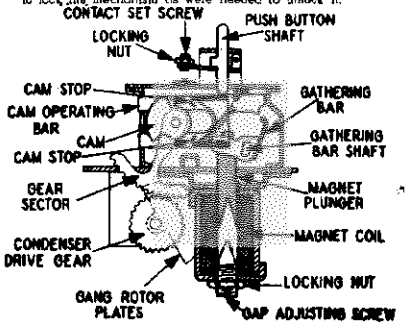

FIG. 3. Magnet Plunger in "OUT" Position

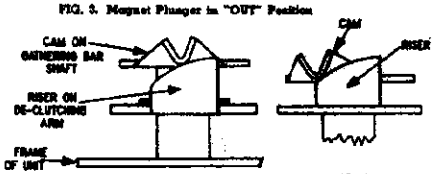

FIG. 7
Correct Position of Cam on Riser

FIG. 8
Position of Cam Too Low

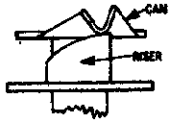

FIG. 9
Position of Cam Too High

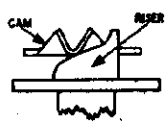

FIG. 10
Correct Position of Cam on Alternate Type Riser

HOW THE "FEATHERTOUCH TUNER" OPERATES

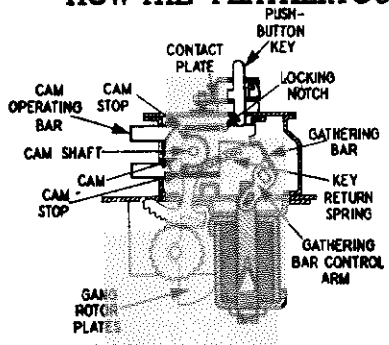

FIG. 4. Magnet Plunger in "IN" Position

Refer to Fig. 3 and Fig. 4. When a push button is depressed, it makes mechanical contact with the cam operating bar located under it, and depresses the bar so that the gathering bar can make contact with it. At the same time, the key forces the contact plate downward, making electrical contact through the contact screw. When the contact screw makes contact, it energizes the winding of the magnet assembly causing the plunger to be drawn completely into the magnet as shown in Fig. 4. The plunger is mechanically coupled to the gathering bar and gathering bar shaft, so that when the plunger is drawn into the magnet, it causes the gathering bar to be forced ahead. The gathering bar engages the cam operating bar which is depressed by the push button key and drives it forward as shown in Fig. 4. This position of the cam operating bar is indicated by the ends of the cam operating bar extending from the mechanism frame (see Fig. 6). When the cam operating bar moves forward, the cam stops attached to the bar, engage the cam, rotating it until it is in the position indicated in Fig. 4. The rotation of the cam causes the cam shaft and gear segment to rotate likewise, rotating the gang condenser to a position corresponding to the station to which this particular key is set.

HOW THE "LOCKING-UP" MECHANISM WORKS

The cam shaft assembly consists primarily of a shaft on which five cams are alternately spaced between friction collars. On the clutch end of this bar is a short threaded section upon which screws the collar which is part of the clutch and clutch spring assembly. When the cams are locked, this threaded collar is turned upon the threaded section of this cam shaft, exerting pressure upon the cams and friction collars, thus locking them securely in position. When the cams are unlocked, this threaded collar is turned so as to unscrew it and exert a minimum of pressure on the cams and friction collars. The only pressure then exerted upon the cams to hold them in position is that exerted by a spring washer near the threaded end of the shaft. Thus the cams are held so they cannot move of their own accord, but are still loose enough to permit them to be set to correspond to the desired station.

The threaded collar is connected through the clutch to the manual tuning control, permitting adjustment of the cams from outside the tuning unit.

OPERATION OF CLUTCH AND DE-CLUTCH ARM

The clutch mechanism of this tuner (see Fig. 6) functions every time a push button is depressed. Its purpose is to de-couple the manual tuning control and its associated gears from the automatic portion of the tuner when tuning electrically. The clutch is a dual unit, providing positive mechanical coupling between the manual tuning gears and the cam shaft, and it also has a leather friction disc which operates in conjunction with the positive coupling element to remove excessive backlash when tuning mechanically.

When the plunger is drawn into the magnet, turning the gathering bar shaft, the cam attached to the shaft (Fig. 6) moves downward on the riser of the de-clutch arm, releasing the pressure on the de-clutch arm, which bears against the inside section of the clutch. When this pressure is released, the clutch return spring contracts, separating the two halves of the clutch, thus disengaging the manual tuning gears.

When the push button is again released, allowing the plunger to be withdrawn from the magnet, the cam on the gathering bar shaft moves upward on the de-clutch arm riser, again exerting pressure on the de-clutch arm, and in turn on the clutch, thus engaging the two clutch sections, and making manual tuning possible.

BINDING BETWEEN SECTOR AND PINION GEARS: Excessive friction between these gears can be reduced by changing the position of the pinion gear so that the set screw indicated in Fig. 6 points upward when the gang is completely closed. (See Fig. 6). This draws the pinion gear slightly farther away from the gear sector, reducing the pressure between them.

COUNTER-WEIGHT STRIKES CASE: Should the gang counter-weight strike the wrap-around case, loosen the four screws holding the tuning mechanism to the chassis and shift the tuning mechanism slightly so counter-weight clears case. Keep in mind that the case side may be pulled in slightly when the cover is put on. If the case is warped inward, bend it slightly outward till counter-weight does not strike it.

SLIPPING CLUTCH (BACKLASH)

A slipping clutch is indicated by excessive backlash during manual tuning. First check to see that the correct plunger return spring is used.

The correct type of spring may be determined from the following table giving the dimensions of the three types of springs which have been used.

	Number of Turns	Length Overall of Body	Outside Diameter
CORRECT SPRING	36	7/8"	13/64"	5/32"
LIGHT SPRING	34 or more	9/16"	11/16"	3/8"
HEAVY SPRING	24	13/16"	13/64"	9/32"

If the unit has the light or heavy spring, replace it with correct one (Stewart-Warner Part No. 118154, Hudson Part No. BO-181529). When changing springs, it is also desirable to replace the magnet assembly if it does not have the Locking Nut and Gap Adjusting Screw shown in Fig. 8. However, this is only necessary when there is insufficient pull of the solenoid to operate the mechanism.

Next check the position of the cam on the end of the gathering bar shaft (copper plated shaft) with relation to the riser of the de-clutch arm while the plunger is out. See Fig. 6 and Fig. 7. The cam should be halfway up the curved portion of the riser as shown in Fig. 7.

If the cam is not halfway up the riser while plunger is out, as shown in Fig. 7 loosen the two Bristol set screws in the retaining collar on the other end of the gathering bar shaft and move the retaining collar on the shaft until the cam is properly positioned on the riser. A special set screw wrench (Stewart-Warner Part No. 112684) is needed to fit the Bristol set screws.

In all cases where slipping clutches are reported, check to see that there is no excessive friction in the gang condenser, dial or gang condenser drive gears. See section on "Binding".

TUNER TROUBLES AND REMEDIES

SET TUNES IMPROPERLY

If the set fails to tune in stations properly, first check the set-up of the various buttons. If the set-up is incorrect, the set will tune consistently to the same point, and this condition can be remedied by resetting the buttons.

If the set will not tune in stations, although the plunger tends to move, make sure the Bristol headed set screws in the retaining collar are tight. This is the collar which is almost touched by the condenser drive gear sector when the condenser plates are unmeshed. A loose set screw may strike the unit frame, causing the plunger to stick in either the IN or OUT position.

If the set fails to tune properly, and the dial stops at different points when approaching the station from opposite ends of the dial the mechanism may not be properly locked up (see "Locking Tuning Mechanisms"). The next step is to check for binding of the mechanism (see section on "Binding"). This trouble also may occur if the pulling force of the magnet is not great enough. This may occur when the battery voltage is low (below 5 volts). It may also be due to too large a gap between the plunger and the pole piece of the magnet assembly. On later sets the gap can be adjusted as described in paragraphs 5 and 6 of "Replacing Magnet Coil Assembly". The adjustable magnet assemblies are identified by the Gap Adjusting Screw and Locking Nut shown in Fig. 6.

In the early type of magnet assemblies, the gap is not adjustable. If one of these magnets is found to have insufficient pull, the remedy is installation of the new type magnet assembly. However, before replacing a magnet assembly, make sure that improper tuning is not due to low battery voltage or the other causes mentioned above.

MECHANISM WHERE TUNING CONTROL FAILS TO REACH STOP DURING UNLOCKING

This is probably due to the shearing off of the "C" washer on the clutch end of the cam shaft (See Fig. 6). On the earlier mechanisms, the "C" washer holding the clutch and gear assembly to the shaft was made of a fairly soft steel. Occasionally these washers may shear off if the customer continues turning the tuning wheel after the mechanism has become completely unlocked. This continued turning forces the gear and clutch assembly against the "C" washer, shearing it off completely. You can replace this washer with the new hardened washer (Stewart-Warner Part No. 118676, Hudson Part No. BO-181579). This can be done without removing the tuning unit from the case. First lock the mechanism; then remove the nuts holding the triangular plate on the clutch end of the tuner. Unhook the plunger return spring so that no pressure will be exerted by the clutch. The washer can now be removed and a new washer installed.

On all early sets, replace this "C" washer even if the old one is still all right.

Shearing or partial shearing of this washer may cause slipping of the clutch or sticking of the plunger in the OUT position.

If a bronze washer is present between the "C" washer and the gear, remove it and discard it. If a steel washer is present, it must be left in place. On early mechanisms, a ⅛" steel washer was used in this position and it must be left in place.

BINDING

If the radio tunes improperly, check for binding in the dial and tuning mechanisms. Below are enumerated some of the reasons for binding:

RUBBING LIGHT DIFFUSION PLATE: Two types of light diffusion plates were used, the new type being riveted to the cover, while the old type is mounted on the unit itself. (See Fig. 5) If the new type light diffusion plate, which is

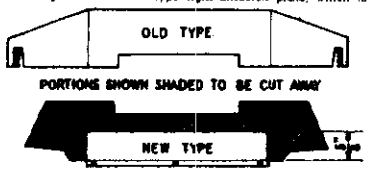

FIG. 5. Illustration Showing Method of Cutting Light Diffusion Plate

mounted in the cover of the control head rubs against the dial scale due to warping of the celluloid, cut this plate as shown by the shading in Fig. 5. This can be done without removing the shield from the cover. In some early units, this diffusion plate was mounted on the unit itself. In this case, enlarge the notch fitting over the dial lamp wire as shown in Fig. 5. Exercise care when enlarging the notch, as the celluloid is quite brittle and may break. Then cement the diffusion plate to the front of the contact plate assembly so that the shield rests flat against this metal plate.

ENDS OF DRUM RUBBING BRACKETS: The dial drum should have a slight amount of end play. If it doesn't, it may be binding. This may be due to improper placement of the volume control mounting bracket. To correct this difficulty loosen the two screws holding this bracket and move this bracket slightly farther away from the drum.

Similar binding may also be due to a loose end cap on the dial drum. In this case, force the cap back on the drum and punch-mark the cap to hold it in place on the dial drum.

In a few cases it may be found that dial end bearing is out of line or slightly off center. The bearing can generally be bent slightly to restore it to its proper position. If this cannot be done, replace the dial scale assembly.

Binding of the drum on the mounting brackets may be due to the fact that the control units fitted too tightly in early cars. This causes the escutcheon to be forced sideways, thus pressing on the tuning controls, which may move the dial drum brackets. This binding can generally be eliminated by bending the brackets slightly outward.

Similar difficulties will be encountered if the control head is not properly installed. When mounting the head, tighten the wing nuts evenly, so the control head will not have a tendency to bind against the dash opening, which would push the escutcheon against the controls.

DRIVE PULLEY STRIKING ANTENNA COIL SHIELD: Check to see that the dial drive pulley is properly located on condenser shaft. Its bushing should touch the condenser pinion gear.

Also, the antenna coil shield can may be moved slightly away from the drum by loosening the two nuts holding down the can.

It may also be possible to move the entire tuning unit slightly away from the shield can. Loosen the four screws holding down the unit and shift it.

CHASSIS WIRING IMPROPERLY PLACED: If the leads from the on-off switch and other leads in the vicinity of the "A" filter assembly are not properly located, they may interfere with free motion of the dial cord or the condenser drive gear sector. Dress these leads so that they cannot touch these moving parts.

STICKING MAGNET PLUNGERS

If the automatic tuning mechanism does not operate but manual tuning is possible, the plunger may be stuck in the OUT position. (See Fig. 3) If manual tuning control turns easily but does not tune stations, the plunger may be stuck in the "IN" position (See Fig. 4). A loose set screw on the retaining collar on the gathering bar shaft may strike the frame and cause the plunger to stick so check the set screws first.

If the plunger sticks when the plunger is all the way in, it is sticking against the conical pole piece of the magnet assembly.

On the later sets, the gap between the plunger and the pole piece is adjustable. Adjustable magnets are identified by the gap adjusting screw and locking nut on the end of the magnet assembly. (See Fig. 6.) In these sets, loosen the locking nut on the rear of the magnet and turn the gap adjusting screw outward (counter-clockwise) one-half turn, and re-tighten the locking nut. If this sticking occurs in early units, replace the magnet with the newer type assembly. Read the paragraph "Replacing Magnet Coil Assembly" for instructions for replacing and adjusting the magnet assembly.

The plunger may stick in the OUT position, if the "C" washer on the clutch end of the cam shaft (Fig. 6) is totally or partially sheared off. Check this washer, and if found defective, replace with the hardened type of washer, (Stewart-Warner Part No. 118676, Hudson Part No. BO-181579). See Fig. 6 of page 14. A faulty "C" washer allows the plunger to come out too far, and also allows the cam to reach a position too high on the de-clutch arm riser (See Fig. 9).

After checking the "C" washer, check the adjustment of the cam on the riser, as explained under "SLIPPING CLUTCH".

If the cam is too far up on the riser (See Fig. 9) it lets the plunger come out of the magnet too far and this may cause sticking. If the cam is not far enough up on the riser (See Fig. 8) the clutch may slip.

If the position of the cam is correct as shown in Fig. 7 but the plunger still sticks loosen the two screws holding down the magnet and shift it slightly until the plunger moves freely, then retighten the screws. If this does not clear up the difficulty, replace the entire magnet assembly.

REPLACING MAGNET COIL ASSEMBLY
(Stewart-Warner Part No. 118177, Hudson Part No. BO-181577)

To replace a magnet coil assembly, proceed as follows:

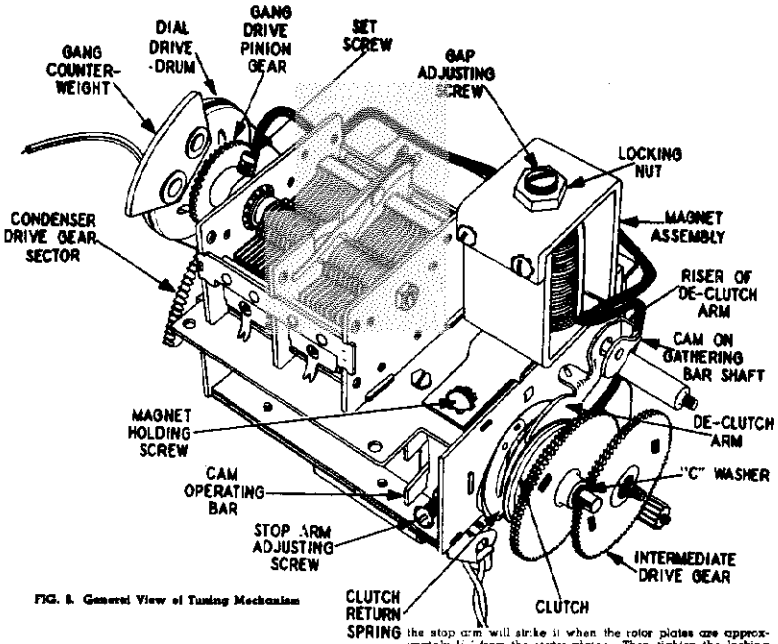

FIG. 6. General View of Tuning Mechanism

1. Remove top and bottom covers of tuning unit. Unsolder red and black magnet wires from points to which they connect.
2. Take out two round headed screws holding magnet to mounting plate.
3. Lift off old magnet assembly and install new assembly.
4. When replacing this magnet assembly, before tightening the screws holding down the unit, check to see that the plunger moves freely inside the magnet coil. If it has a tendency to bind, shift the position of the magnet slightly, until the plunger moves freely, then tighten down the holding screws.
5. It is now necessary to set the large adjusting screw on the top of the new magnet. Loosen the nut and turn the screw out several turns. Now push down one of the push button shafts next to the drum dial. Then with a screwdriver, push the plunger into the magnet as far as it will go.
6. While holding the plunger in very tightly, you can now release the push button shaft and turn the magnet adjusting screw in, until you feel the screw striking the plunger. When this happens, back the screw out one complete turn and retighten the locking nut. This adjustment must be made very carefully since if the threads are tight, it is difficult to notice the exact point where the screw strikes the plunger.

IMPORTANT: To get proper adjustment, a push button shaft must be depressed before pushing in the plunger so that the plunger operates the tuning mechanism as indicated by one of the cam operating bars extending from the frame (Fig. 6). If the above adjustment is done while the power is on the unit, the plunger will pull in by itself as soon as you depress one of the push button shafts. It is then merely necessary to hold the plunger in tightly with a screwdriver and release the push button shaft. The adjustment can then be made.

STOP ARM ADJUSTING SCREW

The function of this screw (Fig. 6) is to prevent damage to the gang condenser plates when the rotor plates are fully opened. This screw is adjusted so that the stop arm on the cam shaft will strike it just before the gang condenser plates open so far as to strike the stationary plates. Set this screw so the stop arm will strike it when the rotor plates are approximately ⅛" from the stator plates. Then tighten the locking nut so as to hold the screw in this position.

There is also a fixed stop whose purpose it is to stop the condenser plates just before they strike the fixed plates when the plates are fully meshed. This fixed stop is part of the frame assembly. When the gang condenser or any of its associated parts are replaced or otherwise adjusted, before tightening the set screws holding the condenser drive pinion gear to the shaft, set the rotor plates so that their upper edges are flush with the top edges of the stator plates. Then turn the condenser drive gear segment until the stop arm on the cam shaft strikes the fixed stop on the frame, then tighten the set screws. When this adjustment is properly made, and when the stop arm adjusting screw is correctly set, no strain is put on the rotor plates of the condenser in either the open or closed position of the gang condenser.

ADJUSTMENT OF CONTACT SCREW

The contact screw, once properly set, seldom requires readjustment. Improper adjustment may be identified by the following symptoms:

CONTACT SCREW TOO FAR IN: When a push button key is depressed, the magnet will operate, but the cam operating bar may not be pushed through as shown in Fig. 8.

CONTACT SCREW TOO FAR OUT: This may permit the push button key to exert too much pressure on the cam operating bar and cause it to stick.

Chattering of the mechanism may be caused when the screw is either too far in or too far out. Adjust the screw until the unit operates properly when any one of the push buttons is depressed.

POSITION OF GANG CONDENSER COUNTER-WEIGHT

Refer to Fig. 14. The purpose of the counter-weight shown in this illustration is to counter balance the weight of the gang condenser. To function properly, the weight must be in the position illustrated in Fig. 14 when the gang condenser is closed. When the weight is in this correct position the edge of the weight nearest the set screw is approximately straight up and down with the gang condenser fully meshed. When replacing the dial drive drum, always check to see that this weight is in the position described above, or the tuning unit may not operate satisfactorily.

MODEL DB40
MODEL SA40
Dial Drive Data

HUDSON MOTOR CAR CO.

REMOVING TUNING UNIT CHASSIS FROM CASE

1. Pry off bottom cover, utilizing screwdriver slot at front of case.
2. Remove four self-tapping screws holding down top cover and pry cover off.
3. Unsolder the blue wire extending from the on-off switch to the "A" choke assembly.
4. Remove two screws holding antenna receptacle to case. Also remove the screw holding down the cable grounding plate. Then remove four screws holding chassis assembly to case.
5. The entire tuning unit chassis can now be lifted from the case.

REMOVING TUNING MECHANISM FROM CHASSIS

1. Unsolder the green-white and the white wire from the gang condenser.
2. Unsolder brown cable wire from low end of volume control.
3. Unsolder gray rubber covered shielded wire (2 copper tracers) from center terminal of volume control.
4. Unsolder gray rubber covered shielded wire (1 copper tracer) from high end of volume control.
5. Unsolder blue wire from on-off switch on volume control. Also unsolder shielding from volume control bracket.
6. Unsolder 2 blue pilot light wires at 6A8 socket.
7. Unsolder ground of .05 mfd. condenser from frame of tuning mechanism. Mechanism can now be lifted out.

HOW TO REPLACE THE DIAL DRIVE CORD

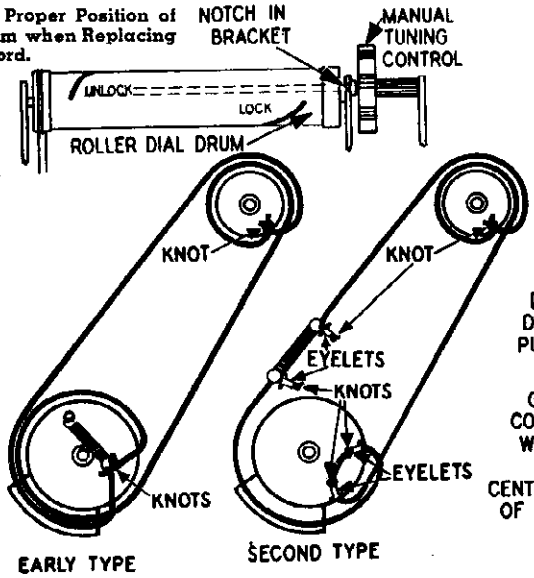

FIG. 11. Proper Position of Dial Drum when Replacing Drive Cord.

FIG. 12
Early Type
Dial Drive System

FIG. 13
Second Type
Dial Drive System

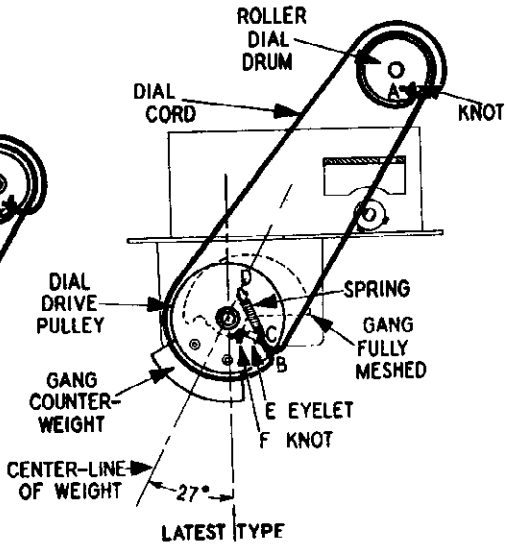

FIG. 14
Details of Latest Type
Dial Drive Systems

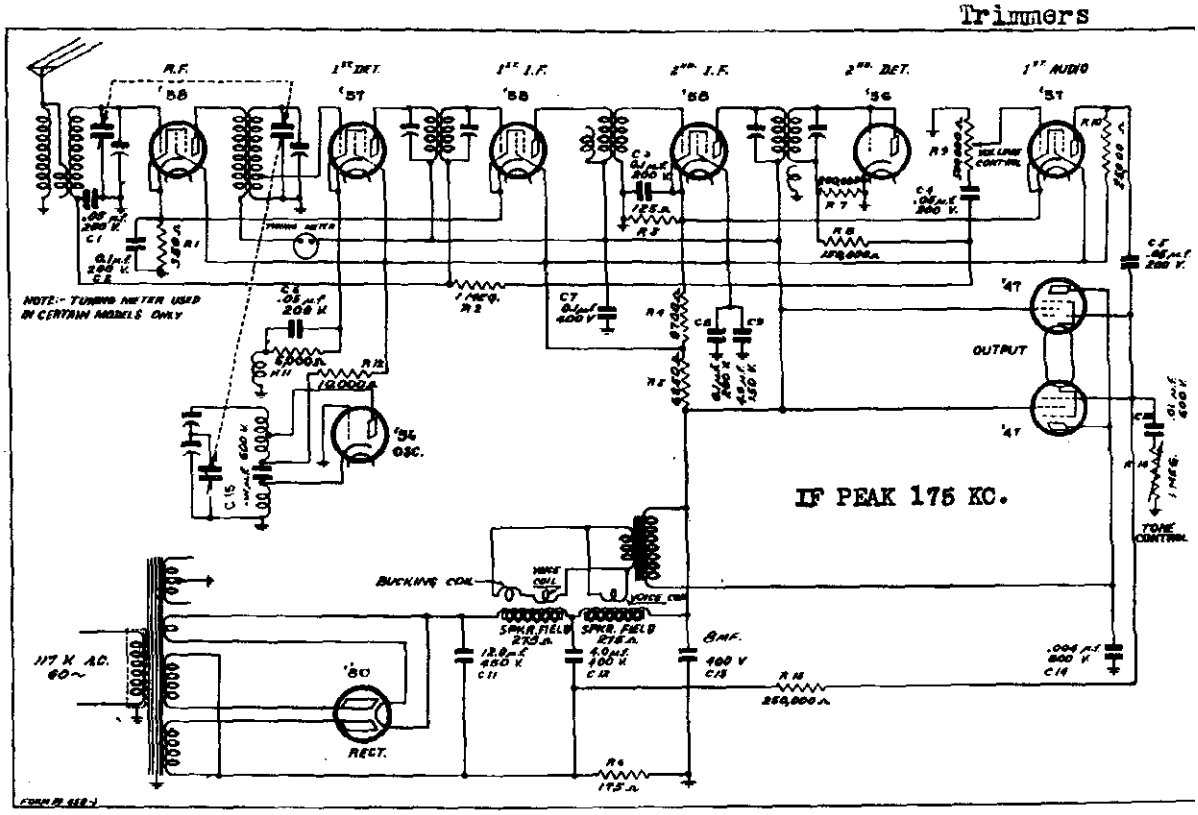
Three dial drive systems are illustrated here. The method marked "Second Type" (Fig. 13) can be used in sets originally using the "Early Type" (Fig. 12). The second type is preferable to the early type.

The method marked "Latest Type" (Fig. 14) is the best but uses a different Dial Drive Pulley. Therefore early type or second type drives **cannot** be restrung as shown for latest type unless a new Dial Drive Pulley (Stewart-Warner Part No. 118176, Hudson Part No. BO-161539) is installed.

The dial cord in the latest type dial drive can be replaced as follows:

1. Remove chassis from case as described on this page.
2. Remove the antenna coil shield can by removing the two nuts holding it to the chassis. This will give access to the dial drive drum.
3. Refer to Fig. 11. Rotate the dial so the word "UNLOCK" is directly in line with the reference notch in the right hand dial support bracket. Block the dial in this position, using a small block of rubber or other soft material which will not mar or damage the dial.
4. Rotate the gang condenser so its plates are fully meshed. (See Fig. 14.) Keep the gang in this position until the dial cord has been replaced.
5. About 26 inches of dial drive cord (Stewart-Warner Part No. 113178, Hudson Part No. BO-158521) are required. Tie a large knot in the center of this dial cord.
6. Pass both ends of the cord outward through hole A in the roller dial drum. (Fig. 14.)
7. Pass one end of the dial drive cord clockwise around the roller dial drum, through the hole in the support bracket and through hole B in the dial drive pulley.
8. Pass the other end of the cord counter-clockwise around the roller dial drum, counter-clockwise around the dial drive pulley and inward through hole B in the dial drive pulley.
9. At this point, make sure that the gang is fully meshed that the counter-weight is in the proper position, and the dial is in the position shown in Fig. 11. Otherwise calibration will be incorrect.
10. Tie a spring to the ends of the dial drive cord inside the dial drive pulley so that the cord extends about 3/8 inch inside the pulley when the cord is pulled taut. See Fig. 14. This illustration shows the recommended method of fastening the spring using an eyelet. Fasten the other end of the spring to the tab D on the pulley. The spring should be stretched only very slightly when in place. Too much spring tension may cause binding.
11. Remove the material used to hold the dial in position as described in Step 2. If the above procedure has been followed, the calibration of the dial will be correct when the unit is replaced in the case.

LAFAYETTE RADIO MFG. CO.



Set the signal generator for 175 K.C. Connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Turn the tuning condenser rotor until the plates are completely out. The ground lead from the signal generator goes to the ground lead of the receiver. Then adjust the four intermediate frequency condensers for maximum output. The adjusting screws for these condensers are reached from the bottom of the chassis.

Next set the signal generator for a signal of exac 1400 K.C. The antenna lead from the signal generator in this instance, connected to the antenna lead of the ceiver. Set the dial pointer on the 1400 K.C. mark on t dial scale and adjust the three trimmer condensers on t gang tuning condenser for maximum output, adjusting t oscillator trimmer first.

Next set the signal generator for a signal of 600 K. and adjust the oscillator 600 K.C. trimmer. The adjusti screw for this condenser is reached from the top of t chassis and is between the I.F. and oscillator coil cans.

Trying Out the Set and Adjusting

After the wiring has all been completed and before the chassis is permanently installed, try out the set and adjust the antenna trimmer. The location of the tubes is shown in Fig. 8. To adjust the antenna trimmer, tune in a weak signal between 1200 and 1400 K.C. with the volume control about three-fourths on. On one end of the chassis box are two small metal plates. Remove the smaller of these two plates. Directly under the hole in the chassis box

First set the signal generator at approximately 262 K.C. Connect the antenna lead from the generator to the control grid of the I.F. 78 tube, through a .05 mfd. condenser. The ground lead of the generator goes to the ground of the receiver. Turn the rotor plates of the tuning condenser completely out and keep the signal weak enough to prevent A.V.C. action. Note from Fig. 10 that the second I.F. transformer is self tuned and cannot be adjusted. Adjust the frequency of the signal generator until the output meter shows maximum output. The intermediate frequency setting of the generator is then correct, although it may be a very small percentage higher or lower than 262 K.C.

Next connect the signal lead from the signal generator to the grid of the 1st detector tube through a .05 mfd. condenser. Then adjust the two intermediate frequency condensers for maximum output. One of the I.F. condenser screws is reached through the hole on the top of the 1st I.F. assembly can. The other I.F. condenser screw is reached from the bottom of the sub-panel through a hole at the bottom of this assembly.

Now set the signal generator for a signal of exactly 1400 K.C. The antenna lead from the generator is, in this instance, connected to the antenna lead of the receiver. Connect the flexible drive shaft to the chassis if it has been disconnected. As explained previously, the dial scale should be at the low frequency end stop when the rotor is completely in mesh. Then turn the station selector knob until the dial scale is at 1400 K.C.

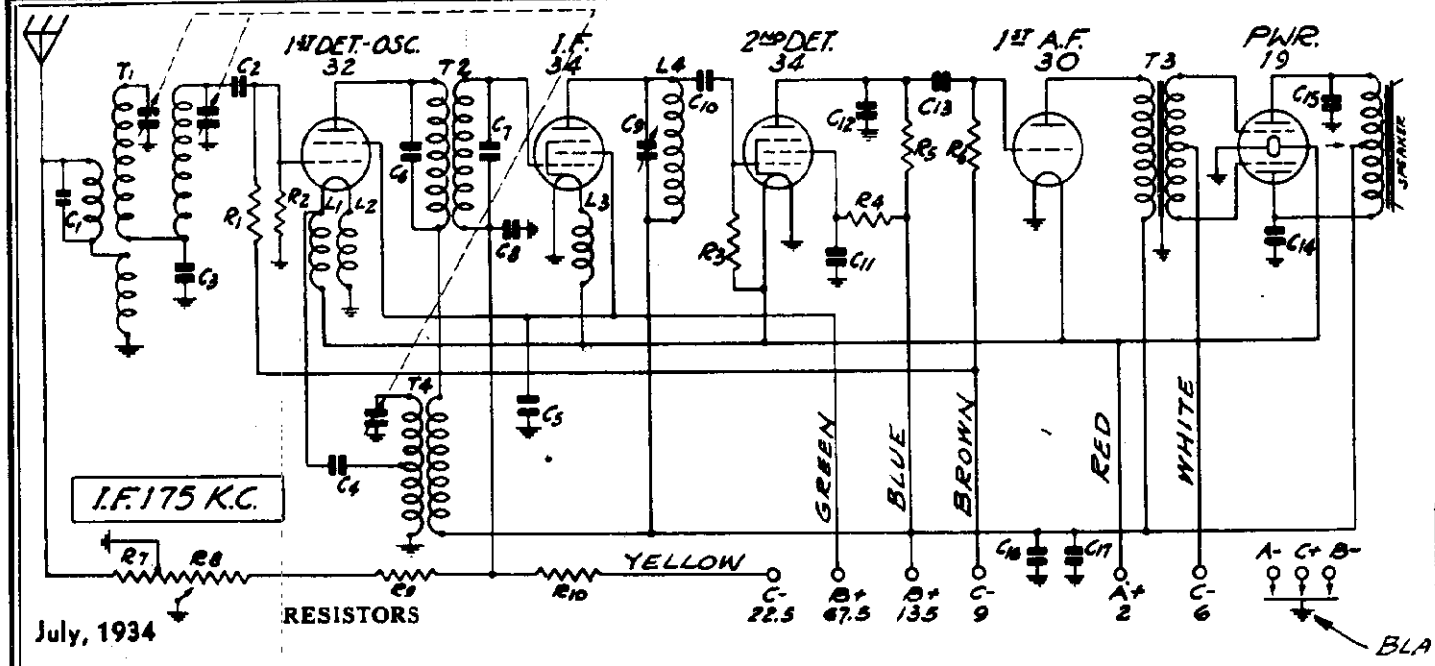
Then adjust the three trimmer condensers on the gang tuning condenser for maximum output, adjusting the oscillator section first.

Next, set the signal generator for a signal of 600 K.C. and adjust the oscillator 600 K.C. trimmer. The adjusting screw for this condenser is reached through a hole in the back wall of the sub-panel.

A non-metallic screwdriver is necessary for this adjustment. Turn the tuning condenser rotor until maximum output is obtained. Then turn the rotor slowly back and forth over this setting, at the same time adjusting the 600 K.C. trimmer screw until the highest output is obtained.

Then set the signal generator again for a signal of 1400 K.C. and check the adjustment of the tuning condenser trimmers at this frequency for maximum output.

adjusting screw up or down until maximum output is obtained.



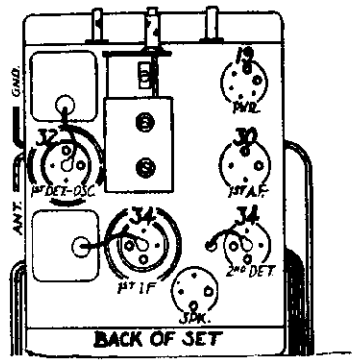


Fig. 1—Schematic Circuit Diagram.

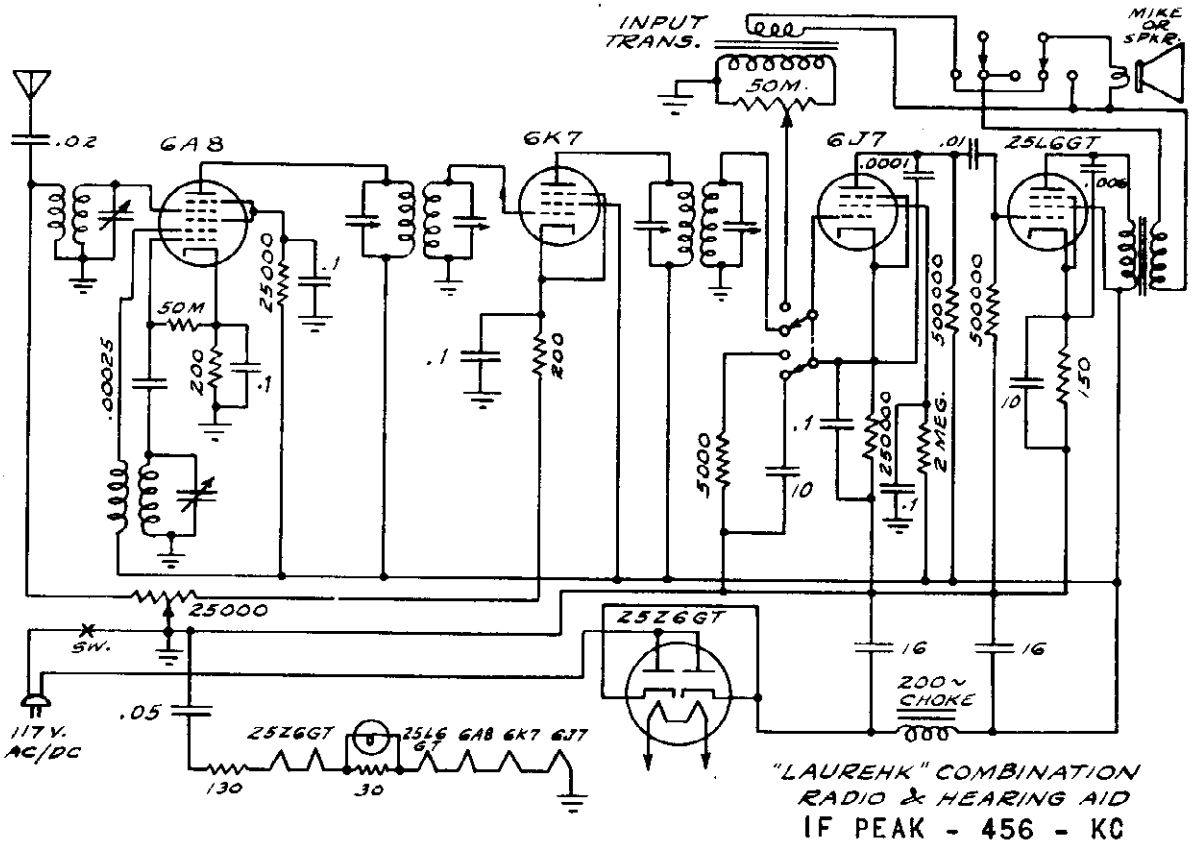
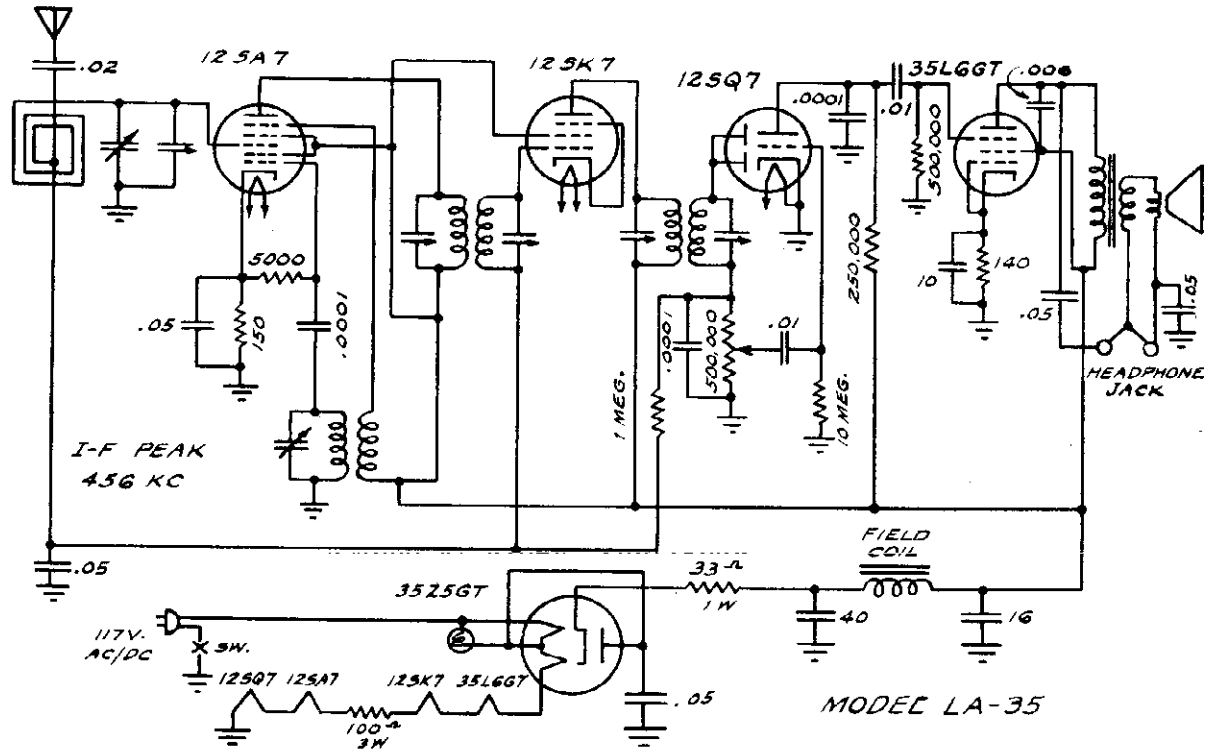
MODEL LA35

LAUREHK RADIO MFG. CO. MODEL Radio-Hearing Schematics



"LAUREHK" COMBINATION RADIO & HEARING AID

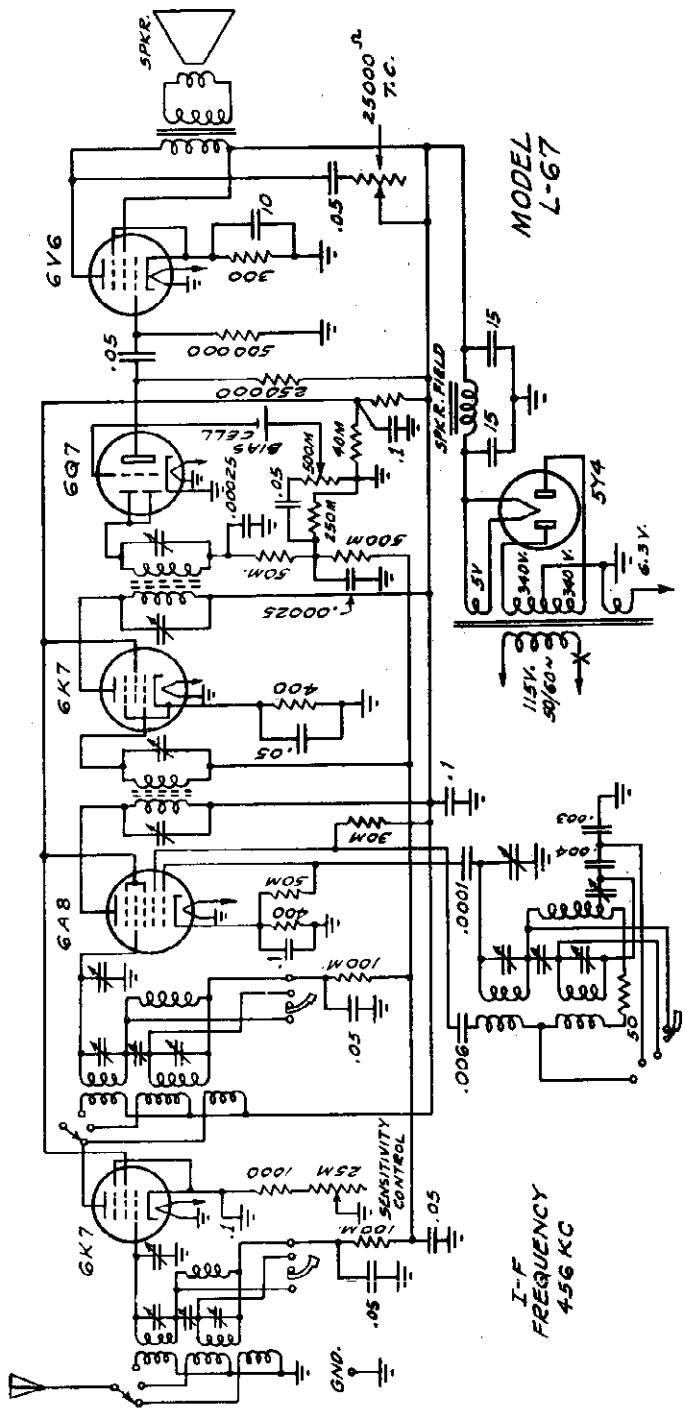
IF PEAK - 456 - KC



MODEL LA-35

MODEL L67
Schematic, Alignment

LAUREHK RADIO MFG. CO.



The I. F. Amplifier is aligned in the usual manner. Connect a service oscillator between the grid of the 6A8 tube, using a condenser .0005 mfd. to .25 mfd. between the grid and the high side of the generator output. Do not remove the grid clip for this operation. The Range Switch should be turned to the Broadcast band and the dial set near 600 Kc; then proceed with alignment at 456 Kc.

Turn the audio Volume Control and Sensitivity Controls on full. Increase the output of the service oscillator until a signal is just audible. Adjust each I. F. Trimmer so that maximum volume is obtained. It is best to repeat this procedure two or three times on each trimmer to obtain the most accurate adjustment. These trimmers are adjusted with a small screw driver through the openings in the top of the shield on each I.F. transformer.

The service oscillator should now be connected to the Antenna and Ground terminals of the receiver, through the proper dummy antenna.

Close the gang condenser and see that the dial pointer position coincides with the last line at the low-frequency end of the dial. If this condition does not obtain, loosen the set-screw on the dial drum, make the necessary correction, and firmly tighten the screw.

Turn the range switch to the Short-Wave (extreme clockwise) position, set the dial and the service oscillator to 17 Mc, connect a 400 ohm resistor between the service oscillator and the antenna binding post as a dummy antenna, turn the output of the service oscillator up to maximum, tighten the top trimmer in the oscillator coil until just snug, then loosen it four turns and then as the trimmer is tightened, set it to the position of maximum response, reducing the output of the service oscillator as alignment proceeds. (If two responses are found of nearly equal intensity, adjust for the one with the trimmer farthest open). Align the top trimmers in the RF coil, but since the RF adjustment has some effect on the oscillator frequency it will be necessary to rock the dial slightly to keep the signal tuned in. Having aligned the oscillator and RF circuits adjust the top trimmer in the Antenna coil for maximum sensitivity, reducing the output of the service oscillator as the receiver becomes progressively more sensitive. If the receiver tends to "motor-boat", turn down the service oscillator output until the trouble stops. Some service oscillators, however, leak through enough signal that even with the output control set at zero, the receiver is still overloaded, in which case it is necessary to turn down the Sensitivity and Audio Controls until the receiver behaves properly.

Turn the Range Switch to the "Police" or middle range and set the service oscillator and dial at 4.8 Mc. Align first the oscillator, then the RF and Antenna coils on this band - lower trimmer on all three coils, in a manner similar to that used on the Short Wave band. Both the Short Wave and Police band ranges have fixed padding condensers.

Turn the Range Switch to the Broadcast position, substitute a 200 mmfd. condenser for the 400 ohm resistor as a dummy antenna, set the dial and the service oscillator to 1400 Kc. and align the circuits again (middle trimmer) in the same manner as described above. Having done this, set the service oscillator to 600 Kc. and tune the receiver dial for maximum response in the neighborhood of 600 Kc. Next, rock the dial back and forth across the signal, at the same time adjusting the padder condenser, turning continuously in one direction until the output of the receiver, as it is rocked across the signal, becomes maximum. If the padder is turned too far, the output will drop off again. After minutes experiment with this operation will show more than a lengthy description. Having completed the padding operation, return the receiver and the generator to 1400 Kc. and realign as before. this completes the alignment of the Broadcast band and of the receiver.

THE MAGNAVOX CO., INC.

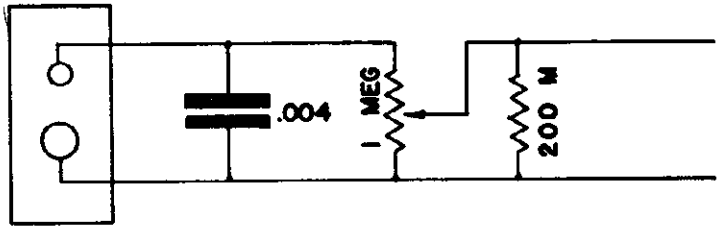
MODEL CR-141 and CR-142.

Since the first production of this model was released, several circuit changes have been made to improve the fidelity and volume of phonograph reproduction. These changes were made at two different times and are shown in Figures B and C. Figure A shows the original circuit. It is possible to check the phonograph input circuit on this radio without removing the chassis from the cabinet by the use of an ohmmeter, according to instructions shown.

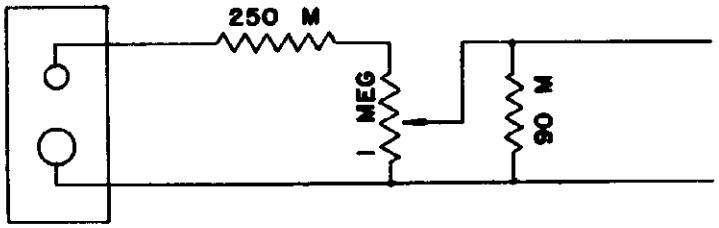
TURN WAVE SWITCH TO PHONO POSITION, REMOVE PICKUP PLUG AND CONNECT OHMMETER TO PICKUP SOCKET — MEASURE RESISTANCE WITH VOLUME CONTROL OFF AND FULL ON.

A



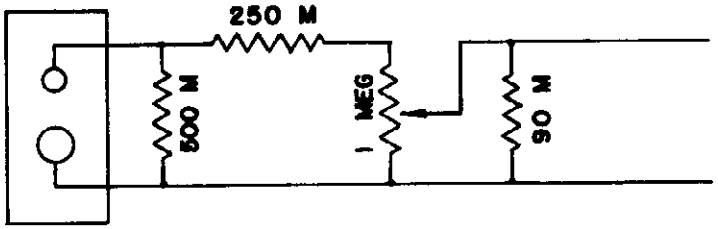
VOLUME CONTROL	
OFF	ON
1 MEG	157,000Ω

B



VOLUME CONTROL	
OFF	ON
1,250,000Ω	332,500Ω

C



VOLUME CONTROL	
OFF	ON
356,000Ω	200,000Ω

IF IT IS FOUND THAT CIRCUIT "A" OR "B" IS USED, CHANGE TO CIRCUIT "C".

10 K.C. FILTER ADJUSTMENT

MODELS CR-136, CR-146, CR-147, CR-148, CR-149, CR-152, CR-153.

With the tone control set for maximum treble response and the Band Expander set in the High Fidelity position (accomplished by rotating the treble control to the right as far as possible), tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by retuning the 10 KC output filter by means of the 10 KC trimmer condenser at the rear center of the chassis. In the absence of such a signal source in the daytime, an ACCURATE audio oscillator may be used to feed a 10 KC into the volume control.

MODELS CR-134, CR-140, CR-142, CR-144, CR-143, CR-145, CR-150, CR-151.

With the tone control set for maximum treble response, tune the receiver to a point between two stations of about the same signal strength on adjacent channels. If a 10,000 cycle heterodyne is heard as the beat note between the two carriers, it may be eliminated by retuning the 10 KC output filter by means of the 10 KC trimmer condenser at the rear center of the chassis.

BERKELEY AND HEPPLEWHITE UNITS

TO REMOVE THE CHASSIS FROM THE CABINET:

1. Remove the four plugs from the lower side of the chassis and remove the antenna-ground terminal board from the side of the cabinet.
2. Pull the control knobs and the push button knobs from their shafts.
3. Remove the stay-hinge from the lid of the cabinet by removing the two upper wood screws holding it in place. Tilt the cabinet lid back and rest it on a support.
4. Remove the stay-hinge plate from the radio panel.
5. Remove the Philips-head wood screws, securing the radio panel, and lift the panel from the cabinet.
6. Loosen the four screws securing the chassis to the cabinet cleats, and lift the chassis from the cabinet.

CAUTION: Do not remove the mounting brackets from the chassis at any time.

ADJUSTMENTS OF PUSH BUTTONS

These push-buttons are adjusted so as to come within three (3) frequency ranges. The first button from the left is for stations lying between 1200 and 1600 kylocycles. The second (2) button is for stations lying between 800 and 1350 kilocycles. The third (3) and fourth (4) buttons are for stations lying between 540 and 1100 kilocycles. To set up these buttons, determine which four (4) stations you wish to receive most frequently. Ascertain their frequencies and determine on which button they should be set up. Push in the button on which a particular station is to be set up and, with a screw driver, turn the screw at the rear of the chassis corresponding to this push-button, until the station you desire to hear is received with best quality and tone. Go to the top rear of the chassis and adjust the corresponding trimmer condenser until that station is heard with maximum volume. Repeat for the other push-buttons. The location of these adjustment points is shown in figure 1.

PUSH BUTTON TUNING

Six buttons on this set are provided to allow you to select your favorite station in the broadcast band instantaneously without any operation except that of pushing a button. These buttons start from the fourth from the left to the fourth from the right, inclusive, and numbering them from the left to the right, as 1, 2, 3, 4, 5, and 6.

The buttons numbered 1, 2, and 3 are designed to cover the frequency range from 1700 to 800 Kc. Buttons number 4, 5, and 6 are designed to cover the range from 1200 to 540 Kc. To set up these buttons it is only necessary to select one of the buttons which includes the frequency of the station which you wish to receive, and depress that button. Select the corresponding screw in the back of the receiver and with a small screw driver adjust it by turning the screw in or out until the station is being received as well as possible. Then, using the same screw driver, adjust the corresponding trimmer from the top of the chassis until maximum volume is obtained on that station. The other buttons may be adjusted in exactly the same fashion to different stations. Every time a button is adjusted for a certain station, remove the call letter tab from the sheet of call letters furnished with the receiver, and insert it through the small slit in the side of the knob so that the call letters show through the top of the knob. After the buttons have been once adjusted in this fashion, it is only necessary to press the button marked with the call letters of the station you wish to receive, whereupon it will be heard instantaneously.

MODELS 5BDA, 5BEA

PUSH BUTTONS: Looking at the front of the set counting from left to right, the first four push buttons are for setting up stations.

Button number 1 is for stations lying between 975 and 1550 Kilocycles
Button number 2 is for stations lying between 850 and 1350 Kilocycles
Button number 3 is for stations lying between 540 and 1100 Kilocycles
Button number 4 is for stations lying between 540 and 1100 Kilocycles
Button number A is for Broadcast Band.
Button number B is for Short Wave Band

Determine on which button a desired station is to be set up. Push that button in. Going to the rear of the receiver, adjust the coil corresponding to the chosen push button until the desired station is heard with maximum volume and best tone. Adjust the trimmer corresponding to the chosen button until that station is heard with maximum volume. Repeat for other push buttons.

MODEL 1M40.

ADJUSTMENT OF PUSH BUTTONS

Determine on which push button you wish to set a particular station. Pull off that button. Using a screw driver, loosen the screw covered by the button. Tune the set manually by means of the station dial drum until the desired station is heard with best tone and volume. Push the push button shaft as far as it will go, tighten the screw, insert the proper station tab in the slot of the push button, and replace the push button on the push button shaft. Repeat for other stations.

PUSH BUTTONS

Looking at the front of the set counting from left to right, the first four push buttons are for setting up stations.
Button number 1 is for stations lying between 975 and 1550 Kilocycles.
Button number 2 is for stations lying between 850 and 1350 Kilocycles.
Button number 3 is for stations lying between 540 and 1100 Kilocycles.
Button number 4 is for stations lying between 540 and 1100 Kilocycles.
Button number A is for Broadcast Band.
Button number B is for Short Wave Band.

Determine on which button a desired station is to be set up. Push that button in. Going to the rear of the receiver adjust the coil corresponding to the chosen push button until the desired station is heard with maximum volume and best tone. Adjust the trimmer corresponding to the chosen button until that station is heard with maximum volume. Repeat for other push buttons.

Plug in the line cord to an AC power line of 105-130 Volts of 60 Cycles for Models 2A50-F and 2A50-F-M, and 50 or 60 Cycles for Models 2A50-F-B and 2A50-F-M-B.

The tubes used are:

1—6A7	Frequency converter
1—6D6	Intermediate frequency amplifier
1—75	Second detector, AVC, and Audio frequency amplifier
1—41	Output
1—80	Rectifier

SETTING UP OF PUSH—BUTTONS

Button No. 1 is for stations lying between 1100 and 1550 KC's.
" No. 2 is for stations lying between 950 and 1450 KC's.
" No. 3 is for stations lying between 800 and 1200 KC's.
" No. 4 is for stations lying between 620 and 950 KC's.
" No. 5 is for stations lying between 620 and 950 KC's.
" No. 6 is for stations lying between 540 and 800 KC's.

1. Select the stations that you wish to set up on the push-buttons.
2. Determine on which push-buttons these stations should be set up, according to above table.
3. Push the button on which you should set up a particular station.
4. Using a screw driver, adjust the coil corresponding to the proper push-button until the desired station is heard with maximum volume and best tone.
5. Adjust the trimmer condenser corresponding to the proper push-button until the desired station is heard with maximum volume.
6. Repeat for other push-buttons.

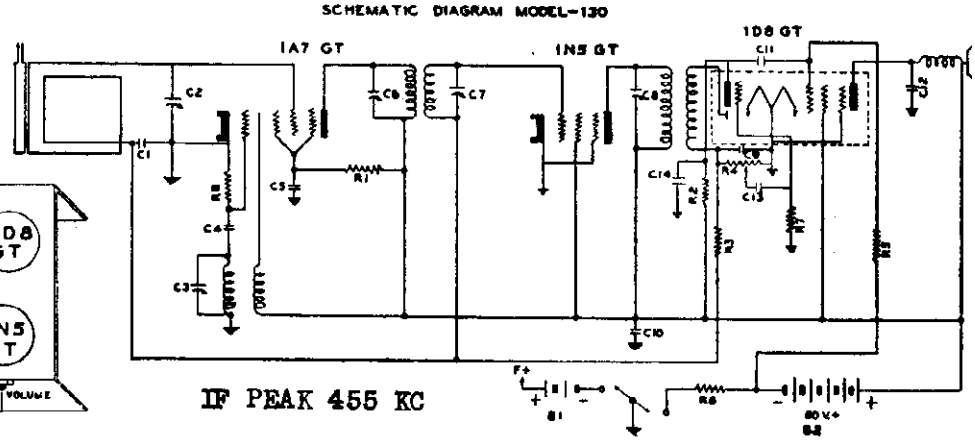
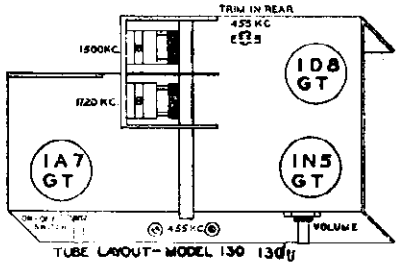
MODEL 130, 130U

SCHEMATIC DIAGRAM MODEL-130



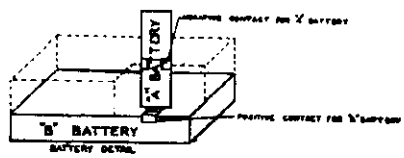


IF PEAK 455 KC

CONVENTIONAL ALIGNMENT SEE SPECIAL SECTION VOLUME VIII

To change the "A" battery, remove the old one from its bracket. Remove the wrapping or tube from the new battery and snap it in position as shown in Figure 1, making certain that the small center contact of the battery makes a good connection to the spring contact as shown in Figure 1.

To change the "B" battery, slide the old one from underneath the chassis. Remove the plug from this battery. Insert the plug into the new battery and replace the new battery.



The tuning range is from 540 to 1750 kilocycles.

The tubes used are:

1—1A7GT	Combined oscillator and 1st detector.
1—1N5GT	Intermediate frequency amplifier.
1—1D8GT	Combined second detector, Audio driver, and Power output.

MODEL 699-P

Model 699-P is a six tube radio phonograph combination operating on a 110 volts 50-60 cycles. The receiver tunes to three bands, these are:

A—Broadcast band 538 to 1750 kilocycles.

B—Police and airplane 1.75 to 5.8 M.C.

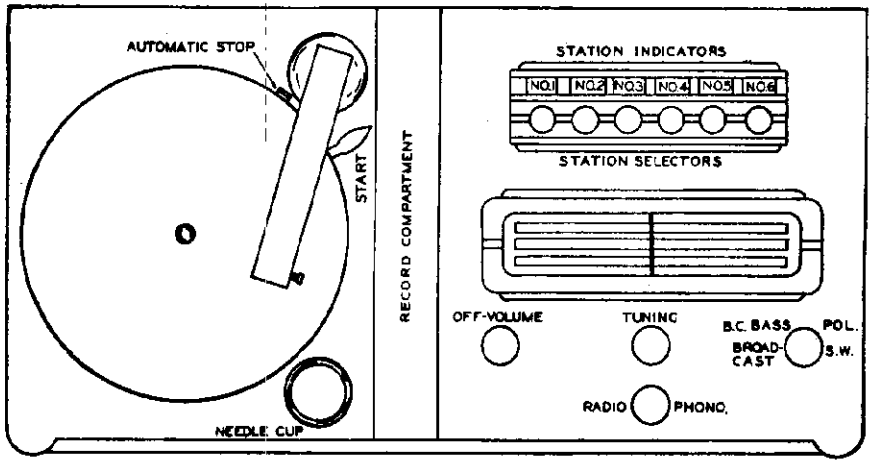
C—American and foreign short wave receptions 5.8 to 18.6 M.C.

The receiver is equipped with automatic volume control, inverse feedback, inverse feedback tone control, base compensation, and mechanical push button tuning.

CONVENTIONAL ALIGNMENT SEE SPECIAL SECTION VOLUME VIII.

The tubes used are:

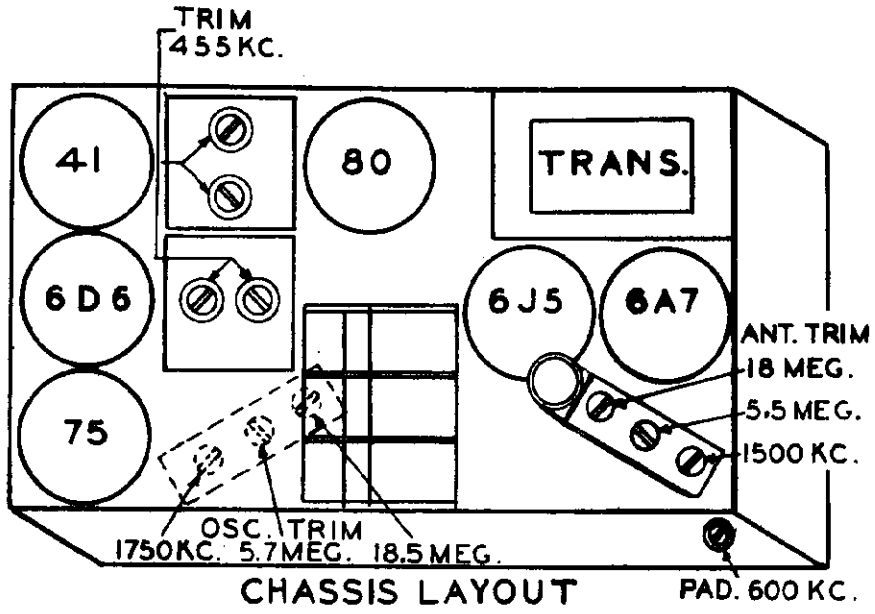
1—6A7	**First detector**
1—6J5	**Oscillator**
1—6D6	**I. F. Amplifier**
1—75	**Second detector, automatic volume control and first audio amplifier**
1—41	**Power output**
1—80	**Rectifier**



Operations For Setting Up Of Buttons

(1) Decide which station you desire to hear on any one button.

(2) Loosen this button by turning it to the left.



CHASSIS LAYOUT

(3) Tune in your desired station manually until it is heard with best quality.

(4) Push in the button while holding the manual tuning knob fixed on the station.

(5) Tighten the button by turning it to the right while the button is pushed all the way in, as tightly as possible. Allow the button to come out and tighten still more. It is of the utmost importance that the buttons be logged as tightly as possible.

(6) Repeal this procedure to set up the other buttons.

IT IS IMPORTANT THAT ALL THE BUTTONS BE LOGGED ON STATIONS LYING BETWEEN 550 AND 1700 KILOCYCLES AND THAT THESE BUTTONS BE SCREWED TIGHTLY. IF THIS IS NOT DONE THE CAMS OPERATING THE PUSH BUTTON UNIT MAY WANDER AND JAM THE WHOLE UNIT.

If there are not enough stations in your locality to log all six buttons, the unused buttons should be logged somewhere between 550 and 1700 kilocycles:

To change any one setting at any time repeat the above procedure. After that, to get this station, push the desired button with an even firm push until it has reached the end of its travel. After the push buttons are adjusted to your desired station, cut out the proper station call letters from the enclosed station call letter sheet, and snap this tab into the rectangular opening above the push buttons. Cover them with the small transparent celluloid tabs supplied with the call letters. These openings are shown in Fig. 1 as No. 1, No. 2, No. 3, No. 4, No. 5 and No. 6.

Drive Cord Replacement

Tie one end of the new drive cord (approximately 70 inches in length) to tension spring. Turn gang condenser to full open position. Thread free end of drive cord up through hole in rim of condenser drive pulley and pull spring flush against pulley rim.

Wind one turn counter-clockwise (from condenser drive pulley side of chassis) around drive pulley. This turn should progress to the left (from front of chassis). Pass cord in back of guide arm—see illustration. Then wind drive cord 3½ turns counter-clockwise (from front of chassis) around tuning control shaft. Turns should progress away from the chassis.

Pass cord around pulleys C, B, and A as shown in illustration. Then wind cord ¾ turn counter-clockwise (from condenser drive pulley side of chassis) around drive pulley. The turn should be at right side (from front of chassis) of pulley groove.

Thread cord through hole in pulley groove and knot securely to spring. Stretch spring and secure free end to hook on drive pulley.

Dial Pointer Attachment—Tune in a signal of known frequency. Set the pointer at this frequency on the dial scale. Secure pointer to cord—See illustration.

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.
Volume Control—Maximum.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale. 117 volt, 50 to 60 cycle AC

The dial lamps used are of the bayonet pin type (bulb No. 51).

ALIGNMENT PROCEDURE

Local-Distance Switch — Distance Position.
Volume Control—Maximum All Adjustments.
Selectivity Control—Sharp Position All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator With a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

Attenuate the signal from the signal generator to prevent the loading-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—In sets using the telephone dial tuning, there will be seen inside the telephone dial button ring an escutcheon plate held in place by four screws. Loosen the 2 screws nearest the pointer. An extension of the pointer will be seen protruding over the edge of this escutcheon plate. Move the pointer to the 1500 KC mark on the dial and then tighten the 2 escutcheon screws. (Do not tighten these screws too much.)

On the electric drive models, the pointer is held to the shaft by a friction clip arrangement. With the electric-manual lever in the manual position, hold the tuning knob and move the pointer to the 1500 KC mark on the dial.

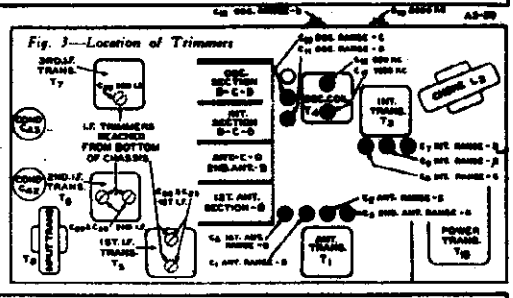
In sets using any other type of dial mechanism, it will be necessary to adjust the position of the indicator until it is at the 1500 KC mark.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less v12 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

NOTICE—Re-alignment is necessary if glass tubes are replaced by their equivalent in metal tubes, or vice versa, in the R.F. and I.F. stages.

Fig. 3—Location of Trimmers



117-234 Volt Power Transformer

Some models are equipped with a 117-234 volt universal power transformer. Connections as shown in Fig. 2 are completed to a special octal socket mounted on the back panel of the chassis. A plug which goes with this socket may then be inserted for either the 117 volt or 234 volt connection.

Models without the electric drive, which are equipped with this transformer, may be used on a power supply of 40 to 60 cycles. If an electric drive motor is used, however, it is important that the set be operated on a 60 cycle power supply only. The reason for this is that the 60 cycle motor in the electric drive panel of this model will not operate satisfactorily at any frequency other than 60 cycle. Consequently, if one of these radios is to be used on a 40 cycle power supply, it will be necessary to change the motor. The motor regularly supplied with the 25 cycle model, is used for this purpose.

If one of these transformers is to be installed in a chassis equipped with a regular transformer, there is a 1⅛ inch round knockout on the back panel which may be removed to permit installation of the octal socket mentioned above.

Twenty-Five Cycle Models

Twenty-five cycle receivers not equipped with an electric motor drive, differ from sixty cycle receivers only in the fact that a different power transformer is used. The twenty-five cycle receiver can be operated satisfactorily from a sixty cycle power supply. However, the reverse is not true—a sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

Phonograph Connections

Phonograph connections are made as shown in the schematic circuit diagram Fig. 2. On the front panel of the chassis base is a round knockout 1⅛ inches in diameter. An octal base socket is mounted in this knockout opening and wired as shown in the schematic.

A phono cable assembly may then be purchased. On one end of this cable is an octal plug and on the other end is a phonograph-radio switch and double tip jack.

Some models are shipped from the factory equipped with the phono socket. A jumper is inserted in this socket which must be removed if the phonograph installation is made—See Fig. 2.

Dial and Drive Assembly

Complete information regarding the dial and drive assemblies will be found in the Dial and Drive Service NOTES issued for this chassis. (see index)

ELECTRIC DRIVE PANEL ASSEMBLY

SEPTEMBER,1937

MODEL 62-433
" 62-447
" 62-449
" 62-451

General Information

The electric drive panel assembly is the same for all touch tuning radios, and may be removed from the chassis as described in the article on that subject.

All sets since August 23, 1937, incorporate several changes in the electric drive unit. These later sets are identified by the number 2 (or higher) stamped on the bracket over the motor On-Off switch located at the upper right of the drive assembly (from the back).

The principal changes made in these later models are the following:

(1) Originally a friction drive was used from the motor to the gear train. This friction drive has been replaced with a fibre gear drive.

(2) A new method of stringing the main drive cable has been used. The new drive cable is not interchangeable with the old.

Instructions for replacing the original friction drive with the new gear drive and for replacing the original drive cable with the new drive cable are not included, since these replacements should not be made in the field.

If major trouble develops in the early models (these do not have a number on the motor On-Off switch bracket), a replacement electric drive panel assembly should be ordered.
The defective panel may then be returned for credit. There is one exception to this and that is in the case of the early 7-tube sets. Instructions for handling repairs on the electric drive panel in these models will be found further on in this manual.

Replacing Electric Drive Panel on Chassis

Remove the chassis from the cabinet using extreme care not to damage the setting button shafts. To do this, it is necessary to remove the touch tuning buttons by pushing down the lower end of the small hairpin spring at the back of the button and, at the same time, pulling the button off the shaft. It is not necessary to remove the setting buttons.

Remove the speaker plug from the socket at the back of the chassis and also the tuning eye tube from its clamp bracket. Loosen the screw holding the bottom shield connection to the back of the chassis. Unscrew and remove the two L bolts (located under the chassis shelf) which are secured to the two rear chassis mounting feet. The screws in the wooden support behind the electric drive panel must be unscrewed and the support removed from the cabinet.

To remove the panel from the chassis, turn the electric-manual lever to the electric position. Unsolder the wire on the silencer switch on the front panel and also the motor connections under the chassis.

Take off the collars from the volume and tone control shafts.

Remove the glass screen from the panel by taking the screw out of the bracket in the upper right corner and loosening the screw in the lower left corner.

Early 7-tube models have four RED SCREWS (two located at bottom of panel and one on each side of the shaft extending through the center of the panel). Unscrew these four red screws.

THE PANEL USED FOR REPLACEMENT PURPOSES CANNOT BE MOUNTED ON THE EARLY 7-TUBE RADIOS (See article on Early 7 Tube Models).

Later models have four RED SCREWS (two located at bottom of panel and two behind glass screen). Unscrew these four red screws. DO NOT remove the screws on each side of the shaft extending through center of panel.

The following procedure for removing the panel from early models is given only in case minor repairs are necessary. If trouble serious enough to require replacement of the panel develops, the entire chassis or complete radio must be sent to the factory. A replacement panel cannot be mounted on the early type chassis.

On early models, pull the panel away from the chassis about ¼", being careful not to damage the steel cable. Then tilt the upper part of the panel toward the chassis. Lower the panel about ¼" and slide it to the left so the steel cable will pass under the bracket at the bottom of the projector compartment. After the cable clears this bracket, the panel may be removed.

On later models, the panel can be pulled straight out from the chassis.

To replace the assembly, reverse the above procedure. Before mounting the panel, caution must be taken that the driver arm on the drive gear and the spring clip on the gang condenser drive pulley line up properly. When they line up, the arm fits into the spring clip as the panel is pushed in toward the chassis.

When installing a new replacement panel on a late model 7 tube chassis, or any 9, 11, or 13 tube chassis, the following points must be observed carefully.

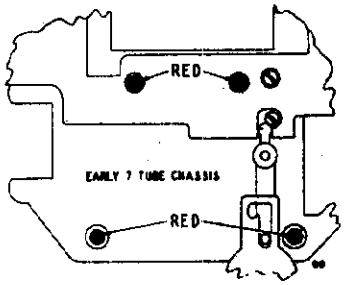

Fig.1 - Location of 4 Red Mounting Bolts in Early Models

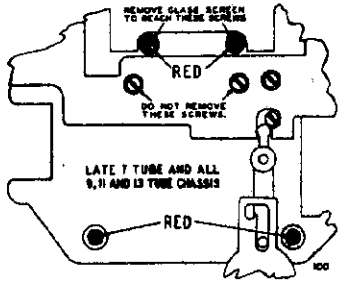

Fig.2 - Location of 4 Red Mounting Bolts in Late Models

MOUNTING BOLTS

The bolts with heads painted red are furnished with the new panel. These bolts are longer than those used in the old panel and must be used in the TOP mounting holes only. (Holes behind glass screen.) The bolts used on the old panel may be used in the two lower mounting holes of the new panel.

MOTOR CONNECTIONS

The motor cable assembly in the new panel has only two lead wires extending from it, while the old motor cable assembly has three. The third lead on the old cable assembly was connected to a condenser which is not necessary when the new drive assembly is used.

The two leads from this condenser (metal shell, tubular type) to the terminal strips should be disconnected. The condenser can be left in the chassis, or it can be removed.

One motor lead is soldered to the terminal strip lug to which is connected one wire of the power cord and one power transformer primary lead. The other motor lead is soldered to the terminal strip lug to which is also connected the lead from the On-Off switch and the other power transformer primary lead.

If Dial Figures Go Back and Forth Without Stopping

THE BUTTON MAY BE SET TOO CLOSE TO THE END OF THE DIAL

It is not advisable to set a station close to the end of the dial travel, at the point where the reversing switch operates. If, when a setting button is depressed, you should turn the tuning knob too far, a click will be heard near the end of the dial travel. Then, whenever THIS touch tuning button is depressed, the dial figures will continue to move back and forth without stopping.

This condition is easily corrected as follows: Remember which tuning button it is, on which the above condition takes place.

Turn the electric-manual lever to the manual position. Turn the manual tuning knob until the 580 KC figure is at the line on the screen.

Turn the manual tuning knob to the left 2½ complete revolutions (5 half turns).

Turn the radio off.

At the back of the assembly are 6 circular discs which correspond to the 6 buttons in front. The first disc corresponds to the first button, etc. Now, refer to the disc which corresponds to the button mentioned above (the dial figures continue to move back and forth when this button is depressed).

The disc of this button will be approximately in the position shown in Fig. 3. With the flat end of a long pencil or a thin piece of wood, carefully depress lever "A" and rotate disc "B" about one inch in the direction shown by the arrow. Do not use a metal rod or the pointed end of the pencil. Disc "B" will turn readily after lever "A" has been depressed.

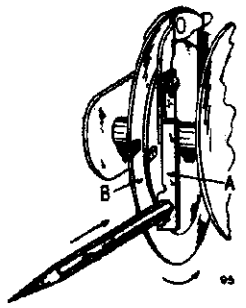

Fig.3 - Adjusting Position of Setting Disc

CAUTION

When the electric drive panel is removed from the chassis, lay it face down and not back down. The reason for this is that there is a possibility that the motor On-Off switch on the back of the unit will be damaged or thrown out of adjustment.

In handling the electric drive panel, do not carry it by the switch operating lever (See Fig. 6) which actuates the motor On-Off switch. This bar may be bent and damaged by such handling.

A NEW ELECTRIC DRIVE PANEL CANNOT BE MOUNTED ON THE EARLY 7-TUBE MODELS

These models may be identified by the fact that when the chassis is removed from the cabinet and the electric-manual lever is in the electric position all four red mounting screws can be seen - See Fig. 1. On late models, the two top red screws are behind the glass screen and cannot be seen unless this screen is removed - See Fig. 2.

If trouble serious enough to require replacement of the electric drive panel develops in the early model radio, it will be necessary to send the entire chassis or the complete radio to the factory to have this done. A replacement panel should not be ordered as it cannot be mounted on the early type 7-tube chassis.

THE PAWL ON THE SETTING DISC MAY NOT ENGAGE THE STOPPING LEVER

The outer edge of pawl "A" (Fig. 4) should extend beyond the outside diameter of setting disc "B". As the setting disc rotates, pawl "A" will pass over stop lever "C" in one direction. When the setting disc is rotating in the other direction, stop lever "C" will engage the tip end of pawl "A" and cause pawl "A" to slide over and permit stop lever arm "C" to fall into notch in the setting disc.

If the tip end of pawl "A" does not extend a sufficient amount beyond the outer edge of the setting disc, the above mentioned action will not take place and the setting disc will rotate beyond stop lever "C" in either direction of rotation.

Should this faulty condition exist on one of the setting discs, whenever the touch tuning button corresponding to this disc is depressed, the dial figures will continue to move back and forth without stopping.

This condition is easily corrected as follows: Using a pair of side cutters, grip the tip of the pawl as shown in Fig. 4 about 1/32 inch from the edge. Pinch firmly and push outward (away from the center of setting disc). Do this until the tip of the pawl is a little more than 1/64 inch beyond the outer edge of the setting disc.

After this procedure has been followed, depress the setting button corresponding to this setting disc and see whether the stop lever edge engages the pawl properly.

IF THIS OCCURS WHEN NO TOUCH TUNING BUTTON IS DEPRESSED

Adjust the motor On-Off switch. See the article on this subject.

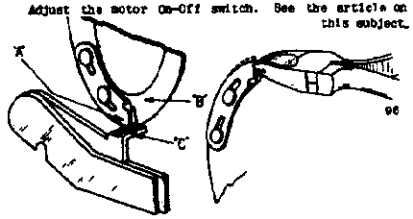

Fig.4 - Pinching Pawl of Setting Disc

MODELS 62-303,62-309,62-32

Drive Panel Adjustments
Compound Gear Notes

MONTGOMERY WARD & CO.

General Adjustments

IF, WHEN A TOUCH TUNING BUTTON IS PUSHED IN, THE MOTOR DOES NOT TURN

Push the button which has previously been depressed or any other touch tuning button, all the way in and release. Then again push in the button which is wanted and this time the drive should function.

The motor On-Off switch may be out of adjustment - See article on that subject in this manual.

JUMPY ACTION WHEN TUNING THE RADIO MANUALLY

Put gear drive in motor - Return electric drive panel to factory to have this done.

EXCESSIVE BACKLASH IN MANUAL TUNING

If there is too much backlash when tuning the radio manually, free the film drum cable. To do this, stretch the tension spring which holds the idler pulley on the film drum cable. Also stretch the phosphor bronze film drum cable and oil the pulleys on which this cable runs. Check the tightness of the set screws holding the drive drum to the tuning condenser shaft.

MOTOR ROTATES BUT DIAL FIGURES DO NOT MOVE

Correct this condition in the same manner as described above under "Backlash in Manual Tuning" (early models only).

Occasionally this condition can be remedied by turning the electric-manual lever to the manual position and holding it in this position. Then turn the tuning knob with the other hand a slight amount in the direction in which it turns most easily. Then turn the electric-manual lever back to the electric position.

The friction disc in the motor may slip. Change to the gear drive in the motor - Return electric drive panel to factory to have this done.

The fibre gear No. 1 (see Fig. 6) may be slipping on its hub. Replace this gear - See article on that subject in this manual.

IF THE DIAL DOES NOT STOP AT THE SAME POINT EACH TIME THE BUTTON IS DEPRESSED

IF THIS OCCURS ON ONE BUTTON ONLY - It will be necessary to replace the defective setting disc at the top of the electric drive assembly which corresponds to that button. Return the electric drive panel to the factory to have this done.

IF THIS OCCURS ON ALL BUTTONS - Tighten the main drive cable by means of the turnbuckle.

See if set screw on top pulley of main drive cable are tight.

Check spring clip on drive drum of tuning condenser which holds drive arm to see whether or not it is gripping this arm tightly.

The silencer switch spring assembly at the front of the electric drive panel may not have sufficient spring tension to push back the motor armature after the circuit is broken. This assembly has a two-fold purpose. First, it silences the radio while the motor is in operation. Its second function is to exert a slight amount of spring tension on the end of the armature shaft which extends from the motor.

Inside of the motor is a small pinion gear which rotates freely on the front motor bearing. There are two pins on the armature and two extensions on this gear. The entire armature shaft assembly slides back and forth in its bearings.

When the circuit thru the motor is complete, magnetic action causes the armature shaft to slide toward the front of the panel. The force is strong enough to overcome the tendency of the silencer switch spring to prevent this movement.

The small gear comes into close proximity with the armature and the two pins and two extensions mentioned above engage, causing this gear to rotate with the armature. The electric tuning mechanism turns as a result. When the circuit thru the motor is broken, the magnetic pull on the armature is released and the silencer switch spring forces the armature toward the back of the panel, causing the small gear to disengage from the armature proper.

Now to get back to our original thought. If there is insufficient tension in this spring, it will not push back the armature shaft after the circuit is broken and the inertia of the motor will continue to exert a driving force on the train of gears. To overcome this condition, tighten the spring by bending it. Care must be taken not to get too much tension on this spring as this would prevent engaging the gear with the armature when the current is on. Care should also be taken not to bend the spring assembly in such a manner that the two points will be permanently in contact.

DRIVE SLIPPAGE WHEN TUNING THE RADIO MANUALLY

Excessive amount of oil on drive belt - Clean off oil.

Increase tension on drive belt by re-adjusting position of idler (early models only).

Both drive cables too tight - Loosen tension on main drive cable by means of turnbuckle, and on film drum cable by lessening tension on idler tension spring.

Friction disc in motor binds - Change to gear drive in motor - Return electric drive panel to factory to have this done.

BUTTONS WORK STIFFLY

The touch tuning buttons may not push in easily. This may be due to the fact that the chassis is too far forward in the cabinet - Pull it back slightly.

Put some grease on each touch tuning button shaft at the point where it passes thru the front locking plate.

IF THE DIAL FIGURES REACH THE END OF THE SCALE AND STOP, BUT MOTOR CONTINUES TO OPERATE

Loosen the reversing switch mounting screws and adjust position of this bracket up or down until the switch operates properly. If this procedure does not remedy the condition, put one of the centering springs on the reversing switch - One of these can be obtained from the factory. Later models are already equipped with this spring. - See Fig. 5.

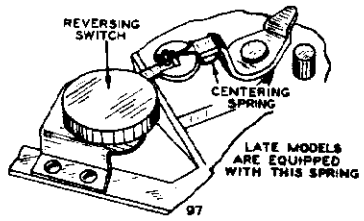

Fig. 5 - Use of Centering Spring on Early Models

Adjusting or Replacing the Motor On-Off Switch

ADJUSTING SWITCH

The motor On-Off switch is at the upper right side of the panel (from back of radio). If this switch is not adjusted properly, the motor may not start when the touch tuning button is depressed or the circuit thru the motor may not be broken at the proper moment when the station is tuned in by means of the electric mechanism.

To check this switch, remove the fibre cover by taking out the screw which holds the bracket over this fibre cover.

When the switch operating lever (offset metal piece across back of assembly which interacts with the 6 setting discs - see Fig. 6) is in its lowest position, the switch should be off. As this lever is raised, the switch will close and at the highest position of the lever the switch will again open.

If the switch does not appear to operate in this manner, loosen the 2 screws which hold it in place. Grasp the bakelite base of the switch at the left side (from back) and raise or lower it until the action as mentioned above is obtained. In exceptional cases, the switch base may have to be bent toward the switch operating lever to get the proper throw of the switch mechanism.

REPLACING SWITCH

If the switch mechanism is broken or cannot be put in proper working order, a new one may be ordered. The old switch is removed by taking out the 2 screws which hold it in place and unsoldering the 2 switch leads.

Replacing Compound Gear

In a few of the first sets incorporating the gear drive from the motor, the fibre gear of compound gear 1 (See Fig. 6) may slip on its hub. There is a spring washer which holds this gear to its hub and this washer may become too loose. When this occurs, the large fibre gear will be seen to rotate while the hub and small metal pinion gear which engages with gear 2, remains stationary.

In a case of this kind, compound gear 1 must be replaced. In the later type, the metal hub is rigidly secured to the fibre gear. Following is the replacement procedure:

Remove electric panel assembly from chassis and lay it face down on the bench.

Remove belt and idler pulley - See Fig. 6.

Refer to turnbuckle take-up on steel drive cable - See Fig. 8. Observe position of hex nut on the stud of this turnbuckle, that is, see how many threads this nut is from the end of the stud.

Loosen the main drive cable by loosening the hex nut on turnbuckle and backing off the round knurled nut about 6 half turns.

Remove horseshoe washer from gears 1 and 2, spreading the horseshoe washers by means of long nose pliers and screwdriver.

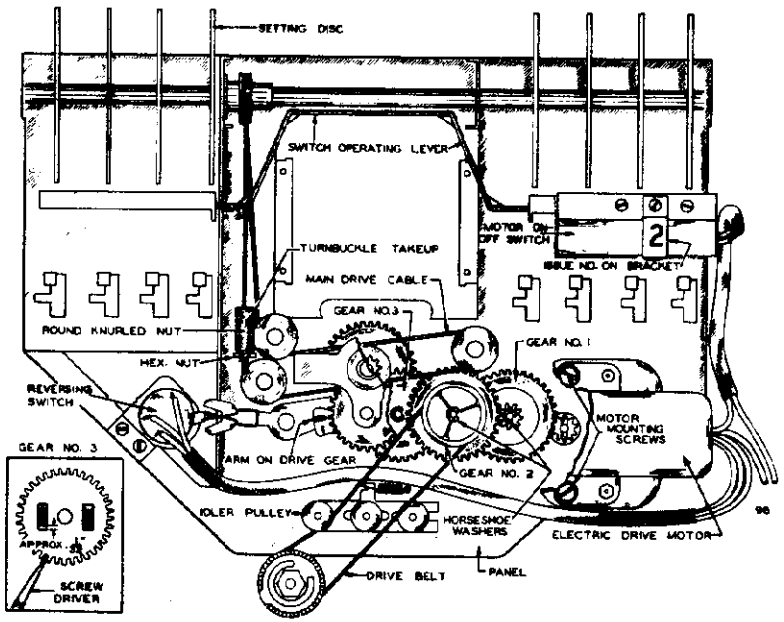

Fig. 6 - Rear View of Electric Drive Panel Showing Gear Assembly

Take out the 2 motor mounting screws and lift the motor out of place - See Fig. 6.

Lift up the main drive cable to clear the teeth at the top of gear 2 - take care not to nick the cable.

Remove gears 2 and 1.

Put the new fibre tooth gear 1 on the shaft and replace horseshoe washer.

Now refer to gear assembly 3 - See Fig. 6. The top gear of this assembly is movable and the bottom gear is fixed. Rotate the top gear one tooth clockwise relative to the bottom gear and hold the two in this position with a screwdriver - See Fig. 5.

Slide gear 2 on its shaft, pulling the main drive cable over the top of the teeth - again care must be taken not to nick the cable.

Push gear 2 all the way on its shaft, engaging gears 1 and 3. Replace the horseshoe washers.

Check for take-up on gear 3. Approximately 1/32 inch of the fixed gear (bottom) will show through slot in top gear - See Fig. 6.

Reassemble motor to frame, pushing tension spring under motor shaft. Be sure to use the same screws to mount the motor to the frame that were taken off. Care must be taken that the pinion gear in the motor meshes properly with the teeth of fibre gear No. 1. If these two gears appear to be so close together that they bind, pull the motor away from gear No. 1 before tightening the mounting screws.

Replace belt and idler pulley.

Retighten turnbuckle on main drive cable bringing hex nut to its former position and round knurled nut down tight against hex nut washer.

Reassemble electric drive panel to chassis.

Replacing Main Drive Cable
(No. 2 and Later Issue Panels)

The main drive cable is the steel cable which has the turnbuckle take-up. A change was made in this cable and the method of stringing it early in production.

Later models with the new cable can be identified by the numeral 2 stamped on the bracket over the motor On-Off switch and also by the large drop of solder adjacent to one of the set screws which hold the top pulley of this cable in place.

EARLY MODEL CABLE - Should cable breakage or any kind of major cable trouble be experienced which would require restringing of this cable in the early models, do not attempt to restring this cable. Instead, order a new electric drive panel assembly from Wells-Gardner and Co. (except in case of early 7-tube set).

LATER MODEL CABLE - Should cable restringing be required in the case of the later type, this can readily be accomplished by ordering a new drive cable, if one is necessary, and putting it on in accordance with the following instructions:

Remove electric drive panel from chassis.

Remove the old drive cable. It will have to be unsoldered at pulleys B and E. See Fig. 11. Turn electric-manual lever to manual position.

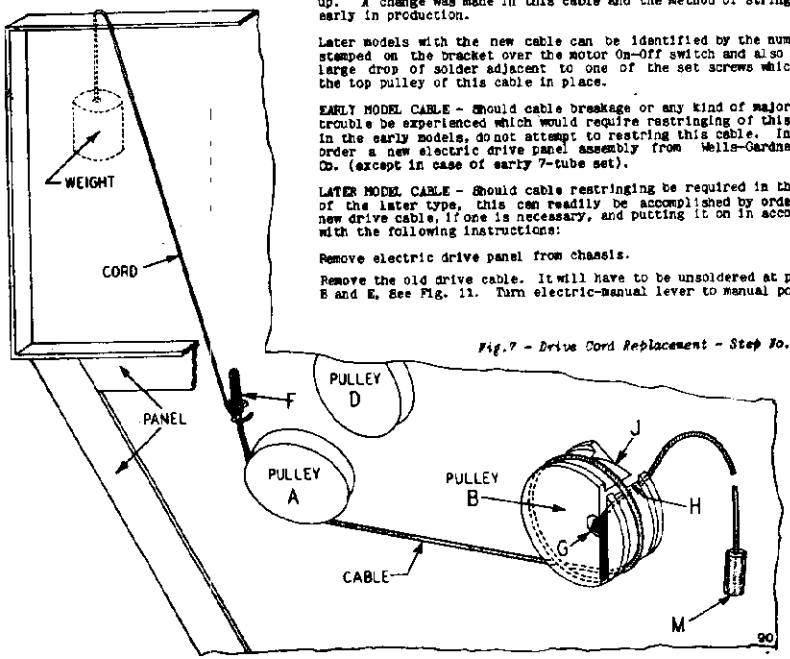

Fig.7 - Drive Cord Replacement - Step No.1

From the front of the panel, turn manual tuning knob to the right (clockwise) as far as it will go. This will bring the arm on the drive gear to the left (from back of panel) - See Fig. 8.

Now support the panel in such a manner that it is held firmly in an upright position, the back of the panel toward the operator. The bottom of the casting can be gripped at a number of points in a vise or clamp - care should be taken not to distort the casting.

Referring to the new drive cable. It will be noted that one end has a screw fitting and the other end has a round knurled nut fitting. These two fittings together with the hex nut and lock washer comprise the turnbuckle take-up.

With screw end F (Fig. 7) hanging down, place the cable into the vertical slot at the back of pulley B with the knot inside of the opening at point G.

Then wind the screw end of the cable on pulley B in a clockwise direction one turn, passing over the portion of this cable which is in slot H.

Bring the screw end of the cable over to pulley A and hold it in this position. This can be done by fastening a 10 inch stout cord to the end of cable F. Attach a weight to the other end of this cord and let the weight hang over the top of the panel as shown in Fig. 7. Instead of a stout cord, the round knurled nut and old cable can be secured to the screw end of the new cable.

Now refer to the portion of the cable that is in the slot at point H pulley B. Using a small wooden prod, bend this cable and bring it back onto pulley B at groove J. CAUTION: Do not use a metal prod as this may damage the cable. It is important that the cable at groove J be kept close to the front flange of pulley B (flange nearest panel) while the portion of the cable which extends downward from point G be kept close to the back flange of this pulley so that the cable from pulley A will ride freely in the center of pulley B - as shown in Fig. 11.

Then from groove J bring the cable in a counterclockwise direction 1/2 turn around pulley B, over to pulley C, 1/2 turn around pulley C, over to the bottom of pulley D, and then up to the shaft at the right of pulley E - Be sure the cable is well down in slot H, pulley B.

Wind the cable LOOSELY one and one-half turns around this shaft, progressing toward the left as shown in Fig. 8.

Rotate the setting discs until pulley E is approximately in the position shown in Fig. 9. Using a thin wooden prod, place cable in slot L with knot in hole at point K of pulley E. Rotate the setting discs a slight amount back and forth. This will provide clearance while getting the cable in the slot. Push the cable well down into slot L - See Fig. 9.

Rotate the setting discs 3/4 of a complete revolution in such a direction that the top of the discs move toward the front of the panel. Bring the round knurled nut under the loop of the cable as shown in Fig. 10.

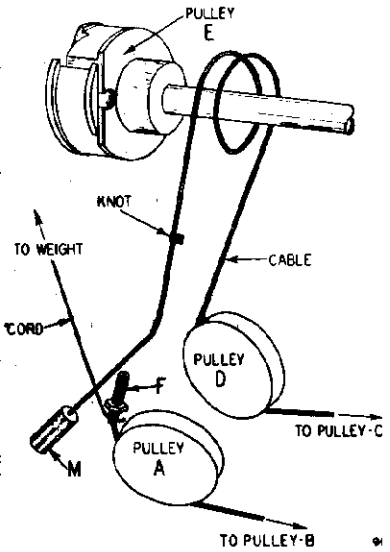

Fig.8 - Drive Cord Replacement - Step No.2

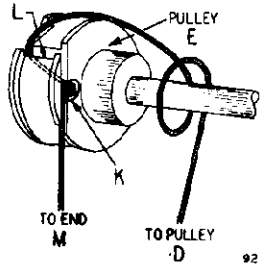

Fig.9 - Drive Cord Replacement - Step No.3

Remove weight and cord (or round nut) from screw end F of the cable. Put the lock washer against the hex nut on this cable. Screw round knurled nut onto screw end of cable. While this is being done, the setting discs

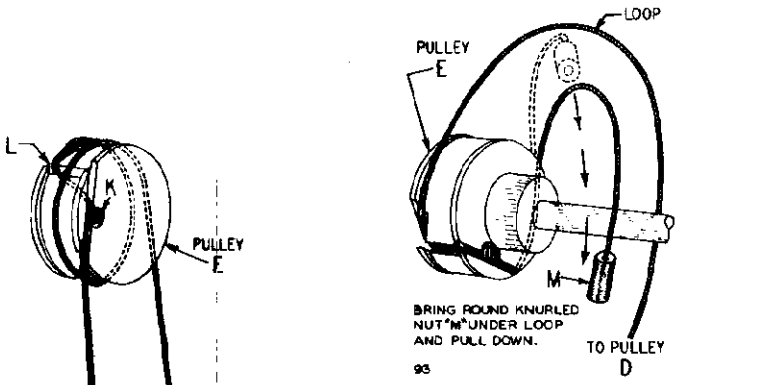

Fig. 10 – Drive Cord Replacement – Step No. 4

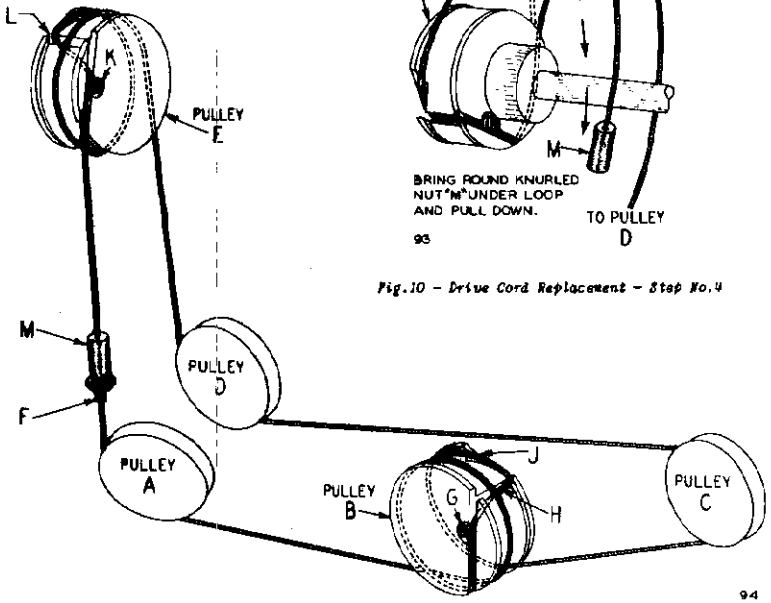

Fig. 11 – Drive Cord Replacement – Complete Assembly

should be grasped by another person and rotated as far as they will go in such a direction that the top of the discs moves away from the front of the panel. The purpose of this is to take up all slack in the cable and to enable the two ends of the turnbuckle to be secured together.

The cable must be firm and with all slack out. It should not be so tight, however, that the setting discs and pulleys do not turn freely. Tension of the cable is regulated by the position of the hex nut. The round knurled nut must be screwed tightly against the lock washer next to the hex nut.

Solder knots at points G and K on pulleys B and E respectively. Reassemble the electric drive panel to chassis.

Place cable from pulley D on pulley E at left flange (from back of panel). Now holding cable from pulley D, rotate setting discs in such a direction that the top of the discs move away from the front of the panel. Rotate the discs approximately 3/4 of a turn or until the slack in the cable from pulley D is all taken up. Pulley E and the cable will then be in the position shown in Fig. 11 and the knurled nut end M of the cable will be hanging down from pulley E and must be held in tension.

The next step is to connect the two portions of the turnbuckle together. Before doing this, see that the cable is on all of the pulleys as shown in Fig. 11. Tension should still be applied to both ends of the cable.

25 Cycle Electric Drive Panel

The 25 cycle electric drive panel assembly is identical to the 60 cycle assembly except that a 25 cycle motor and a different gear No. 1 (see Fig. 6). are used.

The pinion gear in the 25 and 60 cycle motors are not the same. If, therefore, one of these pinions is ordered, the type of motor must be specified. (Both 25 and 60 cycle motors are furnished with pinion included.)

40 Cycle Power Supply

An electric drive chassis equipped with a 117-234 volt 40 to 60 cycle power transformer can be used on a 60 cycle power supply only, unless changed as mentioned below. The electric drive panels of these sets are equipped with 60 cycle motors and these will function satisfactorily only at that frequency.

If one of these radios is to be used on a 40 cycle power supply, it will be necessary to change the motor. The motor regularly supplied with the 25 cycle model is used for this purpose.

Movie Dial Adjustments and Replacements

Replacing and Positioning the Dial Lamp

Caution—If a new lamp is required, use only a No. 81 lamp, Wards catalogue No. 61-8204.

Turn the radio off and turn the band switch to the standard wave position.

Remove the lamp housing by unscrewing and removing the two screws which hold this housing in place—See Fig. 1.

Remove the old lamp from the housing. It will be necessary to depress the contact plug retaining spring which will be seen in the narrow slot near the upper end of the housing and pull the plug out a slight amount from the housing, in order to remove the lamp. Replace the lamp and push the plug down until the locking spring snaps into place.

Replace the lamp housing by means of the two screws, but do not tighten these screws yet.

Turn the radio on.

Then grasp the top of the lamp housing assembly and move it up or down until the image on the screen is clearest and the lines are horizontal. The effect of having the lamp assembly too high or low is shown in the illustration in the instruction book. Tighten the two screws.

Replacing Film

Turn the band switch to the standard wave position. Then remove the lamp housing (See article "Replacing and Positioning the Dial Lamp").

Unscrew and take out the six screws spaced around the edge of the film drum casting. Then carefully lift the edge of the film nearest the back of the chassis. At the same time, lower the opposite edge of the film and slide it in toward the center of the film drum casting. (On two band radios, it will be necessary to lift the lens assembly as high as it will go while removing the film.) When the film clears the lens, it may be lifted out.

To replace the film, reverse the above procedure. Make certain that the entire lower edge of the film rests on the shoulder near the bottom inside the film drum. The radio is calibrated as described in the article under that name in this manual.

Calibrating the Radio

To calibrate the electric drive movie dial radios, tune in a station of known frequency between 530 and 900 KC. In the early models loosen the two set screws in the hub of the film drum pulley. Turn the film drum until it is at the correct kilocycle mark on the dial scale and then tighten the pulley set screws.

In the case of later models, the film drum is held in position by a friction washer which will be seen under the drum. In these models, the film drum can be turned without loosening the set screws.

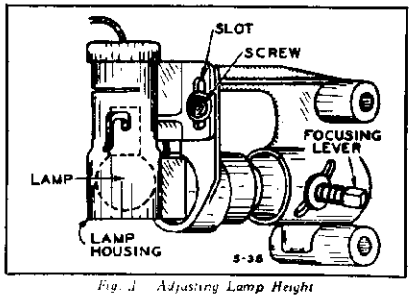

Fig. 1 Adjusting Lamp Height

Replacement Parts List

There is a number on the On-Off switch bracket which identifies the panel as to major part changes. Be sure to mention this issue number when ordering parts for the Electric Drive Panel.

For names of parts shown in the Electric Drive Panel list, refer to the illustrations especially Figs. 3, 6, 7, 8, 9, 10 and 11.

ELECTRIC DRIVE PANEL REPLACEMENT PARTS

Illus. No.	Part No.	Description	Selling Price
	25A176	60 Cycle Electric Drive Panel Complete—Includes Main Casting, Gears, Pulleys, Switches, Motor, Setting Discs, Tuning and Setting Button Plungers, and Tone and Volume Indicators. (Less Gang Condenser and Movie Dial Projector Assembly, Tuning and Setting Buttons, and Glass Screen and Screen Clamps.)	$78.00
	25A247	25 Cycle Electric Drive Panel Complete—Same as above except with 25 Cycle Motor and No. 1 Gear Assembly	19.85
	57X8	Locking Plate	.25
	28DC139	Spring for Locking Plate ..... Doz.	.16
	27X593	Interlocking Lever	.05
	27X595	Clutch Release Lever	.25
	28DC137	Spring used on above Lever ..... Doz.	.16
	26A289	Tuning Knob Shaft	.45
	27X594	Yoke for Clutch Lever (Fits in Groove on above Shaft)	.05
	19X38	Keyway Washer (Used on Clutch Bearing) Doz.	.08
	24DC294	Pulley for Manual Drive Belt (On Back of Tuning Shaft)	.14
	20DC12	Roller Bearing for above Pulley ..... Doz.	.08
	57X10	Clutch Plate	.05
	28X152	Clutch Release Spring (In front of Clutch Plate from Back of Panel) ..... Doz.	.06
	43X57	Manual Drive Belt	.16
	26A278	Belt Tension Pulley and Bracket Assembly	.10
	28DC150	Spring for above Assembly ..... Doz.	.10
	24DC316	Belt Idler Pulley only	.06
	25A178	Setting Disc Assembly	.35
	28X134	Tension Spring (Fastened to Auxiliary and Drum Release Levers) ..... Doz.	.12
	28DC151	Tension Spring for Panel of Setting Disc Doz.	.12
	26X285	Setting Disc Shaft	.20
	20X192	Ball Bearings in Retainer (For Setting Disc Shaft)	.06
	20DC207	Bearing Cone (Without Set Screw)—On Setting Disc Shaft	.08
	20X195	Bearing Cone (With Set Screw)—On Setting Disc Shaft	.10
	24DC288	Pulley for Drive Cable (On Setting Disc Shaft)	.08
	20X403	Support Bracket for Setting Disc Shaft (Left side from back)	.06
	25X412	Support Bracket for Setting Disc Shaft and Motor On-Off Switch	.08
	24A76	Adjusting and Support Rod for Motor On-Off Switch (Panel Issue No. 4 and Later)	.06
	2A105	Motor On-Off Switch Assembly Complete	.40
	27X88	Switch Lever (Right section from back)	.10
	27X96	Switch Lever (Left section from back)	.10
	25A413	Switch Lever (Center section)	.09
	28X137	Switch Lever Spring ..... Doz.	.16
	27X82	Stop Lever	.06
	28X148	Stop Lever Spring ..... Doz.	.08
	26A181	Rocker Arm and Rocker Arm Stop Assembly Complete with Spring	.10
	28DC131	Spring for Rocker Arm Stop ..... Doz.	.06
	26X286	Rocker Arm Shaft	.06
	26X261	Setting Button Plunger	.06
	18A114	Setting Button only	.06
	26X284	Tuning Button Plunger with Stop Pin	.08
	28X138	Tuning Plunger Spring ..... Doz.	.06
	18A113	Tuning Button only	.06
	28X129	Hairpin Springs for Tuning Buttons ..... Doz.	.06
	185X6	Main Drive Cable Complete with Turnbuckle	.40
	122X78	50 Cycle Motor Complete	2.20
	24X296	Pinion Gear only (On Motor Armature Shaft)—60 Cycle	.06
	12X82	25 Cycle Motor Complete	3.00
	25A233	No. 1 Pinion and Gear Assembly (For 60 Cycle Operation)	.22
	25A248	No. 1 Pinion and Gear Assembly (For 25 Cycle Operation)	.26
	24X307	No. 2 Gear and Pulley	.10
	25A184	No. 3 Gear Assembly	.16
	25A221	No. 4 Gear Assembly	.26
	28X141	Spreader Springs for Gears No. 3 and 4. Doz.	.24
	26A78	Pulley Bracket Assembly complete with Gear No. 5, Pulleys and Ball Bearing Assembly	.80
	25A186	No. 5 Gear and Drive Arm Assembly only	.14

RETAIL STORES: Order any parts from Repair Service Department at Chicago or Oakland, on Repair Parts Order Form No. 19567. Order by bin number and description. If no bin number is shown, order by part number and description.

Return defective parts to Repair Service Department only.

There is a large letter on the chassis which identifies the set as to major part changes. When ordering parts please be sure to mention the model number and this issue letter.

16A31	29X20	Brass Collars (Used on Tone or Volume Control Shafts)	.04
	26A56	Station Call Letter Discs and 25 Celluloid Discs	.16
	25X408	Shipping Support Bracket (Top of Electric Drive Panel to Wood Brace)	.10
16B46	8X33	Rubber Cushion (Used with Shipping Support Bracket)	.04

PROJECTOR ASSEMBLY PARTS

Illus. No.	Part No.	Description	Selling Price
	26A76	Gang Condenser and Projector Assembly Complete (Series 57A4) Includes Condenser Mounting Bracket, Condenser Drive Drum, Film Drum Cable and Pulleys, Film Drum Support Bracket, Film Drum, Film, Lamp Housing Bracket, Lamp Contact Ring, Lens Housing, Lens Housing Bracket, Color Filter Projector Compartment, and Elevator and Link Assembly	$8.40
	26A77	Gang Condenser and Projector Assembly Complete (Series 53A3), includes same parts as above	9.34
	26A78	Gang Condenser and Projector Assembly Complete (Series 59A5 and 51A2) includes same parts as above	8.40
	25A196	Front Support Bracket for Gang Condenser—Complete with Two Pulleys and Shafts	.40
	6X48	Rubber Cushion (Mounted on above Bracket)	.05
	28X182	Stud—Used with Rubber Grommet (6X8) on Front Support Bracket for Gang Condenser	.05
	26A79	Drive Drum for Gang Condenser	.24
	25DC393	Support Bracket for Lens Housing, Projector Compartment and Elevator Lever	.44
	25A198	Elevator Lever Arm and Bakelite Link Assembly	.26
	27X88	Lever Bearing Rod	.05
	19X31	Horse Shoe Washer for above Rod ..... Doz.	.04
	27X90	Lever Arm—Short (Fastened to Sand Switch Shaft)	.08
	28DC59	Hairpin Spring (Used on above Lever Arm) Doz.	.04
	28DC136	Tension Spring for Elevator Lever ..... Doz.	.16
	27X85	Support Bracket for Film Drum Shaft and Pulley (Series 57A4, 59A5, 51A2)	.24
	27X88	Support Bracket for Film Drum Shaft and Pulley (Series 53A3)	.28
	26A80	Film Drum Pulley Assembly	.12
	26X253	Shaft for Film Drum	.04
	25A196	Tension Arm Assembly for Film Drum Cable less Tension Spring	.08
	24DC236	Bakelite Pulley only for above Arm and for Front Support Bracket on Gang Condenser	.04
	28DC169	Spring only for Tension Arm ..... Doz.	.14
	6X8	Rubber Grommets—Small (For Mounting Rear of Gang Condenser to Film Drum Support Bracket) ..... Doz.	.08
	28DC201	Stud (Used with above Grommet) ..... Doz.	.12
	28DC180	Stud (For Mounting Rear of Gang Condenser to Chassis)	.05
	25DC362	"L" Bracket (For Mounting Rear of Gang Condenser to Chassis)—Series 57A4, 59A5, 51A2	.05
	25DC382	"L" Bracket (Same as above)—Series 53A3	.05
	6X18	Rubber Grommet (Used on above Bracket) Doz.	.14
	2X236	Rubber Washer (Flat—Used with above Bracket) ..... Doz.	.08
	185X8	Film Drum Drive Cable	.10
	24DC284	Film Drum only less Film (Early type with Flat Side in Drum Center Hole—Spring Washer not used with this type)	.16
	24DC284A	Film Drum only less Film (Late type with Round Drum Center Hole—Spring Washer used with this type)	$0.16
	26A78	Film and Rim (Used on Series 59A5, 51A2, 53A3)	.24
	26A71	Film and Rim (Used only on Series 57A4)	.24
	30X24	Clamp for Holding Film to Drum ..... Doz.	.08
	28DC165	Spring Washer with Three Fingers (Used under Film Drum on late models)	.06
	26A199	Color Filter Assembly Bracket (Series 59A5, 51A2, 53A3)	.06
	28A214	Color Filter Assembly Bracket (Used only on Series 57A4)	.06
	28X194	Lens Housing Casting less Condenser and Projector Lens and Bearing Rods	$0.24
	29X26	Bearing Rod only for above Casting	.06
	19X27	Horse Shoe Washer (Used on above Rod) Doz.	.08
	12X73	Condenser Lens (Lens nearest Dial Lamp)	.08
	28DC128	Lens Retaining Spring ..... Doz.	.04
	13DC2	Projector Lens	.60
11B51	29X27	Focusing Lever Assembly	.04
	7A58	Lamp Housing and Socket	.14
	41-2284	Dial Lamp No. 81	.10
	26A81	Plug Assembly for Dial Lamp with Wire less Dial Lamp and Housing	.14
	22X86	Projector Compartment	.08

Prices Subject to Change Without Notice.

Replacing Film Drum Cable

Remove the electric drive panel from the chassis as explained in the article "Replacing Electric Drive Panel on Chassis" in Manual 124, and lay it face down in front of the chassis. It is unnecessary to unsolder motor or silencer switch connections or to disconnect tone and volume control collars.

Remove the old film drum cable, unsoldering it from pulley "F" at point "S" on early models, or from the pin on later models—See Fig. 2.

Close the gang condenser completely and arrange to hold it in this position while replacing the cable.

Now insert one end of the new cable in hole "B" of condenser drive drum "A" which will be in the position shown in Fig. 2. Bring the cable down and around ½ turn in the groove in the drum, progressing in a clockwise direction, passing it over pulley "C."

Extend the cable horizontally toward the back of the chassis passing it through the groove on the left side of pulley "D" and through the groove on the right side of pulley "E." (See Fig. 2, view from front.)

Place pulley "F" in the position shown in the back view in Fig. 2, with the slot "H" nearly parallel with the back of the chassis. Continue the cable from pulley "E" to the slot on the right side (from back) of pulley "F" keeping the cable in the upper part of the slot. The cable should rest on about ⅛ inch of the pulley surface before entering slot "G."

Insert the cable in slot "G" and continue down and out through slot "H" at point "K." If pulley "F" is the later type, wrap the cable once around the pin as shown in Fig. 2.

Wind the cable one complete turn around pulley "F" keeping it below the cable on the right side and above the cable on the left side. Now extend the cable horizontally to pulley "L" and down to the groove in condenser drive drum "A." Insert end of cable in slot "M."

Now solder the cable to the pin on pulley "F" on late models, or solder the cable to the pulley at point "S" on early models.

Replace the electric drive panel on the chassis and calibrate the dial as explained in the article "Calibrating the Radio."

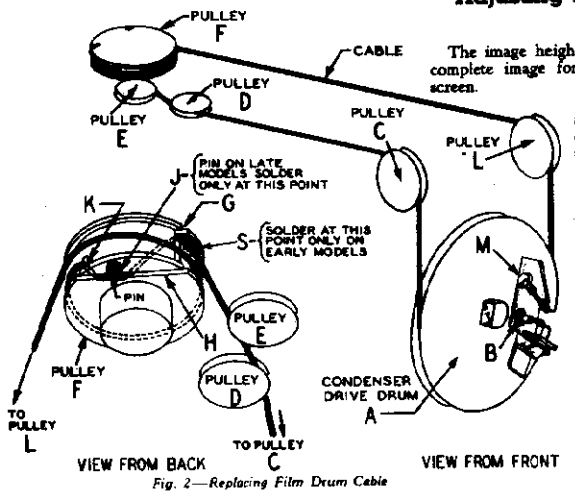

Fig. 2—Replacing Film Drum Cable

Adjusting Height of Image on Screen

The image height should be so adjusted that the complete image for each band will appear on the screen.

If any portion of the image on any band is cut off, turn the radio on and turn the band switch to the 2nd short wave (green) position. Loosen the two set screws of the lever arm on the band switch shaft. This lever arm is connected to the bakelite strip which in turn moves the lamp assembly height mechanism.

Turn the tuning knob until the high frequency end (22.0 MC) of the band is reached. Move the lever arm until the megacycle line is lined up with the letter "W" of the word "West" at either side of the glass screen. Tighten the set screws.

The image height should then be correct for the other two bands.

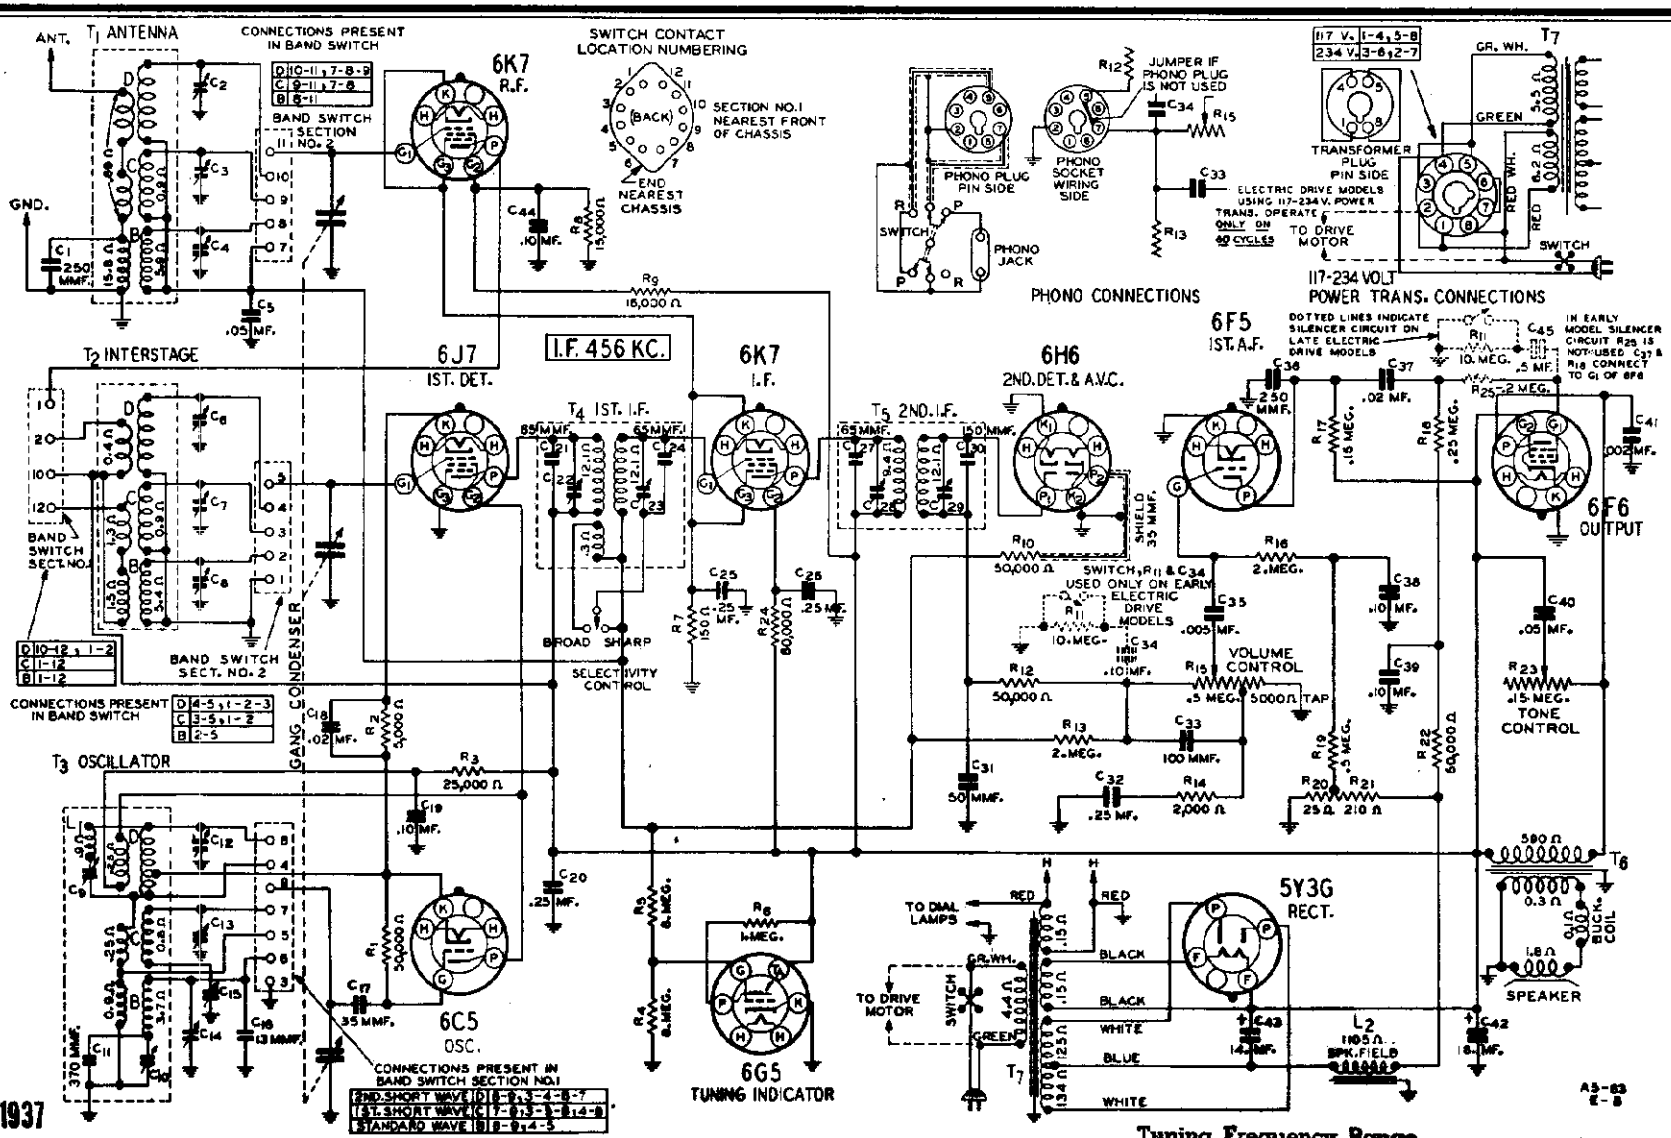

Fig. 2—Schematic Circuit Diagram

SPECIFICATIONS

Power Consumption - 75 Watts (At 117 volts 60 cycles)
113 Watts (Motor Operating)

Power Output - - - - - - 3.0 Watts Undistorted
5.0 Watts Maximum

Selectivity (Sharp) - 27 KC Broad at 1000 times Signal

Intermediate Frequency - - - - - - 456 KC.

Speakers - - - - - - - - 8" or 10" Dynamic

Tuning Frequency Range

B Range	528 to 1830 KC.
C Range	1810 to 6350 KC.
D Range	6300 to 22000 KC.

Sensitivity

B Range	1.0 Microvolts Average
C Range	1.0 Microvolts Average

Circuit

This model is a three band AC operated radio with a tuning range as shown in the specifications above.

Referring to the schematic circuit diagram, Fig. 2, T1 and T2 are the antenna and interstage R.F. transformer assemblies and T3 is the oscillator coil assembly. The standard wave, 1st and 2nd short wave coils in each assembly are indicated by the letters B, C and D respectively.

The band switch completes connections to the coils in use. The band switch sections are designated in the schematic as section 1 and section 2.

The antenna transformer with tuned secondary feeds into a type 6K7 R.F. amplifier tube. The output of this tube is fed through the interstage R.F. transformer with tuned secondary into a 6J7 tube which functions as the 1st detector.

A separate type 6C5 tube is employed in the oscillator circuit. The oscillating circuit is always resonant at 456 KC above the frequency to which the R.F. amplifier is tuned.

One stage of I.F. amplification is employed using a 6K7 tube. The primaries and secondaries of the 1st and 2nd I.F. transformers are tuned by small trimmer condensers.

Referring to Fig. 2, it will be noted that there is a coupling winding connected in series with the secondary of I.F. transformer T4. When the selectivity control is in the sharp position, the coupling winding is open circuited and the loose coupling which exists between the primary and secondary of this transformer results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary is connected in series with the secondary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

A 6H6 tube functions as a diode 2nd detector. AVC voltage is applied to the control grid circuits of the R.F. and I.F. tubes.

Across the volume control resistor R15 is a filter composed of condensers C32 and C33 and resistor R14. At high volume settings, the filter is not effective. At low volume settings, the action of this filter results in an increase of high and low frequency amplitudes relative to the other frequency amplitudes.

A 6F5 triode tube functions as the first audio amplifier while the output stage uses a 6F6 output pentode tube. A dynamic reproducer is employed.

The power unit uses a 5Y3G full wave rectifier. A 6G5 tuning indicator tube is employed.

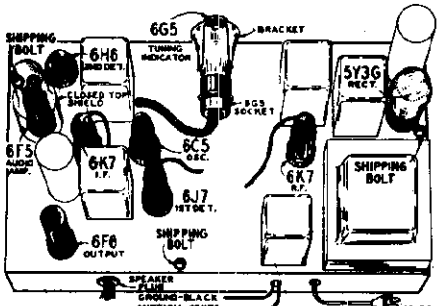

Fig. 4—Location of Tubes

General Service Data

Twenty-five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer and electric drive motor are used.

Ordinarily, a twenty-five cycle receiver may be operated from a sixty cycle power supply. However, the electric drive models cannot be operated in this manner because the twenty-five cycle motor will not operate properly on a sixty cycle power supply.

The sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

117-234 Volt Power Transformer

A 117-234 volt 60 cycle power transformer is also available for this model. *It is important that these sets be operated on a 60 cycle power supply only.*

Ordinarily, radios equipped with a 117-234 volt universal transformer may be operated on a 40 to 60 cycle power supply. However, the 60 cycle motor in the electric drive panel of this model will not operate satisfactorily at any frequency other than 60 cycles. Consequently, if one of these radios is to be used on a 40 cycle power supply, it will be necessary to change the motor. The motor regularly supplied with the 25 cycle model is used for this purpose.

Connections for the 117-234 volt transformer are shown in Fig. 2. There is a 1⅛ inch round knockout on the back panel of the chassis which may be removed to permit installation of a special octal socket. A plug which goes with this socket may then be inserted for either the 117 volt or 234 volt connection.

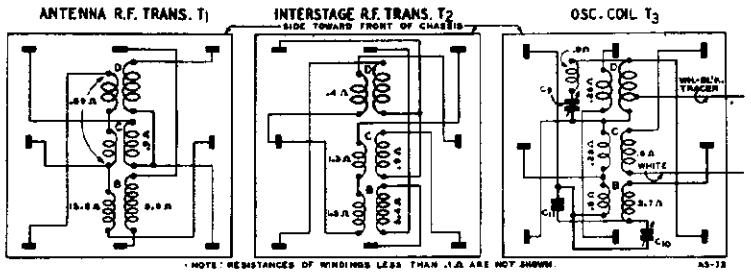

Fig. 6—Coil Terminal Arrangement and D.C. Resistance of Windings

Phonograph Connections

Phonograph connections are made as shown in Fig. 2. On the front panel of the chassis base is a round knockout 1⅜ inch in diameter. An octal base socket is mounted in this knockout opening and wired as illustrated.

A phono cable assembly may then be purchased (see parts list). On one end of this cable is an octal plug and on the other end is a phonograph radio switch and double tip jack.

Dial and Drive Assembly

Alignment, Trimmers

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Selectivity Control—Sharp Position All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter — Non-Metallic Screwdriver.
Dummy Antennas — .1 mf., 200 mmf., and 400 ohms.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—In sets using the electric drive, loosen the two set screws in the hub of the film drum assembly pulley. Turn the film drum until it is at the 1500 KC mark on the dial and then tighten the two pulley set screws. (On later models, the film drum can be turned without loosening the set screws.)

NOTE B—Turn the rotor back and forth and adjust the trimmer until the point of greatest intensity is obtained.

Special Note on Calibration—Movie Dial Sets

If after following the above procedure, the red line on the screen does not intersect the proper call letters when a station is tuned in, proceed as follows:

(1) Tune in any station between 530 KC and approximately 900 KC on the dial. After the station is tuned in, adjust the position of the film drum, as explained above under Note A, until the line on the screen crosses the call letters of the station tuned in. Modify this adjustment if necessary until all stations between 530 KC and approximately 900 KC are tuned in with some part of their call letters touching the vertical line on the screen.

(2) Set the signal generator for exactly 1500 KC. Turn the tuning knob until the line on the screen is at the 1500 KC mark. Then adjust the oscillator B Range trimmer until the signal is tuned in to maximum output.

(3) Adjust the 1st and 2nd antenna Range B trimmers to maximum output at 1500 KC.

(4) Check the 600 KC adjustment for maximum output.

Calibration should now be substantially correct over the entire dial. If it is not, repeat the above procedure.

CAUTION—When aligning the short wave band, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15.000 KC. The signal will then be heard at 15.000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15.509 less 912 KC or 14.888 KC on the dial. It may be necessary to increase the input signal to hear the image.

Circuit

This model is a three band AC operated radio with a tuning range as shown in the specifications above.

Referring to the schematic circuit diagram, Fig. 2, T1 and T2 are the antenna and interstage R.F. transformer assemblies and T3 is the oscillator coil assembly. The standard wave, 1st and 2nd short wave coils in each assembly are indicated by the letters B, C, and D respectively.

The band switch completes connections to the coils in use. The band switch sections are designated in the schematic as section 1 and section 2.

The antenna transformer with tuned secondary feeds into a type 6K7 R.F. amplifier tube. The output of this tube is fed through the interstage R.F. transformer with tuned secondary into a 6J7 tube which functions as the 1st detector.

A separate type 6C5 tube is employed in the oscillator circuit. The oscillating circuit is always resonant at 456 KC above the frequency to which the R.F. amplifier is tuned.

One stage of I.F. amplification is employed using a 6K7 tube. The primaries and secondaries of the 1st and 2nd I.F. transformers are tuned by small trimmer condensers.

Referring to the 1st and 2nd I.F. transformers T4 and T5 in Fig. 2, it will be noted that there is a coupling winding shown below the primary of T4 and below the secondary of T5.

When the selectivity control is in the sharp position, the coupling windings are open circuited and the loose coupling which exists between the primary and secondary of these transformers results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary in the case of T4 is connected in series with the secondary. In the case of T5, the coupling winding which is wound under the secondary is in series with the primary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

A 6H6 tube functions as a diode 2nd detector. AVC voltage is applied to the control grid circuits of the R.F. and I.F. tubes.

Across the volume control resistor R12 is a filter composed of condensers C34 and C35 and resistor R13. At high volume settings, the filter is not effective. At low volume settings, the action of this filter results in an increase of high and low frequency amplitudes relative to the other frequency amplitudes.

The output of the 2nd detector is applied to the 6J7 1st A. F. tube. The output of this tube is fed through resistance coupling into the 6F6 output tube shown nearest to it in the schematic.

A portion of the voltage developed across the output tube grid resistor is applied to the control grid of the 6C5 balancing exciter tube. This tube functions as a phase inverter and applies the audio voltage of proper phase and amplitude to the other 6F6 output tube. The two output tubes operate as a stage of Class A push-pull amplification. The balancing exciter tube thus replaces a push-pull input transformer. A dynamic reproducer is employed.

The power unit uses a 5Y3G full wave rectifier. A 6G5 tuning indicator tube is employed.

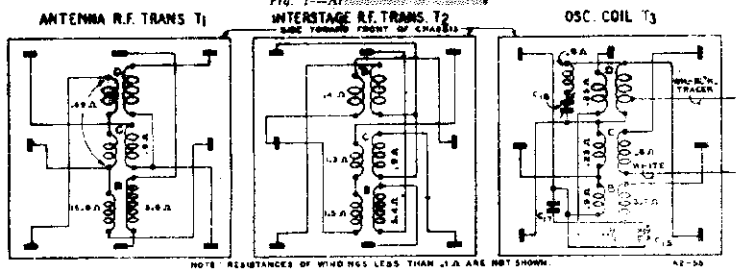

Fig. 6—Coil Terminal Arrangement and DC Resistance of Windings

Twenty-five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer and electric drive motor are used.

Ordinarily, a twenty-five cycle receiver may be operated from a sixty cycle power supply. However, the electric drive models cannot be operated in this manner because the twenty-five cycle motor will not operate properly on a sixty cycle power supply.

The sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

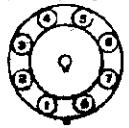

Fig. 4—Octal Tube Terminal Numbering (bottom of socket)

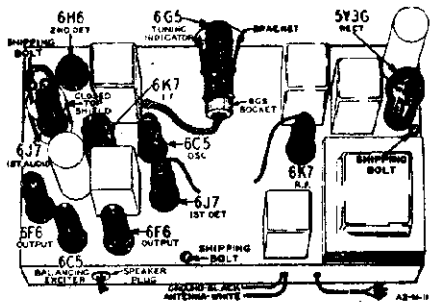

Fig. 5—Location of Tubes

117-234 Volt Power Transformer

A 117-234 volt 60 cycle power transformer is also available for this model. *It is important that these sets be operated on a 60 cycle power supply only.*

Ordinarily, radios equipped with a 117-234 volt universal transformer may be operated on a 40 to 60 cycle power supply. However, the 60 cycle motor in the electric drive panel of this model will not operate satisfactorily at any frequency other than 60 cycles. Consequently, if one of these radios is to be used on a 40 cycle power supply, it will be necessary to change the motor. The motor regularly supplied with the 25 cycle model is used for this purpose.

Connections for the 117-234 volt transformer are shown in Fig. 2. There is a 1⅛ inch round knockout on the back panel of the chassis which may be removed to permit installation of a special octal socket. A plug which goes with this socket may then be inserted for either the 117 volt or 234 volt connection.

Phonograph Connections

Phonograph connections are made as shown in Fig. 2. On the front panel of the chassis base is a round knockout 1⅛ inch in diameter. An octal base socket is mounted in this knockout opening and wired as illustrated.

A phono cable assembly may then be purchased. On one end of this cable is an octal plug and on the other end is a phonograph-radio switch and double tip jack.

Circuit

This model is a two band AC operated radio with a tuning range as shown in the specifications above.

Referring to the schematic circuit diagram, Fig. 2, T1 and T2 are the antenna coil assemblies and T3 is the oscillator coil assembly. The standard wave and short wave coils in each assembly are indicated by the letters B and D respectively.

The band switch completes connections to the coils in use. When it is in the Range B position, a double tuned antenna R.F. stage is used while for the D Range, a single tuned secondary is used.

A type 6J7 tube functions as the 1st detector.

A separate type 6C5 tube is employed in the oscillator circuit. The oscillating circuit is always resonant at 456 KC above the frequency to which the R.F. amplifier is tuned.

One stage of I.F. amplification is employed using a 6K7 tube. The primaries and secondaries of the 1st and 2nd I.F. transformers are tuned by small trimmer condensers.

Referring to Fig. 2, it will be noted that there is a coupling winding connected in series with the secondary of I.F. transformer T4. When the selectivity control is in the sharp position, the coupling winding is open circuited and the loose coupling which exists between the primary and secondary of this transformer results in high selectivity.

When the selectivity control is in the broad position, the coupling winding which is wound under the primary is connected in series with the secondary. This provides overcoupling which results in a greatly widened resonance curve. Passage of a wide range of audio frequencies is thus obtained.

A type 6Q7 duo-diode triode functions as the second detector and a one stage audio amplifier. AVC voltage is applied to the 1st detector and I.F. tubes.

Resistance coupling is used between the 1st audio stage and the output stage which employs a type 6F6 ouput pentode tube. A dynamic reproducer is used.

The power unit uses a 5Y3G full wave rectifier. A 6G5 tuning indicator tube is employed.

SEE INDEX

Twenty-Five Cycle Models

The twenty-five cycle receiver differs from the sixty cycle receiver only in the fact that a different power transformer and electric drive motor are used.

Ordinarily, a twenty-five cycle receiver may be operated from a sixty cycle power supply. However, the electric drive models cannot be operated in this manner because the twenty-five cycle motor will not operate properly on a sixty cycle power supply.

The sixty cycle receiver cannot be operated from a twenty-five cycle power supply.

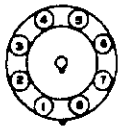

Fig. 6—Octal Tube Terminal Numbering (bottom of socket).

117-234 Volt Power Transformer

A 117-234 volt 60 cycle power transformer is also available for this model. *It is important that these sets be operated on a 60 cycle power supply only.*

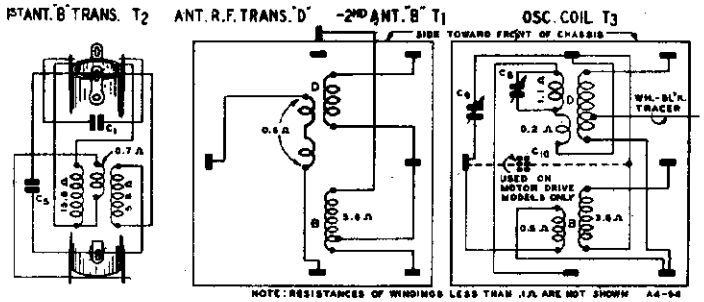

Fig. 4—Coil Terminal Arrangement and D.C. Resistance of Windings

Ordinarily, radios equipped with a 117-234 volt universal transformer may be operated on a 40 to 60 cycle power supply. However, the 60 cycle motor in the electric drive panel of this model will not operate satisfactorily at any frequency other than 60 cycles. Consequently, if one of these radios is to be used on a 40 cycle power supply, it will be necessary to change the motor. The motor regularly supplied with the 25 cycle model is used for this purpose.

Connections for the 117-234 volt transformer are shown in Fig. 2. There is a 1⅛ inch round knockout on the back panel of the chassis which may be removed to permit installation of a special octal socket. A plug which goes with this socket may then be inserted for either the 117 volt or 234 volt connection.

Phonograph Connections

Phonograph connections are made as shown in Fig. 7. On the side panel of the chassis base is a round knockout 1⅛ inch in diameter. An octal base socket is mounted in this knockout opening and wired as illustrated.

A phono cable assembly may then be purchased On one end of this cable is an octal plug and on the other end is a phonograph-radio switch and double tip jack.

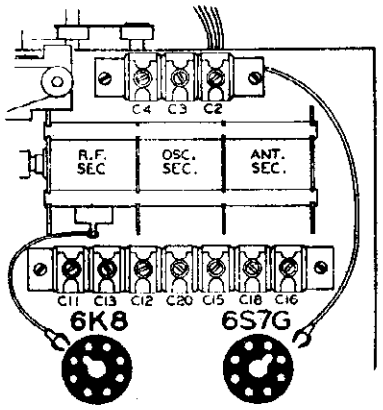

FIG. 5—TOP OF CHASSIS

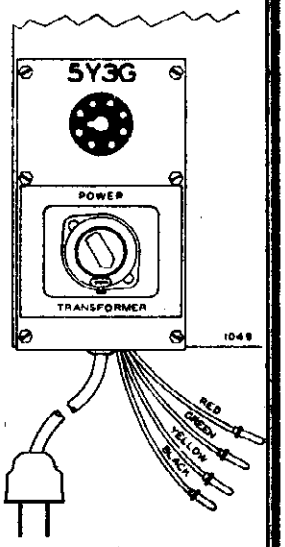

FIG. 2—MODEL 62-381X A. C. POWER UNIT

BATTERY AND POWER SUPPLY:

This radio obtains its power entirely from a six volt storage battery—no other batteries are required.

1. For 6 volt storage battery operation:
   (a) Connect the lead (containing the fuse receptacle) marked A positive (+) to the positive (+) post of the storage battery.
   (b) Connect the lead marked A negative (—) to the negative (—) post of the storage battery.
2. For 100-250 volts, 40/60 cycle operation; see Fig. 2.

Installing the Model 62-381X Power Unit

(For 100-250 Volt 40/60 Cycle A. C. Operation)

To install the Model 62-381X A.C. power unit proceed as follows:—

1. **Remove the chassis from the cabinet,** by removing the four chassis mounting bolts from the bottom of the cabinet.
2. Referring to Fig. 1, note that the **6-volt power unit** is fastened to the top of the radio chassis with **eight copper head screws,** (six on top of chassis, and two on rear flange of chassis).
3. Remove the eight copper head screws.
4. Disconnect the four flexible leads of the power unit from the chassis connector strip. These leads clip into pin jacks. Note that the color of each flexible lead matches the color dot on the chassis pin jack connector strip.
5. Place the model 62-381X A.C. power unit (see Fig. 2) on the top of the radio chassis and plug the four flexible leads into the pin jacks on the chassis connector strip.
   (a) The **red lead** should be plugged into the pin jack which is marked with a **red dot.**
   (b) The **green** lead connects to the pin jack which is marked with a **green dot.**
   (c) The **yellow** lead connects to the pin jack which is marked with a **yellow dot.**
   (d) The **black** lead connects to the pin jack which is marked with a **black dot.**
6. Mount the power unit to the chassis using the eight copper head screws.

IMPORTANT:

After the A.C. power unit has been installed check the connections again to make sure you have followed the instructions correctly. Set the switch on the top of the power transformer to the proper voltage.

SERVICE NOTES:

Voltage taken from different points of circuit to chassis are measured with volume control at minimum, all tubes in their sockets and speaker connected, with a volt meter having a resistance of 1000 ohms per volt.

IN ORDER TO PREVENT SIGNAL FROM ACTING UPON AVC AND AFFECTING ACCURACY OF VOLTAGE MEASUREMENTS, AERIAL AND GROUND LEADS SHOULD BE SHORT CIRCUITED WHILE MAKING MEASUREMENTS.

All voltages as indicated on the voltage chart are measured with a fully charged 6 volt storage battery or from 117 volt A. C. line if the Model 62-381X A. C. power unit is installed in place of the 6 volt power unit.

ALIGNMENT PROCEDURE

Models No 93-BR-420B, 93BR-421B, 93BR-423B, 93BR-424B and 93BR-431B Models No. 93BR-420A and 93BR-421A

- Volume control—Maximum all adjustments.
- Connect —B of radio chassis to ground post of signal generator through .1 Mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
BROAD-CAST BAND	1720 Kc.	.1 MFD.	Connect to Terminal "B" (See Fig. 4)	Iron Cores All the way out	Trimmer (C6) (See bottom of Radio, Fig 3)	Oscillator	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Iron Cores All the way out	Trimmer (C3) (See bottom of Radio, Fig 3)	Antenna	Adjust to maximum output (See Note "A"
	1400 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1400 Kc.	Adjust position of antenna coil up or down (see Fig. 4)	Antenna Coil Adjustment	Adjust to maximum output
	1720 Kc.	200 MMF.	Connect to Terminal "A" (See Fig. 4)	Turn Dial to 1720 Kc.	Adjust trimmer (C3) (See Fig. 3)	Antenna	Check for tracking (See Note "B"

NOTE "A"—The antenna coil assembly is made so that it is movable up or down. When making the adjustment as given in the alignment procedure move the coil assembly very slowly. It can be moved by hand or by pivoting one edge of the blade of a screwdriver in the hole and engaging the blade in the gear teeth of the coil form.

NOTE "B"—After the antenna coil has been tracked at 1400 Kc. it is necessary to check the antenna trimmer (C3) adjustment again at 1720 Kc. If no appreciable change in trimmer adjustment is made the coil is in track, if the trimmer requires considerable change it will be necessary to again adjust the position of the antenna coil at 1400 Kc. These two adjustments should be tried several times until no change of trimmer adjustment is required at 1720 Kc.

MODELS 93BR-461A, -462A.

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

NOTE "A"—A 1 megohm resistor must be connected between the two loop antenna leads from the chassis when aligning the I. F. transformers and setting the oscillator trimmer, (C2). The loop antenna must be disconnected from the chassis.

NOTE "B"—Remove the 1 megohm resistor from the loop antenna leads; mount the chassis and the loop antenna in the cabinet, connect the loop antenna to the chassis. Adjust trimmer (C3). (See note "C").

NOTE "C"—Lay the output lead from the signal generator in back of the loop antenna. Turn up the output of the generator, picking up the energy in the loop antenna without any electrical connection from the signal generator.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F. 93BR-461A ONLY	465 Kc.	.1 MFD.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Four trimmers on top (See Fig. 1)	Output and input I. F.	(See Note "A") Adjust to maximum output
I. F. 93BR-462A ONLY	465 Kc.	.1 MFD.	Grid of 1N5GT I. F. Tube	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	(See Note "A") Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 1A7GT	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	(See Note "A") Adjust to maximum output
BROAD-CAST BAND	1620 Kc.	.1 MFD.	Grid of 1A7G Tube	Rotor full open (Plates out of mesh)	Trimmer (C3) front section of gang (See Fig. 4)	Oscillator	(See Note "A") Adjust to maximum output
	1400 Kc.		See Note "C"	Set Dial at 1400 Kc.	Trimmer (C3) rear section of gang (See Fig. 4)	Antenna	(See Note "B") Adjust to maximum output

MODEL 93BR-714B (CAT. NO. 62-721)

- Volume control—Maximum all adjustments.
- Connect radio ground to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I F.	465 Kc.	.1 MFD.	Grid of 6SK7 I. F.	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	Output I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SA7 Mixer	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top	Input I. F.	Adjust to maximum output
SHORT WAVE BAND (See Note A)	18 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 18 Mc.	Trimmer C1	Short Wave oscillator	Adjust to maximum output
	18 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 18 Mc.	Trimmer C2 (See Fig. 4)	Short Wave antenna	Adjust to maximum output
	6 Mc.	400 Ohms	External Antenna and Ground	Short Wave	Set Dial at 5 Mc	Trimmer C5 (See Fig. 4)	Short Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROAD-CAST BAND (See Note A)	1500 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Rotor full open (Plates out of mesh)	Trimmer C4	Broadcast oscillator	Adjust to maximum output
	540 Kc.	200 mmf.	Grid of 6SA7	Broadcast	Set Dial at 540 Kc.	Trimmer C5 (See Fig. 4)	Broadcast oscillator series pad	Adjust to maximum output
LOOP ALIGN-MENT (See Note B)	1500 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial At 1500 Kc.	Trimmer C1	Broadcast antenna	Adjust to maximum output
	600 Kc.	200 mmf.	External Antenna and Ground	Broadcast	Set Dial at 600 Kc.	Trimmer L1	Iron Core Tracking Coil	Adjust to maximum output

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the Short Wave Band and to the grid of the 6SA7 tube and ground terminal when setting the Broadcast Band oscillator and frequencies, (1500 and 540 K.C.).

The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals and the jumper on the terminal board connected to "ANT." terminal (See Fig. 1).

NOTE "C"—Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each band is completed, repeat the procedure as a final check.

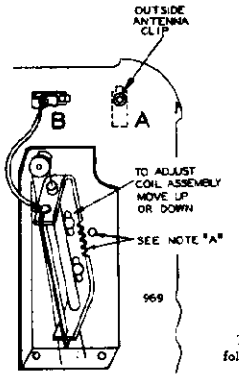

FIG. 4
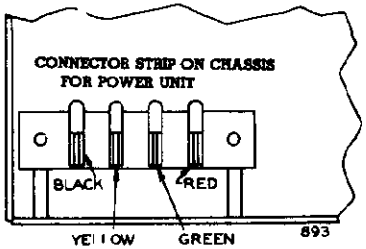
FRONT VIEW

Installing the Model 62-381 Power Unit

(For 105-125 Volt 50/60 Cycle A. C. Operation)

MODEL 93BR-858A and 93BR-868A SERIES A



To install the Model 62-381 A.C. power unit proceed as follows:—

1. **Remove the chassis from the cabinet,** by removing the four chassis mounting bolts from the bottom of the cabinet.
2. Referring to Fig. 1, page 1, note that the **6-volt power unit** is fastened to the top of the radio chassis with **eight copper head screws,** (six on top of chassis, and two on rear flange of chassis).
3. Remove the eight copper head screws.
4. Disconnect the four flexible leads of the power unit from the chassis connector strip. These leads clip into pin jacks. Note that the color of each flexible lead matches the color dot on the chassis pin jack connector strip.
5. Place the model 62-381 A.C. power unit on the top of the radio chassis and plug the four flexible leads into the pin jacks on the chassis connector strip.
   (a) The **red lead** should be plugged into the pin jack which is marked with a red dot.
   (b) The **green lead** connects to the pin jack which is marked with a **green dot.**
   (c) The **yellow lead** connects to the pin jack which is marked with a **yellow dot.**
   (d) The **black lead** connects to the pin jack which is marked with a **black dot.**
6. Mount the power unit to the chassis using the eight copper head screws.

IMPORTANT:

After the A.C. power unit has been installed check the connections again to make sure you have followed the instructions correctly.

ADJUSTING THE ANTENNA:

IMPORTANT: MODEL 93BR-462A

After the batteries have been installed and the radio placed in operation, tune in a weak station around 1400 Kc. on the dial.

On the back of the cabinet a small adjustment screw is provided, (see C2, Fig. 2).

Very carefully turn this adjustment screw in or out until the station is as clear and loud as it can be made.

This adjustment should be made in any case whether the radio is used with an outside antenna and ground or whether only the built-in loop antenna is used.

NEXT:—Tune in a station around 600 Kc. on the dial and adjust adjustment screw (See A, Fig. 2). Both these adjustments are very important for best reception.

NOTE: The "A" battery should be placed in the cabinet so that the plug-in socket on the top of the battery is nearer to the side of the cabinet which is faced down than to the side of the cabinet which is facing up. Also, the "A" battery should be pushed all the way into the cabinet so that it fits between the left end of the radio chassis and the side of the cabinet.

CONVENTIONAL ALIGNMENT

SEE SPECIAL SECTION VOLUME VIII

ALIGNMENT NOTES:-

NOTE "A"—The signal generator is connected to the "ANT." and "GND." terminals on the rear of the chassis when aligning the **Short Wave Band** and to the grid of the 6A8G tube and ground terminal when setting the **Broadcast Band** oscillator end frequencies, (1550 and 540 K.C.). The loop antenna need not be connected to the radio when making these adjustments.

NOTE "B"—Loop alignment is made with the chassis mounted in the cabinet and the loop antenna connected to the terminal board. The signal generator is connected to the "ANT." and "GND." terminals.

When an outside antenna is used connect the antenna to the binding screw on the rear of the chassis, marked "Ant." Connect the ground to the binding screw marked "Gnd." Do not disconnect the loop antenna when an outside antenna and ground are used.

MODEL 93BR-1201A MONTGOMERY WARD & CO.

Alignment, Trimmers Voltage, Socket Sensitivity

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Position of Band Switch	Variable Condenser Setting	Trimmers Adjusted (in Order Shown)	Trimmer Function	Adjustment
I. F.	465 Kc.	.1 MFD.	Grid of 6SK7 (2nd I.F.)	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Output I. F.	(See Note "A") Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6SK7 (1st I.F.)	Broadcast	Rotor full open (Plates out of mesh)	Three trimmers on top (See Fig. 1)	Interstage I. F.	Adjust to maximum output
	465 Kc.	.1 MFD.	Grid of 6K8	Broadcast	Rotor full open (Plates out of mesh)	Two trimmers on top (See Fig. 1)	Input I. F.	Adjust to maximum output
SHORT WAVE BAND	21 Mc.	400 ohms	Antenna lead	Short Wave	Set Dial at 21 Mc.	Trimmer (C13) (See Fig. 3)	Short Wave oscillator	(See Note "B") Adjust to maximum output
	21 Mc.	400 ohms	Antenna lead	Short Wave	Dial Set at 21 Mc.	Trimmers (C3 & C8) (See Fig. 3)	Short Wave antenna & R. F.	Adjust to maximum output
MIDDLE WAVE BAND	6 Mc.	400 ohms	Antenna lead	Middle Wave	Set Dial at 6 Mc.	Trimmer (C14) (See Fig. 3)	Middle Wave oscillator	Adjust to maximum output
	6 Mc.	400 ohms	Antenna lead	Middle Wave	Dial Set at 6 Mc.	Trimmers (C4) (C9) (See Fig. 3)	Middle Wave antenna and R. F.	Adjust to maximum output
	2.3 Mc.	400 ohms	Antenna lead	Middle Wave	Set Dial at 2.3 Mc.	Trimmer (C12) (See Bottom of Chassis)	Middle Wave oscillator series pad	Adjust to maximum rock dial. (See note "C")
BROAD-CAST BAND	1730 Kc.	200 mmf.	Antenna lead	Broadcast	Rotor full open (Plates out of mesh)	Trimmer (C15) (See Fig. 3)	Broadcast oscillator	Adjust to maximum output
	1500 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 1500 Kc.	Trimmers (C5) (C10) (See Fig. 3)	Broadcast antenna and R. F.	Adjust to maximum output
	600 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C17) (See Fig. 3)	Broadcast oscillator series pad	Adjust to maximum rock dial. (See note "D")
	465 Kc.	200 mmf.	Antenna lead	Broadcast	Set Dial at 600 Kc.	Trimmer (C1) (See Fig. 3)	I. F. Wave Trap	Adjust for minimum output (See Note "E")

NOTE "A" I.F. Alignment as given is for use with output meter. For oscilloscope alignment; connect oscilloscope between ground and high side of 125M ohm diode load resistor on output I.F. Make same adjustments as above except readjust input I.F. trimmers in broad position for uniform expansion.

NOTE "B" Make certain that the 21MC signal and not the image has been tuned in by noting that the image falls near 20MC. on the dial scale.

NOTE "C" The middle wave oscillator series padder condenser is mounted on the bottom of the chassis at the rear of the bandswitch. When adjusting this trimmer turn the dial back and forth slightly (rock) and adjust until the peak of greatest intensity is obtained.

NOTE "D" Turn the dial back and forth slightly (rock) and adjust trimmer until the peak of greatest intensity is obtained.

NOTE "E" After adjusting wavetrap trimmer (C1), go over 1730 Kc, 1500 Kc and 600 Kc adjustments again.

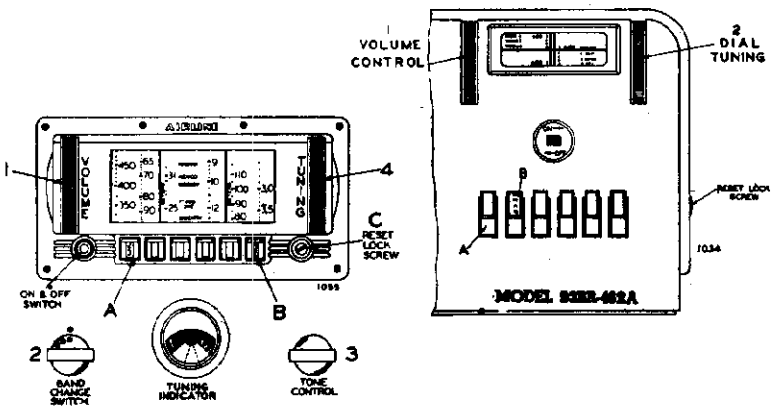
Procedure for Setting the Automatic Push Buttons



TYPICAL FRONT VIEW FOR MANY MODELS SEE PROCEDURE

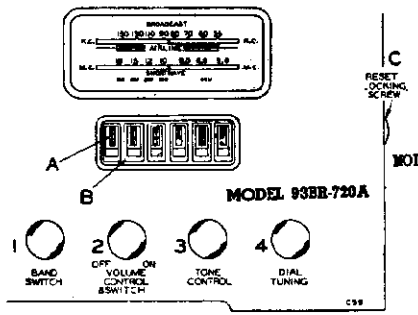


FIG. 2—FRONT VIEW

IMPORTANT—Read carefully before setting the automatic push buttons:

There are six push buttons by means of which six stations may be selected, (See "A" Fig. 2). Make a list of local stations or stations you tune in regularly; any number up to and including six.

On the front of each automatic push button an opening is provided for inserting the call letter tabs, (See "B" Fig. 2).

Insert the call letter tabs in the rectangular openings of each of the automatic push buttons. One of the small celluloid tabs supplied should be inserted into place over each of the station call letter tabs.

NOW, PROCEED AS FOLLOWS:

Unlock the Tuner Mechanism.

(NOTE:—The automatic tuner mechanism is locked tight when radio is shipped from the factory.)

1. Remove the snap-in button from the dial escutcheon plate on the front panel of the radio (see "C," Reset Lock Screw, Fig. 2). If the snap-in button will not come out easily using your fingers, pry it off with a screwdriver or a knife, being careful not to mar the finish on the escutcheon plate.
2. Unlock the tuner mechanism by inserting a screwdriver through the hole in the panel. Press in and loosen the locking screw by turning it to the left as far as it will turn without forcing.
   You will note that as the locking screw is turned it will turn easily until the dial reaches its stop and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point, the locking screw will turn quite easily again until the tuner mechanism is completely unlocked. At this point do not force the locking screw any further. The tuner mechanism is now unlocked.

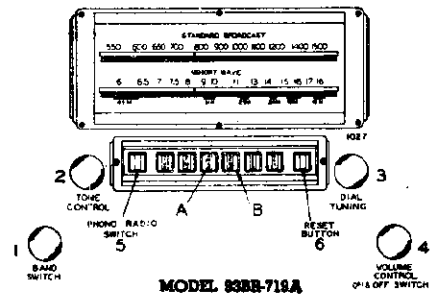

FIG. 3.

SETTING PUSH BUTTONS

1. Press in all the way any one of the automatic tuner pushbuttons. Holding it in firmly, tune in by means of the Dial Tuning Control, No. 4, the station indicated on the station call letter tab on this push button. Move the Dial Tuning Control very slowly up and down (while still holding the automatic tuner push button in firmly), noting the width of the shadow on the screen of the cathode-ray tuning eye. Minimum width on the tuning eye indicates the ideal tuning position (resonance). The station will then be clearest and accurately tuned in.
2. Press in another tuner push button. Holding it in firmly, carefully tune in the station indicated on the call letter tab on this push button.
3. Follow this procedure until you have selected all of your favorite stations.

   (NOTE:—If the dial mechanism works hard or has a tendency to slip when setting up a station for one of the push buttons, it is due to the tuner mechanism not being unlocked all the way. Loosen the reset locking screw. The Dial Tuning Control should turn the dial drum freely with a push button pushed in.)

LOCKING THE TUNER MECHANISM:

1. To lock the tuner mechanism insert a screwdriver through the hole in the escutcheon panel and press in and turn the reset locking screw to the right until it cannot be turned any further without forcing it.
2. This will lock the tuner mechanism and all the stations that have been set up on the push buttons will be locked in place for automatic tuning.

Press in any one of the push buttons and—YOUR FAVORITE STATION IS SELECTED.

MODEL:- 93BR-719A Procedure for Setting the Automatic Pushbuttons

1. Make a list of six stations you tune in regularly. There are six pushbuttons on the front of the radio by means of which six stations may be tuned automatically (See "B," Fig. 3.)

2. Punch out the call letters of the stations you have selected from the set of station call letter tabs supplied.

On the front of each automatic tuner button an opening is provided for inserting the call letter tabs, (see "A," Fig. 3).

Insert the call letter tabs in the rectangular openings in each of the automatic tuner pushbuttons. One of the small celluloid tabs supplied should be snapped into place over each of the station call letter tabs.

3. Stations may be set up in any sequence desired.

NOW, PROCEED AS FOLLOWS:

1. Pull the "Reset" button all the way out (see control No. 6, Fig. 3), and rotate the button to the left (counter-clockwise) until it cannot be turned any further.

You will note that as the button is rotated it will turn easily until the pointer reaches the end of the dial scale and then a slight amount of force will be required to actually start unlocking the tuner mechanism. Beyond this point the button will turn quite easily again until the tuner mechanism is completely unlocked. At this point do not force the button any further. The tuner mechanism is now unlocked.

(NOTE:—Automatic tuner mechanism is locked tight when radio is shipped from the factory.)

2. Push in all the way any one of the pushbuttons and at the same time push in firmly on the dial tuning knob. Both the dial tuning knob and the pushbutton should be pushed hard enough to make them stay latched in.

You may find it necessary to rotate the dial tuning knob slightly when pushing it in to make certain that the gears mesh properly.

3. Both the pushbutton and the Dial Tuning Knob are now latched in. Do not hold the pushbutton in by hand while tuning in a station. Tune in by means of the dial tuning knob the station indicated on the station call letter tab on the pushbutton which is latched in. Turn the dial tuning knob very slowly back and forth until the station is clearest. The station will then be accurately tuned in.

4. Push in all the way another pushbutton, at the same time push the dial tuning knob in so that both the pushbutton and the dial tuning knob are latched in together. Tune in the station indicated on the call letter tab on this pushbutton.

5. Follow this procedure until you have tuned in all of your favorite stations.

6. Pull the "Reset" button all the way out and rotate the button to the right (clockwise) until it cannot be turned any further. This will lock the automatic tuner mechanism and the stations you have set up for automatic tuning will be locked in place.

CHANGING STATIONS:

If you should desire to change any station you selected to another, pull the "Reset" button all the way out and rotate the button to the left (counter-clockwise) and unlock the tuner mechanism. Select the new station as explained.

(NOTE:—If the dial mechanism works hard when setting up a new station for one of the automatic tuner pushbuttons, it is due to the tuner mechanism not being unlocked all the way. Pull the "Reset" button out all the way and rotate the button to the left (counter-clockwise) until it will turn no further. The dial mechanism should work freely with a tuner pushbutton latched-in.

After you have selected the new station, pull the "Reset" button all the way out and rotate the button to the right (clockwise) to lock the tuner mechanism. Be sure the button is turned until it will turn no further.

The automatic tuner buttons are now set up for quick tuning.

MODELS 93WG-1186 and 93WG-1304 ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

IMPORTANT—Follow procedure in the order shown.

The following equipment is required for aligning:

An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter—Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 200 mmf., and 400 ohms.

SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I. F. 456 KC	Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	2nd I.F. (C23) & (C24) 1st I.F. (C20) & (C21)
RANGE D 18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
15,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C2) Int. Range D (C6) Rock Rotor—See Note A
RANGE C 5400 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Full Open	Oscillator Range C (C11)
5000 KC	Antenna Lead	400 Ohm	C Range	Turn Rotor to Max. Output	Antenna Range C (C3) Int. Range C (C7)
RANGE B 1400 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C12)
1400 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC—See Note B	Ant. Range B (C4) Int. Range B (C8)
600 KC	Antenna Lead	200 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C13) Rock Rotor—See Note A

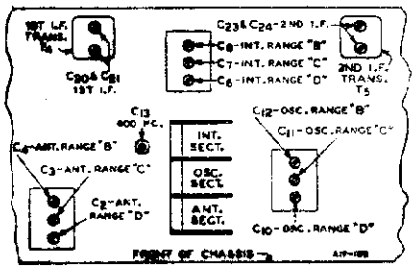
Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the point of greatest intensity is obtained.

NOTE B—If the pointer is not at 1400 KC on the dial, loosen the 2 clamps which hold the pointer assembly on the cord, move the pointer to the 1400 KC mark, and tighten the clamps.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say, the signal generator is set for 9000 KC. The signal will then be heard at 9000 KC on the dial of the radio. The image signal, which is much weaker will be heard at 8088 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.



Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.

Volume Control—Maximum.

Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale.

Procedure for Setting the Station Buttons

FOR MODELS 93WG-382, 04WG-726, 93WG-754,-755, 93WG-800,801,805 (LOOP MODELS)
93WG-801,802,805, 93WG-1000,1001 and 93WG-1000,1001 (LOOP MODELS)

Selecting the Stations to be Set

There are 6 buttons on the automatic tuning dial by means of which 6 stations may be set for quick tuning.

Make a list of your favorite stations, those which you tune in regularly. There may be any number up to and including 6 in this list.

It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

Setting a Station Button

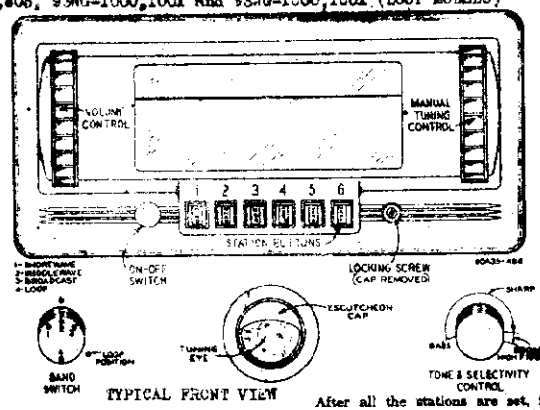
Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached.

At the right side of the escutcheon (from the front) will be seen a cap which covers a hole in the escutcheon —See illustration. Pull off this cap.

At the end of the tube in back of the hole in the escutcheon is the locking screw. Using a small handled screwdriver, unlock the mechanism by turning this screw in a counter-clockwise direction several turns.

TO SET STATIONS ACCURATELY, DO NOT JAR THE RADIO OR BUTTONS WHILE THE MECHANISM IS UNLOCKED.

Select the first station from the list you have prepared, and carefully tune in this station by means of the manual tuning control using the tuning eye as a guide.



TYPICAL FRONT VIEW

With one hand, hold the manual tuning control to prevent it from turning and with the other hand, push one of the station buttons shown in the illustration all the way in. It is better to start with button No. 1.

Hold this button all the way in. With the other hand, see whether or not this station is still accurately tuned in by moving the tuning control a slight amount back and forth while observing the tuning eye. Be sure to hold the button all the way in.

Release the button slowly after the station is tuned in.

CAUTION—Do not touch this button again while the mechanism is unlocked as the setting may be altered.

Carefully tune in the second station on your list. Then hold the tuning control and push the second button slowly and firmly all the way in. Check for accurate tuning.

Proceed in the same manner to set any additional stations on your list on the remaining station buttons.

After all the stations are set, it will be necessary to lock the mechanism so that the settings will not change. Turn the manual tuning control so that the dial moves toward 1700 KC until the stop is reached. Then, with a SMALL HANDLED screwdriver, turn the locking screw in a clockwise direction until it is tight. Tighten the locking screw firmly but not excessively to avoid stripping the threads. Replace the cap over the hole.

Remove the correct station call letter tabs from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press the tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

If at any time you wish to change the setting of a button from one station to another, repeat the above procedure. Changing the setting of one button will not affect the setting of any of the other buttons.

MODEL 93WG-510

Drive Cord Replacement

Remove dial lamp socket and bracket from dial mounting plate.

Remove tension spring from pulley. Double new drive cord and knot both ends to same loop on tension spring. There should be a distance of 13 inches between knot and looped end of cord.

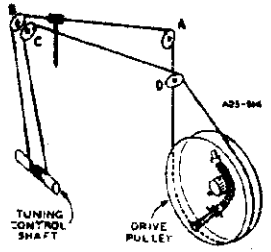
Secure other end of spring to hook on pulley. Thread looped end of cord, starting from inside of drive pulley, through hole in rim of drive pulley.

Turn gang condenser to completely closed position. Remove any twists in doubled cord. Pass one portion of cord over pulleys A and B as shown in illustration. Then wind 3½ turns counter-clockwise (from rear of chassis) around tuning control shaft—See illustration.

Loop ½ turn around bottom rear of drive pulley. Continue cord over pulley D. Pull remaining portion of cord and place over pulley C.

Dial Pointer Attachment—Tune in a station of known frequency. Set the pointer at this frequency on the dial scale and secure pointer to cord —See illustration.

MODEL 93WG-510



Caution

The metal chassis is connected to one side of the line through a .25 mfd. condenser. Both AC and DC power lines are generally grounded on one side. If the side of the line not connected to the metal chassis through this condenser is grounded and the metal chassis comes in contact with an external ground, this condenser will be connected across the line and there will be an increase in hum.

Therefore, in any service work on the chassis, keep it on a wood or other insulated surface to avoid contacts with ground. The person working on the set should avoid getting in contact with any ground.

MODEL 93WG-382

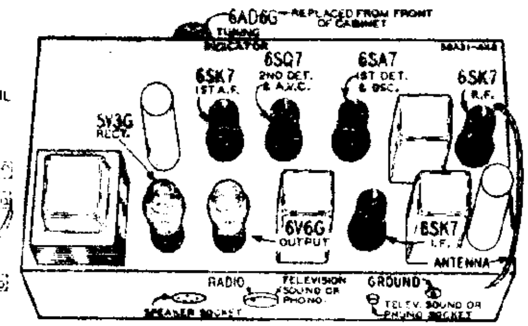
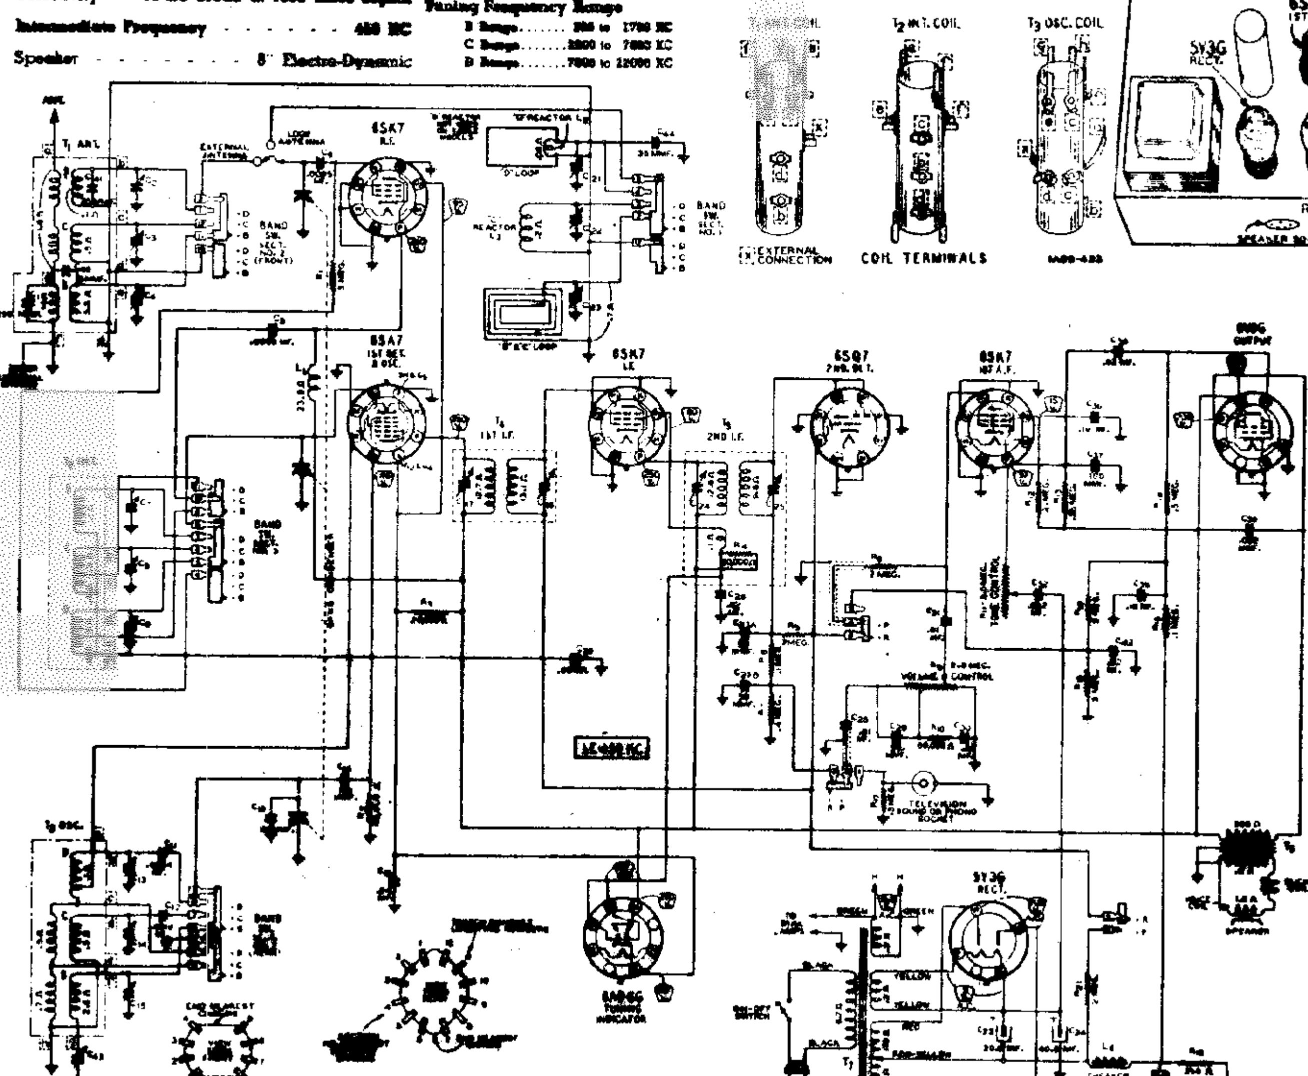
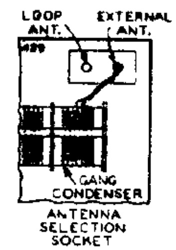
D Range.......7000 to 22000 KC





117 volt, 50 to 60 cycle AC
100 volt, or other service are so marked on label.

The dial lamps used are of the bayonet pin type (bulb No. 51).



ANTENNA SELECTION SOCKET

ANTENNA SELECTION SOCKET—At the right front corner (from back of cabinet) of the chassis base is a 2 hole pin tip socket. See illustration. If it is desired to operate the radio using the loop antennas, the pin tip should be inserted in the hole farthest from the side of the chassis. If it is desired to operate the radio using an external antenna, insert the pin tip in the hole nearest the side of the chassis.

Voltages at Sockets

The voltages at sockets are shown on the schematic circuit diagram. Unless otherwise specified, the voltage indicated is between the socket terminal and ground.

These voltages are read under the following conditions:

Line Voltage—117.
Volume Control—Maximum.
Antenna Shorted to Ground.

Readings taken with 1000 ohm-per-volt meter. Plate and screen voltages are read on 500 volt scale.

LOOP CONNECTIONS

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—For all adjustments, with the exception of the 3 loop range adjustments, the pin tip should be in the external antenna hole of the Antenna Selection Socket—See illustration on page one.

NOTE B—If the indicator is not at 1500 KC, it will be necessary to re-calibrate. Loosen the set screw on the dial hub near the volume control drum. Hold the tuning control drum stationary and at the same time turn the dial drum the necessary amount in the required direction. Retighten the set screw.

NOTE C—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE D—Re-install set in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place signal generator so that this loop is between 3 and 10 feet from loop in cabinet. Insert pin tip in loop antenna hole of Antenna Selection Socket—See illustration on page one.

NOTE E—Console models only—Turn knob of loop until output is maximum.

CAUTION—When aligning the short wave bands, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 5000 KC. The signal will then be heard at 5000 KC on the dial of the radio. The image signal, which is much weaker, will be heard at 5000 less 912 KC, or 4088 KC on the dial. It may be necessary to increase the input signal to hear the image.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

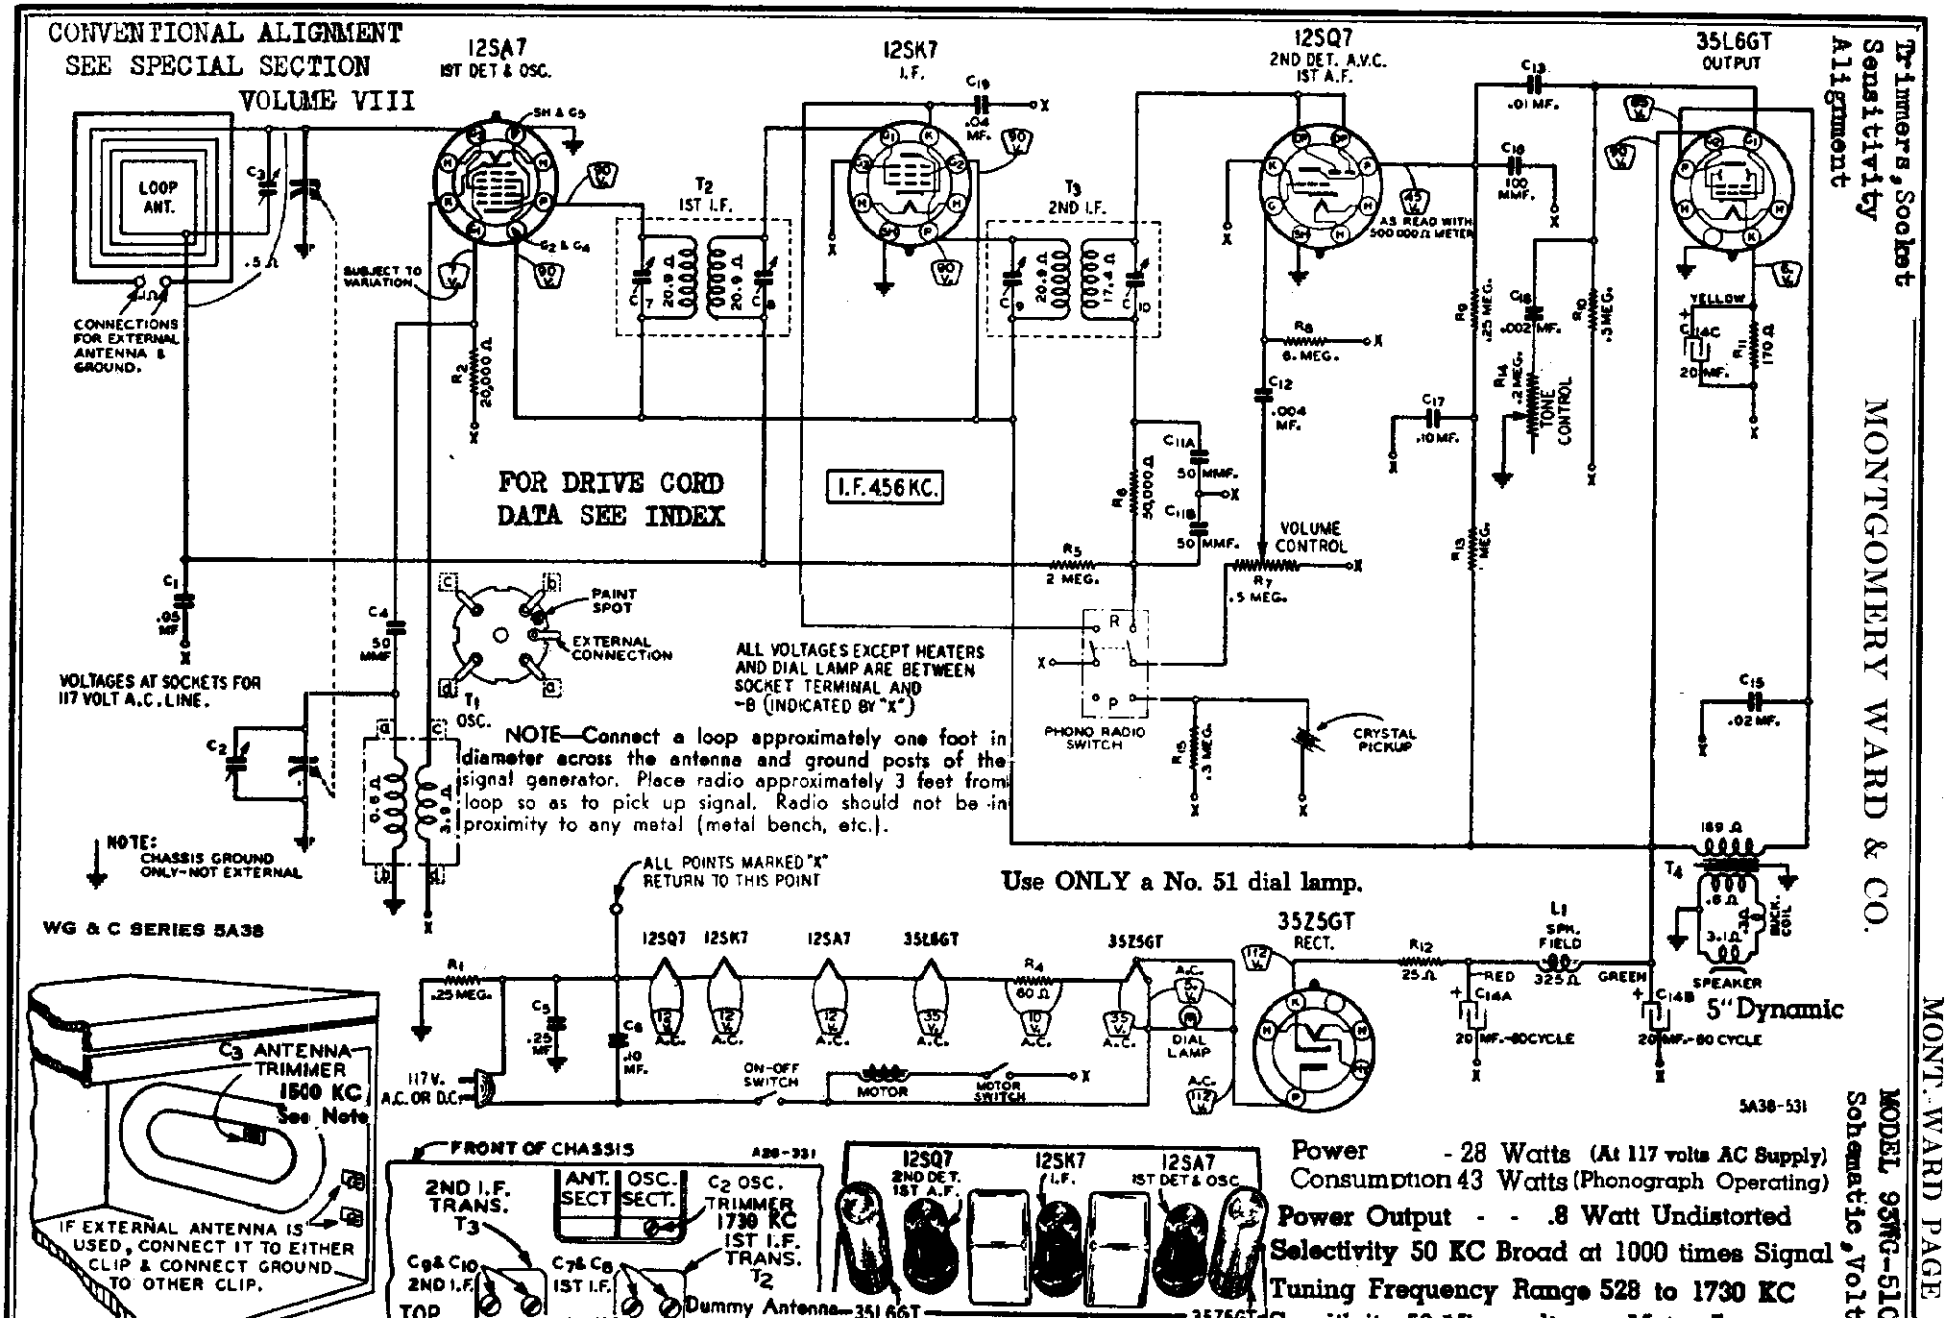
NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Tune in a 1400 KC signal. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

NOTE C—Reinstall set in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place signal generator so that this loop is between 3 and 10 feet from loop in cabinet.

CAUTION—When aligning the short wave band, be sure NOT to adjust at the image frequency. This can be checked as follows: Let us say the signal generator is set for 15,000 KC. The signal will then be heard at 15,000 on the dial of the radio. The image signal, which is much weaker, will be heard at 15,000 less 912 KC, or 14,088 KC on the dial. It may be necessary to increase the input signal to hear the image.

MONTGOMERY WARD & CO.



Power Consumption - 28 Watts (At 117 volts AC Supply) 43 Watts (Phonograph Operating)

Power Output - - .8 Watt Undistorted

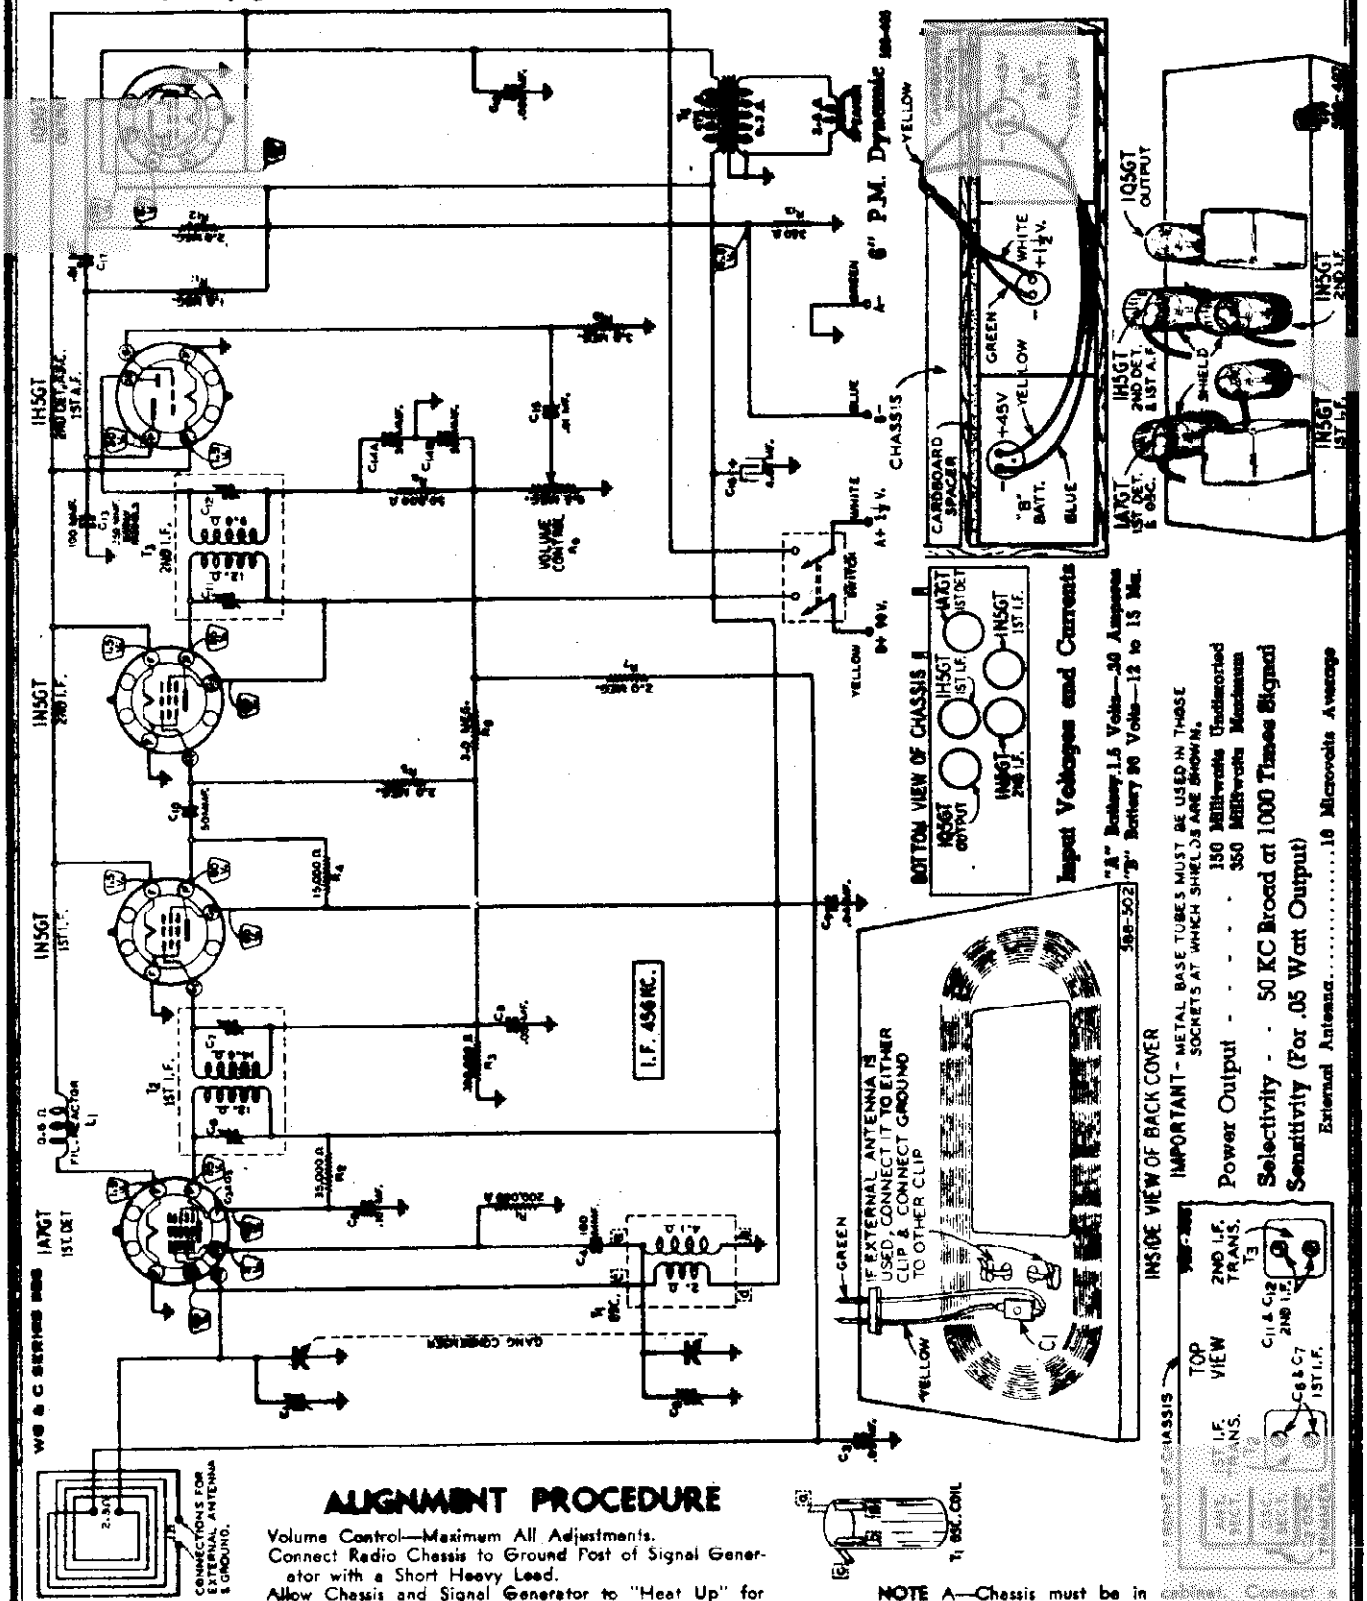
Selectivity 50 KC Broad at 1000 times Signal

Tuning Frequency Range 528 to 1730 KC

MODEL 93WG-565A
Schematic, Voltage

MONTGOMERY WARD & CO.

Socket, Trimmers
Alignment, Sensitivity



ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

SIGNAL GENERATOR FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
456 KC	Signal Grid of 1st Det. (Top Cap)	.1 mf.	Turn rotor to full open	1st I.F. (C6) & (C7) 2nd I.F. (C11) & (C12)
1600 KC	Signal Grid of 1st Det.	.1 mf.	Turn rotor to full open	Oscillator (C2)
1500 KC	Note See Note A		Turn rotor to max. output	Antenna (C1)

NOTE A—Chassis must be in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. The back of the cabinet must be in place. Place radio approximately 3 feet from loop so as to pick up signal. Radio should not be in proximity to any metal (metal bench, etc.).

CALIBRATION (For models with pointer in front of dial scale)—To obtain dial scale calibration, tune in an 800 KC signal. The pointer should be at the 800 KC mark on the dial. If it is not, hold the pulley at the back of the dial, loosen the pointer screw, set the pointer at the 800 KC mark, and retighten the pointer screw.

FOR TUNER AND ALIGNMENT SEE INDEX

32 Volt Power Supply

This radio is designed for use on farms and in those places where the power supply consists of a 32 volt direct current generating plant. The radio may not be satisfactory on plants which do not use storage batteries.

The power consumption of this radio is 57.6 watts. When first turned on, the power consumption is higher for a few seconds until the tubes heat.

Power Consumption - 1.60 Amperes at 36 Volts DC

Power Output - - - - - - .17 Watt Undistorted
.40 Watt Maximum

Selectivity - - 30 KC Broad at 1000 times Signal

Sensitivity (For .05 watt output)

B Range .... 528 to 1730 KC ...6.0 Microvolts Average
D Range ....5750 to 18300 KC...8.0 Microvolts Average

Line Voltage Range

The radio will operate satisfactorily within a line voltage range of 25 to 42 volts. If the line voltage is higher than 42, it will be necessary to use a series resistor to cut it down. If the voltage varies, a variable resistor may be required.

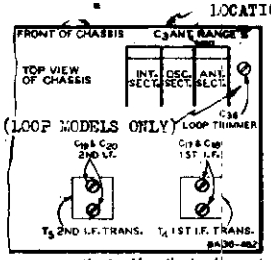
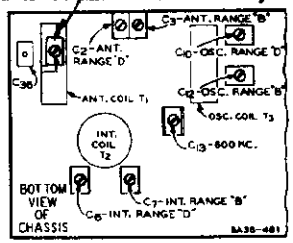
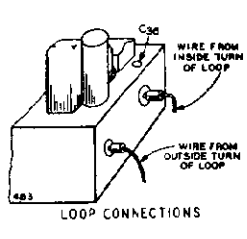
LOCATION OF C2 and C3 ON 93WG-801,-802 and -806 (EARLY MODELS)







Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC.

After each range is completed, repeat the procedure as a final check.

NOTE A—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

93WG-801,-802,-805.

NOTE A*—If the indicator is not at 1500 KC, it will be necessary to re-calibrate. Loosen the screw—See Illustration. Lift the tuning control drum upward so that the gears disengage and rotate the drum assembly the necessary amount in the required direction. Re-engage the gears and retighten the screw.

NOTE B—Reinstall set in cabinet. Connect a loop approximately one foot in diameter across the antenna and ground posts of the signal generator. Place signal generator so that this loop is between 3 and 10 feet from loop in cabinet.

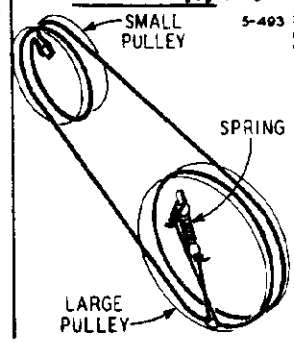
NOTE C (CONSOLE MODELS)—Turn knob of loop until output is maximum.

CALIBRATION—Chassis should be in cabinet. If it is necessary to recalibrate the radio, loosen the set screw on the dial hub near the volume control drum. Tune in a signal of known frequency. Hold the tuning control drum stationary and at the same time turn the dial drum the necessary amount in the required direction. If the radio detunes as the dial drum is turned, loosen the set screw a slight additional amount and recalibrate. Retighten the set screw.

CAUTION—When aligning the short wave 15,000 on the dial of the radio. The image band, be sure NOT to adjust at the image signal, which is much weaker, will be heard at frequency. This can be checked as follows: 15,000 less 912 KC, or 14,088 KC on the dial. Let us say the signal generator is set for It may be necessary to increase the input 15,000 KC. The signal will then be heard at signal to hear the image.

Drive Cord Replacement

MODELS 93WG-754,5,-800.



Use a new drive cord approximately 27 inches in length. Tie one end of drive cord to tension spring. Thread the other end of cord, starting from inside of large pulley, through hole in groove of pulley. Do not secure spring to hook on pulley.

Turn gang condenser to completely closed position.

Rotate tuning control drum so that hole in groove of small pulley is on top. Wind cord 1½ turns clockwise (from tuning control side of chassis) around small drive pulley. Turn should start at right side (from front of chassis) of pulley groove and progress toward the left. Thread cord through hole in groove.

Thread cord back through same hole, leaving a small loop below the pulley rim. Secure loop to hook on pulley—See illustration. Pull cord tight.

Wind cord one turn clockwise (from tuning control side of chassis) around large drive pulley. This turn should start at left side (from front of chassis) of pulley groove and progress toward the right.

Rotate large pulley until hole in groove is on top. Pass cord through hole. Tie a knot with a small loop at free end of cord. Secure loop to hook on pulley. Stretch spring and secure free end to same hook.

ALIGNMENT PROCEDURE 93WG-1000,-1001 (EARLY AND LOOP MODELS)

Volume Control—Maximum All Adjustments. Allow Chassis and Signal Generator with a short Heavy Lead.

Selectivity Control—Sharp Position All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a short Heavy Lead.
