# TV ALIGNMENT INSTRUCTIONS

Before starting the alignment of this receiver, pre-set the controls as follows:  
 Picture Control to center position, Brightness Control to position where raster is visible,  
 Focus Control to position where focus is obtained, Vertical Hold to center position,  
 Vertical Linearity center position, Vertical Size to normal raster height, Horizontal Hold center position,  
 Horizontal Size, to normal raster width.  
 If the video IF channel is badly out of alignment and oscillating, it is recommended to pre-set the adjustments as follows to stop the oscillations.

"A" Adjustments	Slug Position
A1	Out
A2	Out
A3	In
A4	In
A5	In
A6	In
A7	Out
A8	Out
A9	Out

Remove the RF Amp. tube V1 and the oscillator tube V3 and connect the signal generator to Point A thru the input adapter shown in Fig 1 keeping all leads as short as possible.

Also connect a 3 volt bias battery to the AGC buss. Negative to AGC line-positive to chassis.  
**CAUTION:** If the common lead of the VTVM being used is grounded to the meter case it is necessary to insulated the meter case from the receiver chassis. If not, the -149V bias line will be shorted out.

### OVERALL TV IF RESPONSE CHECK

Connect the oscilloscope as shown in Fig 2. The filter circuit of two capacitors makes possible the grounding of the oscilloscope to the receiver chassis without shorting out the -140 volt bias supply.  
 Small ripples may occur on pattern which is due to feedback from the horizontal oscillator circuit. However, never remove the horizontal oscillator tube (V22) or the damper tube (V24) as the removal of either of these tubes will result in excessive plate current in V23 (Horizontal output tube) and will eventually burn out R7 (Horizontal size control).

### TV OSCILLATOR ALIGNMENT

It is necessary that the sound IF system be accurately aligned before attempting alignment of the oscillator circuits.

Since small inductances are connected in series with the tuned circuits for channels 7, 9 & 11, the order of alignment is important. It is necessary to align the higher channel of each pair (7 & 8, 9 & 10, 11 & 12) first.

Insert V1 and V3 in the tuner which were removed for the video and sound IF alignment and set the fine tuning control to the midpoint of its rotation.

The coils slugs are held in place with wax which must be removed when aligning the individual coil and should be replaced after alignment is completed.

**TV RF & MIXER ALIGNMENT**

In the event complete alignment of the RF Amp and Mixer circuits is necessary, it is recommended that the complete tuner be returned to the factory for a replacement unit. If only one or two channels require adjustments, alignment for those channels may be performed.  
 Short the AGC line to chassis while aligning the RF circuits.  
 Keep signal generator output as low as possible and still give reading

# AM FM ALIGNMENT INSTRUCTIONS

## ALIGNMENT INSTRUCTIONS—READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT

To set pointer turn tuning cap. fully closed and set pointer to last reference mark at low frequency end of dial.  
 Use insulated alignment screwdriver for adjusting.  
 Dummy antenna consists of a 200MFD cap. in series with a 20millihenry choke, the choke being shunted by a 400MFD cap in series with a 100Ω carbon resistor.

### AM ALIGNMENT

Loop should be maintained in same relative position to chassis as when receiver is in cabinet.  
 Volume control should be at maximum position. Output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated alignment screwdriver for adjusting.

### FM IF ALIGNMENT USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

Use frequency modulated signal with 60% modulation and 450KC sweep.  
 Connect the synchronized sweep voltage from the signal generator to the horizontal input of scope. This voltage may be taken from the powerline if signal generator does not have a sync. voltage output. There may be some phase shift encountered between signal generator and scope horizontal sweep. If provision is made for this in the scope, rotate phase control until a single trace pattern is obtained. If no provision is made for this, the same thing may be accomplished by inserting a cap. of suitable value (.01 to .1MFD) in series with the horizontal sync. input.

 \* Measured from pin 2 of V27

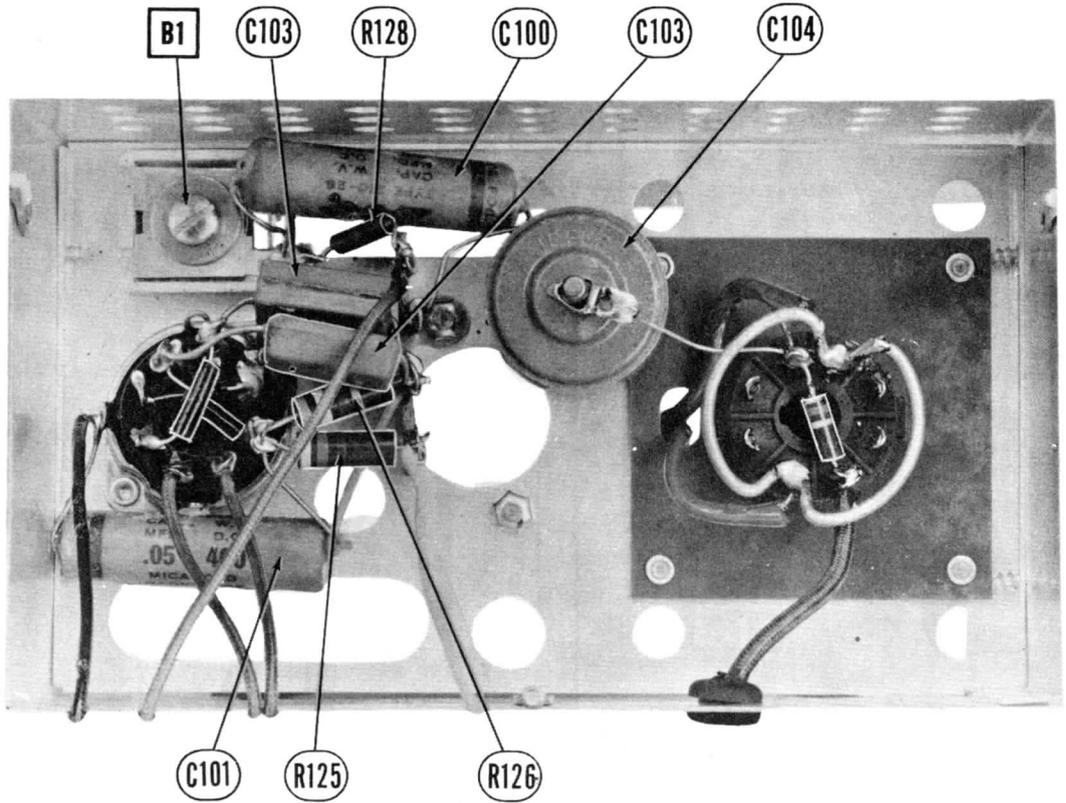

- DC Voltage measurements are at 20,000 ohms per volt; AC Voltage measured at 1,000 ohms.
- Pin numbers are counted in a clockwise direction on bottom of socket.
- Measured values are from socket pin to common negative unless otherwise stated.

- Line voltage maintained at 117 volts for voltage readings.
- Front panels controls set at minimum.
- Where readings may vary according to the setting of the service controls, both minimum and maximum readings are given.

## DIAL CORD STRINGING

## DISASSEMBLY INSTRUCTIONS

### MODEL 4900TV

1. Remove five push-on type control knobs.
2. Remove back cover from center compartment.
3. Remove speaker wires from transformer.
4. Remove HV lead from picture tube.
5. Remove power plug from TV chassis.
6. Disconnect AC plug to switch on door.
7. Remove radio AC plug from power supply.
8. Remove pilot light from mounting bracket.
9. Disconnect antenna lead at cabinet.
10. Remove four hex head screws holding power supply chassis. Remove power supply.
11. Lay cabinet front down on floor. CAUTION: The radio panel and phono unit must either be fastened or held while tipping cabinet.
12. Remove two hex head screws from bottom of chassis.
13. Slide chassis far enough back to unhook holding lugs then lift chassis straight up out of cabinet.

### MODELS 4939TV, 4940TV, 4941TV.

1. Remove five push-on type control knobs.
2. Remove twelve phillips head wood screws and two 1/4" hex head self tapping screws holding back cover. Remove cover.
3. Disconnect power switch plug. And remove power plug from TV chassis, HV plug from picture tube, and remove cabinet light.
4. Remove four 3/8" hex head metal screws holding power supply chassis. Remove power supply chassis.
5. Remove power switch lever. Remove hex head nut holding power switch. Remove power switch.
6. Remove isolation lead from door hinge.
7. Remove speaker wires from output transformer.
8. Remove four 3/8" hex nuts holding speaker. Remove speaker.
9. Lay cabinet down on front.
10. Remove two phillips head wood screws holding antenna mounting strip. Remove strip.
11. Remove two 3/8" hex head metal bolts from bottom of chassis. Slide chassis back to unhook holding lugs then remove by lifting straight up.

## HIGH VOLTAGE RF OSCILLATOR ADJUSTMENT

The high voltage output may be varied by adjustment of trimmer B1 which is located in the high voltage compartment.

This trimmer is adjusted for approximately 10KV on the high capacity side of the high voltage peak.

This setting gives maximum efficiency and regulation.
