

RCA Victor 2IT178

TRADE NAME RCA Victor Models 2IT176, 2IT177, 2IT178, 2IT179, (Chassis KCS68C, CB)
 MANUFACTURER RCA Victor Div., Radio Corp. of America, Camden, N. J.
 TYPE SET Television Receiver
 TUBES Twenty Five

POWER SUPPLY 110-120 Volts AC - 60 Cycle
 TUNING RANGE—Channels 2 thru 13

RATING 2.7 Amp.

ALIGNMENT INSTRUCTIONS

ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

The high voltage shock hazard may be eliminated by removing the horizontal oscillator tube, (V18), from its socket.

VIDEO IF ALIGNMENT

Connect the ends of a 1000Ω potentiometer across a 7.5 Volt battery capable of withstanding considerable current drain. Connect the positive end of the battery to chassis. Connect the center arm of the potentiometer to the junction of R95 & R96. Connect the synchronized sweep voltage from the signal generator to the horizontal input of the oscilloscope for horizontal deflection.

ANTENNA MATCHING UNIT ALIGNMENT

This unit has been properly aligned at the factory and is very stable. Alignment should not be attempted unless it has been definitely established that it is out of alignment and proper equipment is available to align it. The required equipment consists of a sweep generator capable of at least 1 volt output, and an oscilloscope with a sensitivity of at least .02 Volts per inch. Misalignment of this unit can cause serious attenuation of the signal especially on channel 2. Adjustment of the FM trap, (A43), however will not effect the alignment.

In the event of replacement of the antenna matching unit, the entire tuner should be realigned.

Disconnect the FM trap, L8, from the channel selector switch. The free end of L8 is alignment Point D, as shown on the schematic.

| 16. | " | " | 50MC (10MC swp.) | 50MC 52MC 53MC | " | A19, A20 | Connect a 300Ω resistor from Point D to chassis. Adjust for response curve similar to Fig. 7. A19 controls the placement of the shoulder. A20 is adjusted to give maximum amplitude of .53MC marker consistent with curve shape shown in Fig. 7. Repeat steps 14, 15 & 16 until no further improvement can be made. |

If the tuner is operating and requires only touch up alignment the completely realigned pre-set all adjustments to the approximate position. Pre-set A26 so the screw head is approximately $3/8$ inch above the top of the tuner. Do not change any adjustments on the antenna matching unit. Disconnect the coax link from terminal 'A' of L24. Connect a 39Ω resistor in series with the coax link. Connect a clip lead from the tuner AGC terminal, (terminal 3) to the ground connection of the 39Ω resistor. During step 17 the signal generator is connected to the RF Amp. g and the tube replaced in its socket. Connect the generator to the tuner. Set the fine tuning control 30 degrees clockwise from the mechanical stop. Connect the synchronized sweep voltage from the signal generator.

FM TRAP

ALIGNMENT INSTRUCTIONS (CONT.)

RF ALIGNMENT

If the tuner is operating and requires only touch up alignment the following pre-setting adjustments should not be performed. If the tuner is to be completely realigned pre-set all adjustments to the approximate center of their range with the following exceptions.
 Pre-set A26 so the screw head is approximately 3/8 inch above the chassis. Turn A9 fully counter-clockwise. Set A23 one quarter turn from tight. Do not change any adjustments on the antenna matching unit.
 Disconnect the coax link from terminal "A" of L24. Connect a 39Ω carbon resistor across the open end of the link..
 Connect a clip lead from the tuner AGC terminal, (terminal 3) to chassis.
 During step 17 the signal generator is connected to the RF Amp. grid by means of a piece of small diameter wire slipped over Pin 7 of the tube, and the tube replaced in its socket. Connect the generator to the free end of the wire.
 Set the fine tuning control 30 degrees clockwise from the mechanical center of its range.
 Connect the synchronized sweep voltage from the signal generator to the horizontal input of the oscilloscope for horizontal deflection.

| DUMMY ANTENNA | SIGNAL GENERATOR COUPLING | SIGNAL GENERATOR FREQUENCY | MARKE GENERATOR FREQUENCY | CHANNEL | CONNECT SCOPE | ADJUST | REMARKS |

DISASSEMBLY INSTRUCTIONS

1. Remove 8 push on type control knobs.
 2. Remove 3 wood screws from back cover. Remove cover.
 3. Disconnect built-in antenna.
 4. Disconnect speaker.
 5. Remove clip on jewel light.
 6. Disconnect H. V. lead.
 7. Disconnect picture tube socket.
 8. Disconnect yoke plug from H. V. unit.
 9. Remove 6 chassis bolts. Remove chassis.
 10. Remove speaker mounting nuts. Remove speaker.
- Note: For picture tube removal, it is necessary to remove the chassis as outlined above.

OSCILLATOR ALIGNMENT POINTS

CABINET-REAR VIEW

HORIZONTAL SWEEP CIRCUIT ADJUSTMENTS

Turn the set on and tune in a TV station, preferably a test pattern. If the picture cannot be synchronized with the horizontal hold control, turn the hold control to the center of its range and adjust the horizontal frequency slug, (B1). If adjustment of B1 will not synchronize the picture, turn the waveform slug, (B2), several turns out counter-clockwise and readjust B1. Examine the width and horizontal linearity of the picture. If they are not approximately correct adjust the horizontal drive, width, and linearity as outlined under HORIZ. DRIVE, WIDTH, AND LINEARITY ADJUSTMENT.

Connect the low capacity probe of an oscilloscope to terminal C of L38.

Adjust the waveform slug, (B2), until the broad and narrow peaks of the waveform on the scope are of equal height as shown in figure 9. If necessary during adjustment of B2, readjust B1 to keep the picture synchronized.

Turn the horizontal hold control to fully counter-clockwise, and momentarily interrupt the signal by switching to another channel and back again. If the picture is not out of synchronization turn B1 slightly and repeat the signal interruption until the picture is out of synchronization and shows several bars sloping downward to the left.

Slowly turn the hold control clockwise and carefully note the least number of sloping bars present before the picture pulls into synchronization. If more than 3 bars are present adjust the locking range trimmer, (B3), slightly clockwise, if less than 2 bars are present adjust B3 slightly counter-clockwise.

Repeat the check and adjustment of B3 until 2 to 3 bars are present at the pull-in point.

Turn the horizontal hold control to fully clockwise.

Adjust B1 until one bar, sloping downward to the right, appears in the picture. Then back off until the bar just moves off the picture leaving the picture in synchronization.

HORIZONTAL DRIVE, WIDTH, AND LINEARITY ADJUSTMENTS

Pre-set the adjustments as follows.

Place the width link in the minimum width position, (top).

Pre-set the width slug, (B6), to approximately mid-position.

Pre-set the horizontal linearity slug, (B5), near minimum inductance, (counter-clockwise).

Pre-set the horizontal linearity control near minimum resistance, (clockwise).

Pre-set the horizontal drive trimmer, (B4), to minimum capacity, (counter-clockwise).

Turn the set on and tune in a TV station, preferably a test pattern. Allow a few minutes for set to warm up.

If the raster is cramped or shows a bright vertical bar in the picture adjust B4 clockwise just enough to remove this condition.

Adjust B5 clockwise until the picture of best linearity and maximum deflection, or the best compromise, are obtained and then one quarter turn more.

Retouch B4 if necessary to obtain best results.

Check the horizontal linearity at various settings of the brightness control. There should be no compression of the right side of the picture, and no appreciable change in linearity especially at the extreme left side of the picture.

If objectional changes do occur, turn B5 slightly clockwise and repeat the check.

Adjust the width slug, (B6), until the picture is slightly wider than necessary to fill the mask horizontally. In the event of low line voltage, it may be necessary to move the width link to the lower position to obtain proper width. In this position the width coil, (B6) is inoperative.

If the left side of the picture appears stretched, adjust the horizontal linearity control counter-clockwise. If the left side of the picture appears cramped turn the linearity control clockwise. Whenever possible it is desirable to correct the linearity with the linearity control rather than the drive trimmer(B4).
